The first five classes in the nurserymen's section, of which two were for show, two for fancy, and one for show and fancy Dahlias intermixed, were each represented by three displays. There was not much to choose in many cases between the various exhibits, and in the class for 48 blooms of distinct varieties the judges had to resort to careful pointing of each flower in the best two collections in order to arrive at their decisions. Some of the best blooms among show varieties were Daniel Cornish, James Cocker, William Powell, David Johnson, Miss Ormrod, Spitfire, and Chieftain. A magnificent specimen of this last-named variety was shown by Mr. WALKER in his 3rd prize exhibit. Among the "fancies" this same exhibitor had beautiful flowers of Dandy, Mrs. Saunders, John Forbes, Wm. Sheldon and Dorothy, while Mr. TRESEDER showed a magnificently-coloured flower of Peacock in his 2nd prize group. The popularity of the Cactus type of flower was evidenced all through the show, and more competition obtained in the classes for these flowers than in any other section. The premier classes in the nurserymen's section for Cactus Dahlias were those for 18 varieties in bunches of 6 blooms each, and for 48 blooms, distinct, and in each case the premier honours were carried off by Messrs. J. STREDWICK & SON. The flowers that won for them the 1st prize in the former class were a wonderful lot, including as they did no fewer than nine new varieties that had never before been displayed on the show board. Among this exhibit was found the premier bunch

of Cactus Dahlias in the nurserymen's section, in the variety Rev. Arthur Hall, a crimson-purple kind that is fully described below. Messrs. J. BURRELL & Co., who were 2nd in this class, showed three new varieties, and in addition had choice specimens of Harbour Lights, Elate (pink), J. B. Riding, and Alight. Class 9, for 24 Cactus Dahlias in distinct varieties, was strongly contested, nine exhibits being seen, in which the quality of the flowers was good throughout. The best exhibit in the great vase class saw popular varieties nicely arranged with coloured foliage—Bracken, Golden Elm, coloured Privet, Ampelopsis, &c., and berries—Mountain Ash, Snowberries, Berberis, &c. Some very good flowers were seen in the 2nd prize exhibit, notably those of Wm. Marshall and Mrs. Shoesmith, but the arrangement was not so pleasing.

Competing in the Pompon classes were seen the same old exhibitors of former years, Mr. CHAS. TURNER, Slough, winning in the larger class for 24 varieties in bunches of 10 blooms of each variety, while Mr. JOHN WALKER won in the smaller class for 12 varieties. A selection of the best flowers included Mignon (crimson magenta), Nerissa (bright pink), Elsa (white), Mars (scarlet), Little Mary (of perfect form), and Edina (yellow tipped with red in the centre florets).

The pretty single Dahlias were only represented by two exhibitors in each of the two classes provided for these flowers. Messrs. SEALE had, among others, charming flowers of Yellow Queen, Mavourneen (new, described below), Edie Oblan (pale velvety heliotrope fading to yellow in the centre of the flower), and Fortuna (yellow).

The enthusiasm shown by amateur members of recent years was well maintained, and in the amateur class for nine varieties of Cactus Dahlias there were no fewer than 15 entries; of this number 12 were staged, and so good was the general quality throughout the class that the judges recommended an extra prize. The Rev. ARTHUR BRIDGE carried off the premier prize, which included a silver challenge cup, but the next best two were so close in point of merit that the judges awarded them equal 2nd. The cup collection contained the premier bunch of Cactus Dahlias in the amateurs' section, in Fairy, a white, thin-petalled variety, with incurved segments. The top flower of the trio was a very promising bloom.

Mr. THOS. JONES, who is well-known in the Sweet Pea world, carried off the silver challenge cup for 24 show or fancy Dahlias intermixed, with good blooms that were easily 1st; indeed, there was not a weak flower among the two dozen. His best examples were Mrs. Seward, Standard, David Johnson (a grand flower), Duke of Fife, Marjory, and Blush Queen. Mr. H. BROWN, 171, North Street, Luton, Beds., showed the best "pompon," and Rev. ARTHUR BRIDGE the best "singles" in the amateurs' section.

A new class was provided for fancy Cactus Dahlias, a section represented by Cactus Dahlias with striped, spotted, or tipped markings. Messrs. STREDWICK were easily 1st, with an exhibit containing several new varieties, two of which were awarded Certificates of Merit. Messrs. STREDWICK showed 14 new flowers in all, every one of which possessed merit, although many were too much like existing varieties to gain recognition. They received certificates, however, for four new Cactus varieties, as will be seen below.

AWARDS.

CACTUS DAHLIAS.

Rev. Arthur Hall.—A variety of crimson purple shade, with a magenta reverse, which just shows on the tips of the petals. The segments are very thin, claw-like, and incurved. The flower is full and of large size.

Dr. G. G. Gray.—A large, well-shaped flower of bright fiery red or scarlet colour. The petals are very fine and incurved.

Diavolo.—This and the following variety belong to the fancy Cactus section. It is a striped flower on a yellow ground, slightly suffused with rose. The markings are chocolate-coloured, some of the florets having broad bars of this colour, while others are not so heavily marked.

Victor.—Another "Fancy Cactus," with very incurved and revolute florets that are striped with bright violet-purple on an almost white ground. As in the case of the last-named, some of the florets show heavier markings than others. All the above were shown by Messrs. STREDWICK.

SHOW DAHLIAS.

Gloria.—A very large flower of good form. The florets forming the centre of the flowers are flushed with heliotrope, which colour is slightly suffused through the older florets that are lighter in colour.

Claret Cup.—A medium-sized flower and one with remarkable colouring. The tip of each floret has a brown marking, and below is a magenta tint, which loses itself in the interior of the floret in a purple shade. Both these flowers were shown by Mr. S. MORTIMER.

SINGLE DAHLIA.

Mavourneen.—A flower of good form, and free from coarseness. The lower portion of the florets is rich crimson, the apex being of a magenta shade. The rich, dark, central portion of the flower is well set off by a cluster of golden-coloured stamens. Shown by Mr. SEALE.

POMPON DAHLIA.

White Perfection.—A miniature flower of first-class shape, with pure white florets. Shown by Mr. W. EACOTT, Addlestone, Surrey.

NON-COMPETITIVE EXHIBITS.

Pretty exhibits of Dahlias were shown by Messrs. HOBBIES, LTD., Dereham, Norfolk (Silver Gilt Medal); Messrs. H. CANNELL & SONS, Swanley (Crystal Palace Silver Medal); Mr. J. T. WEST, Tower Hill, Brentwood (Silver Gilt Medal); Mr. J. E. KNIGHT, Wolverhampton (Silver Medal); and Messrs. T. S. WARE, LTD., Feltham (Silver Gilt Medal). Messrs. PEED & SONS, Norwood, displayed Begonias, Gloxinias, and hardy flowers. (Crystal Palace Silver Medal).

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 12, 13.—The autumn show of the above Society held in the Waverley Market, Edinburgh, proved a pleasant surprise, for the exhibits were not only numerous, but they were of remarkably good quality. Displays of cut flowers were especially numerous, and, although this show is principally noted for its displays of Grapes and other fruits, this year the cut flowers constituted an important feature, for they were shown in great quantities and were of excellent quality. Roses, Sweet Peas, and Carnations were all exhibited in extraordinary numbers, and they were of the finest quality. Other flowers were less noteworthy, because, perhaps, they were more common. Vegetables, as usual, were a good show, Mr. GIBSON'S collection being of superior merit.

DESSERT FRUIT.

The best collection of 10 dishes of dessert fruits was staged by Mr. Kirk (gr. to J. THOMSON-PATON, Esq., Norwood, Alloa). He had very fine Grapes, Pineapple, Melon, Dr. Jules Guyot Pear, Nectarines, Peaches, Plums, and Figs.

Mr. GOODACRE, Elvaston Castle Gardens, was awarded the first prize for 12 dishes of fruit. The exhibit included grand examples of Pears, Apples, Peaches, Nectarines, Plums, and Figs; 2nd, Mr. MCKINLAY, Wiest Park Gardens, Beds.

An attractive display resulted from the competition for a table of dessert fruit decorated with flowers in vases and epergnes. The highest number of points, 125½, was secured by Mr. J. H. Goodacre (gr. to the Earl of HARRINGTON, Elvaston Castle, Derby); Mr. D. Kidd (gr. to Lord ELPHINSTONE, Carberry Tower, Edinburgh) followed with 112 points; and Mr. T. Young (gr. to Sir. GEO. BULLOUGH, Kinloch Castle) was 3rd with 103½ points.

SCOTTISH CHALLENGE TROPHY FOR GRAPES.

The Grand Challenge Trophy for eight bunches of Grapes brought six competitors. The judges had an extremely difficult task to decide the winner, but, after much deliberation, the trophy was awarded to Mr. A. Kirk (gr. to J. THOMSON-PATON, Esq., Norwood, Alloa; 2nd, Mr. Goodacre (gr. to Earl HARRINGTON, Elvaston Castle); Mr. Beisant (gr. to Lady ARMISTEAD, Castle Huntly), last year's winner, gained 3rd prize; and Mr. W. J. Green (gr. to Sir C. PALMER, Grinkle Park, Yorkshire), 4th prize. There were 14 other classes for Grapes, and as many as 142 competitors entered, giving an average of over 10 exhibitors for each class. In all cases the bunches were large and well-shaped, while the individual berries were almost perfect.

Mr. PIRIE (Dalhousie Cast'e) had the best two bunches Muscat of Alexandria Grapes; Mr. GALLOWAY, of Gosford, Longniddry, being awarded the 2nd place. Mr. GOODACRE had the best single bunch of this variety; 2nd, Mr. GALLOWAY. Mr. ANDERSON, North Berwick, was 1st for two bunches of Black Hamburgh Grapes in a large class; 2nd, Mr. GORDON (Whauphill, Monreith). Mr. GORDON was 1st in the class for one bunch of the same variety, gaining with it also the Williams' Memorial Medal. There was also a keen competition in classes for single bunches of other varieties.

Eight bunches of Grapes.—Mr. KIRK, Alloa, was a good 1st with large, full clusters of Dr. Tisserand, Madresfield Court, Muscat of Alexandria, and Cooper's Black; 2nd, Mr. GOODACRE, with smaller bunches; 3rd, Mr. BEISANT, Castle Huntly.

Four bunches of Grapes.—Mr. MURRAY, Culzean Castle, was awarded the 1st prize for large bunches; 2nd, Mr. PORTER, Whiteinch, Cumberland, who had well-finished examples.

OTHER FRUITS.

There was a fair display of Apples and Pears, but, generally speaking, they lacked the high finish one is accustomed to see in southern displays. Plums, Peaches, Nectarines, Figs, and Melons formed a comparatively small display, but some good dishes were staged, and represented produce from various parts of the kingdom.

GROUP OF MISCELLANEOUS PLANTS.

Two competitors only entered for a group of miscellaneous plants. Mr. Davis (gr. to Col. STEWART RICHARDSON, Stanley, Perth) put up the best exhibit. The arrangement was bold and well executed, tall Codiæums (Crotons), Abutilons, and Humeas forming the principal features. 2nd, Mr. Wood (gr. to J. BUCHANAN, Esq., Canaan Lane).

Among the exhibits of specimen plants it was reminiscent of old times to see Fuchsias trained pyramid fashion and forming fine specimens 4 to 8 feet high, almost every plant being profusely flowered. For the best two plants the 1st prize went to Mr. A. Pryde (gr. to Mrs. MCLAREN, Newington House, Edinburgh); 2nd, Mr. AITKEN, Balerno; and Mr. D. Plenderleith (gr. to T. A. C. MORTIMER, Esq.) 3rd. For one specimen Fuchsia Mr. AITKEN won the 1st prize.

There were numerous other groups of pot plants, the most noticeable specimens being some fine Lilium lancifolium and L. auratum, Vallotas, and a grand collection of tuberous-rooting Begonias. There was keen competition in the classes for Begonias, of which some splendid examples in 10-inch and 12-inch pots were seen.

Trained plants of Lapagerias, Clerodendrons, Statices, Aroides, exotic Ferns, Codiæums (Crotons), Cycads, and Coleus were the chief subjects among the other classes for pot plants.

ROSES.

These flowers formed an exhibition in themselves, the great majority of the blooms being characterised by large size and rich colours, especially those of the dark varieties, wonderfully developed.

Nurserymen's Classes.—Messrs. J. COCKER & SONS, Aberdeen, were 1st for 24 varieties, their blooms being in perfect condition. They showed choice examples of H. Dickson, A. Colomb, S. M. Rodocanachi, Mrs. J. Laing, G. Pigneau, Frau K. Druschki, and others; 2nd, Mr. H. DICKSON, Belfast; 3rd, Messrs. CROLL, Dundee.

Eight competitors staged in the class for 24 Tea Roses, the blooms being equally as good, but in some instances less fresh than in the above class. Mr. DICKSON was 1st with a grand lot, and he was followed by Messrs. COCKER.

Mr. DICKSON was also 1st for 12 blooms of a scarlet variety, having the variety H. Dickson. For the similar class for 12 blooms of a pink variety, Messrs. COCKER won with examples of Mrs. J. Laing, and for 12 white blooms Mr. DICKSON was again 1st, with Frau K. Druschki. Messrs. CROLL were 1st for eight vases of Tea Roses, with clear good blooms; 2nd, Messrs. SIMPSONS, Dundee.

Messrs. FERGUSON, Dunfermline, were 1st for 12 decorative Roses.

In the class reserved for gardeners, Roses were also very fine. Mr. RUSSELL, Newton Mearns, was 1st for 24 blooms of fine quality. This was a good class, no fewer than 12 exhibits being seen. For 12 hybrid Teas, Mr. DALGORM, Arbroath, won. There was also a good competition in other smaller classes.

A class was provided for a collection of Roses arranged on tables. Messrs. FERGUSON secured the 1st place with masses of blooms that were well up to an exhibition standard. Messrs. COCKER followed with a fine lot of blooms; 3rd, Messrs. SIMPSON, Dundee.

ORCHIDS.

Only a few of these plants were shown. Mr. A. Findlay (gr. to A. DRYBROUGH, Gogar Park), took 1st prize for three Cypripediums, one called "Transvaal" (Rothschildianum × Chamberlainianum) being very distinct. Mr. T. Dewar (gr. to W. T. ROY, Esq., Perth), gained the 1st prize for four Orchids; 2nd, Mr. FINDLAY; 3rd, Mr. G. Wood (gr. to J. BUCHANAN, Edinburgh). Arachnanthe Lowi won the 1st prize for Miss NELSON, Salisbury Green (gr. Mr. Henderson) in the class for one plant. Messrs. CHARLESWORTH & Co., Bradford, exhibited cut flowers, showing some of their finest hybrids; and Mr. D. McLEOD, Chorltum-cum-Hardy, showed fine Cypripediums, and several Orchid portraits.

MISCELLANEOUS CUT FLOWERS.

Sweet Peas, next to Roses, formed the chief display in the section for cut flowers. Twenty-six competitors staged in the class for nine varieties, and 29 in that for six; Mr. MALCOLM, Duns, being first in both classes, with Mr. GIBSON, Duns, 2nd in the class for nine, and Mr. WILSON, Selkirk, 2nd for six varieties. The competition was very close, but Mr. MALCOLM'S flowers excelled in colouring. Queen of Norway, Queen Alexandra, Etta Dyke, Henry Eckford, and John Ingman were especially fine.

Gladioli of remarkably fine quality were seen. Mr. Lawrie (gr. to M. SMITH, Esq., Prestwick), to whom the 1st prize for 12 spikes was awarded, had really grand examples. Mr. VEITCH, Carlisle, was a close second in this class. Mr. BENNET, Tweedmouth, had the best six spikes in the smaller class.

Dahlias also made an especially good show. Mr. SUTHERLAND, Kirkintilloch, was 1st in the class for 12 show varieties of Dahlias; Mr. JENKINS, Cambuslang, 1st for six show; Mr. PAUL, Killearn, 1st for 12 Cactus, and also for six Cactus varieties; and Mr. SUTHERLAND 1st for six varieties of Cactus Dahlias arranged in bunches. Carnations and Picotees were even more numerously shown than Dahlias, and the blooms were extraordinarily fine. For six vases of these flowers Mr. STEWART, Jun., Alloa, was placed first, with grand blooms; Mr. INNES, Hawick, was a close 2nd. The same competitors occupied identical positions in the class for six vases of these flowers containing 12 varieties. Phloxes, Chrysanthemums, Asters, and Pansies were other notable features in the cut flower classes.

Hardy flowers formed a grand display, Mr. RICHARDSON being 1st in the gardeners' class for six kinds, and Mr. BRYDON, Innerleithen, 1st for 12; both exhibitors showed grand specimens. In the nurserymen's classes Messrs. CAMPBELL & SON, Gourock, were easily 1st for Gladiolus, having 36 spikes of extra good quality; 2nd, Messrs MAW & SON, Prestwick. In the Dahlia classes in the nurserymen's section, Messrs. SMELLIE and Messrs. CAMPBELL were the chief prize-takers.

FLORAL DECORATIONS.

The important class for a dinner table decorated with flowers and foliage brought five competitors. Messrs. CAMPBELL & SON, High Blantyre, won the 1st prize with an arrangement in which pink and white flowers predominated; 2nd, Mr. MCINTOSH, 38, Polwarth Gardens, with a somewhat heavier arrangement, composed of Carnations and Dendrobiums; 3rd, Mrs. DUNCAN, Fogo, Duns, who used Henry Eckford and a cream-coloured variety of Sweet Peas, but the display was rather spoiled by the addition of Lily of the Valley. Mr. DAVIS, Stanley, Perth, showed the best decorated table, but by a mistake he was not permitted to compete.

Messrs. PERKINS & SON, Leamington, were 1st for a floral design with a representation of a gateway and gate, composed largely of Tuberoses and Orchids. They were also 1st for a hand bouquet of white flowers, for a coloured shower bouquet, and for a bouquet of Dahlias.

VEGETABLES.

The vegetable classes were 24 in number, for which there were over 300 entries, giving an average of 14 competitors in each class. The class for a display of 18 dishes of vegetables in not fewer than 12 varieties, and not more than two dishes of any kind, saw some noted growers competing with magnificent produce. The 1st prize was won by Mr. Jas. Gibson (gr. to the Duke of PORTLAND, Welbeck Abbey); the 2nd prize going to Mr. Harper (gr. to J. R. S. RICHARDSON, Esq., Perth); and the 3rd to Mr. R. Stuart (gr. to the Earl of LAUDERDALE, Thirlstane Castle).

The classes for Potatos were well filled, and the judges must have had considerable difficulty in deciding the best in each class, so excellent were the displays generally. Coloured Potatos apparently find but little favour in Scotland, as there were only a few dishes of these shown.

Tomatos of exceptional quality were seen, and they were in most cases of the usual smooth, globular type. About two dozen competitors contested in the classes for Tomatos.

Splendid Onions were shown. Mr. Gibson (gr. to the Duke of PORTLAND) easily secured the premier position with 12 bulbs of Ailsa Craig; 2nd, Mr. J. Laing (gr. to Sir J. C. RATTRAY, Blairgowrie); and 3rd, Mr. D. Murray (gr. to the Marquis of AILSA).

Fifteen competitors entered in the class for four heads of Cauliflowers. The best were shown by Mr. W. Bell (gr. to the Earl of HOME, Bothwell Castle); 2nd, Mr. J. K. Brown (gr. to J. OSWALD, Esq., Kirkaldy).

Cabbages, Curled Greens, Lettuce, Celery, Beetroot, Parsnips, Carrots, Turnips (white and yellow), Savoys, and Leeks formed the principal subjects of the other vegetable classes, and several growers competed in each section.

NURSERYMEN'S NON-COMPETITIVE EXHIBITS.

Mr. CUTHBERTSON, Rothesay, exhibited Pompon Dahlias, early Chrysanthemums, and Montbretias; Mr. YOUNG, Elgin, staged some 50 of the best varieties of Phloxes.

Messrs. J. COCKER & SONS, Aberdeen, had a nice assortment of cut border flowers, including some choice named Phloxes.

Messrs. J. GRIEVE & SON, Pilrig, staged Border Carnations and early-flowering Chrysanthemums.

Mr. HENRY ECKFORD, Wem, showed Sweet Peas, some of the finest ever staged in Edinburgh.

Mr. FORBES, Hawick, showed florists' flowers, Pentstemons being especially meritorious.

Mr. MCOMISH, Crieff, had a pretty lot of border flowers and Carnations.

Messrs. SUTTON & SONS, Reading, staged an extensive collection of Melons, Tomatos, Wax-pod and Scarlet Runner Beans, Ailsa Craig Onions, Celery, &c.

Mr. PAGE, Liberton, showed Tomatos and Chrysanthemums.

Messrs. STORIE & STORIE, Dundee, had a good lot of Apple trees in pots; also Streptocarpus, Begonias, and Celosias.

Messrs. H. LOW & Co., Enfield, London, staged Carnations in variety and cut blooms of Orchids.

Messrs. R. WALLACE & Co., Colchester, showed Montbretias Prometheus and other varieties.

Messrs. DOBBIE & Co., Rothesay, had an interesting collection of Turnips, and on another table a collection of cut flowers, including Roses, Sweet Peas, Chrysanthemums, Dahlias, Pansies, &c.

Mr. L. R. RUSSELL, Richmond, contributed a large collection of hardy Heaths.

Messrs. CUNNINGHAM, FRASER, & Co., Comely Bank, Edinburgh, showed seasonable hardy flowers, among which Tamarix odessana, Lysimachia sanguisorba, Tritoma "Seraph," T. Lemon Queen, T. rufa, and others were noticed.

Messrs. J. DICKSON & SONS, Hanover Street, showed shrubs in great variety.

THE SCOTTISH MUSHROOM CO. (1906), LTD., displayed Mushrooms.

Messrs. BEN REID & Co., Aberdeen, had Lilums, Veronica subsessilis, and Eulalias.

Messrs. R. B. LAIRD & SONS, besides a collection of Conifers, had a group of stove and greenhouse plants.

Messrs. J. METHVEN & SON, Leith Walk, arranged on the floor of the market, Lilies in variety, with Codiæums (Crotons), Dracænas, Caladiums, and other decorative plants.

Mr. FORTUNE, Queensferry Street, had a table of cut flowers arranged to show the value of the Beatall Flower Holders.

Messrs. THOMSON & SONS, Clovenfords, exhibited Grapes of fine quality.

Messrs. CAMPBELL & SON, High Blantyre, staged a bright group of Dahlias.

Dr. JOHN WILSON, St. Andrew's, exhibited a case of pods of hybrid Peas and their parents, to demonstrate the effect that crossing has upon the form and colour of the seeds. Nine varieties were shown, including wrinkled, green, round, and yellow garden Peas, and the field, crown and sugar Peas. All conformed to the principles set forth by the Mendelian theory. The series having the Sugar Pea as a parent were exceptionally interesting.

BRITISH GARDENERS' ASSOCIATION.—A fairly large meeting was held in the Bible Society's Rooms, St. Andrew's Square, Edinburgh, on September 12, when Mr. J. Weathers, Hon Sec., delivered an address on the aims and objects of the association. Mr. McHattie occupied the chair. A few nurserymen were in the audience, but only one took part in the discussion that followed. The general opinion of the meeting was that, if the society is conducted on proper lines, nothing but good would result from joining the association. It was stated that the executive council would be pleased to have a Scottish branch with headquarters in Edinburgh, or, better still, to have a branch in each Scottish county to co-operate with headquarters.

KUMAON.—This is a province of the Western Himalaya west of Nepal. Little was known of its flora till Lieut. (now Sir RICHARD) STRACHEY about 60 years ago commenced the survey of the region, in which he was afterwards associated with Mr J. E WINTERBOTTOM. The region traversed passes from S.W. to N.E., commencing in Rohilkund at an elevation of 1,000 feet above the sea-level, through the snowy ranges, and terminating in the Tibetan plateau at an altitude of 14,000 to 15,000 feet on the upper course of the River Sutlej. The numerous specimens collected were beautifully preserved and carefully ticketed, and they were distributed among the herbaria at Kew and other botanical centres. A provisional catalogue was prepared in 1882, and this has now been revised and extended by the very competent aid of Mr DUTHIE, who himself made extensive tours in British Garwhal, N. Kumaon and W. Nepal. In the present list Mr. DUTHIE enumerates 3,013 species distributed amongst 1,084 genera. Twenty-three species of Primula are enumerated and 10 of Androsace, whilst among Conifers, Cupressus, torulosa, three species of Juniper, one Yew, three Pines, one Cedar, one Picea, one Tsuga and two Abies are included. There are 161 Orchids, including 15 species of Dendrobium, six of Coelogyne, seven of Calanthe, eight of Habenaria, &c. Ferns are numerously represented, as are also Hepaticæ. Grasses, Composites and Leguminosæ supply the largest number of species. The species are enumerated in their respective natural orders, and tabular details are afforded, supplying information as to habit of growth, colour of flowers, time of flowering, locality, elevation above sea-level and geographical distribution. We have said enough to indicate the value of this carefully compiled catalogue as a work of reference, for which purpose the excellent index offers additional facilities. The work is published by LOVELL, REEVE & Co.

ENQUIRIES AND REPLIES.

CORNISH ELM.—Can any reader inform *J. M.* if this variety known as Ulmus campestris Cornubiensis originated in Cornwall, and by whom it was distributed, and in what year?

ANSWERS TO CORRESPONDENTS.

Ash. R. R. and S. We have further examined the specimen alluded to in this column last week, and find that there is no fungus present on the leaves; the brown discoloration is the result of injury caused by the scale on the

trunk. A tree in the Royal Gardens, Kew, has just the same appearance.

ASTERS FAILING: *H. B.* Without seeing a specimen, it is impossible to correctly determine the cause of your plants dying, but we suspect it is due to the Aster disease, the result of a fungus Erysiphe cichoracearum See our issue for June 2, 1900, p. 355

BOOK. *H. B* We know of no work on the subject other than *Vegetable Teratology*, by Dr. M. T. Masters, which is now out of print. You may, perhaps, be able to obtain a copy from a second-hand book shop.

BRACKEN (Pteris aquilina) *A G* If the growths are continually pulled out as soon as they can be observed above the ground, the rhizomes will in course of time die because the essential functions of the plants will be thereby prevented But bracken is capable of causing you very much trouble before it is exterminated by such means. The best method to adopt would be to trench the ground and get out all the rhizomes and roots, after which the grass seeds would have a much better opportunity to produce a good sward It would probably be also the cheaper means in the end. The applying of chalk alone would not effect your purpose.

CANADIAN GARDENING PAPER: *D R. The Canadian Horticulturist*, 507 508, Manning Chambers, Toronto, Canada.

CELERY DISEASED: *J L.* Your plants are attacked by a fungus, Cercospora apii. See answer to *H S*, in our last issue

DELBATING SOCIETY: *H. R. M.* Apply to the secretary of the Ilford Horticultural Society, Mr D J Hill, 31, Selborne Road, Ilford The horticultural instructor for the county of Middlesex is Mr J Weathers, Talbot Villa, Isleworth

EUCHARIS PLANT: *W. Cookson.* We have illustrated many very fine specimen plants of Eucharis grandiflora in these pages, at various times, but of most other plants showing skilful cultivation we shall be pleased to receive photographs for inspection from any of our readers.

EVERGREENS FOR BORDERS IN SUNDERLAND: *Doubtful.* Have the border thoroughly broken up and well manured before planting is attempted, as the roots of the old Sycamore trees will have robbed the soil of plant food Arrange your specimens in groups of say five to twelve, or even more, plants, because the effect of a colony of one species is much more pronounced than that produced by the mixed system of planting. The undermentioned plants are likely to prove satisfactory Two of the best flowering shrubs for your purpose are Berberis Darwinii and B. stenophylla, a third Barberry, B aquifolium, might be included on account of its perfect hardihood and brownish-crimson foliage in winter. Philyrea decora (P Vilmoriniana) is an easily grown handsome species with tiny white, hawthorn-scented flowers crowded round the previous year's wood in spring The golden-leaved form of the common broad leaved Privet will give colour all the year through, and is a good shrub for town gardens Cratægus pyracantha, the evergreen fire thorn, and Olearia Haastii, the New Zealand Daisy bush, are both good plants for your purpose. The Hedsworth and other strong growing-varieties of the common Box—Buxus sempervirens would flourish, and also the green and variegated forms of Elæagnus pungens. The Skimmias are hardy, dwarf in habit, and pleasing in foliage flower and berry. Aucuba japonica is an accommodating shrub, but is especially effective on sunny borders. Cytisus albus and C scoparius (white and yellow Brooms respectively), as well as the varieties præcox and Andreanus, also Cytisus battandieri, are very hardy and floriferous. Yucca recurva is a handsome foliage plant for the front part of the border, and at flowering time is particularly ornamental. Hollies should be planted freely, especially such varieties of the type as Hodginsii, camelliæfolia, platyphylla Golden Queen, aurea marginata bromeliæfolia, argentea marginata "Silver Queen," and argentea pendula picta (albo picta) If your soil is free from lime many hybrid Rhododendrons, such as Cynthia, H. W. Sargeant, Ascot Brilliant, Gomer Waterer, Viscountess Powerscourt, Baroness Rothschild, and Countess of Tankerville should be included Wherever Rhododendrons succeed Pieris (Andromeda) floribunda should be grown. Ilex europæa fl. pl. (double-flowered gorse), Quercus ilex and Osmanthus ilicifolius variegatus are hardy and ornamental. If you wish to include a few Conifers those here mentioned are particularly hardy: Cupressus nootkatensis, C. Lawsoniana, C.-L. lutea, C.-L. Silver Queen, C.-L. argentea, Retinospora obtusa aurea, R.-o. filifera, R.-o. gracilis, R. pisifera squarrosa, &c Of Yews, Taxus baccata elegantissima and T. b. aurea are the best. Thuya occidentalis lutea, T.-o. Ellwangeriana are effective.

GRAPES DISEASED: *L. G R. and R. S. O.* The berries are affected with the grape spot disease, the work of a fungus, Gloeosporium ampelophagum The lateral sent by *R S. O* is also affected by the disease. The diseased berries must be all cut out and burned Dredging with flowers of sulphur should be practised on the shoots and leaves at intervals of ten days. A small quantity of quicklime should be mixed with the sulphur on the second application, and the quantity should be increased each time until the proportion of lime and sulphur is about equal. It has been found of service to thoroughly wet the branches with a solution of sulphate of iron when the vine is resting. The use of rich stable manure is stated to render the vines susceptible to this disease. All fallen leaves and prunings should be collected and burned

GRUBS IN SOIL: *F F* The grubs can be destroyed by baking the soil In the case of your pot plants, make a hole in the soil near the side of the pots and pour in bisulphide of carbon at the rate of about two teaspoonfuls to a 6-inch pot. Close the holes after the application has been made and keep the plants in the shade for a week afterwards Caution: bisulphide of carbon is highly inflammable and poisonous

HEAVY TOMATO FRUIT: *G. G* Your fruit weighing 1 lb. 6 ozs. is not a record weight for a Tomato. In the *Gardeners' Chronicle* for April 26, 1902, p. 279, an illustration was given of a fruit which weighed 1 lb 10 ozs That specimen was grown by Mr. Burgess at Knowle.

JUDGING EXHIBITS AT FLOWER SHOWS: *J W* The system you recommend is already practised at Shrewsbury and some other large exhibitions, where the points awarded each dish in the large fruit classes are tabled and exhibited to the public Whether this system could be usefully extended to the smaller classes at such shows, and to Rose exhibitions is a question of expediency and convenience. It may, however, be remarked that in cases where the list of points awarded is not published, the actual awarding of the prizes may possibly have been determined by point-judging When the judges approach a competitive class of whatever nature it may be, they have to consider whether the differences in the exhibits are markedly distinct or not, and if the competition is good, the only safe course for them to adopt is to agree upon a standard and "point" the different constituents of the best exhibits But in other cases where there is considerable disparity between the produce shown and the order of the prize exhibits can therefore be easily determined upon examination, there is not the same need for point-judging, though in theory this may always be held to be desirable. We quite agree with your opinion that the quality of size is frequently over-appraised at horticultural shows, and that the practice of showing a few flowers of new varieties of Rose obtained from maiden plants may be misleading to visitors who attend exhibitions for the purpose of taking notes of varieties that appear to them desirable for cultivation in their own garden. These are disadvantages connected with exhibitions that have long been recognised and freely discussed. Those responsible for the holding of such shows should regard it as a duty to minimise these and other disadvantages as much as possible. Whether they could be entirely prevented is doubtful, and in any case we think the good arising from properly conducted horticultural shows is sufficient to outweigh such evils. It is necessary, however, for amateurs to learn that whilst it is exceedingly useful to make themselves familiar with the best exhibitions, and to take note of varieties that excite their admiration, it is essential that, before they decide to cultivate such varieties in their own gardens, information should be sought as to their habit of growth, strength of constitution, and general fitness for cultivation in the conditions under which they would be expected to grow.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruits at one time; they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.*

Miss R. Apple Harvey's Wiltshire Defiance (a grand fruit).—*W. G. S.* 1, Minchull Crab; 2, Worcester Pearmain; 3, not recognised; 4, King of the Pippins; 5, Greave's Pippin; 6, Bedfordshire Foundling.—*C. A. B.* Apple Summer Strawberry. The Nectarine was crushed. Peaches and Nectarines should be fully grown, but not perfectly ripe when packed, and they should be sent in a separate package.—*F. A. T.* 1, Malster; 2, Cellini Pippin; 3, Lord Suffield; 4, Dumelow's Seedling (Wellington); 5, Gravenstein; 6, Emperor Alexander.—*A. J F., Leamington.* Apple King of the Pippins.—*H. G.* 1 and 4, Dutch Codlin; 2, Grenadier; 3, Alfriston.—*Sleath* 1 and 3, Worcester Pearmain; 2, Scarlet Pearmain.

NAMES OF PLANTS: *Winterhome.* 1, Camellia japonica; 2, send when in flower; 3, Phyllocactus species, but no flowers are sent; 4, Agave americana variegata; 5, send later when in flower, 6, Cratægus sp.; 7, Cotoneaster frigida; 8, the specimen is insufficient; 9, Dactylis glomerata variegated variety; 10, Isolepis gracilis syn. Scirpus setaceus; 11, Oplismenus Burmannii (Panicum variegatum).—*C. L. B.* Tecoma radicans, a well-known North American plant, Nat. Ord. Bignoniaceæ.—*Miss C.* Parnassia palustris, but the leaf sent is not that of this species.—*T. G., Buntingford.* Polygonum baldschuanicum.—*W. E. L.* 1, Carex sp.; 2, Dactylis glomerata, variegated variety; 3, Rivinia humilis.—*I. S. E.* It is impossible to name the Arum from the berries alone; an inflorescence and leaf are required.—*Rayner.* 1, Helianthus multiflorus; 2, Helianthus rigidus. It is difficult to be certain when naming such scraps as these specimens.—*G. W. L.* You send more than the regular number. 1, Melia Azedarach, 2, Moorea bicolor; 3, Banksia sp.; 4, not recognised; 5, Eriobotrya japonica; 6, Eugenia sp., flowers required to identify; 8, Persea gratissima; 9, Ceanothus Gloire de Versailles, 10, Pyrus Aria, 11, Pyrus Aria var. —*C E F.* Erica flava.—*L. W.* Why not number your specimens? The trailing plant is Linaria Cymbalaria. The Heath with the decussate leaves is the common Ling, Calluna vulgaris; the other is Erica cinerea, the Scotch Heather.—*J. M.* 3, Trifolium arvense; 4, Apium graveolens; 5, Heracium umbellatum. Thanks for the contribution of two shillings to the Royal Gardeners' Orphan Fund. The names of Pears will be published next week.

NURSERY BUSINESS: *E. H.* The amount of your capital being so small, it will be better to cultivate some speciality, which will depend upon the experience you obtain in the meantime.

PEARS FAILING TO KEEP WELL: *A. F. H.* The Pears should not have been gathered in so green a condition as you mention. They should be harvested when they can be readily parted from the stalk, which can be ascertained by lifting them in the hand. With regard to your other question, we should not advise your commencing business if you have no experience, but providing you know something of the trade you could start in a small way with the capital you mention. It would be better to work in the nursery for a time as an assistant and save your money, than to risk losing it when you have no knowledge of marketing and selling.

COMMUNICATIONS RECEIVED.—A. Spriging (your letter has been forwarded—Galbraith, Bethune & Co. (many thanks, the news was published in these pages a fortnight ago)—C. Sprenger (many thanks)—F. M.—H. FRUIT-GROWERS, THE GOVERNMENT, AND THE RAILWAYS.

AN interesting correspondence has been going on lately in the *Times*. In the first place, Mr. C. Radcliffe Cooke, following the recommendations of the Departmental Committee to enquire into the present condition of the fruit industry, urged the formation of a special department of the Board of Agriculture with two sub-departments, one to act as a bureau of information on all subjects connected with the industry, the other to form and supervise a special experimental fruit-farm. The present President of the Board of Agriculture was waited on by a representative deputation to urge him to give effect to the recommendations of the committee. The results were not encouraging. The Government is pledged to economy and to reduce taxation, and does not see its way to carry out the recommendations of the committee. So far as these objects can be effected by co-operation among the persons concerned, it would no doubt be better to rely on private enterprise than to invoke Government aid. But there are other matters that only a central government armed with the necessary powers can accomplish—such, for instance, as the enforcement of measures to prevent the introduction of diseases, so far as that may be possible, or to stamp out the pests when they have been introduced. Individuals, or even associations of individuals, can only render imperfect aid in such matters, or it may be that their efforts might prove futile. The phylloxera spread far and wide in spite of the most strinent Government restrictions. Mr. Radcliffe Cooke instances the Pear midge, which, he says, though we think he must be mistaken, has only been known in this country for twenty years. At any rate he says, had the Board of Agriculture of that day possessed such a department as he advocates, the existence and habitat of this pest would have been known, and precautions would have been taken against its introduction or to secure its extermination. Now, in this matter, as in so very many similar instances, the pest was described and figured years ago in the *Gardeners' Chronicle* by foremost experts [see *Gardeners' Chronicle*, July 14, 1888, p. 45]. The difficulty is, or has been, to get people to read, and more especially to heed what they read. Thanks to the increased activity of the Department of Agriculture and to the County Council schools and lecturers, there are signs of improvement in these particulars, and the coming generation will be better fitted to deal with these matters than their predecessors. The United States Department of Agriculture and the numerous colleges and stations, to whose labours we have so often to allude, furnish an excellent example, which we might follow with great advantage in this country.

Another subject of great importance to fruit growers is raised by Mr. Cecil Hooper. He does not do more than allude to the rates charged by the railway companies, and in this perhaps he is wise, as the companies have to make a living as well as the fruit growers, and their shareholders have as much right for consideration as the growers. A fair compromise is all that can be expected between conflicting interests. Motor-cars and canals will sooner or later compete so keenly with the railways that the public, at least, will gain by the competition. Mr. Hooper's complaint is mainly directed against the late arrival of the fruit-trains, the possible loss of a market, and the certain deterioration of quality of the fruit by delays in delivery. Mr. Hooper cites instances where Strawberries which arrived at Covent Garden at ten in the morning sold at nine shillings the peck, whilst at 11.45 the price had fallen to 4s. 6d. and 5s. This is no doubt very grievous to the grower whose fruit arrived late, but it must be remembered also that if all the fruit were delivered early the price would also be low in proportion, and, again, there is, within twenty or thirty miles of London, and doubtless of other great centres of population, no reason why farmers and fruit growers should not co-operate and be their own carriers by motor-traction, and by steam boats where rivers and canals are available. Wholesome competition of this kind would doubtless induce the railway companies to reconsider their tariffs and increase their speed. Mr. Hooper concludes his letter with the following recommendations:—

"Parliament should deal with the railways in the matter of their carriage of perishable produce as to:—

(1) Reclassification, based on trouble given, amount of handling, and space taken rather than on the basis of liability to claim.

(2) Efficient care should be given to all goods, independent of rate.

(3) The railways should be held responsible to deliver in reasonable time; and (4) to deliver the proper quantity.

(5) Temporary "glut rates" should be allowed when there is a very abundant crop, in order to carry the fruit cheaply to greater distances and to market, to avoid fruit being left unpicked and wasted.

(6) The Board of Trade should put in force their existing powers in case of breaches of the law by the railway companies.

(7) In the case of agricultural produce, the Board of Agriculture should be arbitrator in disputes between the producer and the railway.

The English fruit grower asks for fair play and to be treated as well as the foreigner, and believes the railways by granting greater facilities and cheaper rates would not only benefit this valuable and important industry, but that the railways would be more prosperous, and increased dividends would be earned for the shareholders."

In a subsequent number, Mr. Pratt traverses some of Mr. Hooper's specific statements by reference to the records of the railway companies. Mr. Pratt further intimates that the delay in delivery is not entirely the fault of the railway companies:

"The evidence given before the two committees proved that, whatever the actual shortcomings of the railways, the fault for this late delivery is far from being entirely due to them. It was shown, in the first place, that fruit-growers generally send their consignments to the local station only at the last moment, so that difficulties occur in handling them, and the delay of trains in starting is unavoidable. Then, when the railway-vans take the consignments to the London markets, they may be kept waiting for several hours owing either to the congestion of traffic in the streets, or, alternatively, to the reluctance of the salesmen to accept delivery when the market is over-supplied and previous consignments have made poor prices. Concerning such delays Mr. Vincent W. Hill, general manager of the South-Eastern and Chatham Railway, said in his evidence before the Departmental Committee on the Fruit Industry: 'That renders it extremely difficult and very expensive to the companies, seeing that the vans cannot get back to take a second load, and it also causes delay at the railway by not clearing away the second lot of fruit that comes in.'"

PROPAGATION IN SEPTEMBER AND OCTOBER.

IN the present month, as in August, great use may be made of the mild hot-bed in the open air for the propagation of the under-mentioned plants, which are largely employed in the flower garden and greenhouse. Some of them winter sufficiently well in store pots of from 6 to 8 inches diameter, filled with sandy loam and leaf-soil, and surfaced with clean silver sand, or washed sea sand. If space will permit, however, better results are obtained by potting the rooted cuttings singly in large or small 60's, in which they may be kept till the spring or planting-out time, according as may seem desirable, or, should the plants be required to furnish cuttings for early spring propagation, a slight re-potting may become necessary at the end of the month of January. A mild hot-bed, i.e., one that will afford a bottom heat of 75°, is best made of freshly-fallen tree leaves, but failing these, those left over from the previous autumn will do if mixed with long stable litter in equal proportions. The bed must be made one foot wider and longer than the garden frames that

will be placed thereon, and the materials should be firmly trodden, and when the frame is in position other leaves should be added so as to bring the tops of the cuttings within 6 inches of the lights. Some gardeners plunge the cutting pots directly into the leaves; others place a 6-inch layer of finely-sifted coal ashes or half-decayed leaves over the last-named material, in which to plunge the pots.

In such beds can be rooted the following:—Cuphea platycentra, Verbenas in variety, Petunias, Ageratum in variety, Bouvardia (roots and cuttings of the top growths), Gazania, Gnaphalium, Heliotropes, Lantanas, Angelonia, Anthemis, Veronica, Coleus, Senecio, Solanums, Pelargoniums, and Chelone.

All of the varieties of Pelargoniums employed in flower beds in the summer are the better for being rooted in prepared beds of sandy soil in full sunshine, as early in September as it may be possible to obtain firm, well-matured shoots from the top and exposed parts of the plants. The varieties usually grown for greenhouse decoration, viz., the fine large-flowered Zonals and the Ivy-leafed, may be equally successfully rooted in these open-air beds as under glass, or in the mild hot-bed, and the plants are more robust, and the losses fewer.

In the warm bed, cuttings formed of two-year-old shoots of Ficus elastica, Dracæna terminalis, and underground tubers may be rooted; also Phœgelius capensis. Iresines and Alternantheras, both require more warmth than is afforded by the mild hot-bed, say, a bottom warmth of 80° and top heat of 70°. These early struck Alternantheras afford better and stronger shoots for the spring propagation than old store plants, and are, therefore, to be preferred. The same applies to Iresines, but, perhaps, to a lesser degree.

If plants of Sempervivum tabulæforme, Echeveria metallica, or others are in bloom in the open ground, some of them may be carefully taken up and be potted in sandy loam, and stood in a sunny house that is well ventilated daily; they will then set their flowers, and ripen their seeds, which is unlikely to occur out of doors in this country. When ripe, sow the seeds, after allowing them to become dry for a day or two, and nice plants will be secured for the following year.

Seeds of Lilium Thunbergianum, and L. tenuifolium often occur in the ripe state on the plants. The capsules should be gathered, and dried in the sun for a day or two, when the seeds may be sown in peat and leafmould, in which they will germinate in about four weeks. Seeds of L. auratum, L. giganteum, and others take a year, or even longer, to appear above ground. The wooden box is, in the case of Lilies, a better receptacle for the soil than pots or pans. A warmth of 55° is required to germinate the seed.

A shady border, prepared by digging and adding a liberal sprinkling of sharp sand, and having some well-rotted leafmould incorporated with the soil, may be made of use for the reception of cuttings of Centaurea candidissima, C. gymnocarpa, Pentstemons, Pansies, Violas, and Phloxes, both shrubby and prostrate species.

A sort of cold bed is employed on the Continent for the purpose of wintering cuttings that need protection, and in these may be put at this season Roses, Kerria, Honeysuckles, Hydrangeas, Dianthus, Lilac, Aubrietia, Laurel, shrubby Veronicas, &c. It is usual to surround these beds with sheep hurdles, matted thickly with straw, in order to keep out frost and cold winds, and to cover them at night time with mats, formed either of straw or bast. Such beds should be kept at about 40° to 45° Fahr.

Cuttings of many kinds of evergreen shrubs and others may be inserted in sandy soil laid upon beds of almost spent tan, old Melon beds, and the like, which retain a certain amount of heat that will favour the formation of roots. Euonymus japonicus, E. radicans, Aucuba, Weigelia, &c., may be propagated in this manner. The French call such lukewarm beds *couche sourde*, and use them extensively for striking cuttings of shrubs from soft shoots, and for the propagation of such plants as Bamboos, Yucca, Arundo, &c., from cross sections of the stems.

The following species of shrubs may now be layered:—Rhamnus, Viburnum [Laurestinus], Magnolia, Spiræa, Rhododendrons, and Aucubas. Rhododendrons raised from layers as stocks on which to graft the finer varieties may be lifted and potted in readiness for grafting under glass. Bud the female Aucuba with the male kind in these months, in order that when the female blossoms appear, they may become fertilised, and furnish an abundance of shining scarlet berries in the winter months.

Seeds.—Sow for late flowering seeds of Primula, Calceolaria herbacea, and Cinerarias of the various sections. *E. M.*

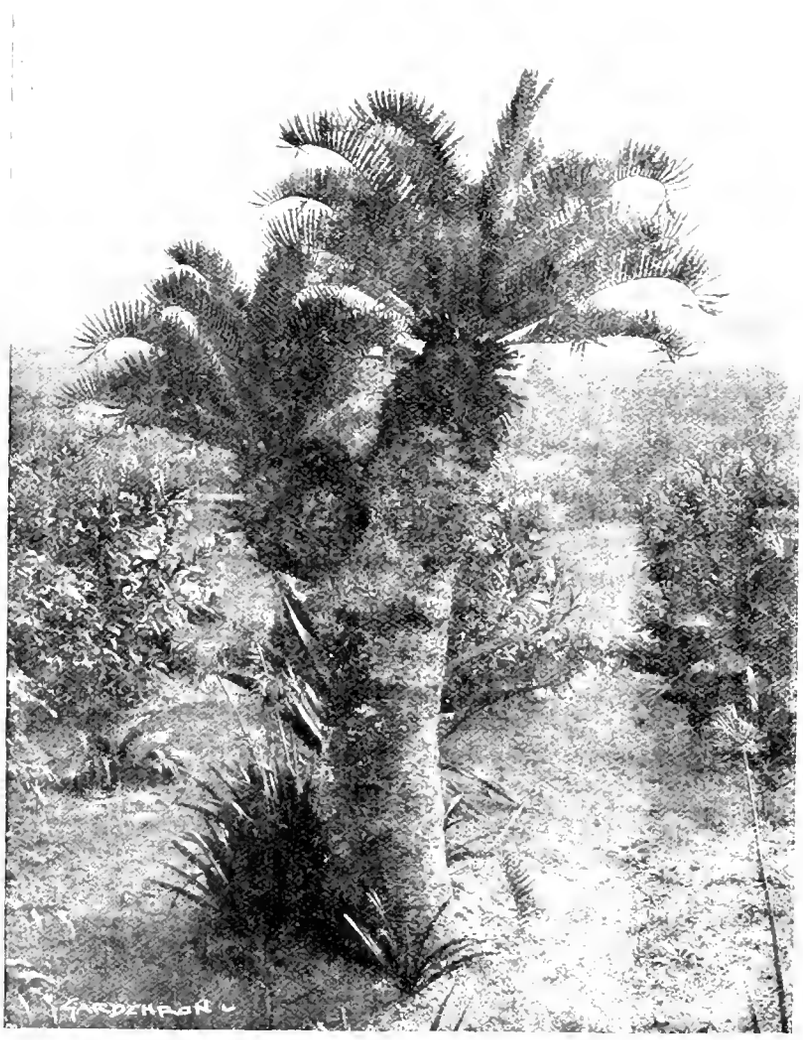

FIG. 84.—ENCEPHALARTOS ALTENSTEINII GROWING IN CAPE COLONY.

ENCEPHALARTOS ALTENSTEINII.

I SEND you a photograph (reproduced at fig. 84) of a very fine specimen of Encephalartos Altensteinii. The plant, with many more of the same and other species of the genus, is growing in the garden of Mr. Smartt, in the Uitenhage division of Cape Colony, and is estimated to be considerably over 100 years old. It has survived a good many bush-fires, and the aged trunk is charred like a cinder from the base to a point at about 3 feet from the ground, and is a great curiosity owing to the offshoot which is invariably termed the Piccaninny—growing, as it does, similar to the way a Kaffir mother carries her child. Mr. Smartt is a great admirer of these uncommon plants, and is never tired of collecting aged, quaint, and new specimens, or relating his experiences concerning their characteristics and peculiarities. Situated some 25 miles from Port Elizabeth, it is a locality of beautiful scenery and botanical interest. A fine river runs through the farm, and the lovely Van Staadens Gorge is quite close. Miss North visited the farm and district, and her notes are, I believe, preserved in the library at the Royal Gardens, Kew. *Harry Rabpohn.*

THE PRIMULAS OF CHINA.

(Continued from page 192.)

In height, Chinese Primulas range from half an inch in P. Pumilio to 3 feet or more in P. pulverulenta. The first-named has bright rose-pink flowers, which expand immediately the snow melts, forming lovely carpets in the moist, grassy belts. So minute is the plant that it is nearly impossible to find it when in fruit or out of flower, and, even when in flower, it is tedious work gathering specimens.

P. pulverulenta, on the other hand, is seen from afar, and once seen, never forgotten. This new species has already many friends in this country, and is, I venture to predict, destined to become in the near future the most highly-prized of all hardy Primulas. It is in the way of, but distinct from and superior to, P. japonica [see fig. 85, p. 20] no higher praise can be given. The cultural requirements of P. pul-

FIG. 85. THE PRIMULAS OF CHINA: P. JAPONICA, HARDY PERENNIAL; COLOUR OF FLOWERS, MAGENTA.

(For text see page 206.)

verulenta are those of P. japonica, and all who succeed with the latter will have no difficulty with the new plant. In vigour, size, and colour of flowers, P. pulverulenta equals the best forms of the Japanese Primrose, whilst its tall scapes, often with nine separate whorls of flowers, are densely clothed with white farina. It is in the possession of this latter character, combined with all the good qualities of P. japonica, that P. pulverulenta may be placed at the head of the family of Primroses hardy in this country.

There is one unfortunate fact about Primulas, and one that is of much horticultural significance, namely, that many species are little better than biennials, and only succeed under cultivation when treated as such. This is particularly true of many of the strong-growing bog-loving species, such, for example, as P. sikkimensis, P. Wilsoni, and P. vittata [see fig. 87, p. 209]. A great many of the Chino-Himalayan species really belong to this category, but such as P. Veitchii and P. pulverulenta are absolutely perennial.

Comparisons are ever invidious, and if any are entered into here it is not with any intention or desire to disparage the merits of Primulas found in countries other than China. To do so would be absurd. In P. sinensis China supplies what is probably the most popular member of the whole Primrose family. For about sixty years this was the only species of Primula known from the Flowery Land, in cultivation in this country, and the habitat of even this species was unknown until about three decades ago. Twenty-five years ago the late Chas. Maries, when collecting for Messrs. Veitch, introduced from Ichang the now well-known P. obconica. About 1889 two other species, P. Forbesii and P. Poissoni, were sent to France by Père Delavay, and shortly afterwards these got into cultivation in this country.

To these four species cultivated in this country, the writer, under the auspices of Messrs. Veitch, has had the good fortune to add 19 more species. Several of these are quite new, and all have flowered in this country. Many of the new-comers have been figured and described in the columns of the *Gardeners' Chronicle*, and Messrs. Veitch's exhibit of new Primulas at the Temple Show will be fresh in the minds of all who saw it.

Various systems of classification have been devised and adopted by botanists who have dealt with the Primula family. All such systems are more or less useful, but for the purpose of this article we need not trouble ourselves about specific affinity, and a classification based on habitat will probably be of most interest to plant lovers. The Chinese Primulas easily lend themselves to such grouping, and we may divide them into *Limestone*, *Woodland*, and *Grassland* species. These groups are very unequal, 85 per cent of the species falling into the last-named group.

I. *Limestone.*—The most noteworthy member of this group, and the only one in cultivation, is P. sinensis. So much has been written about this favourite that there is really nothing left to tell. I may perhaps remind readers that in a wild state this plant is a true perennial, and occurs on bare ledges and niches of cliffs fully exposed to the sun, where it gets but very, very little moisture. In a state of nature the flowers are of a uniform mauve pink, and I never saw any variation in colour not even an Albino! This is, to say the least, remarkable, when we consider the wide range of colour we find in this plant under cultivation. In late January and February the cliffs around Ichang, where this plant has its home, are a delightful picture. After flowering, the flower-stalk becomes negatively heliotropic (turns away from the light), an interesting biological character which the plant appears to have lost under long cultivation.

P. cuneifolia, P. pulchella and P. bracteata are three of Delavay's "finds" belonging to this category of Limestone species. P. bracteata is a truly extraordinary species with a woody stem as thick as an ordinary lead pencil, and 8 inches to 1 foot long. The flowers are pink, of small size.

II. *Woodland.*—This, like the preceding, is a small group, comprising fewer than a dozen species. P. ovalifolia and P. sonchifolia are perhaps the most striking. From Central to Western China (about 1,000 miles), between 3,000 and 8,000 feet, the first-named is very abundant, and is to China what P. vulgaris is to this country. P. sonchifolia connects up with P. ovalifolia at 8,000 feet, and extends to 11,000 feet. Both species have large violet-purple flowers. Owing to some unknown reason (possibly excessive rainfall) both these species apparently fail to produce good seeds. The capsules swell up well, but burst before the seeds are mature. The green immature seeds may be seen in the ruptured capsule, and though several attempts were made with these "seeds," all failed to grow.

The introduction of P. ovalifolia was accomplished by bringing to this country living plants from the neighbourhood of Ichang. P. ovalifolia flowered at Coombe Wood last year, and was figured in the *Gardeners' Chronicle*, 1905, vol. xxxviii., p. 62 Suppl. Unfortunately, this lovely plant so far refuses to thrive under cultivation. P. calliantha is a denizen of the Pine-woods of Western Yunnan, where it was discovered by Delavay. It is a very handsome species, in many respects resembling P. nivalis. P. deflexa, P. Viali, P. Giraldi, P. nutans, P. bellidifolia, and P. cernua are all found growing in thin woods and shrubberies at considerable elevations. These species form a curious group, having the flowers arranged in a dense cone-shaped head; the pedicels are very short and the corollas deflexed. The flowers are of varying shades of violet-purple or blue, and are very sweet-scented. The scapes are often 1½ feet high. P. deflexa, P. nutans, P. bellidifolia, and P. ovalifolia are the only members of the woodland group as yet in cultivation.

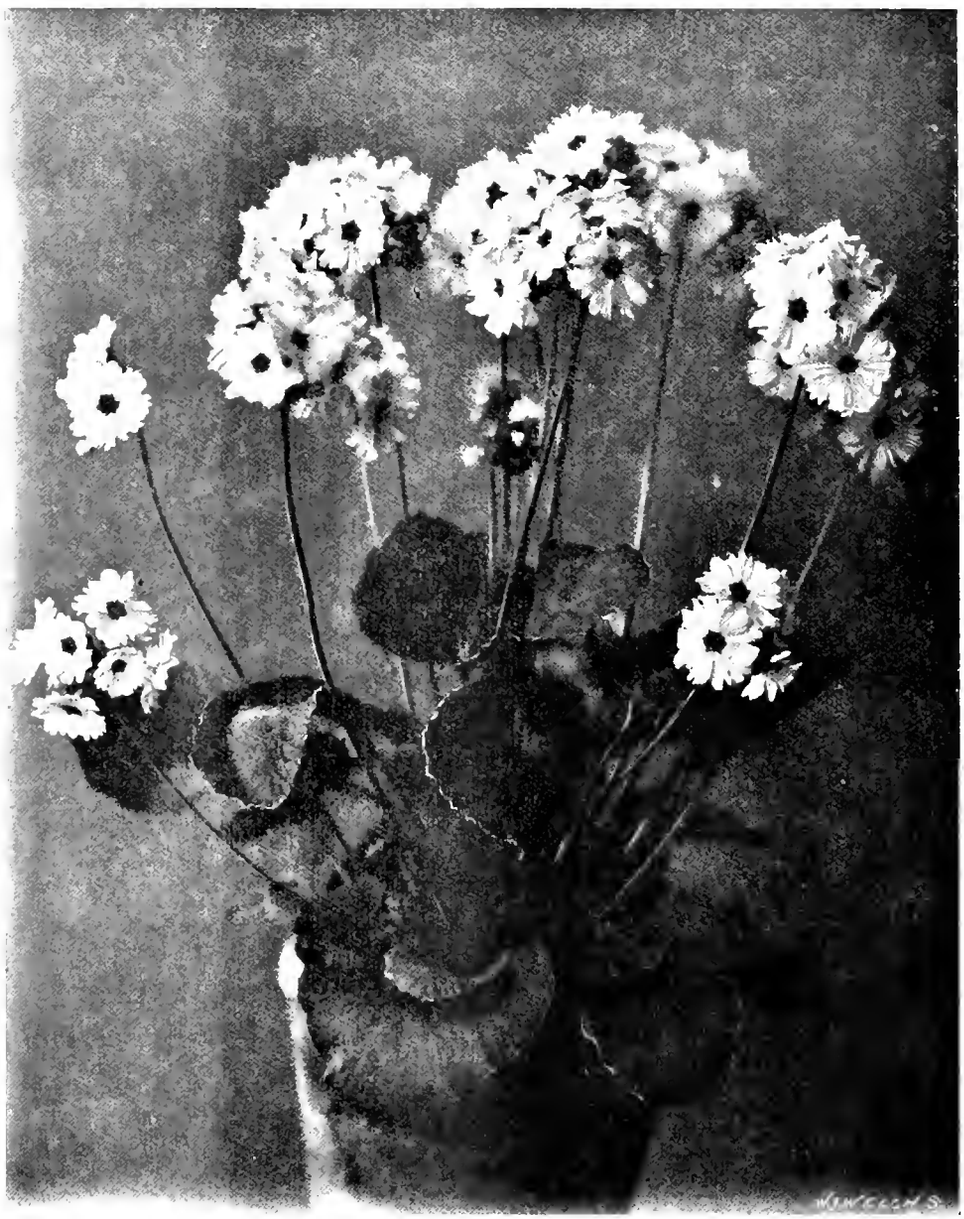

FIG. 86.—THE PRIMULAS OF CHINA: AN IMPROVED FORM OF P. OBCONICA.

III. *Grassland.*—The term, "Grassland," is somewhat vague, and is used for the simple reason that a more comprehensive one is not forthcoming. Under this heading are grouped all the species of Chinese Primulas which inhabit open places, whether it be grassland, marshland, woodland glades, or bare rocks in the higher Alpine regions. As members of this group extend practically from the sea-level to the limits of vegetation, it will conduce to clearness if some sort of sub-division be made. Fortunately, the species lend themselves to this, and we may conveniently group all found below 8,500 as Temperate species. Those found above 8,500 we may designate Alpine species.

III.a. *Temperate.*—This, though not so large as the Alpine group, includes a great many species, some of which rank among the finest of the genus. Two species (P. obconica and P. Forbesii) are well known in gardens in this country and the Continent. P. obconica [see fig. 86, p. 208] is very abundant in moist, grassy places from Ichang westward, and ranges up to 4,000 feet. It is very variable in size and texture of leaves, and the flowers also vary in size and colour. Under cultivation, the plant has marvellously improved, so much so, in fact, that the best of the wild forms are mere "weeds" in comparison. *E. H. Wilson.*

(To be concluded.)

NURSERY NOTES.

ANNUALS AT READING.

A RECENT visit to the interesting trial grounds of Messrs. Sutton and Sons, Reading, afforded me an opportunity of inspecting a collection of annuals, most of which were in their full beauty. The display of these showy and easily-grown plants was indeed remarkable, whether viewed from its great extent or its exhaustive character. In all, some sixty acres are at Reading devoted to experimental trials of plants. Great numbers of stocks and diverse types of the plant that is undergoing trial are brought together side by side for testing. The trial is, therefore, essentially comparative, and neither effort nor expense is spared in the endeavour to render it as complete as is possible. The date of sowing, the appearing above ground of the seedlings, the coming into blossom, and numerous other items are all recorded. Taking Stocks for an example, the rows must have measured considerably over half-a-mile, and at the time of my visit these were a mass of flowers. A given number of plants of each variety are grown in convenient quarters of land some 24 feet wide. It was instructive to see the large area covered by individual plants, for in numberless instances they measured 18 or 20 inches across, and this, too, in a stony soil of very little depth. I was especially impressed with the wonderful mass of blossoms, the sturdy, vigorous character of the plants, the quality of the strains, and the very high percentage of double flowers. The dry summer has suited the Stock. The bedding (ten weeks) and the intermediate sections were excellent. Mauve Beauty, Superb Bedding, and Perfection are ideal types of the first-named section, and there are many distinct shades of colour. Queen of Mauves and All the Year Round, the latter with flowers of snow-white purity, are excellent among the winter flowering kinds. Mignonette is also tested on a large scale in these nurseries, and it is difficult to see where further improvement can be made in the type known as the "Giant" strains. The variety Improved White well merits its name.

Very large and exhaustive trials of Verbenas and Petunias were noticed, and the value of both these species as dry-weather plants was as apparent as in the case of Stocks. The former were sown in batches of certain colours, and the manner in which they came true showed them as reliable as named varieties for bedding purposes, while they have greater vigour than named sorts, and fine spreading tufts of flowers. A noticeable feature was the prostrate habit of growth in certain strains, which thus requires no pegging. Other important subjects seen were Sweet Williams, Antirrhinums, both dwarf and tall; Marguerites, Carnations, &c. Border Carnations also receive considerable attention, but these were past their best condition at the time of my visit. Deserving more than a passing note is the valuable Nigella "Miss Jekyll," the plant so well known by its popular name of Love-in-a-Mist. As a blue-flowered annual of great merit this fine plant is deserving extended cultivation. This particular form quite surpasses the Cornflower in richness and intensity of colouring, and from every consideration, whether as a garden subject or for furnishing cut flowers, I know of few plants to equal it. The rich blue flower heads are freely produced, and are about 2 inches in diameter. Godetias were an exceedingly gay gathering, and one was impressed by the purity of the Stocks, and the wonderful profusion of flowers. Surely no

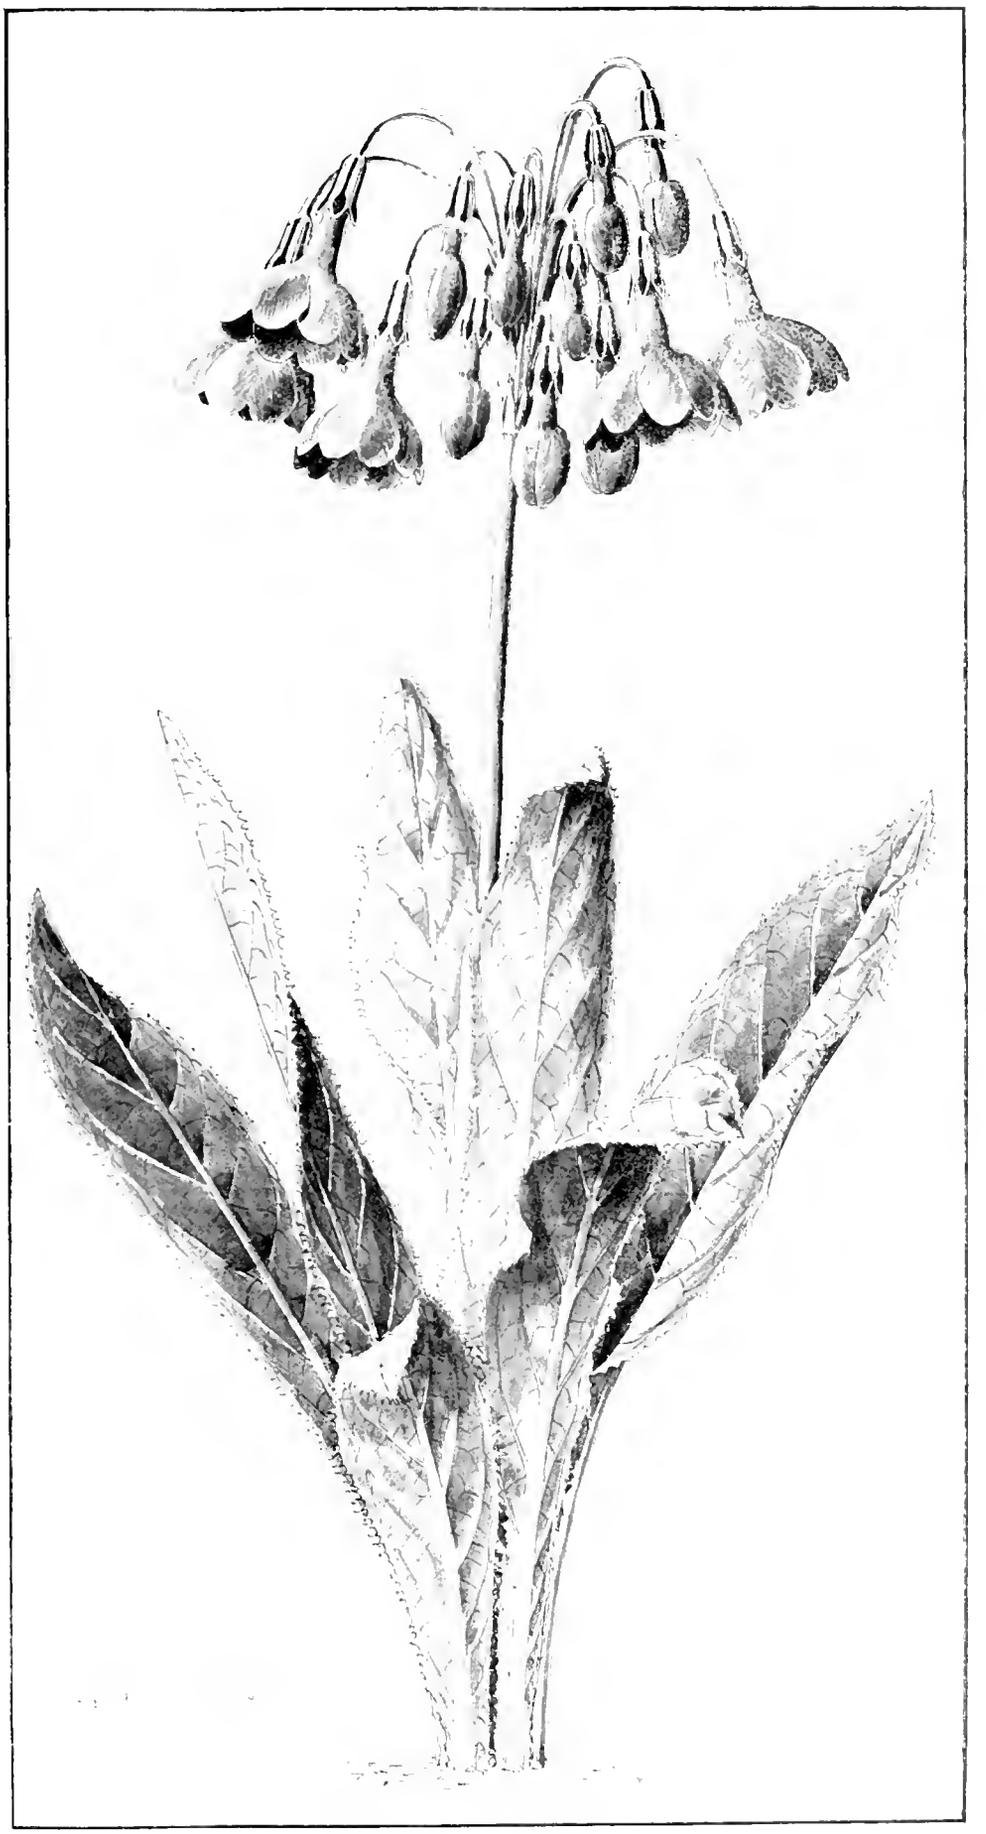

FIG. 87.—THE PRIMULAS OF CHINA: P. VITTATA; COLOUR OF FLOWERS, PURPLE.

annual can surpass these in richness or in diversity of colouring. Crimson King is a flower of intense colour, and equally good is Scarlet Queen. Double Rose is also very beautiful, and invaluable for cutting. Among the annual Larkspurs (Delphinium) the Stock-flowered rosy-scarlet variety is unique in the richness of its colour, and in its fine branching habit. The colour is rare, and the variety possesses an especial value in consequence. A plant growing 3 feet high was one of the most desirable plants that came under my notice.

Of distinctive habit, and of much worth for beds of large size, are the Lavateras, some of which, including rosea splendens and alba splendens, mark a considerable advance. The colour of the first-named is a brilliant rose pink.

I have named but a few of the subjects grown in these famed trial grounds. Sweet Peas and Poppies were over, while the Asters and many other annuals were not yet in flower. *E. H. J.*

NOTICES OF BOOKS.

SOILS. By E. W. Hilgard, Ph.D., LL.D. The Macmillan Company, London. Price, 17s. net.

WE gladly welcome this contribution of Dr. E. W. Hilgard, LL.D., Professor of Agriculture in the University of California.

If there is an authority who is especially capable of speaking upon this most complex subject, it is the author, who has devoted a considerable portion of his time to this branch of agricultural science.

We gather from the preface that from boyhood up it has fallen to the author's lot to be almost continuously in more or less direct contact with the conditions and requirements of newly-settled regions, as well as with those hardly yet invaded, even by the pioneer farmers, where the question of cultural adaptation was yet undetermined or wholly in the dark. Being during his active life constantly called upon in his official capacity to give information and advice to pioneer farmers or intended settlers in regard to the merits and adaptations of virgin soils, the author's attention was naturally and forcibly directed towards soil investigation as a possible means of determining beforehand the general prospects and special features of agriculture in regions where actual experience was either non-existent or very inadequate.

Popular forecasts of soil values. In newly-settled countries, and still more in those yet to be settled, the question of the immediate productive capacity and the future durability of the virgin soil are the burning ones, since they determine the future of thousands of human beings for weal or woe.

This need has long ago led to approximate estimates made on the part of the settlers by the observation of native growth, especially the tree growth, and where this consists of familiar species, normally developed, such estimates on the part of experienced men, based on previous cultural experience, are generally very accurate, so much so that in many of the newer States they have been adopted in determining not only the market value, but also the tax rate upon such lands, their productive and probable durability, and since the native vegetation normally represents the results of secular or even millennial adaptation of plants to climatic and soil conditions, this use of the native flora seems eminently rational.

It was from this standpoint that the author, suggested by his early experience in the Middle West, and subsequently more impressively presented to him in the prosecution of the geological and agricultural survey of Mississippi, undertook the detailed study of the physical characters and chemical composition of soils. It seemed to the author incredible that the well-defined and practically so important distinctions, based on natural vegetation everywhere recognised and continually acted upon by farmers and settlers, should not be traceable to definite physical and climatic differences in the respective lands, by competent, comprehensively-trained, scientific observers, whose field should be broad enough to embrace concurrently the several parts of view—geological, physical, chemical, and botanical—that must be conjointly considered in forming one's judgment on land.

The work before us consists of 589 pages, with a comprehensive and well-arranged index. It comprises the formation of soils, their properties, composition, and relations to climate and plant-growth in the humid and arid regions.

Each section is most carefully and comprehensively dealt with by the author, and comprises both a "text" and "reference" book of no mean value. It has been the writer's aim to reach not only students in the agricultural colleges generally, but the rapidly-increasing class of farmers of both regions who are willing, and even anxious, to avail themselves of the results and principles of scientific investigation without "shying off" from the new or unfamiliar words necessary to embody new ideas.

It is not easy to imagine a subject of higher direct importance to the physical welfare of mankind, whose very existence depends on the yearly returns drawn by cultural labours from the soil.

We can with every confidence recommend the work to those who are intending to become settlers in the New World, and anticipate laying down land to corn or to fruit growing. A previous study of such a volume as the one before us may possibly prevent the waste of years of labour and the useless expenditure of thousands of pounds sterling.

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to SIR EDMUND G. LODER, Bart., Leonardslee, Sussex.

Planting Fruit Trees.—The preparation of the ground for tree planting should be well done. If a piece of new ground has been selected, it may need trenching and probably draining, and if it is a small area only, say for planting 50 or 100 trees, it should certainly be trenched. If young trees are to be planted in the place of aged and worn out specimens, or to replace worthless varieties, the old soil should, as much as is possible, be cleared away. It is a mistake to plant again in the old soil, but if this cannot all be replaced, use at least one third of new loam. Road trimmings can usually be procured in quantity, and this is a very suitable material to mix with the old loam, and it is especially valuable when mixed with a portion of soil from an old pasture. After the old trees are rooted out, trench the ground to a depth of 2 feet 6 inches, after which fill in the holes where the trees are to be planted with the new material as described. In preparing the land for Peach and Nectarine planting some mortar rubble should be incorporated with it. I do not advocate the use of manure at the time of planting fruit trees excepting where the ground is very poor, and then it must be in a well-rotted condition. The fresh soil will supply all the needs of the trees for the first year or two, and afterwards they can be given a top-dressing of manure, or be fed in some other manner. Apple and Pear trees grafted on early fruiting stocks are the best for fruit gardens of limited area. Fruit trees should be ordered from the nurseryman early in the season, as they send out their best trees first.

Strawberry Planting should now be finished and the autumn sunshine will enable them to strengthen their crowns for next season's fruiting. Runners planted early must have frequent supplies of water for the soil is still very dry. Stir the surface of the ground lightly with the hoe for this will improve the soil and keep it clean.

Insect Pests.—Trees infested with American blight should be thoroughly cleansed after the fruits have been removed. Rub some approved insecticide on the parts affected using a rather hard or worn brush. If the trees are large, apply a paraffin and soap mixture by means of a pump sprayer. The trees will require spraying several times in order to cleanse them. If the bark of the trees is infested with the oyster scale insect, remove them with a hard scrubbing brush and some petroleum emulsion or carbolic soap and warm water. This pest spreads rapidly, so remedial measures should be applied as soon as possible after the insect is detected. The Pear Slug-worm, appearing at this season of the year, does much damage to the foliage of the Pear trees. Dust the leaves with tobacco powder and afterwards syringe with XL All wash; one or two dressings are usually sufficient. Cherries and Pears are the trees most affected by this insect. If Pears are still hanging on the trees, the tobacco powder only should be used.

Peaches and Nectarines.—Late varieties of these will require the maximum amount of light and sun heat to ripen their fruit, all leaves, therefore, that shade the fruits should be turned aside. Continue to cleanse the trees as they become divested of their fruits. Trap wasps and flies, for these insects do much damage in the middle of the day.

Cob Nuts and Filberts.—These much-prized fruits must be watched and gathered as soon as thoroughly brown or ripe. The Cobs are the latest to mature; let them be thoroughly dried before being stored. Those to be stored for the winter must be put in earthenware vessels to preserve them in a fresh condition, but even then nuts are never quite so nice as when freshly gathered.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

Shading.—The roller blinds may now be entirely dispensed with and all fixed shading removed. The present time affords an opportunity to wash the roof glass externally, inasmuch as it has become touchly coated with dust during the dry weather. This should not be allowed to remain on the glass until late in the autumn, when fogs are prevalent, owing to the sulphurous gases which fogs contain having such an effect on the dust that even heavy rains will not remove it to any appreciable extent. The need of keeping the glass clean throughout the autumn months is too often overlooked, and thus is prevented the free access of light, which is one of the great vitalising factors and sources of energy in plant life.

Keeping Foliage Plants Clean.—Foliage plants are frequently left for weeks together without being sponged or washed with a little insecticide. The result is that a deposit accumulates on their leaves, choking up the pores and becoming an obstacle to the proper growth and development of the plant. Use every means available to keep the foliage clean. The value of a plant is increased by its clean, healthy appearance, and clean plants will last in good condition for years, but dirty ones are shabby in appearance and short lived. With flowering and foliage plants alike cleanliness is the first essential to successful culture.

Rhododendrons for Forcing.—As a result of the hot, dry weather, the early flowering plants may make a secondary growth upon the occurrence of heavy rains. This should be at once checked by throwing the plants over on one side, where they may remain for a few days, after which fill in the soil again. The flowering buds will then harden and the plants be enabled to flower better.

General remarks.—Poinsettias should not be left in a cool atmosphere any longer; an injudicious application of water to the roots would be very injurious whilst the plants are in such conditions. If they can be removed to a house having an atmospheric temperature of 60° 65° they will be quite safe. Abundance of air should be admitted for the first two weeks or so, otherwise the plants will become weakened and lose much of their foliage; keep the plants close to the glass and expose them to all the light and sunshine possible. It is too early to house the general stock of Chrysanthemums, but any large flowering varieties which already show any florets should be placed under cover, otherwise the dampness of the atmosphere will cause them to decay.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Dendrobiums.—Many of the deciduous and semi-deciduous species of Dendrobiums, such as D. nobile, D. aureum, D. crassinode, D. crystallinum, D. Findleyanum, D. lituiflorum, D. signatum, D. tortile, and others, together with the hybrids derived from them, will have completed their season's growth. In order to retain a vigorous constitution in the plants, and to obtain a full complement of flowers, it is necessary that the growths be thoroughly ripened. Plants, therefore, that have finished their growth (which can be determined from the terminal leaf at the top of the pseudo-bulb being developed) should be removed to a cooler and drier atmosphere such as is afforded by an ordinary greenhouse or a vinery from which the Grapes have been gathered. In cases where a large and representative collection of these Dendrobiums are grown, it rarely happens that all the plants are ready for removal at one time, and this is a decided advantage, for it allows the flowering season to be considerably lengthened. In houses devoted entirely to the culture of these Orchids, the fire heat should be

turned off on all warm, sunny days, and only in dull or cold weather should artificial heat be afforded, when the hot-water pipes may be heated to a lukewarm temperature. At night-time, if the temperature appears likely to fall below 55°, a little artificial heat should be allowed. Plants still growing should be removed to the warm stove, but on the completion of their growth they should be placed in their resting quarters. Plenty of ventilation is necessary to the welfare of these Dendrobiums, and especially when the sun is shining on the plants. They must be allowed to reach a condition of rest gradually, and it is a mistake to withhold water directly the growths are completed, for at this time the earlier formed roots send out a number of lateral rootlets, and these small roots are of much value to the plant. The surface of the compost, being fully exposed to air and direct sunshine, dries very quickly, and careful judgment is necessary to know when the roots require water. After the compost has been thoroughly soaked, no more water should be given until the whole becomes dry again; as the growths of each plant become properly matured, the amount of water given should be gradually lessened. The majority of the tall-growing species, such as D. moschatum, D. Dalhousieanum, D. clavatum, D. calceolus, D. fimbriatum, its variety oculatum, &c., are still growing freely, and they should have warm, moist treatment until growth is completed, when they, too, may be removed to a drier and a cooler atmosphere. Dendrobium superbum and its rare varieties Huttonii, Burkei, and Dearei will require similar treatment to these species. Plants of the evergreen section, as D. thyrsiflorum, D. densiflorum, D. Farmeri, D. suavissimum, D. chrysotoxum, &c., are still rooting freely, although their growths are completed. These plants should be placed in the Cattleya or intermediate house, and be given water sufficient only to maintain proper root action. The nigro-hirsute section, which includes such species as D. Jamesianum, D. infundibulum, D. Jerdonianum, D. cariniferum, D. eburneum, &c., do not require so much exposure to light and air as the species mentioned above. At their resting period they do not require much water at their roots, but they should never be kept in a really dry condition.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

The Vinery.—Vines in early and mid-season houses, from which the bunches of Grapes have all been removed, should now have their lateral growths shortened to within six or seven eyes from the main rods, for this will allow additional light and air to reach the buds, and it will help to ripen the wood and make it in a better condition for the final pruning later. Should the foliage be infested with red spider or with thrips, subject the vines to a thorough washing occasionally with the garden engine, for it is necessary to keep the foliage clean in order that the buds may mature properly. If the borders appear to be dry they should receive a copious watering. Afford plenty of ventilation both during the day and the night-time, and shading material that was placed on the glass when the Grapes were ripe should now be taken off without delay, for the wood will need the maximum amount of sun heat in order to ripen it.

Peaches and Nectarines.—During the latter part of August and the beginning of the present month it was difficult to keep the houses sufficiently cool to prevent some of the fruits from ripening prematurely. Trees from which all the fruits have been gathered will be benefited by having the old fruit-bearing wood removed. If the top lights of the house are removable, they should be taken off to allow the trees to become exposed to the air and the moisture from night dews, which are of much benefit to them.

Peach Marquis of Downshire.—This variety is of exceptional merit. Its fruits attain a large size, possess a good flavour, and are very juicy, and they have a nice appearance owing to the colour at their apex. If grown in a cool house the fruits ripen about the first week in September, but the variety can be forced into growth much earlier, and is a suitable variety for the purpose. The fruits are of a nice shape and pleasing to the eye. The tree is a robust grower, and well worthy a place in any fruit-growing establishment.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH St. Fagan's Castle, Glamorganshire.

Herbaceous Plants.—Though the spring months are considered by some to be the best season in which to prepare and re-arrange the borders and to plant out herbaceous plants, I believe that September is the best season for doing the work, provided the ground is not too dry at the time and the necessary attention can be given to it. It is an advantage if the roots can be started in the fresh soil during the autumn, and the plants established before winter. In addition, the re-arrangement can be done much easier while the colours and habits of the plants are still fresh and vivid in the memory. The borders should be thoroughly re-arranged every three years, and on each occasion the ground requires to be trenched well, and supplied liberally with manure, for, as a rule, the plants are gross feeders and readily respond to a deeply dug and well-prepared rooting-medium. When arranging the borders it must be remembered that though hardy perennial plants predominate, this class of plants should not be cultivated exclusively if a display of flowers is required for as long a period as possible. Therefore, spaces must be left for the addition in the spring of such indispensable half-hardy plants as Salvia patens, S. splendens, and S. farinacea, Gladioli, Lobelia (Cardinalis type), Canna, Paris Daisy, Calceolaria amplexicaulis, Heliotrope, Verbena, and Dahlias; also annuals such as Sweet Peas, Phlox Drummondi, Dianthus, Asters (particularly Callistephus sinensis), Stocks, Poppies, Marigolds, Lavatera, Arctotis, Anagallis, Scabious, Larkspur, Nicotiana affinis, and N. Sanderæ hybrids. In these borders even plants that are looked upon as true bedders can often be employed with advantage. Pelargoniums, Lobelia pumila, Ageratum, Begonia, Petunia, &c. In the flower garden where there are many borders, it is advisable to avoid having a sameness in the arrangement, even to the extent of not using the same kind of plants in different borders. There are many garden resplendent with borders of herbaceous and mixed hardy plants which are disappointing because of their similarity. One border often is only typical of the rest. In an ideal flower garden this defect would not exist.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Cabbages.—The seedlings will, in most cases, be ready for planting in their permanent quarters, and those that are ready should be transplanted. The strongest plants should be selected for planting on a warm border facing to the south, and these will be ready for cutting much in advance of those grown in the open. Place the plants in rows 18 inches apart and allow a distance of 15 inches between the plants in the lines. These spaces will be found quite sufficient for all ordinary purposes, and with the advantage that the plants shelter each other at an early stage of their growth when cold spring winds prevail. The plants that yielded their first crop in the spring are now furnishing splendid produce in their side growths. These plants should be encouraged to grow to their fullest extent, all decayed leaves should be removed and the ground about them kept clear of weeds. These side sprouts, or small Cabbages, are as nice when cooked as the earlier heads, and they can be had in great quantities.

Outdoor Tomatos have, in the south, been of fine quality this year. Any remaining, immature fruits, even if quite green, can be used for making Ketchup. Plants intended for winter fruiting should be shifted from the frames into the glass-house so that a good set of fruits can be secured before the winter fogs and dull weather make their appearance. I prefer cultivating Tomatos in pots at this late season of the year rather than growing them in borders, as they are more easily fruited in pots, and the growths are not so sappy and immature.

Winter Cucumbers.—Seeds of a freely-fruiting variety should now be sown in the usual way in a warm propagating pit or hot-bed. Lockies' Perfection is still one of the best varieties to sow at this date; it sets its fruits freely and these are of a medium size with a very short neck. Fruiting plants in the houses should be top-dressed with some rich material and have surplus growths cut away, which will help to prolong their season of bearing. Pruning should be performed early in the day so that the cut surfaces may become dry before nightfall, at which time the atmosphere in the plant houses is fully charged with moisture. All fruits should be cut immediately they reach a suitable size for the table in order that the plants be not unnecessarily exhausted.

Runner Beans.—Surplus Beans should not be wasted, for good use can be made of the pods by preserving them, and if the preserving is well done they are little inferior to the fresh vegetable. French Beans should be similarly treated.

French Beans.—It now being too late to make any further sowings of these in cold frames, their culture as forced vegetables will now have to be considered. Where Melons are finished for the season and the beds still remaining, it is an excellent plan to dig over this material and sow the beds with a good climbing variety of this vegetable. Princess of Wales is the best and heaviest cropper with me. These climbers are better adapted to resist the fogs that are prevalent in many places during the short days than dwarf plants. They also set their flowers better, and give a far greater return than can be had from the old system of cultivation in pots. Where, however, there is not the accommodation necessary for the climbing variety, seeds of the dwarf type should be sown in pots. The pots may stand outside for a time yet, or be given the protection of a frame. Canadian Wonder is one of the best for this sowing, but for the middle of winter Ne Plus Ultra and Osborn's Forcing are two of the best, and where space is very limited Laxton's Forcing may be sown.

THE APIARY.

By CHLORIS.

Successful Bee-keeping in 1907.—The spring of 1906 caused many failures among bee-keepers, and we ought, therefore, to take stock and seek the causes of the disasters. Unfortunately, among bee-keepers, as in every other craft, there is procrastination, a tendency to leave the bees to chance, with the result that when spring arrives the bees are either dead or starving, and we blame the climate, forgetting it is our own neglect. If the coming season is to be successful, granted seasonable conditions, we must endeavour to have our stocks strong by the end of September. These ideal conditions can only be secured by feeding the bees.

Feeding.—The honey-flow of 1906 has practically ceased. Most of us have encouraged the little insects to store as much honey as possible in the supers. Probably, the bees have neglected the brood chamber, and, unfortunately, many careless apiarists, thinking only of their present gains, forget to inspect the lower chamber and leave the bees to chance and to almost certain death. In a few instances the bees may have stored more than a fair share below, and, as a result, the colony has not raised sufficient brood and is weak. Both conditions are certain to bring failure in 1907. In each case feeding will be necessary to induce the queen to lay, so that there may be a large quantity of young bees flying in the coming spring, and to prevent starvation in the former instance. Let us deal with those that have stored only a little in the brood chamber. Make some good syrup by using white sugar and water in the proportion of 2 lbs. of sugar to one pint of water, and boil it well. Feed rapidly, placing the syrup on the frames lukewarm, and wrap up the bottle warmly to prevent the escape of valuable artificial heat. All the changing should be done in the evening when the bees have ceased to be on the wing, taking care to spill no syrup, and by this means we may ensure that no robbing will be started, if the entrances are closed so that only one bee may enter at a time. When we deal with the others we must remove some of the combs and extract the honey, or replace them by empty drawn-out foundation. Our object in this case is to secure as much brood as possible. The syrup need not be so thick as in the former case, but the bees must not be allowed to take down the syrup so quickly. This may be achieved by covering a portion of the mouth of the jar with tin or zinc and thus limiting the access to the food. If the bees have about 30 lbs. of stores, and are strong, there will be no cause to worry about their safety next spring, and, as a consequence, the bees will not leave their hives on cold days to be cut down by cold and pitiless winds. Remember that burnt syrup will cause the death of the colonies, so stir well whilst it is on the fire. A few bee-keepers have made syrup by mixing the sugar with boiling water and stirring until the sugar is completely dissolved,

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers. *Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, Sept. 25.—British Gard. Assoc. Exec. Com. meet. Roy. Hort. Soc. Coms. meet. Onion Fair at Birmingham (5 days).

SATURDAY, Sept. 29.—Michaelmas Quarter Day. Dutch Gardeners' Society meets.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—55·9

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, September* 19 (6 P.M.): Max. 61°; Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September* 20 (10 A.M.): Bar., 30·2, Temp., 61°, Weather—Fair, but overcast.

PROVINCES.—*Wednesday, September* 19 (6 P.M.): Max. 63° Southampton; Min. 53 East Coast of Scotland.

SALES.

MONDAY AND WEDNESDAY—
Sale of Bulbs at Stevens' Rooms, King Street, Covent Garden, at 12.30.

MONDAY TO FRIDAY—
Bulbs at Protheroe & Morris's rooms, each morning.

TUESDAY, WEDNESDAY AND THURSDAY—
At Dulcote's, Broad Water Down, Tunbridge Wells, a collection of Orchids, by order of Walter Cobb, Esq., by Protheroe & Morris, at 12.30 each day.

FRIDAY—
Sale of Fruit Trees and Roses, at The Nursery, Downham, Norfolk, by Protheroe & Morris.

Rain.

We do not suppose there is any other word in our language so dear to the heart of the English horticulturist, or one which is so frequently in his thoughts or on his tongue, as that little word rain. At the same time we could not well select any term more distasteful to him than that of drought. It may seem strange, but it is nevertheless true, that in the British Isles, the climate of which is generally regarded as dull and humid, the lack of sufficient rain, during at all events the growing period of the year, is one of the most serious wants felt by gardeners and farmers. The apparent contradiction in these two views is partly to be explained by the fact that even in those summers where the total rainfall is sufficient for all reasonable purposes, it is often so irregularly distributed over the season that our plants derive comparatively little benefit from it.

The actual requirements are really by no means extravagant, for all we need is sufficient rain at the beginning of the summer to thoroughly saturate the soil and subsoil, and afterwards the modest quantity of about half an inch each week during the rest of the season.

Unfortunately we seem just now to be passing through a series of summers in which even the total rainfall is deficient, to say nothing of its unequal distribution. By summer is here meant the six months beginning with April and ending with September, when vegetation is in more or less active growth. Taking the last twenty-three such summers, there have been only three in which the rainfall has been in any way in excess of the average, the remaining twenty being all more or less dry. Some comfort may, however, be derived from the consideration that there is no reason to suppose that our climate has altered and is consequently becoming drier than formerly. Also in the fact that the previous twenty-seven summers were more than half of them wet, and in some instances, as notably in 1879, far wetter than could be desired.

Our thoughts naturally turn to this question of rain on the welcome appearance of "*British Rainfall.* Although this is the forty-fifth annual issue of this interesting and valuable publication, there are no doubt many of our readers who have not yet seen a copy of the work. Its history is briefly as follows:—In 1860 Mr. G. J. Symons, F.R.S., conceived the idea of gathering together from different parts of the country all the then available records, with a view to studying the character and distribution of rainfall in these islands—questions of considerable importance to the engineer as well as to all interested in agricultural and horticultural pursuits. In that year he was only able to obtain satisfactory returns from 168 observers. But as years went on, owing to his untiring zeal and the skill with which he dealt with the data placed at his disposal, the work increased so rapidly that at the time of his death in 1900 the number of observers working under him had risen to over 3,000, and the annual issue, originally a four-page leaflet, was a substantial volume of more than 200 pages. Since that time this remarkable rainfall organisation has been practically under, and is now entirely under, the direction of Dr. R. H. Mill, who, while retaining the admirable plan and general scope of the work devised by his predecessor, has year by year added new features to it in order to keep it abreast of the times, and to extend its usefulness. To show how ably the work is now carried on it may be stated that at the present time *British Rainfall* contains carefully discussed and classified observations from over 4,000 observers distributed all over the United Kingdom.

Turning to the volume before us it is surprising how even a rapid glance through its pages and over the many interesting maps which it contains causes our ideas on the subject of the fall of rain in this country to become enlarged. For instance, we learn that last year as much as 171 inches of rain fell during the twelve months at The Stye, in Cumberland, whereas Shoeburyness, in Essex, the driest spot in 1905, had to be content with a meagre 15 inches. Dr. Mill, putting the question in another way, confirms what we have previously stated as to the interest of the gardener in rainfall being confined principally to the summer half of the year, when he says "the rain which falls in the winter half-year, during the rest time of vegetation, is of comparatively little concern to the farmer." Taken as a whole we find the year 1905 to have been dry, not only in England, but also in Scotland and Ireland. Then, as we are principally concerned with the summer rainfall, we turn to the maps for the three months of that season, where we at once see that throughout the southern half of England the weather in June proved as wet as could be wished, whereas in other parts of the country the fall was below average. July was a dry month everywhere, while August was, on the contrary, almost universally wet.

We began by saying how greatly droughts were dreaded by all interested in gardens. And no wonder, considering that of all the enemies of our gardens none is quite as destructive or injurious to plant life generally as a prolonged drought. The "absolute drought" of the meteorologist is a period of more than 14 consecutive days without rain; while a "partial drought" is defined as a period of more than 28 days, the average rainfall of which does not exceed one hundredth of an inch per day. But to the horticulturist neither of these definitions convey his own idea of what he understands by a drought, which might be described as any dry period injurious to vegetation. For instance, there not infrequently occurs long periods of dry weather, with occasional slight falls of rain, which are practically, under such conditions, of no service whatever to vegetation, and yet which would prevent that painfully long and trying spell described as either an "absolute drought" or a "partial drought." On referring to the chapter on heavy rains one of the principal causes of the irregularity of our summer rainfall appears to be thunderstorms, which visit certain localities with considerable regularity, while other places only a few miles away are rarely affected by them. We have only indicated a few of the interesting questions dealt with in *British Rainfall*, but trust that enough has been said to induce many garden lovers to add the last annual volume to their library, and so be in a position to study it for themselves.

* *British Rainfall* (Ed. Stanford, Long Acre, price 10s. 6d.).

OUR SUPPLEMENTARY ILLUSTRATION to the present issue shows a fruiting spray of Ochna multiflora, a stove shrub which was first introduced to this country in 1820. The species subsequently fell out of cultivation and was re-introduced, but is rare even at the present time except in botanical gardens. The flowers, which are yellowish, last only a short time, but the black fruits, together with the enlarged crimson receptacles and calyces, are very ornamental. The shrub will grow 5 feet or more in height and may be propagated by half-ripened shoots obtained during summer. Our illustration was prepared from specimens exhibited by Mr. CHAS. TURNER, Royal Nurseries, Slough, at one of the Royal Horticultural Society's meetings.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the committees will be held on Tuesday, September 25, in the Society's Hall, Vincent Square, S.W. A lecture on the "Distillation of Perfumes from Flowers" will be given by Mr. J. C. UMNEY at three o'clock.

THE ROYAL HORTICULTURAL SOCIETY OF IRELAND will hold a fruit and Chrysanthemum show, and a conference on fruit, in Ball's Bridge, Dublin, on October 24 and 25, 1906. The secretary is Mr. W. KEATING, Junr., 5, Molesworth Street, Dublin.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—At a meeting of the association to be held at Winchester House, Old Broad Street, E.C., on October 2, at 7 p.m., Mr. J. F. H. GILBARD will deliver a lecture on "The Bacteria of the Soil," illustrated by lantern slides.

THE HONEY SEASON IN THE NORTH.—A correspondent, writing from Aberdeen, states that the cold weather in April and May caused much loss to bee-keepers. Although the honey that was gathered in these months is darker in colour than clover honey, it is equally good, and is obtainable in considerable quantities. In some districts June was propitious for swarming, but in others when the Clover season began, in that month the temperature continued low and the bees were very often unable to leave the hives. This was a source of great disappointment, as seldom has the Clover bloomed so profusely as it did this year. In many districts splendid work was done all through July, even weaklings pulled up well by the closing days of the month. August, being partially wet, was not so beneficial till towards the close, when brilliant sunshine came, and just at the time too when the late Heather bloom was at its best. For "Heather men" the season will have excellent results. During the great heat wave the appearance of the hives was remarkable. Every nook and cranny was crammed full of bees, and the strongest hives not only filled their body box but as many as four crates of sections (84 lbs.). Many hives have produced over 120 lbs. surplus, but the average may be put down at from 50 to 60 lbs. The current price per pound in rural districts is 6d. and in some exceptional cases 7d. In cities the price in retail shops is one shilling and even more. I have heard of a profit of over £30 being obtained from a few hives, but the cost of feeding the bees during the winter season may not have been taken into account. When we consider that a single bee will not collect more than a teaspoonful of honey in a season it becomes evident what an extraordinary multitude there must be at work to produce the large quantities of honey which have been placed on the market.

A NEW TEXTILE PLANT FROM BRAZIL.—For some time Dr. V. PERINI, a Brazilian gentleman, and Mr. KNIGHT, a member of the English firm of KNIGHT, HARRISON & Co., of Rio de Janeiro, have made experiments in the cultivation of, and preparation for, the market of a plant, Canhamo braziliensis "Perini," discovered in Brazil by Dr. V. PERINI. Until now they have planted an area of 150,000 square metres, and the Government of the State of Rio de Janeiro have recently allotted them the State property of Farenda Boa Victa, two square kilometres in extent, on the condition that besides the establishment at that place they establish another at Nictheroy for the preparation of the material for market. The necessary machines for the work are already imported. An importation of the fibre to the European market has met with a favourable reception, and has been woven into stuff for pocket handkerchiefs, and spun into cordage, laces, and made into fine sorts of paper. The fibre may be brought to European markets for about £40 per ton for linen weaving, and the stalks for the fabrication of paper for £12 per ton. The short fibre and refuse from the manufacture it is intended to find a use for in Brazil as string, &c. The returns are expected to be satisfactory, owing to the many uses the fibre can be put to, its excellent quality, the fact that three harvests can be obtained in the year, and the cheapness of production. Dr PERINI has secured the sole right to the preparation of the material for textile and paper making for a period of 15 years from April 20, 1904.

THE GREENHOUSE AT KEW.—The flowering period of many plants in the greenhouse has been considerably shortened by the hot, dry weather. A showy plant now in flower is Ipomœa rubro-cærulea, whose trailing growths ramble among Asparagus plumosus, which sets off the beautiful light blue of its flowers. In pots and on the roof Plumbago capensis variety alba is flowering profusely. Another subject which does equally well, grown either as a pot plant or against a pillar, is Lantana salvifolia (delicatissima). The long slender growths and magenta flowers are distinct from most of the Lantanas. The climbing Dahlia, Hidalgoa Wercklei (see fig. in *Gardeners' Chronicle*, Aug. 4, 1900, p. 83), has now a nice sprinkling of bright scarlet flowers. Although this plant is never a free bloomer, the trailing growths hanging from the roof are very graceful. The plant is really a perennial, but it is best grown as an annual from cuttings inserted in autumn, as old plants are liable to die in the winter. A young plant of Mandevilla suaveolens, only planted last year, has made growths fully 20 feet in length, and its pure white flowers are very fragrant. For some considerable time, hybridists (especially Continental) have been raising hybrids of Nerium Oleander, the common Oleander. Very satisfactory results have been obtained, and a number of these new seedlings, both double and single flowering kinds, are now in flower in No. 4. Some of the double flowers are almost as large as Carnations, but they are not quite so full of petal. Most of the Costums (Habrothamnus) soon grow into large specimens, but C. Smithii is an exception, and forms useful decorative plants with pale rose-coloured flowers, 1 to 2 feet high, when grown in 5-inch and 6-inch pots. The flax-leaved Chironia, C. linoides (exifera), now in flower, seldom fails to produce a plentiful supply of flowers if given perfect drainage. One of the most beautiful Cupheas is C. micropetala, but the showy part of the flower is the large scarlet calyx tipped with yellow. As the name denotes, the petals are small. A singularly distinct and striking flower is that of Lilium nepalense. The mouth inside is purplish black, the reflexed segments being broadly tipped with yellow; the outside of the petals are of a greenish yellow shade. A good batch of the pretty small-flowered, rose-pink Melastomad, Bredia hirsuta, a by no means common Japanese plant, attracts much attention. A useful subject for large tinctures and one now in bloom is Calceolaria Burbidgei. It will commence to flower when about 2 feet high. A small plant of Incarvillea (Rogeria) Delavayi has flowers not unlike those of the Laurestinus, each growth being terminated with a large cyme of sweet-scented, pink flowers.

FLOWERS IN SEASON.—From Messrs. JOHN PEED & SON, Roupell Park Nurseries, West Norwood, we have received a number of flowers of tuberous-rooting Begonias, of both double and single varieties. They were gathered from the open ground, being seedlings raised early in the present year. They represent a good strain of this useful bedding plant. The colours of the flowers include shades of scarlet, rose, yellow, apricot, orange, and white. Some of the "crested" type of flowers were included.

ACETYLENE GAS IN PLANT GROWING.—The results obtained in the elaborate experiments with acetylene on plant life at Cornell University, as set forth in Professor JOHN CRAIG's paper, is what would be expected, when the close approximation of acetylene illumination to sunlight is considered. The sun, as everyone knows, stands for life and development in plant culture. It is the chief element upon which the gardener who forces flowers and vegetables under glass depends. The dark periods when the sun refuses to reveal itself are as well dark periods to the spirits of the forcing man. When, therefore, he can turn to what is virtually sunshine, as produced with ease, economy and in abundance by acetylene, he at once finds help over hard places. Professor CRAIG begins his paper by quoting Munsterberg as showing the nearly equal colour values of the sun and acetylene as revealed by spectrum analysis. It is a showing such as no other artificial light reveals. In that brief comparison is found the basis of the success with acetylene in plant culture. The benefit from acetylene was found not only as making up for deficiency of sunlight, but in adding to the efficiency of sunlight for plant growth. In the experiment on 150 different kinds of plants, with few exceptions the growth was stronger, while the time of bloom and of maturity was materially advanced. For instance, Strawberries were brought into bearing 16 days, or more than two weeks earlier as a result of acetylene added to sunlight. In the case of Geranium Pelargonium and Lilium blooms, the gain was even greater, being sometimes three weeks ahead. In many plants the amount of bloom was increased several fold through the use of acetylene. Radishes are a common crop with the under-glass grower. Not only was the maturing period of Radishes shortened 20 per cent., but the product was increased in weight under the influence of acetylene as compared with sunlight alone. It is not overlooked that the cost of carbide must be reckoned, but with the season of growth shortened by weeks, a large, direct reduction in the always costly fuel bill is made. The force of this point is that the saving on fuel comes at a time when the outside temperature demands liberal coaling in order to provide the requisite forcing heat. The increase in the product from [the use of] acetylene as noted in Radishes and in some flowers, likewise will go directly to offsetting the outlay for acetylene. *Acetylene Journal, Chicago.*

IMPROVED VARIETIES OF ZONAL PELARGONIUMS.—In this country there are many fine varieties of Zonal Pelargoniums in cultivation, which, owing to a certain tenderness in growth and blossom, cannot with safety be employed in out of-doors decoration. We read, however, in the German journals, in the accounts of the recent show at Cassel, of an exhibitor, Herrn GEORG BORNEMANN, who had some remarkable varieties which for form, and size of the blooms, and heads could not be improved upon. H. BORNEMANN, with but few exceptions, showed flowers of varieties of his own raising; his chief aims being to obtain abundant flowering and ability to withstand the influence of the weather, together with good habit.

A PALM HOUSE FOR BUDAPEST.—It is proposed to construct, at the cost of the municipality, a great Palm house in the vicinity of the recently erected artesian baths, of an area of 1,870 square metres, with small glasshouses for plant cultivation on two sides. The cost will amount to 435,000 kronen. Besides this large house there will be built later an Aquarium, and various glasshouses for plant culture.

THE ROYAL NURSERIES, MAIDSTONE.—On the 12th inst., a party of gardening friends met by invitation at the above nurseries on the occasion of Mr GEORGE BUNYARD, the head of the firm, celebrating the completion of 50 years of business life. We offer our congratulations, and trust that Mr. BUNYARD may have yet many more years of useful and successful work.

AREA UNDER RUBBER IN CEYLON.—Mr. J. C. WILLIS, Director of the Botanical Gardens, Peradeniya, Ceylon, writes as follows in the *Tropical Agriculturist*: "A very good answer to those who are claiming that Malaya is the premier rubber planting country is supplied by the statistics just to hand for the new Edition of FERGUSON'S *Ceylon Handbook and Directory*, which show that the Ceylon area in rubber, or to be planted during this present south-west monsoon (and consequently probably nearly all planted by now), is no less than 104,000 acres, besides which there are probably 15,000 or 16,000 in native hands, amounting in all to 120,000 acres. Mr. CALLEDHER'S report on the Federated Malay States for 1905 shows that at the end of that year they had only

38,000 acres planted in rubber, with about 100,000 acres alienated for this product, and it is hardly likely that they can have planted the difference since. Even allowing that the Ceylon estimate is too much by 25,000 acres, and the Malayan too small by the same amount, and allowing another 25,000 acres for the rubber in the Straits Settlements and Johore, this will not make the figures meet. Already Ceylon alone contains perhaps enough for nearly one quarter of the world's consumption."

Publications Received.—*Journal of the Board of Agriculture* for September. Contains, along with other information, a useful article by Mr. A. D. Hall on "How long does lime last in the soil?"—*The Forest Flora of New South Wales* (J. H. Maiden), vol. II., pt. 10; *Proceedings of the Academy of Natural Sciences of Philadelphia*, vol. 58, pt. 1.—*University College, Reading*. Prospectus of course of instruction in poultry keeping.

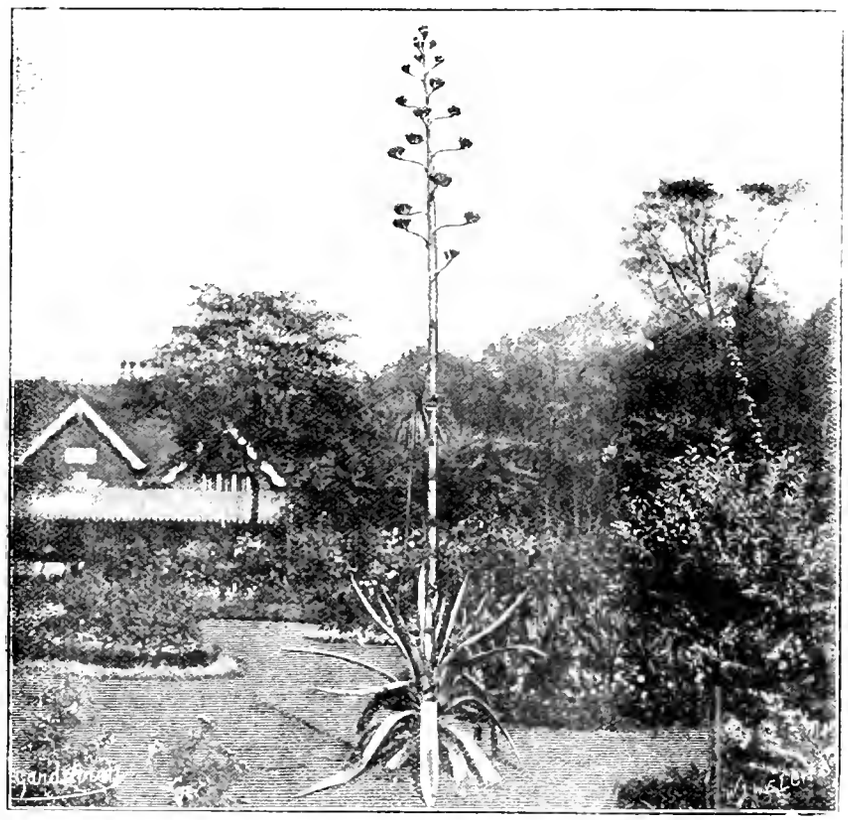

FIG. 88.—AGAVE AMERICANA FLOWERING IN THE ZOOLOGICAL GARDENS, REGENT'S PARK.

THE FERNERY.

HARDY FERNS IN AUTUMN.

As regards the removal, division, or planting generally of hardy Ferns, the early autumn is a very good time to carry out such operations and for several reasons. First, any damage caused to the fronds matters little as the season is so nearly over. Secondly, the roots have still time to take hold of the ground in their new positions before frost sets in to any appreciable degree, and finally, they are assisted in establishing themselves by the cool, moist conditions usually prevalent at this season. Under these circumstances they will start growth in the spring as well-established plants, and, therefore, there is little choice between the two seasons as regards success in planting. As many of the fronds, especially of deciduous species, will be shabby or fading, all such may be removed without detriment to the plants, and with the evergreen ones there is usually an accumulation of dead old fronds around the crown which may also be removed, a careful look-out being kept for those basal bulbils which often form on the finest forms of Shield Ferns (Polystichum), and afford capital opportunities for increasing the number, since if cut off with, say, an inch of the old frond base, and inserted as cuttings, they are sure to make roots and establish themselves, while if left *in situ* they are apt to be smothered, or if they survive handicap both themselves and the parent plant by the crowding and intermingling of fronds and roots. All the crown-forming Ferns make finer plants if the side-shoots or offsets are removed, and where long-established plants have been allowed to form dense clumps by such accumulation, it is good policy to dig them up bodily and pull the individuals apart, planting them singly. As a rule this is a simple operation, as each one is really distinct and has its independent roots, while the original connecting link is easily broken or cut, and the roots and fronds disentangled.

If the weather be dry after replanting, the Ferns must be watered so long as any fronds are green, but if thoroughly well watered in when planted, the ordinary rainfall and dews will suffice, since no fresh growth this season is likely to assert itself above ground. Good garden soil suits most species well, but if it be at all heavy there must be a liberal admixture of leaf-mould to lighten it. With regard to aspect it must be remembered that all Ferns are shade lovers, and thrive best where, while plenty of top light is available, they are screened to some extent from blazing sunshine. Wind, moreover, is detrimental since the fronds are too delicate to stand, without damage, the friction set up by strong breezes. Hence a north or north-east aspect is good as regards modified exposure to sun, provided there is some wind-screen in the vicinity to break the force of the blast. If, therefore, it be a question of rockery construction a deep dell is the ideal to be aimed at as far as local surface conditions permit, while to plant Ferns in an exposed mound is simply to court failure. Given, however, ample moisture at the roots Fern fronds are very accommodating and stand far more sunshine that would be expected, but if so exposed and the soil gets dry, they are scorched immediately beyond recovery so far as appearance goes. Under north walls we have seen fine collections, and these positions should be utilized. Ferns under glass in pots are best left alone until the spring. The soil conditions in pots are not so favourable as those outside and lacking the circulative stimulus set up by active root growth, the soil is very apt to get sour during the winter rest, which in the open is not the case. During the season of rest watering must not be omitted, though of course not much is required. Ferns in their native habitats are usually soaked the winter through, and their crowns are more or less buried in dead leafage, also wet most of the time. It is therefore fatal to let pots containing Ferns get dust dry as is too often done, and if space be precious in the greenhouse, the pots can quite well be spared this risk by being buried in a shady garden corner out-of-doors, to be lifted again when the next season's growth is imminent. For those in the open also a good mulching of dead leaves is beneficial. *Chas. T. Druery, V.M.H., F.L.S.*

AGAVE AMERICANA AT THE ZOOLOGICAL GARDENS.

THIS stately plant flowers occasionally in this country, but it is a comparatively rare occurrence, especially so near to the metropolis as the specimen shown at fig. 88, although in our issue for January 31, 1903, two of these plants flowering in Victoria Park, London, formed the subject of our supplementary illustration. The plant figured on the present occasion is growing in the Zoological Gardens, Regent's Park, the pot in which it is cultivated being plunged in the grass on the lawn round about the refreshment pavilion. The flower spike is from 18 to 20 feet in height, and bears on its upper part about 20 axillary panicles, as will be seen from our illustration. Near by is a companion plant, a much larger and finer specimen, and with leaves uninjured, but as often obtains in the plant world, it is the weaker one which has flowered. Hundreds of visitors have been attracted by the unusual sight of this plant in flower, and it is commonly spoken of as the "century" plant from the erroneous belief that the Agave only flowers once in a hundred years. It is also known as the American Aloe, but as the Aloe belongs to a different order of plants, there is no justification for the name.

In more favoured climes, such as the south of France, Agaves in flower are common objects, and in our issue for December 25, 1875, is an illustration of a bed containing a dozen or more plants in flower in the gardens of Mr. Smith, in the Scilly Islands.

The Agave under notice is situated among a series of excellent flower beds, and at the background is a charming border furnished with many gay subjects, among which Canna Alphonse Bouvier is conspicuous. Many of the beds are furnished with well-grown specimens of Celosia pyramidalis, in red and yellow shades, and although these are now somewhat past their best condition, enough remains to show what a beautiful display they have made.

Another plant that is worthy of mention is Eucalyptus cordatus, and in several of the beds this plant is utilised. A good combination was seen in a bed containing Pelargonium Mrs. Marshall, intermingled with Salvia Horminum, and Flower of Spring Pelargoniums, with a band of the dwarf Pelargonium Golden Fleece. Another pleasing bed was furnished with Fuchsia Mrs. Roberts and Verbena Miss Willmott. Abutilon Thompsoni, carpeted with Begonia "Vesuvius" and edged with Pelargoniums, furnished a choice display.

[In respect to the Agave we may remark that the flowers are not yet perfectly open, and visitors to the gardens during the next fortnight will, therefore, be able to see them.]

DOUBLE GLOXINIA.

To Mr. Leonard Sutton we are indebted for the specimen whence our illustration was taken (fig. 89). The calyx and corolla were normal, but on looking down into the tube of the corolla the cavity appeared filled up with a dome-shaped mass of white petals. Further examination showed that there were four stamens cohering by their anthers in the usual way, whilst the filaments were dilated on each side into a petal-like

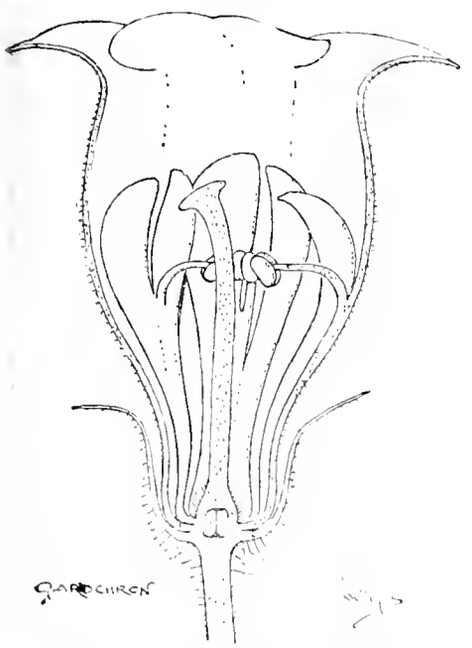

FIG. 89.—GLOXINIA
Section through the flower showing the petaloid stamens surrounding and arching over the ovary.

outgrowth. These petaloid stamens were sometimes free, at other times connate with the corolla tube for half its length. Time will show whether this arrangement can be so far developed as to be acceptable to florists. At present it is a curiosity only. We have not seen a similar case before, and we are not aware whether a petaloid development of this kind occurs normally in any of the genera of Gesneraceæ. The flower was one of five on the same seedling plant, all showing the same condition

MODERN BOTANY.

(Continued from page 177.)

"Let us now attempt an analysis of some of the causes which have led to this condition of affairs.

"In the first place, our two national herbaria (Kew and the British Museum) stand apart from the ordinary botanical current. They are administered, the one as a portion of the Kew establishment under the Board of Agriculture, the other as a department of the British Museum under a Board of Trustees. Neither has any connection, direct or indirect, with any university organisation. The keepers and assistants as such have no educational functions allotted them; I mean positions in these herbaria carry no teaching duties with them. There are no facilities for teaching; there are no students. No machinery exists for training recruits or for interesting anybody in the ideals and methods of systematic botany. A recent event illustrates my meaning better than any words. My friend, Dr. Rendle, accepted the Keepership of the Botanical Department at the British Museum a few months ago. Previously, as assistant, he had held a lectureship at a London college. One of the first consequences of his new appointment was his retirement from the teaching post. Now that was bad. Under the conditions which one would like to see there would have been no resignation. On the contrary, the Keepership should have entitled Dr. Rendle to promotion to a full professorship. I do not mean a great post, with elementary classes, organisation, and so on, but one in which he would be occupied with his own branch, giving a course for advanced students, let us say, once a year during the summer months. Nor is that all. Such are the vagaries of our university organisation in London that we run some risk of losing Dr. Rendle from the Board of Studies in Botany. Automatically he ceases to be a 'recognised teacher,' and unless some loophole can be found the connection will be severed.

"Next we come to the question of routine duties. These are heavy in herbaria, and must include a great many that could be satisfactorily discharged by handy attendants. As in the case of those who work in laboratories, half a man's time should be at his own disposal for original investigations. It is important, for a variety of reasons, that the members of the staff should take a leading part in advancing systematic botany.

"Then there is another way in which a great economy could be effected in effort, time, and money. This is the transfer of the collections and staff of the Botanical Department from the Museum to Kew. This is a very old proposal, first seriously entertained some fifty years ago after the death of Robert Brown. There must be endless files of reports and Blue Books in official pigeon-holes dealing with this question. The most recent report of a departmental committee is known to all interested in the matter. From the character of the evidence tendered it is not surprising that no action has been taken. I am at a loss to find any adequate reason for the continuance of two separate herbaria. It has been urged, no doubt, that botany would suffer if unrepresented in the Museum collections at South Kensington, and that the dried collections and herbarium staff are a necessary adjunct to the maintenance of a botanical museum. But there is little force in the contention. The specimens that go to make a herbarium are not proper subject-matter for museum display; nor is there anything about herbarium work which intrinsically fits the staff to engage in the arrangement of museum cases. The function of a botanical museum is to interest, stimulate, and attract. It should convey an idea of the current state of the science, and particularly of the problems that are to the front, in so far as it is possible to illustrate them. It requires a curator with imagination and ideas, as well as an all-round knowledge of his subject. He must also be an artist. Logically, there is no reason why a museum should be part of the same organisation as systematic collections. There is, indeed, a danger of making the museum too exhaustive. I am speaking, of course, of a teaching museum, which belongs really to the province of a university, or university extension if you like. Systematic collections kept exposed under glass are luxuries. All the world agrees that the museum side is admirably done at South Kensington, and most people attribute this success to the systematic element which is paramount behind the scenes. But, as we have seen, this is a fallacy, and the 'museum argument' for keeping the herbarium at South Kensington may be ignored.

"By the fusion of the herbaria at Kew one would look for increased economy and efficiency, more time for original work as distinguished from routine duties, and a more complete specialisation."

(To be continued.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

A NEW WHITE BEGONIA.—In the centre of a showy arrangement of tuberous Begonias in the gardens of T. F. Blackwell, Esq., The Cedars, Harrow Weald, is a very handsome white form in which the female flowers are nearly as large and showy as the male blooms, and in both sets the floral segments are finely crimped. The batch was raised by Mr. J. Dinsmore, the head gardener at The Cedars, and several exceptionally good varieties have flowered out of it, but none is equal to the white one alluded to, especially in the extraordinary size of the female flowers. There is also a good show of flowers on the shrubby Begonias which are well grown at The Cedars and continue to bloom in the glasshouses throughout the winter. *B*

HYDRANGEA HORTENSIA IN TUBS.—I enclose a photograph [not reproduced] of Hydrangea Hortensia growing in a tub. We plant them in these receptacles for placing about the pleasure grounds, and one great advantage of this method of culture is that the plants remain a long time in flower, and up to the present time they have been effective for a period of about four months. The photograph shows 133 fully expanded flowers, and will furnish an illustration of their usefulness when grown in tubs. *J. Thompson, Delamere House Gardens, Northwich, Cheshire*

A CHAMPION VEGETABLE CLASS.—I cannot but think that Mr. Gibson, p. 184, is asking for something of an extraordinary nature in inviting the Shrewsbury authorities to provide a special class for the vegetable champions. One would think he had forgotten several that of late years have been provided for such a purpose, for instance the class at Edinburgh last year and the one at Chiswick but a short time previously. It is but fair to ask, after witnessing the various prizes gained at the late Shrewsbury show by the champion growers, how many would compete in such a class as Mr. Gibson now suggests? When we read that Mr. Beckett won Messrs. Bull's cup and Messrs. Carter's premier prize, Mr. Gibson Messrs. Sutton's, Mr. Pope Messrs. Sydenham's, and so forth, and that in no one class were these growers found competing against each other, what conclusion must be drawn from such incidents? What I would suggest in future competition, is that all vegetables should be really of the varieties they are labelled in each class. It is so common now at shows to see classes made for so many kinds to represent the varieties introduced by the donors of the prizes. This is reasonable as intending to illustrate the advantage of one variety of Runner Beans, or Carrots for example, over another, and as a means of showing to visitors and customers the advantage of selection in stock and variety. What is the result of such classes so liberally provided by seedsmen? The answer can readily be found if at any of the leading shows an interested spectator will listen to the criticism of visitors when examining the exhibits: "I see no difference in the Tomatos in this exhibit named Perfection and the Epicure or Temptation, or even those Bountifuls in Mr. Brown's first prize exhibit." "Why, Mr. Thomson's Prize-taker Leeks are quite like Mr. Robinson's Monstrous variety. What is the difference between Mr. George's selected Duke of Albany Pea and that new variety staged by Mr. Johnson at our own show last week? It is bewildering; I did think by coming here I should be able to select my varieties for next season, but now I am in a worse plight than ever." *Nous Verrons*

PEACH CULTURE OUT-OF-DOORS.—The excuses one reads about the difficulty of producing even Peaches of reasonable quality out-of-doors makes one smile when one remembers what used to be done in this direction less than twenty years ago. Those persons who had knowledge of the magnificent Peach and Nectarine trees at Heckfield, under the care of the late Mr. Wildsmith, or those at Broadlands Park, near Romsey, under the management of Mr. Thirlby, must look for reasons other than climatic influence to account for the decline in the production of high-class fruits. Apathy on the part of the gardener contributes in no small degree to the ill-success, for many nowadays seem to think that Peach culture under glass is the aim and end of all. Now that gardeners are so much engrossed in adding glasshouses to the garden—and rightly, too—to meet the many demands for plant and flower production, they lose interest in, or, in some instances, do not cultivate a taste for, out-door Peach culture. Another reason is that when a new gardener takes charge of a place where outdoor Peaches have perhaps been the pride of his predecessor, he devotes all his energies to vegetable culture, because he can exhibit these, whereas little in the exhibition arena is procurable from Peaches. Neglect of minor details in culture quickly shows itself in a difference in the appearance of the trees. In many instances these are condemned; they require replacing with superior (?) varieties. This is done with a flourish, the trees receive a fair start for a season, and as quickly fail, and thus Peach culture out-of-doors is condemned. The employer listens to the arguments put forth, such as an unsuitable

climate, and there is an end of the attempt. This is no fanciful picture, but a reality that can be seen every day, if persons will open their eyes and also give some thought to the subject. I will instance a few reasons why Peach culture is mismanaged. Take, for example, a season like the present. A tree has perhaps furnished a moderate crop of fruits in August or the early part of September, but after the fruit is gathered the trees are forgotten: not a drop of water is given to the parching roots, and they must be in a very dry condition, especially if at the foot of a high south wall after such a spell of heat as we have recently experienced. How can trees, under such conditions, carry out their natural functions of bud formation and maturation for the following season's fruit crop? It will be generally agreed that the foundation of the fruit crop is laid during the preceding season. Without a sufficiency of moisture at the roots, how can the trees accomplish this? Another reason I would advance for failure is neglect in dealing with insect pests. In some seasons green and black fly are both prevalent, and in the case of these pests twelve hours' neglect to eradicate them will do much to cripple the growth of the trees for the whole of the season. Instead of applying prompt remedies, the insects are neglected, until the leaves are curled and the growth is so crippled that recovery is altogether impossible. Again, at the end of the summer, and after the fruit is gathered, red spider often appears upon the leaves owing to neglect in supplying the roots with moisture, and so severely does this pest prey upon the energy of the tree, that its natural functions are completely crippled, and, instead of healthy leaves, which would tend to the production of plump buds, the leaves are limp and colourless, and the buds are weak and puny. Much more might be advanced to prove that non-success in Peach culture out of doors is not entirely owing to climatic influence. When walking round Lord Battersea's charming garden at Overstrand, near Cromer, on September 10, I noticed a wall about 10 feet in height facing to the south that had been furnished about three years ago with Peach trees, and these were carrying an excellent crop of highly-coloured fruits. In front of the trees was a 4-foot alley, afterwards a wide border of herbaceous plants, and then a Pergola, which, at certain seasons of the year may rob the trees of some sunlight. The wall was faced with cement. In the mind of some persons this material is not considered the best for the purpose, but it has its advantages in not providing a harbour for insect pests, as do some old brick walls. The varieties of Peaches were Barrington, Duchess of Cornwall, Gladstone (very fine), Goshawk (especially rich in colour), Hale's Early, Princess of Wales, Sea Eagle, Nectarine Peach, Condor, and Pitmaston Orange Nectarine. The fruits of the latter variety were quite small. *E. Molyneux.*

HEAVY TOMATO FRUITS.—In the "Answers to Correspondents" column of the *Gardeners' Chronicle* for September 15, I observed a reply to "G. G." respecting heavy Tomato fruits, in which it was stated that Mr. Burgess grew a specimen weighing 1 lb. 10 ozs. In the year 1903 I grew a fruit which weighed 1 lb. 14 ozs., the variety being Daniels No. 1. In 1900 I had three specimens which weighed 1 lb. 6 ozs., 1 lb. 6½ ozs. and 1 lb. 7½ ozs. respectively, in one house containing the variety Fidlers Gem. This year I had a fruit which weighed 1 lb. 4 ozs., the variety being King Edward VII., the plant at the same time carrying 40 other fruits several of which weighed over 8 ozs. each. *Henry Rowles, 8, Minster Terrace, Partridge Green, Sussex.*

MYOPORUM ROSMARINIFOLIUM.—Some months ago I received in a consignment of plants one under the above name. I was unable to find any mention of it in the horticultural dictionaries or in the files of the gardening Press, and, on applying to the donor, was informed that he knew nothing about it except that it was an Australian plant. My little specimen, which was watered well on being planted, has been left rigidly alone since, but has done very well having made plentiful and strong growth. The curious part about this growth is that it is entirely prostrate and apparently has not the slightest inclination to assume a perpendicular position. The plant has about 30 shoots, the longest being 2 feet 6 inches in length. The leaves, which are deep green and corrugated, are 1¾ inches long and an eighth of an inch in breadth, and the shoots are studded with small five-petalled, white flowers a quarter of an inch across. These are very similar in form to those of Myoporum laetum, well known in the south-west, but the latter are spotted with purple. The most striking characteristic of M. laetum is its foliage, which is powdered with innumerable transparent dots, but there is no trace of transparency in the leaves of M. rosmarinifolium. If the latter should prove as hardy as M. laetum it will, with its prostrate habit, be a valuable plant for covering rockwork and banks, for it is quite pretty when in full flower. *S. W. Fitzherbert, Devonshire.*

IRIS TECTORUM.—The white form of Iris tectorum has hitherto been so rare that only this year an authority on the subject spoke of it to me as being probably a myth. The photograph (reproduced at fig. 90) taken from a plant which flowered with me in May last proves, however, that it has an objective existence. The flower is pure white

FIG. 90.—IRIS TECTORUM, WHITE VARIETY. (Reduced ¼.)

with the exception of faint golden markings on the claw and sides of the crest. The species is one of the comparatively few Irises in which the large standards spread out almost horizontally. It is doubtless quite hardy, but seems to require to be kept dry in winter. I have consequently grown it in a pot and wintered it in a cold greenhouse. I hope to have several flowers next year. *F. W. Stansfield, M.D., Reading.*

STRAWBERRIES IN SEPTEMBER.—As Mr. Bunyard in his instructive article on Strawberries, published in the last issue of the *Gardeners' Chronicle*, omitted to mention the so-called perpetual-bearing varieties, I am induced to send the Editor a few sprays of fruit of St. Antoine de Padoue, to show what the variety is capable of doing if treated as an autumn-bearing and not a perpetual-fruiting variety. To expect a good crop of fruit twice in a year is, in my opinion, unreasonable. Those, therefore, who have not given this variety a fair trial, I would advise to procure runners at once and plant them in good soil. Remove all flowers that appear next spring, rigorously picking off all runners also. Afford the roots water as often as they require it, and you may expect to obtain next September several useful dishes of fruit for dessert. In addition to what I now send the Editor I picked (two days ago) 1½ lb. of good fruit from 40 plants, besides several small "dishes," during the early part of the month. *W. Peters, Givon's Gardens, Leatherhead, September 16.*

[The berries are some of the largest and best we have seen of this variety, which was illustrated in these pages, October 18, 1902, p. 291.—ED.]

RAINFALL IN DEVONSHIRE.—The rainfall in these gardens for the three months ending August 31 was very slight, the total amount registered being 3·55.—June, 1·61; July, ·62; August, 1·32; the greatest amount for 24 hours being on June 29, when the gauge registered 1·2. Previous to the 13th of this month no rain has fallen for 18 days, or since August 25. Birds have caused much injury to fruits, partly, I think, owing to the weather having been so dry, and Wasps, which were very late in turning up this year, seem to be doing their best to make up for lost time. *Fred Leach, The Avenue Gardens, Brampford Speke, Exeter.*

RHODODENDRON BARBATUM.—The appearance of this beautiful species at the present season suggests the question whether it is carnivorous. The buds of next year's leaves and flowers exude an exceedingly viscid secretion, which hardens into varnish during the winter months, but just now is very clammy. Every untortunate fly which settles on one of these buds is doomed. The gummy exudation is quite enough to detain any insect up to the size of a common hover-fly, and the struggles of larger insects, such as blue-bottles, are further impeded by the stiff hairs on the footstalks of the leaves, whence the plant derives its specific name. These all point inwards round the bud, forming an effective *chevaux de frise* against escape. I was looking to-day at a specimen of the bearded Rhododendron, about 10 feet high, in my garden, which must have several hundreds of clammy buds, each one of which has captured from five to ten flies of different kinds. The question is, can the plant assimilate nourishment from its victims? *Herbert Maxwell, Monreith, September 18.*

SOCIETIES.

ROYAL HORTICULTURAL.

TRIAL OF DAHLIAS AT WISLEY.

SEPTEMBER 14.—A deputation from the Floral Committee visited the Society's gardens at Wisley on the above date to inspect the trials of Cactus Dahlias. The deputation judged the varieties chiefly from the standpoint of garden decoration, but nevertheless was careful in refusing to make an award even to an erect flowering variety if the flowers were not of a type that could be properly described as good Cactus form. Notwithstanding all that has been said and written on the importance of obtaining better habited Cactus Dahlias, the trial served to show that in the best exhibition type but little improvement can be found in the habit of the plants. The flower stalks are still too short and too slender, whilst in many instances the stalk bends back again, almost like a pot-hook, thus causing the flowers to droop and turn their face to the earth. The Committee, in awarding three points to the Cactus varieties, keeps the standard as high as the present conditions will allow, but would gladly raise it if it were practicable to do so. An Award of Merit is usually intended to mark a Dahlia as a good exhibition flower, but three x x x indicate that it is of decorative value in the garden. Some varieties have obtained both awards, as Floradora, and others. On the occasion under notice three x x x were awarded to those following:—

A. D. Stoop.—A rosy crimson flower of good Cactus form, and flower stalks that hold the blooms well above the foliage.

Mont Blanc.—Recognised chiefly for its late flowering habit, but it does not possess equal merit to that of the variety "Fairy."

Pink Pearl.—The flowers of this variety are of a charming shade of mauve.

Prince of Yellows.—A very commendable yellow variety for the garden, but scarcely so good as Mrs. J. S. Brunton for exhibition purposes.

Reggie.—This was the best magenta crimson flower in the trials, but there is room left for improvement.

West Hall Scarlet.—A good garden variety raised at Byfleet.

Salvia splendens "*Zurich*."—This variety of Salvia is exceedingly dwarf, and, planted out in the open, was very freely flowered.

It was decided to recommend the full Committee on Tuesday next to grant an Award of Merit to Cactus Dahlia H. F. Robertson, as the deputation was impressed with the quality of its flowers, but could not recommend it for garden decoration.

NATIONAL ROSE.

SEPTEMBER 19.—The autumn exhibition of this society was held on Wednesday last in the Royal Horticultural Hall, Westminster. A very pretty display was seen, although the exhibition was not quite so good as in some former years, owing to the dry summer, which hastened the development of the blooms, so that in many cases southern growers were unable to compete. The more northern growers and those in Ireland, who have been favoured with a greater rainfall, showed by far the better blooms. Outstanding varieties were Maman Cochet and Frau Karl Druschki.

NURSERYMEN'S CLASSES.

The class for 36 blooms in distinct varieties was contested by seven growers. The winning collection, shown by Messrs. J. COCKER & SONS, Aberdeen, was a very fine exhibit, the blooms being large, and with beautifully-developed colours. As was to be expected at this late season, some of the outer petals bore traces of injury, otherwise they were in perfect condition. A selection of the best blooms include Caroline Testout, Mrs. J. Laing, Frau Karl Druschki, Bessie Brown, Captain Hayward, Hugh Dickson, S. M. Rodocanachi, Mad. Wagram, Annie Wood, Horace Vernet, and Marie Baumann. The example of Mrs. J. Laing was awarded the Silver Medal for the best Rose other than a Hybrid Tea, Tea, or Noisette variety exhibited in the nurserymen's classes. 2nd, Mr. HUGH DICKSON, Royal Nurseries, Belfast, for a very bright lot, but they were rather smaller than those of the 1st prize collection. Hugh Dickson, J. B. Clark, Ulrich Brunner, Comte de Raimbaud, John Stuart Mills, and Mad. Joseph Combet were the more notable examples, the last-named being awarded the Silver Medal offered for the best Hybrid Tea Rose exhibited by a nurseryman. 3rd, Messrs. ALEX. DICKSON & SONS, Newtownwards, Co. Down.

A class was also provided for 36 blooms in distinct varieties in trusses of not fewer than three blooms of each variety. The exhibits were limited to an area of 8 feet by 5 feet. This was a very pretty class, but only two growers staged, Mr. JOHN CROSSLING, Penarth Nurseries, South Wales, and Messrs. G. PAUL & SON, the Old Nurseries, Chesbunt, who won in the order named. The premier collection contained good examples of White Maman Cochet, Marie Van Houtte, Mad. Lambart, and others.

TEAS & NOISETTES.

There were five good displays seen in the class for 18 blooms in distinct varieties, the 1st prize being awarded to Messrs. ADAM & CRAIGMILE, Fernielea, Rubislaw, Aberdeen. The blooms were small, but very refined. Among the flowers was a glorious example of Maman Cochet, which was awarded the Silver Medal offered for the best Tea or Noisette Rose in the nurserymen's section. A bloom of White Maman Cochet was almost as good. 2nd, Messrs. D. & W. CROLL, Dundee, for a collection of light-coloured varieties. Maman Cochet was again shown well in this collection.

Class 4, for 12 distinct varieties of Roses, seven blooms of each variety, was a charming one, the 1st prize collection of Mr. HUGH DICKSON, Belfast, being magnificent. He had Frau Karl Druschki, Mrs. John Laing, Hugh Dickson, and Ulrich Brunner in splendid form. Mr. DICKSON quite out-distanced all other exhibitors in this class. 2nd, Messrs. JAMES COCKER & SONS, Aberdeen.

Mr. DICKSON was also 1st in the class for 12 blooms shown in a single vase, his variety being J. B. Clark.

DECORATIVE ROSES were poorly represented. No exhibits were forthcoming in a class for 24 varieties, and only one was staged in a smaller class for 12 varieties. This exhibit, however, was remarkably good. It was shown by Messrs. W. & R. FERGUSON, Brucefield, Dunfermline, and included good vases of Killarney, Mad. Abel Chatenay, and Liberty. Two growers only showed in a class for Decorative Roses arranged in fancy bamboo stands—Mr. JOHN MATTOCK, New Headington, Oxford, and Mr. GEO. PRINCE, Oxford—and these growers were awarded the 1st and 2nd prizes in the order named. Mr. MATTOCK had Bardou Job, Paul's Single White, Mad. Antoine Mari, Longworth Rambler, &c.

GROUPS OF ROSES.

Class 10 was for a group of Roses arranged on the floor. One exhibit only was staged, that of Messrs. GEO. PAUL & SON, Cheshunt.

A class was also provided for a group of cut Roses arranged on a staging and occupying an area not exceeding 100 square feet. This brought three good displays, the winning collection being the finest group in the hall. It was put up by Mr. GEO. PRINCE, Oxford, and embraced most of the better-known varieties. Prominent in the centre of the display were many choice blooms of Frau Karl Druschki, while Maman Cochet was also well shown. 2nd, Messrs. G. JACKMAN & SON, Woking.

Rose Fruits.—A new class was provided for the "hips" of nine distinct species or varieties of Rose with their foliage. They were required to be shown in vases. The 1st prize was a piece of Plate presented by the President, C. E. Shea, Esq. We were rather disappointed with the result, although four displays were presented; perhaps it is too early for these to be coloured their best. Mr. JOHN MATTOCK, Oxford, had the heaviest berried branches, and he was awarded the 1st prize—R. rugosa, R. rubrifolia (very handsome), R. canina, Sweet Briar, &c. 2nd, Messrs. G. PAUL & SON, Cheshunt, Herts.

AMATEURS' CLASSES.

Eighteen Blooms in distinct varieties.—Three growers competed, the premier position being won by the Rev. J. H. PEMBERTON, Haveringatte-Bower, Essex. The blooms were not up to the standard of former years, although several were of merit, notably Bessie Brown, White Maman Cochet, Comte de Raimbaud, and others. The 2nd prize exhibit, shown by W. BOYES, Esq., 30, Duffield Road, Derby, contained the medal flower for the best Rose other than a Tea, Hybrid Tea, or Noisette variety in Victor Hugo, a magnificently-coloured flower.

Twelve Blooms in distinct varieties.—E. M. EVERSFIELD, Esq., Deane Park, Horsham, was easily 1st among two. His example of Maman Cochet was a very fine flower.

Six Blooms in distinct varieties.—The winning exhibit contained a half-dozen remarkably fine flowers that surpassed any seen in the foregoing amateur classes. They were so good, we give the names: Mildred Grant, A. K. Williams, Chas. Grahame, Frau Karl Druschki, Maréchal Niel, and Tom Wood. The exhibitor was W. SPENCER CHAPMAN, Esq., The Cottage, The March, Warminster, Wilts. The example of A. K. Williams was very beautiful.

A pretty display of Roses in vases was shown by the Rev. J. H. PEMBERTON, in the class for twelve distinct varieties, in trusses of three flowers.

TEA AND NOISETTE ROSES.

E. M. EVERSFIELD, Esq., Deane Park, Horsham, showed the best dozen blooms, distinct, among three. Great difference was seen in the flowers, some being of high quality, for example Maman Cochet, which was awarded the Silver Medal for the best flower of this type in the amateurs' section, while others were but mediocre. 2nd, Rev. F. R. BURNSIDE, Great Stambridge Rectory, Essex; both Maman and White Maman Cochet were shown well in this group. The smaller class for nine blooms saw H. ADAMSON, Esq., South End, Bedale, placed 1st, and he was followed by C. F. H. LESLIE, Esq., Hertingfordbury, Herts.

Stronger competition was seen in the class for six blooms, the prize being awarded W. SPENCER CHAPMAN, Esq., Warminster, for a very fine half-dozen flowers.

GOLD MEDAL FLOWERS.

Dorothy Page Roberts.—This is a H.T. variety of a charming shade of colour, and with beautiful petals. The colour is rose-pink suffused with apricot. Some of the older blooms showed an open centre, and these appeared like glorified Austrian Briars. Shown by Messrs. ALEX DICKSON & SONS.

Mrs. Stewart Clarke, H.T.—This variety is the result of a cross between Rubens and Tom Wood. It is a large flower, with plenty of centre petals. The colour is cerise-pink.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 17.—On Monday evening last the Executive Committee held a meeting at Carr's Restaurant, Strand, when Mr. J. H. Witty presided.

After reading the minutes of the previous meeting, the new secretary (Mr. R. A. Witty) reported that the annual outing took the form of a trip to Deepdene and Broomhill, and was well attended.

A rough financial statement was presented, showing a working balance in hand, which it is hoped will shortly be materially increased by the receipt of members' subscriptions and other items falling due. It was arranged that the annual dinner be held as usual at the Holborn Restaurant, on November 27, when it is hoped that the President will preside.

The question of a Dean Memorial Medal was then discussed, and it was resolved that a design be procured, with all necessary particulars as to size, cost, &c.

Mr. C. H. Curtis presented the report of the Publication Sub-Committee, in which it was specially mentioned that it was desirable for the Society to issue publications likely to interest those members of the National Chrysanthemum Society living at a distance. After some discussion it was resolved that a publication in the form of an *Annual* shall be prepared for gratuitous distribution among the members, and that the same shall be ready early in the ensuing year. Judges were nominated to make awards to miscellaneous exhibits at the forthcoming shows.

Sixteen new members and Fellows were elected.

——At the meeting of the Floral Committee held on the same day Mr. D. B. Crane was re-elected chairman of this committee for the ensuing year.

First-Class Certificates were awarded to the following varieties:—"Ethel" (sport from Pabbie Burns), Messrs. WELLS & Co., Merstham; "Mrs. Arthur Beech," White Countess and Mercedes, all seedlings, shown by Messrs. LOWE & SHAWYER.

LONDON DAHLIA UNION.

SEPTEMBER 18, 19.—The London Dahlia Union held its annual exhibition on these dates in the Royal Botanic Gardens, Regent's Park. The exhibits were accommodated in the large conservatory and the corridor. The number of entries exceeded the average for the Union's shows, and most of the noted growers of these flowers competed in the various classes.

Mr. S. MORTIMER, Rowledge, Farnham, Surrey, won in the principal open class for show Dahlias, that for 24 blooms in distinct varieties, and Mr. SIDNEY HOOPER, The Hamlet, Chippenham, had the best of these flowers in the amateur's section.

The best 12 varieties of Cactus Dahlias, in bunches of six flowers, in a class open to all, were shown by Messrs. J. STREDWICK & SON, Silverhill Nurseries, St. Leonards-on-Sea, who showed a charming collection, principally of new varieties.

The open class for 24 blooms of Cactus Dahlias in distinct varieties, to be shown on boards, was an important one. The 1st prize was secured by Messrs. J. BURRELL & Co., Howe House Nurseries, Cambridge, for a very fine display.

Two Gold Medals were offered by the Union to perpetuate the name of Mr. Richard Dean, its late secretary and founder, one in the trade, and the other in the amateurs' classes respectively. Messrs. BURRELL's exhibit of 24 Cactus blooms was adjudged the best group and was accordingly awarded one of the medals. The examples of Pearl, Nelson, Harbour Lights, and Premier, were of high merit.

In the class for 12 varieties of Pompon Dahlias in bunches of 10 flowers of each variety four good displays were seen. The 1st prize was awarded to Mr. M. V. SEALE, Sevenoaks. The examples of Little Mary and Thalia were remarkably good. The best "single" Dahlias were shown by Messrs. J. CHEAL & SONS, Crawley, Sussex, who had Columbine, Miss Roberts (yellow), Victoria, Eclipse, and others in good form.

The principal prize in the amateurs' classes was that of the Hobbies Challenge Cup. This was

offered for nine varieties of Cactus Dahlias in bunches of three blooms. Good competition obtained, the number of entries totalling seven. The trophy, which carried with it a monetary prize, was secured by Admiral Sir L. BEAUMONT, K.C.B., Baldslow, Sevenoaks (gr. Mr. W. E. Peters). The flowers were of exceptional quality, and they were awarded the other "Dean" Memorial Medal.

A strongly-contested class was that for 12 blooms of Cactus Dahlias open to amateurs. L. MCKENNA, Esq., Honeys, Waltham St. Lawrence, Twyford, Berks, had the best dozen flowers among ten competitors.

NON-COMPETITIVE EXHIBITS.

Displays of Dahlias were shown by HOBBIES, LTD., Dereham Nurseries, Norfolk; Messrs. WAKE, LTD., Feltham; Mr. J. T. WEST, Tower Hill, Brentwood; Mr. J. E. KNIGHT, Tettenhall Nurseries, Wolverhampton; and Messrs. H. CORTIS & SON, Groenekan, Utrecht, Holland. Messrs. J. BURRELL & Co., Howe House Nurseries, Cambridge, showed Dahlias and a fine display of Gladioli; Messrs. J. PEED & SON, West Norwood, staged flowers of tuberous-rooting Begonias; Mr. ERIC F. SUCH, Maidenhead, put up a mixed group consisting of Dahlias, Chrysanthemums, and border flowers.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

SEPTEMBER 10.—The usual monthly meeting was held on this date, Mr. Chas. H. Curtis in the chair. Two new members were elected, making 72 this year up to the present date. Eleven members were reported on the sick fund. The amount paid for sickness is £93 less this year than at the corresponding date last year, notwithstanding that the chronic sick members are now paid from the benefit instead of from the benevolent fund. Members over 60 years of age may now, under the new rules (rule 18), withdraw twice the amount of interest on their balance of last year, thus enabling them to pay their contributions with ease. The annual dinner will be held at the Holborn Restaurant, on Tuesday, October 9 next, at 6.30 p.m., when J. Gurney Fowler, Esq., will preside.

GARDENERS' DEBATING SOCIETIES.

BRIXTON, STREATHAM, AND CLAPHAM HORTICULTURAL.—The first meeting of the new session of this society was held on September 12, the president, Mr. W. Roupell, occupying the chair. A lecture, entitled "A Visit to the Canary Islands," illustrated by lantern slides, was given by Mr. T. Ernest Waltham, F.R.H.S. The views were extremely good, and depicted the habits and surroundings of the people. Mr. Waltham also showed a collection of photos of Orchids and other flowers taken in their natural colours. The attendance of the members was satisfactory. The society has decided to extend the means for the mutual improvement of its members, and the committee has arranged to hold meetings every second Wednesday in each month during the season. The advantages are not confined to members.

THE HARDY FLOWER BORDER.

LILIUM AURATUM VAR. PLATYPHYLLUM

This is a most handsome Lily and one which up to the present time appears to be immune from the dreaded disease which often attacks plants of the type. It has a stronger and more vigorous constitution than the older form, the foliage being larger and of greater substance. The flowers are also of a very large size, and when they are fully expanded on a vigorous, well-grown plant, measure 12 and often 15 inches across. The form known as virginale has the same sturdy habit as the above, from which it only varies in the colour of its flower. The flower of L. a. platyphyllum are evenly and richly spotted with crimson, but not quite so prominent as in L. auratum. In the variety virginale a deep golden band runs through the centre of each petal, which is also slightly spotted with yellow, and in some cases with light crimson. The large, dark-coloured anthers form an additional attraction, and as many as 12 to 15 flowers are borne on stems 4 to 5 feet high; the scent is equal to if not stronger than that of L. auratum. A group of these plants presents a bold effect in the flower garden.—*W. H. Clark, Aston Rowant, Oxon.*

Obituary.

HARRY TURNER, V.M.H.—Mr Harry Turner, of the Royal Nurseries, Slough, died at his residence, at Langley, on Friday morning, September 14, at 2.30. He had not had the best of health for some time past, although he was well enough to go to Woodstock to judge at a horticultural show on the previous Tuesday. On his return from this show deceased was seized with an attack of hemorrhage, and towards the following day became unconscious.

THE LATE HARRY TURNER, V.M.H.

Mr. Harry Turner was a keen florist, and took over the management of the Carnations and Auriculas on the death of his father in 1885. His brother Arthur, who was a joint and equal partner with him, managed the Roses and some of the other departments. I do not think that Harry Turner missed a single exhibition held by the National Carnation and Picotee Society, or National Auricula Society during the 21 years since the death of his father. He was an expert judge at flower and fruit shows, and had a keen appreciation for everything connected with a country life, being fond of animals and birds. He was also an excellent musician. It was well that he died in harness, as it were, being engaged serving the public shortly before he passed away. We shall miss him sadly, as we missed his father 21 years ago. The firm of Charles Turner has been represented at the London exhibitions for more than 60 years, and those of us who can remember the great exhibitions at Regent's Park and Crystal Palace will never forget the magnificent specimens of Roses, Azaleas, Show and Fancy Pelargoniums, &c., that came from Slough, and in this connection we must not forget that faithful servant of the firm, John Ball, who attended to the show Tulips, Carnations, and Auriculas during very nearly the entire period of the firm's existence. He is still happily with us, but is not able to do much, being, I think, in his 78th year. It is known to most of Mr. Turner's friends that his wife died in July, 1905, and deceased has left a family consisting of three boys and two girls. He was buried at Langley at 3.15 on Tuesday last.—*J. Douglas.*

ANDREW HENDERSON.—The death of Mr Andrew Henderson occurred in Florida, U.S.A., on August 31, at the age of 83 years, in the presence of Mrs Henderson. Deceased was a member of the firm of E. G. Henderson & Son, of the old Wellington Nursery, St. John's Wood, London, now incorporated in Lord's Cricket Ground. This business was for some time one of the most flourishing nursery and seed establishments in the country, many new plants being distributed from it, and all classes of plants from herbaceous perennials to Orchids, Economic plants, and florists' flowers being grown with success. On the death of the late Edward George Henderson, his son, Mr. Andrew Henderson, continued the business, who subsequently took over the Pineapple Nursery, Maida Vale (now built upon), and carried on both establishments until the Wellington Nursery passed out of his hands. Messrs. E. G. Henderson & Son's business was a good example of the old-fashioned nursery, its stock, which partook greatly of the botanical garden, being of the most varied character. But the fashion in gardening altered, and the buyers of collections of plants became imbued with the idea of growing batches of decorative plants, and the demand for odd plants from the carefully compiled catalogue, and for stove and greenhouse plants, became less and less. Finally, the business was wound up, and some 16 years ago Mr. Henderson went to Florida with the intention of growing Pine Apples for market. A succession of cold winters rendered his project inadvisable, and he turned his attention to forcing Lily of the Valley and other flowers for sale, continuing the business with a moderate degree of success until his death. He had a great knowledge of plants, and in the flourishing days of the Wellington Nursery, sent out many new ones. He had the monopoly of the tri-coloured Pelargoniums of that day, raised by Mr. Peter Grieve, and many other plants which were then remarkable. The late Mr. Henderson was of a retiring disposition, and never took that place among his fellow-horticulturists which his knowledge and position entitled him to take, and to that fact, perhaps, more than any other, may be attributed the decline of the once famous business. He was, however, very pleasant with those with whom he had to do, and had many good qualities.

OTTO FROEBEL.—We reproduce a photograph of Otto Froebel, whose death on August 28 last, at the age of 62, has been announced. Deceased was a nurseryman, having a business at Zurich,

THE LATE OTTO FROEBEL.

and was well known for the success he obtained in the raising of choice, cross-bred varieties of Begonias, hardy Water Lilies and Anthuriums.

FREDERICK STREET.—We regret to record the death of this nurseryman which occurred on Wednesday the 12th inst., at the age of 71. Deceased was a well known cultivator of Rhododendrons, Conifers, and hardy trees and shrubs, and in addition was a vendor of peat.

MARKETS.

COVENT GARDEN, September 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

REMARKS.—English and French Tomatos are likely to be firm in prices owing to the wet weather. Good Madresfield Court and Gros Maroc Grapes meet with little demand and can be bought at 1s. per pound. Good dry Blackberries suitable for making jam can be purchased at 3s. per peck. Others can be bought at 2s. 6d., but the fruit is rather wet. Prices for large English Peaches are firm. Medium-sized fruits are rather scarce. Damsons are very dear and scarce owing to a short crop. English Plums are also seen in very limited quantities. Trade generally is fairly good. *E. H. Rubs, Covent Garden, Wednesday, September 19, 1906.*

POTATOS.

Large supplies of Potatos are still coming from all districts, and trade is very dull. Lincolns, 55s. to 65s.; Bedfords, 60s.; Kents, 70s. to 80s.; Blacklands, 50s. to 60s. *John Bath, 32 and 34, Wellington Street, Covent Garden.*

COVENT GARDEN FLOWER MARKET.

A very slight improvement in trade is seen. Chrysanthemums sell fairly readily, except the inferior plants of which there are large quantities. These are difficult to sell at 4s. per dozen. Erica gracilis is good, also the variety nivalis, but I find the variety gracilis alba has quite a pink shade. Small plants of this latter variety sell well. Asters are still plentiful and some are of very good quality. Among Zonal Pelargoniums the best are Mrs. Lawrence, Berthe de Presilly, and Raspail. Spiræa japonica and white Lilies from retarded plants are both good. Rose Madame Levavasseur, although well-flowered, does not sell readily. Liliums in pots vary; some are good, others are of indifferent quality. Bouvardias are now plentiful. There are large supplies of Ferns, Palms, and other foliage plants. Codiæums (Crotons) are good. Compact plants of Physalis Francheti realise from 18s. to 42s. per dozen, and a few of extra quality 5s. each. Solanums are very good; some are sold for good prices, but it is too early in the season for their sale in large quantities. Hardy shrubs are already seen, also Ivies, Ampelopsis, Clematis, and other climbers.

Cut Flowers.

Chrysanthemums are now seen in large quantities. The varieties White Countess, Mercedes (yellow), and Mrs. A. Beech (bronze), which received Certificates from the National Chrysanthemum Society on Monday last, the 17th, are marketed by Mr. J. Lowe, of Uxbridge, and the same grower has Princess, a good pink flower. I may mention that Clara, golden yellow, and Ethel, a primrose sport from Rabbie Burns, are promising varieties, although not yet seen in the market. The last-named gained a First Class Certificate, and Clara was commended. These came from Messrs. Wells & Co., who also had some pretty varieties of a new type of singles. Asters are still plentiful, and Dahlias are also seen in large quantities. Roses do not improve greatly in quality, but those that are sold fetch rather better values. Prices for Carnations are also advancing a little. Liliums and Lily of the Valley are still plentiful. Not so many Gladioli are seen, while Sweet Peas are almost finished for the season. Gaillardias, Coreopsis, Michaelmas Daisies, and other hardy flowers are to be had in large quantities. Gypsophila paniculata is now nearly over, but G. elegans and several varieties of Statice are plentiful. Physalis Francheti is seen in large heaps. Hardy foliage with autumnal tints is significant of the approach of winter. *A. H., Covent Garden, Wednesday, September 19, 1906.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 15, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS

The *weather*, after being fine and bright at the commencement of the week, gradually fell into a very showery and changeable condition over the whole kingdom. The falls of rain were, however, mostly slight, and there were frequent intervals of sunshine. Thunderstorms were experienced at Swarraton and Dungeness on Saturday, lightning was seen at several other southern stations, and thunder occurred at Holyhead.

The *temperature* was a little above the average in Scotland, the eastern section of England, and in the Channel Islands, in Ireland and the south-west of England it was slightly below, and in the north-west of England in exact agreement with the normal. The highest of the maxima were generally recorded either on Sunday or about the middle of the week, and ranged from 74° in England S. and the Channel Islands, and 73° in England E., to 67° in Scotland N. and to 66° in Ireland N. The absolute minima, registered at most stations on Tuesday, were much lower than of late. In England S.W. (at Llangammarch Wells) the thermometer fell to 32°, and in the Midland Counties to 34°, while in the other districts the readings ranged from 35° in Scotland E., England E., and Ireland N., to 40 in Scotland N. and to 51° in the Channel Islands. Frost was experienced on the ground in many parts of England on Tuesday.

The *rainfall* exceeded the average over the kingdom generally, but was rather deficient in Scotland E., England N.E. and Ireland S., and very slightly in the Channel Islands.

The *bright sunshine* was above the normal in all districts. It exceeded 50 per cent. of the possible amount over the greater part of the kingdom, being as much as 59 per cent. in the Channel Islands. The lowest percentage was 39 in Scotland N.

THE WEATHER IN WEST HERTS.

Welcome rains.—There occurred one cold day when the highest reading in the thermometer screen never exceeded 56°, but throughout the rest of the week the weather remained warm. The ground temperatures have fallen rather rapidly, the reading at both 1 and 2 feet deep being at the present time only about seasonable. Rain fell on six days during the week, and to the total depth of nearly 1¼ inches, making this the wettest week experienced here since the record rainfall at the end of June. Of this amount, which is equivalent to a watering of 5½ gallons on each square yard, about 1 gallon has passed through the bare soil percolation gauge. This gauge had previously been perfectly dry for seven weeks. The sun shone on an average for 5¼ hours a day, or for half-an-hour a day in excess of a seasonable duration. The winds were, as a rule, rather high, but in no hour did the mean velocity exceed 13 miles. There was about an average amount of moisture in the air, at 3 p.m. *E. M. Berkhamsted, September 19, 1906.*

Answers to Correspondents

ABIES NOBILIS GLAUCA: *G. H. C.* We do not know that this variety is more subject to splitting than is any other Conifer.

APPLE: *J. Mc* The disease is Apple rot, caused by a fungus Gloeosporium fructigenum. Spray the trees next spring with a solution of sulphide of potassium, ½ ounce of sulphide dissolved in a gallon of water. The first application must be made when the Apples have just set, and successive applications at intervals of a fortnight. These sprayings must be carried out without fail where the disease has previously been present. Diseased fruits should not be allowed to rot on the ground, but, together with all diseased fruits hanging on the trees, should be removed and destroyed by burning.

BEDDING PELARGONIUMS: *H. W.* There is no fungus disease present We have had several similar complaints of plants having been injured by creosote whilst growing near to roadways laid with wood so treated See also the reply to J. W. printed below.

BOG MYRTLE: *H. L.* If you want to obtain the use of a cold storage, you may write to Messrs Thos Rochford & Sons, Turnford Hall Nurseries, Broxbourne, Hertfordshire. We do not think, however, that such treatment would be of any service for the purpose you mention. Myrica Gale being a deciduous plant, it would probably be possible to lift it now, giving it sufficient check to cause rest, and, following this by etherisation, bring it into such a condition that it might be forced into growth again by November Failing this you might press the growths very carefully as they do herbarium specimens, so as to retain the colour in the leaves, and if the result is as good as might be expected, they would be of use at the wedding and could be made to appear almost as fresh specimens.

BOOKS: *J. H. E. The Origin of Species*, by Charles Darwin, can be obtained from our publishing department, price 2s. 9d. post free.

EGG PLANT: *H. L. F* This is the popular name for Solanum ovigerum. The plant requires similar treatment to that given to Aubergines Seeds and plants can be obtained from the nurserymen.

ETHER AND ACETYLENE GAS AS APPLIED TO PLANT CULTIVATION: *Hortus.* We know of no special work on the subject of the etherisation of plants published in the English language The *Acetylene Journal* is published in Chicago. See a note referring to the subject of acetylene gas on p. 213 of our present issue, and in our last and previous issues information may be found on the etherisation of plants.

FORSYTHIA SUSPENSA: *B. L.* This species may be capable of growing to a height of from 20 feet to 30 feet if trained against a wall in suitable conditions.

HORTICULTURAL JUDGE: *A Constant Reader.* Horticultural judges are generally selected from first-class nurserymen and gardeners of long and wide experience. They are not only well-versed in the practical details of horticulture, but in most cases they are men who have obtained a reputation for obtaining unusual success in the cultivation of plants, fruits, or vegetables, and they are invited to judge classes in which their special knowledge will be valuable. It would be impossible, therefore, to recommend you a book that would fit you for such a responsible and onerous position as the judging of cultivated products imposes upon those who undertake the task. Practice in the cultivation of plants continued for a long period and under varying conditions is the one essential quality a horticultural judge should possess, and if he has this experience, and it is combined with a good theoretical knowledge of the subject and familiarity with the methods obtaining at the best exhibitions, so much the better

HORTICULTURAL TRADE JOURNALS: *Hortus Horticultural Trade Journal*, Horticultural Printing Co, Junction Street, Burnley *Horticultural Advertiser*, A. & C. Pearson, Lowdham, Notts. *The Nurseryman and Seedsman*, 30, Wellington Street, Covent Garden, London. *Fruit, Flower, and Vegetable Trades Journal*, Biggs & Co., 139-140, Salisbury Court, Fleet Street, E.C. *Fruit Grower, Fruiterer, Florist, and Market Gardener*, Geo. Tucker, 1, 2 & 3, Salisbury Court, Fleet Street, E.C.

HORTICULTURAL TRAINING: *M. L. L.* Apply to the Superintendent, Horticultural Department, Reading College, or to the Royal Botanic Society, Regent's Park, London.

LAWN UNDER PLANE TREES: *F. C.* We think that sulphate of ammonia would be better than nitrate of soda to apply to lawn-grass under Plane trees, because the ammonia would be retained more in the surface soil than the nitrate would be, and therefore is less liable to be washed into the subsoil, where it would quickly be appropriated by the roots of the trees themselves. About 50 lbs. to the half acre may be applied, to which it would be advisable to add 25 lbs of superphosphate or basic slag. These manures may be mixed together and sown broadcast in the month of February next, adding a little sifted earth to ensure their more even distribution. In the meantime apply a dressing of sifted horse droppings, or of peat-moss manure. These may be applied at once so that they may be exposed to the rain during winter.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruits at one time: they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *H. P.* Apple White Transparent.—*Walter Lane.* Apple Lady Sudely.—*J. M.* 1, Beurré d'Amanlis; 2, specimen had decayed.—*Thomas Murray.* Apple Lady Henniker.—*Pinehurst.* Pear Autumn Bergamot; Apple Yorkshire Beauty (Greenup's Pippin) *Mrs G.* Apple Dumelow's Seedling (Wellington): Pears, 1, Autumn Josephine; 2, Uvedale's St Germain.—*Dr. B., Worthing.* We have failed to determine the variety of Apple you have sent us from trees obtained from France under the name of Calville Rouge, and which you have found to be so utterly worthless. The variety recommended to you by the nurseryman you mention was probably Calville Rouge Précoce, which is a good Apple. You would do well to graft the tree with some choice variety that is known to succeed well in your district They will soon make good "heads" if the branches are not cut back too closely before grafting is done. At first sight the fruits resemble Catshead, but they are not as good as that well-known variety. Calville St. Sauveur is the most conical variety of the section, but it is of much better quality on comparison with your specimens. —*A. R.* Apple Dean's Codlin.—*J. B.* 1, Marie Louise d'Uccle; 2, Marie Louise; 3, Josephine de Malines.

NAMES OF PLANTS: *J. S. F.* Alnus glandulosa var. quercifolia The small black "bobs" are the female catkins.—*L. H.* 1, Polygonum cuspidatum, 2, Polygonum Persicaria; 3, Solanum nigrum.—*W. & S.* Achillea Ptarmica.—*J. W.* 1, Yucca aloifolia variegata; 2, Dracæna intermedia, 3, Myrtus communis (Myrtle); 4, send better specimen with flowers; 5, Tradescantia zebrina, 6, Tradescantia viridis; 7, Sempervivum urbicum.—*L. E. S.* Veratrum nigrum. —*C. G.* Ruellea macrantha (flowers) and Strobilanthes Dyerianus.—*W. E., Pembroke.* 1, Abelia triflora, 2, next week; 3, Saponaria officinalis flore pleno.—*H. C.* 1, Bocconia cordata; 2, Asclepias curassavica; 3, send specimen with flowers; 4, Cryptomeria japonica.—*C. P.* 1, Kochia scoparia; 3, Schinus molle (Pepper tree); The seedlings 2 and 4 are not sufficiently developed to name with certainty.

NARCISSUS AND TULIPS: *W. & S.* For successful bulb growing it is essential that the soil should contain an abundant supply of humus matter. This is best given in a mixture of horse and stable manure with cow manure in about equal quantities, or peat-moss manure may be used, but is not so good for the purpose. This should be well incorporated in the soil previous to planting the bulbs; the sooner it is done the better. When making up the beds for planting give a dressing of bone meal and dried blood manure, three parts of the former to one part of the latter. Apply 6 ozs. per square yard of surface soil, or 1 lb to a barrow-load of earth. This may be lightly forked or raked into the soil. Concentrated, nitrogenous manures should be avoided in bulb growing, otherwise foliage will be produced at the expense of flowers, and the bulbs will be liable to rot.

PELARGONIUM IN THE BEDS IN FRONT OF BUCKINGHAM PALACE: *W. H. C.* The fine scarlet-flowered zonal variety in these beds is the one known as Paul Crampel, which was noted on p. 122 of our issue for August 18 as being exceedingly effective in the Gunnersbury Park Gardens. It is the best variety of its type.

PELARGONIUMS IN PARLIAMENT SQUARE: *J. W. & others.* The injury has been caused by the vapour from the recently laid creosoted wood-paving on the adjoining road, supplemented by the dust charged with creosote from the same source and carried to the plants by the south-west wind. The plants in the square, even as far away as the Catalpas in the Palace Yard, Houses of Parliament, have felt the effects, and the first tree in the row has suffered considerably, the edges of the leaves being burned and growth reduced almost to a standstill. The trees have been afforded water in abundance and also frequent washings to counteract the ill-effects. It has been found that in Hyde Park, adjoining Park Lane, in the new gardens in front of Buckingham Palace, and in the new Mall, creosote upon the roadways has been injurious to vegetation in recent years. Eight newly-planted Plane trees that stood in the track of the south-west winds were killed outright and others suffered. The plants in the flower garden were in many cases killed; others were put in, but similar results followed, most of the plants being thus changed three times in 1904, when the new roads were paved. A remedy against creosote is to cover the wood paving with fine gravel; an example of this may now be seen on the new road near the Admiralty Buildings, but where the roads are of a more public nature as are those at Parliament Square and near the Palace this remedy could not be conveniently applied.

RAISING ORCHID SEEDLINGS: *J. B., Hamburg.* An excellent contribution on this subject is to be found in the report of the Orchid Conference (1885) of the Royal Horticultural Society. A more recent article containing the exact information you require was published in the issue of the *Gardeners' Chronicle* for November 2, 1901, p. 317, and may still be obtained from our publishing department. Darwin's *Fertilisation of Orchids* is published in very cheap editions, and you would gather much useful information from it. Another work on the subject is *Orchids, their Culture and Management*; this book can be obtained from our publishing department, price 20s. 6d. post free to Hamburg.

SWEET PEAS FOR FLOWERING IN FEBRUARY: *J. J.* We scarcely think you would meet with much commercial success with Sweet Peas, if it is imperative to clear the crop so early as the end of February, but if thought desirable you could, under restricted conditions of culture, get them into flower at that time so as to obtain flowers over a few weeks. If the seed has not been already sown, it should be sown at once, selecting early flowering varieties such as "Mont Blanc." After transferring the plants to the houses early in December, they would need continuous artificial heat Being grown in pots the growth will be somewhat restricted and the flowers only of secondary quality with short stems. If a large quantity be placed on the market so early in the season we are doubtful of the venture proving remunerative. When Sweet Peas are grown, however, under more liberal conditions, by planting them out in rows, they usually pay well, but the plants if so treated would not flower so early as you desire.

THE LAW OF GARDEN FIXTURES.

IN comparatively few cases are market gardeners or nurserymen the owners of the freehold (i.e. the absolute owners) of the lands which they occupy for the purposes of their business. The vast majority are merely tenants of some landlord, and are therefore materially concerned in the question of fixtures and the law relating to them. This branch of the law involves the consideration of the rights of such traders in respect of conservatories, greenhouses, and other similar erections which they may have put up during their tenancy, and it may therefore perhaps be said to furnish the subject which, from the legal point of view, bears most closely upon the ordinary business of a nurseryman or market gardener. One often hears doubts expressed as to what erections or articles may be taken away at the end of a tenancy and what have to be left behind by a tenant on changing his premises. Such questions as these can only be grasped by one who has some knowledge of the law with regard to fixtures, a brief outline of which it is now proposed to give.

Fixtures and Chattels.

The first thing to be borne in mind is that unless an article is actually *attached* to the land, or to some building which is upon the land, by some physical means it is *not a fixture at all, but is what the law calls "a chattel."* In this case it remains the property of the tenant who placed it on the land and it may be removed by him at pleasure. For example, all articles which merely *rest on the surface* of the soil, as distinct from being built into it, are chattels pure and simple, and belong absolutely to the tenant who placed them there.

If this fact is clearly borne in mind, a great deal of the confusion which seems to surround the subject will disappear.

Tenant's Fixtures.

There are, however, certain cases in which the law recognises the right of the tenant to remove even fixtures properly so-called, that is to say: Articles and erections actually attached or fastened to the land. Whether the tenant can do so or not depends upon whether such fixtures fall under the category of "tenant's fixtures" or under that of "landlord's fixtures." Tenant's fixtures may be defined as "those which may be removed by the tenant during the continuance of his tenancy," and it is important to bear in mind that they comprise only such articles as can be taken away without doing any real damage to the landlord's property.

This, then, is the first and principal test of whether an erection falls within the category of tenant's fixtures, i.e., can it be removed without causing serious injury to the land? If it cannot, then we shall generally be safe in saying that it is *not* a "tenant's fixture." Unfortunately the converse of the rule does not always hold good, and when the cases bearing on the point are looked into one might be disposed at first sight to think that there is an extraordinary conflict between the various decisions given on different cases as they arise. The reason of the apparent confusion is that so much depends upon (1) the actual purpose for which the fixtures are set up, (2) on the manner in which they are affixed, and (3) on the occupation followed by the tenant who erects such fixtures. The matter becomes greatly simplified when it is borne in mind that the rights of a tenant differ materially according to whether he is a trader, such as a nurseryman, who, for the purpose of his business, is bound to erect greenhouses and other fixtures, or, whether he is an agricultural tenant who makes erections not for the primary object of his business but as convenient accessories thereto, or, lastly, whether he is merely a private individual who maintains a garden for his own pleasure.

Nurserymen and Market Gardeners.

Dealing in the first instance with nurserymen and market gardeners who carry on business for the purpose of trade or profit, it is clear that their position is much more favourable than that of the two other classes mentioned above. It is obviously essential for nurserymen to erect greenhouses and grow plants and trees on the land for the purposes of their trade, and they are therefore entitled to special protection when their tenancy comes to an end. This point is set out very clearly by a judge who decided a case well-known in the trade. An extract from the judgment in that case reads as follows:—"Shall it be said that the great gardeners and nurserymen in the neighbourhood of the metropolis who expend thousands of pounds in the erection of greenhouses, hot-houses, etc., are obliged to leave all those things upon the premises, when it is notorious that they are even permitted to remove trees (or such as may be likely to be such) in the thousands in the necessary course of their trade? If it were otherwise the very object of their holding would be defeated." It will be seen, therefore, that the reason why special advantages are given to traders is that the law recognises the principle of the necessity of encouraging trade and commercial enterprise.

For the reasons above stated nurserymen and market gardeners are entitled to remove greenhouses, hot-houses, and similar structures of wood and glass as well as furnaces set up for the purpose of heating such buildings, and it has been decided that even where a wooden building was raised on a brick foundation (having a brick chimney) the tenant was entitled to remove it before or at the end of his term since it was set up for the purpose of his business. In another case a tenant has been held entitled to remove a steam engine to which a chimney was necessarily an adjunct.

Curiously enough there would seem to be no reported case in the English Courts dealing with the question as to whether in addition to being entitled to remove structures composed of wood and glass a nurseryman is also entitled to remove the low brick walls on which such structures usually rest. The point was once mentioned in a case heard in Scotland, and although this special point did not have to be decided by the Court, two of the judges nevertheless expressed their opinion that in the circumstances of that particular case the bricks constituting the walls in question might also be removed by the tenant.

During or before the expiration of his tenancy a nurseryman or market gardener is also entitled to remove trees and shrubs growing in the ground if planted in the way of trade so as to form part of his stock-in-trade, and this rule applies even to fruit trees in full bearing provided they are really nursery trees and not trees of such a size as to render it impossible for them to be dealt with in the way of trade. Similarly he can remove shrubs and plants even where they are used for the purpose of making a border to the paths.

Farmers.

A tenant who is a farmer, as distinct from a market gardener or nurseryman, is in a much less fortunate position, for (with the exceptions created by Acts of Parliament hereafter to be noticed) the law does not extend to him the privilege (granted to the two latter classes as "traders") of removing fixtures which have been erected or affixed to the soil for the purpose of his business or calling. Farming, for some inscrutable reason, is not recognised by the law as a "trade," and accordingly the rule in the case of the occupier of a farm or agricultural holding (in the ordinary and limited acceptation of the term) is that all "fixtures" placed on the land by the tenant become the property of the landlord unless he complies with the conditions of the Agricultural Holdings Acts. It is, however, necessary to bear in mind that the rule applies only to fixtures in the strict legal sense; that is to say, to structures and other articles which are actually affixed to the land, or to some building which is built on, or itself attached to, the land. However bulky, and however substantial the thing

may be, so long as it only rests on the surface of the land it is not a "fixture," but, as already explained, remains a "chattel" in the eyes of the law, and may therefore be removed by the tenant who placed it there. For example, it is possible to put up machinery, and even agricultural buildings, in such a way as not to be let into the soil, and therefore not to become "fixtures." Barns, granaries, sheds or mills erected upon blocks, rollers, pattens, pillars or plates resting on brickwork (if not affixed to the land by being let into it, nor united to the land by mortar, nails or otherwise) are not treated as "fixtures," and the farmer can take them away notwithstanding that they may have sunk into the ground by reason of their own weight. If an agricultural tenant erects a wooden barn which, by its own weight, rests upon a foundation of brick and stone let into the ground it can be removed by him. A wooden stable standing upon blocks and rollers has also been held to be removable by the tenant.

As already stated, such articles as those above enumerated are not "fixtures" at all, but are removable on the express ground that they have never been affixed to the soil. So far as fixtures properly so-called are concerned, the farmer as such has, apart from Acts of Parliament, no special privileges, but stands in exactly the same position as a private person.

The first exception to this rule was created by an Act passed in the year 1851, which enabled the tenant of an agricultural holding to remove at the end of his tenancy certain specified fixtures provided they were erected with the previous consent in writing of the landlord and certain other conditions were complied with. But the most important modifications of the rule were created by a series of Acts known as The Agricultural Holdings Acts, the benefits of which are shared by market gardeners and farmers alike. These Acts (as well as the question whether nurserymen are, or are not, entitled to share their benefits equally with market gardeners) will be considered more fully in a subsequent article, but it may be here stated that their general effect is to confer upon the tenant the right either to remove or to receive compensation at the end of his tenancy for certain improvements and fixtures which he may have carried out or erected on his holding provided he complies with certain conditions.

PRIVATE INDIVIDUALS.

The rights of a private individual who maintains a garden for his own pleasure and not for profit are at common law practically identical with those of the farmer, but he is not entitled to the benefits conferred on the latter by any of the Acts just quoted. His rights, therefore, are more restricted than those of any other class of tenant. He may, it is true, remove structures put up for ornament or domestic convenience provided he can do so without causing material damage to the landlord's premises, but this is a privilege which is shared by the farmer and, indeed, by tenants of every class. He may not, however, remove fruit trees even though he has planted them himself, nor in strictness can he take away hedges, plants, or even a border of Box. (In practice it is understood that amateurs often "pot" a few of their favourite plants some time before the end of their tenancy!) It has also been held that a non-trading tenant cannot take away a conservatory erected on a brick foundation affixed to and communicating by windows and doors with rooms in his dwelling-house even where he has put it up at his own expense. Neither can he remove a verandah, the lower part of which is attached to posts fixed in the ground. Furthermore, a non-trading tenant cannot take away greenhouses constructed of wooden frames fixed with mortar to foundation walls or brickwork, and some learned writers have doubted whether he could even take them away if they merely rested on the foundation walls or ground by reason of their own weight. However, this seems to carry the doctrine rather far in favour of the landlord, and there is certainly one decided case where a rector was held entitled to remove his hot-houses without incurring liability for dilapidations. A private tenant cannot remove a boiler built into the masonry of a greenhouse, but, on the other hand, it has been held that he is entitled to remove the pipes with heating apparatus connected with such boiler by screws.

Tenants should remember that when putting up a fixture screws should always be used in preference to nails.

Lastly it should be borne in mind that small circumstances often alter cases very materially, and there is always a possibility of some special fact taking a particular case out of the general rule. For this reason the question of whether an article is a fixture at all, and if so whether it is a "landlord's" or a "tenant's" fixture, must always be decided more or less on the merits of the particular case in point. *H. Morgan Veitch.*

HERBACEOUS PHLOXES.

DURING the months of July and August, and much later in northern districts, and in the south also where special attention is given them, herbaceous Phloxes are almost without a rival in the herbaceous border. The year 1906 will long be remembered as one most trying for these plants, especially for those growing in light soils. The small amount of rainfall has necessitated much watering, and in cases where this has been neglected the plants have presented a miserable appearance. Adequate moisture at their roots is essential in the case of these plants, because they produce the majority of their roots quite near to the surface of the soil, and it is from this reason the plants quickly suffer from excessive sun-heat and drought. They are much benefited by applications of liquid manure.

Garden Phloxes should never be planted in highly-mounded beds; rather should the plants be placed in a shallow depression, or at the level of the ground, where they will receive the full benefit of the rain or of any water that is applied. In some respects light soils are better than those of a more retentive nature, which, during dry weather, form deep fissures in all directions, and lose the whole of their moisture; although repeatedly moving the surface of the ground and early mulchings of some light material will do much to modify these evils, especially if sufficient water is applied to prevent the soil cracking. It is quite obvious, judging by the many excellent groups of these plants seen at recent meetings of the Royal Horticultural Society, that the requirements of these moisture-loving plants can be met even in a dry season. Indeed, it is hardly possible to conceive anything finer of its kind than the splendid groups, wholly composed of Phloxes in the best varieties, brought this season from the neighbourhood of Birmingham by Messrs. Gunn & Sons. The exhibit of these plants by this firm at the Holland House Show this summer was much the finest thing of its kind I have ever seen in the early days of July, the splendid inflorescence and the brilliant colours of the flowers being remarkable, and affording evidences of high-class culture. The plants had doubtless been grown under glass for a time. That so highly decorative a subject can be had in such perfection early in the season, and by means of later flowering varieties as late as October, is an item of much importance. Border Phloxes are not merely moisture-loving subjects: they are, in addition, gross feeders.

An abundance of good varieties exists, and the cultivator can select a snow-white flowered kind such as Tapis Blanc (see fig. 74 in our issue for September 8) with growths about 1 foot in height, or one with equally pure white flowers, such as Sylphide, that grows 3 feet in height. The first-named variety recently received an "Award of Merit" from the Royal Horticultural Society, and the excellent condition in which it was shown should do much to render it popular where very dwarf kinds are desired. For a mixed arrangement of scarlet Begonias, or as a carpet plant for Lobelia Queen Victoria (also a moisture loving subject), this dwarf Phlox should make an ideal subject, the more so from the superb quality of its individual flowers. To many persons, however, the taller kinds possess the greater value, and in the gardens these are ever conspicuous during their season of flowering. The greater amount of their fibrous roots are made by these plants during the autumn and winter; the early autumn is therefore a suitable season for their planting. *E. H. Jenkins, Hampton Hill.*

WESTWICK HALL.

WESTWICK HALL, the residence of Major Petre, is a white stuccoed mansion built in the reign of Queen Anne, and is pleasantly situated in a well-timbered park on the road from Norwich to North Walsham. Not far from the estate is the church of St. Botolph, situated in the village of Worstead, which is a noted one even in Norfolk, where fine churches are unusually numerous. It is built of stone in the decorated and perpendicular styles, with an embattled western tower with pinnacles, and contains several monuments to the Berney and Petre families.

The gardens at Westwick are not extensive, but they are remarkable for the culture of hardy plants, Apples, and Pears. The gardener, Mr. Davison, invariably secures the leading awards for hardy flowers at shows in the neighbourhood. The position of head-gardener at Westwick has been held by the Davison family for three generations. The present gardener succeeded his father seventeen years ago, but his grandfather held the same position in 1828. At the present moment there is still another generation in being, and Mr. Davison's son is a promising youth under the careful tuition of his father.

WESTWICK MONTBRETIAS.

The gardens have lately been brought into greater prominence by the introduction of the improved varieties of Montbretia referred to on p. 197 of the *Gardeners' Chronicle*, as well as several others, of which George Davison, the finest of yellow-flowered forms, is such a great acquisition to the hardy flower border where a bright August and September display is required. In addition to those named, the "Norvic" is another variety deserving notice. In height it reaches 3 feet 6 inches, and one inflorescence had as many as eight branches. The flowers are of large size and rich yellow colour, with a deep orange-red coloured exterior. The view of these Montbretias as they grow is very different from the appearance of a few cut flowers, and is convincing as to their value as garden plants. For example, that extremely large variety Prometheus (see fig. 93) filled one border

many yards in length. The plants were growing from 3 feet to 4 feet in height, and were abundantly furnished with flowers, each of which measured about 3½ inches in diameter.

Mr. Davison does not practice the "dot" system of planting herbaceous plants, but prefers the massing of one kind together to provide a mass of colour, and as his borders are wide he can do this successfully. One long, wide border, so planted at the foot of a Holly hedge with an eastern exposure, must be a glorious sight in July and August. At the foot of a high west wall many interesting plants were to be seen. Never have I seen Cypripedium spectabile in a mass growing so luxuriantly; some strong plants were ripening seed. After flowering is past a mulching of sandy leaf-mould is applied to encourage the surface roots to produce and to keep this in a moist condition a low-growing mossy Saxifrage is allowed to grow on the soil. Gentiana verna is present in a remarkable patch planted but two years ago. Moisture, sandy leaf-mould, and partial shade are found to favour its growth here. G. acaulis fills two beds in front of a low greenhouse, and the plants were growing in the same site in the year 1878! About every sixth year the plants are lifted, and the whole of the soil removed to a depth of 18 inches. The plants are pulled into pieces and replanted. Hendhera sanguinea is treated differently here than is usual. The plants form a carpet for Rose beds, and they furnish a sheet of colour every year. In July the plants are pulled into pieces, dibbled into the soil at about 6 or 8 inches apart, and when the flowering season approaches the soil is quite covered by them. Kniphofia (Tritoma) John Benary was remarkably fine, fully 8 feet in height and a mass of glowing red, quite the best variety of this type of Kniphofias. K. Rufus was attractive, and so was the yellow-flowered variety Ruta. Tropæolum speciosum, growing at the foot of a west wall, 14 feet in height, was a remarkable sight, presenting a mass of its glowing, crimson blossoms and purple seed pods. Never have I seen this plant so effective. Galaxiaphylla, growing near to Genista racemosa on this wall, and furnished with luxuriant foliage, was very happy. Gladiolus primulinus was still flowering gloriously. Statice cyanea precox, with its pretty blue flowers 4 inches in diameter, was a dwarf but showy plant.

The crop of Apples is a remarkable one. Mr. Davison has during the last few years planted these largely for market purposes, and the trees have succeeded uncommonly well. As many as 300 trees of Lane's Prince Albert, an equal number of Ribston Pippins, and Bramley's Seedling, as well as a number of Worcester Pearmain and Allington Pippin, have been planted. The trees are planted 12 feet and 15 feet apart. Ribston Pippin was remarkably luxuriant in both growth and fruit, especially the standard trees of this variety. The more established trees from which exhibition fruits are gathered are espalier-trained specimens in the kitchen garden.

Pears on trees growing against walls were also extremely fine in quality. *W. Young Bowman.*

NOTICES OF BOOKS.

FUNGOID PESTS OF CULTIVATED PLANTS. By M. C. Cooke, M.A., LL.D., V.M.H., A.L.S. Spottiswoode & Co. 10s. 6d. net.

As a mycologist, Dr. Cooke has been known for the past half-century, and during that period has done more to advance the general study of mycology than any other man. The late Rev. M. J. Berkeley, whose articles are mainly published in these columns, may, without fear of contradiction, be styled the founder of vegetable pathology, more especially of that branch which deals with injuries caused to the higher plants by fungi. Cooke continued the study of this branch, and the book under consideration embodies his latest views on the subject. It is reprinted from the *Journal* of the Royal Horticultural Society, Vols. 27 to 29, and its primary object, which is stated to be "to interest and instruct the cultivator in the simplest and most practical manner," has most decidedly been at-

tended with success. As implied by the title, the diseases of cultivated plants only are dealt with, as the following headings show:—"Pests of Flower Garden," "Pests of Garden Vegetables," "Pests of Orchard and Fruit Garden," "Pests of Vinery and Stove," "Pests of Ornamental Shrubbery," "Pests of Forest Trees," "Pests of Field Crops." In addition, there is a chapter on "Fungicides," also a general introduction dealing with the life-history of typical forms of fungi. The student will search in vain for any reference to the many theories which from time to time have been propounded. Dr. Cooke is perhaps what many younger and less experienced mycologists would define as belonging to the old school. Respecting the subject of heteroecism, for instance, the author is somewhat pungent in his remarks, and perhaps he is quite justified; for, however interesting the subject may be from the standpoint of abstract science, it has not proved to be of any service in combating diseases. The idea, that if one of the two host-plants on which a given fungus is supposed to exist during different periods of its development were removed, the pest would of necessity be obliterated, has, unfortunately, proved to be erroneous. If a fungus usually accustomed to a change of host cannot do so, on account of the removal of one of its food plants, it simply sticks to the one remaining, and carries on its destructive career just as if nothing had happened.

The illustrations are profuse, and mostly very characteristic. There are twenty-four coloured plates and twenty-three figures in the text. The general symptoms of each disease, along with a description of the fungus causing it, are described in language that the practical man can understand. Curative and preventive measures are also given. Fortunately, Dr. Cooke's old-fashioned views led him to make but one index; that, however, is a very full one. Just to show that I am not in accordance with the author on every point, I may say that I object to the title "Fungoid Pests," on the ground that such pests are real fungi, and not something resembling fungi. The book is printed on good paper, well bound in half-calf, and is in every sense a credit to its author and to the Royal Horticultural Society, under whose auspices it has appeared. *Geo. Massee.*

PLANTES BULBEUSES, TUBERCULEUSES, ETC.

UNDER this title Mr. Raphael De Noter has compiled, and M. Charles Amat, 11, Rue Cassette, Paris, has published a treatise for the use of amateurs giving brief descriptions and cultural details of the principal bulbous plants. We think that had the author passed the now waning summer in this country he would not have spoken of the climate, at least in the south, as *brumeux et triste*. Because these epithets are sometimes correctly applied it does not follow that they always would be so. It would not be correct to describe Paris as always bright and sunny; we know by experience that it can be sometimes as *triste* in the matter of weather as London itself in November. The various genera of Amaryllids, Irids, Lilies, etc., are treated of in alphabetical sequence. The term "bulbous" is used in a very wide sense, and includes Berberids, Asclepiads, Boussingaultias, Campanulas, and various other genera which are technically not bulbous plants; but the amateur for whom the book is written will not trouble himself about inconsistencies of that sort. The cultural details are concise and appropriate, the illustrations numerous, and there is a good index. Moreover, the "etc." of the title serves to cover many things

THE ALPINE GARDEN.

BORDER PINKS AT HOPETOUN HOUSE.

AMONG the special features of the gardens at Hopetoun House, West Lothian, the residence of the Marquis of Linlithgow, is a collection of border Pinks, which includes some eighty varieties, that are cultivated in groups consisting of a number of each variety. The collection is the most complete private one in Scotland, and it is doubtful if there are many others of its size elsewhere. These deliciously fragrant flowers are great favourites with the family at Hopetoun House, and Mr. Thomas Hay, the gardener, sees that the collection embraces the best of both old and new varieties. The Pinks comprise the old self-coloured varieties, as well as those of modern introduction; while the exquisite laced flowers, the pride of the Pink fanciers of olden days, are fully represented, as are numerous varieties of more recent production. "Perpetual-flowering" Pinks are not so numerous, but this is solely because they do not succeed well at Hopetoun. The fine white variety, Her Majesty, is still appreciated for its handsome white flowers; but a greater favourite is alba fimbriata major, the larger-flowered variety of our old border Pink, alba fimbriata, whose fragrance is unexcelled among Pinks. Mention must also be made of the very choice variety Buen Retiro, with its white flowers that possess handsome rose-coloured centres; the rose-tinted Paddington, an old variety that holds its own among newer flowers of its class; and the handsome laced variety Minerva, with its pretty rose centre, is very good here. A good Pink is erecta, so named from the habit of its pleasing flowers; another is the handsome Morna, with large, white flowers and deep maroon-crimson lacing, one of the choicest of all. Then there are the prettily fringed Oriel, whose flower possesses a pleasing rose-tinted centre; the handsome Lufra, with large flowers of good colour, the centre being maroon and the lacing deep red; Old Chelsea, a flower of Mr. James Douglas' raising and among the best, with its rose centre and heavy rose-red lacing. This variety is extra fine at Hopetoun. The charming Snowdrift, one of the newer varieties, figures in my notes as "extra fine." The flowers have a flush of rose in their centres. Another especially noted was Capo di Monte, a lovely flower with a white ground and a centre and margin of rose. Harry Hooper, one of the best laced Pinks, was well represented; and the strong-growing Fairy, with its admirably shaped flowers, was also doing well. Other good kinds include Mrs. Laban, white, with a pink centre; Rainbow, a rose-laced flower, with a centre of deeper rose colour; Mrs. Waite, Rubens, Mrs. Fred Hooper, Mrs. Maitland, Bojard, the charming Argus, Gem, white, with rose centre and lacing; Arthur Brown, Captain Hunter, a grand variety with large, well-formed flowers having a deep red and margin; John Ball, still a favourite with all who appreciate the best laced Pinks; the pretty Mrs. Waite, with lacing of a medium width; Reliance, Zurich, a good, white flower with a crimson centre; the exquisite Amy, with its fine maroon centre and a lovely lacing of the same colour; Beauty, a large flower of fine form and with a centre of rosy-crimson; Evelyn, Godfrey, and a large number of others. I also noticed a grand breadth of that unsurpassed Mule Pink, Napoleon III.—the fine plants seen would raise the envy of many growers; another Mule Pink, which is usually known as Dianthus multiflorus hybridus; and a lot of the new hybrid Dianthus Mrs. Dixon were flourishing. These Pinks are mainly grown in broad borders in the vegetable garden, and the plants are in excellent health. As an old lover of the Pink, I was delighted to see so many varieties and such excellent culture. *S. Arnott.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MOUNT HARRY, BRIGHTON.

THE collection of R. G. Fletcher, Esq., at Withdean (gr. Mr. Garnett), contains a very large number of Odontoglossums, some of which are always in flower. The month of May is the show season of the Odontoglossum, and this year in May it is said that over three thousand Odontoglossums, principally O. crispum, bloomed at Mount Harry. As in most other collections, the chief object is to obtain handsomely blotched forms, and in this particular some success has been obtained. At the present time but few forms of O. crispum are in bloom, but in one of the houses there is a show of O. Hunnewellianum and O. Adrianæ in flower and bud. In one house there is a very fine batch of Odontoglossum Pescatorei, which flowers here very freely. Over five hundred plants of the batch are said to have flowered, and only one, O. excellens, has as yet appeared.

At the end of one of the houses a group of Orchids was blooming at the time of my visit, including Sobralia Veitchii, Vanda cœrulea, Odontoglossum Hallii, O. triumphans, O. Wallisii, O. luteo-purpureum, Oncidium macranthum, and other showy species. In the warm house, with Allamanda on the roof, the plants of Dendrobium Phalænopsis were in bloom, and in the Cattleya-house were Sobralia xantholeuca, S. macrantha Kienastiana, Cattleya intermedia, and its white variety; Lælio-Cattleya Nysa, and some other hybrids and a good lot of Cattleya Trianæi and C. Schroderæ in sheath.

The central stage of the next warm house had some enormous plants of Eucharis grandiflora in tubs, the old flower-stems showing what a fine crop of flowers they had produced. The side staging contained a good selection of Cypripediums, C. Stonei and some of the C. Leeanum varieties being very large plants; one specimen of C. niveum having three spikes a foot in height and bearing two flowers on each. The Phalænopsis also thrive well.

CATTLEYA × DAVISH (velutina × Hardyana).

This pretty companion to C. Maroni (C. velutina × C. Dowiana aurea) is flowering in the collection of J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). The flowers are similar in size and shape to those of C. Maroni, and are borne on two-leafed pseudo-bulbs. The sepals and broader petals are of Indian yellow colour, delicately veined and slightly tinged with purple, some purple spots also showing towards the wavy edges of the petals. The side lobes of the lip, which fold over the column are short, yellowish, and are streaked and margined with rose-purple. The disc of the lip is orange-coloured, with lighter yellow lines, and the broadly-expanded and nearly circular front lobe of light rose-purple, finely veined with ruby-purple and with a pale orange tinge at the apex. *J. O'B.*

CYPRIPEDIUM × LAWRENCEANO-NIOBE.

A very worthy addition to the crosses in which C. Fairrieanum has been used, and in which the features of C. Spicerianum and C. Fairrieanum derived from C. Niobe, effectively combine with the colours and more massive form of C. Lawrenceanum. The upper sepal, which partakes most of C. Spicerianum, is pure white, with a dark purple band up the middle and shorter feathered rose-purple lines on each side. The base is of pale green colour, with short, emerald-green lines ascending into the purple ones. The ciliate petals are extended, pale green, tinged with rose on the outer halves and spotted with chocolate-coloured dots on the inner. The lip is greenish behind, and dull purplish-rose on the face and sides. The staminode is rose coloured, with a central red and green spot. The plant has flowered with Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins).

THE ROCK GARDEN AT LILFORD HALL.

THE accompanying picture (fig. 94) of three interesting and beautiful hardy plants in full flower in Lilford Hall Gardens, Northamptonshire, the residence of Lady Lilford, is calculated to impress the reader far more than words would do. It is an object-lesson indicating the positions in the rockery in which these plants will succeed.

Androsace lanuginosa is a native of the Himalaya, and without doubt the most valuable garden plant of the genus. The stems, which are frequently red-coloured, are of trailing habit, and are freely furnished with inch-long, ovate, acuminate leaves that are heavily clothed with soft, silky hairs. A large number of the prostrate stems issue from the base of the plant about the root stock, and after a stem has reached a few inches in length it produces a roundish, clustered head of blossoms toned to a delicate shade of pink, and having a rather conspicuous yellow eye. Presently, a new growth appears from near the old flowering stem, and this in turn furnishes a further cluster of blossoms, and this secondary flowering is continued for many weeks in succession. Disliking manure and rich soils generally, the plant is perfectly at home in a very sandy compost, loam or peat, and is benefited by the presence of old mortar rubble. No more beautiful plant for clothing old walls or rocky slopes could be chosen, and if provided with a deep rooting-medium and perfect means of drainage, the plant will give but little trouble. The flowering period is from May, or early in June, until October. Cuttings of unflowered shoots, made about 1 inch in length, will easily make roots at any time from August to October, and they always root freest under a hand-light. Dibble the cuttings into an inch-deep bed of sand. The group of plants shown in the illustration had been planted by Mr. Edward Wilson, the head gardener, only 14 months when the photograph was obtained.

The Ramondias and Cypripedium afford a pretty picture of floral companionship. In the illustration we see a rocky face studded with two very beautiful Ramondias—R. pyrenaica alba and R. serbica, the latter with mauve-lilac flowers. Below, in the front of the picture, is a group of Cypripedium spectabile growing in a moist peat-bed. The Ramondias press closely to the rock, and from beneath the rugged or blistered leafage appear the flowering stems a few inches only in height. Usually three flowers are produced on a single stem, occasionally more. Very sandy soil or peat and light loam in a mixture, with entire shade from hot sunshine, constitute the chief requirements of these Ramondias.

Cypripedium spectabile under cultivation assumes its greatest vigour when the points of its yellowish root fibres are in a position to touch moisture constantly. This condition, and a foot-deep bed of peat, leaf soil and loam will suit it admirably. The plant is not adverse to manure, and overhead shade is very desirable. The best planting season is from October to December.

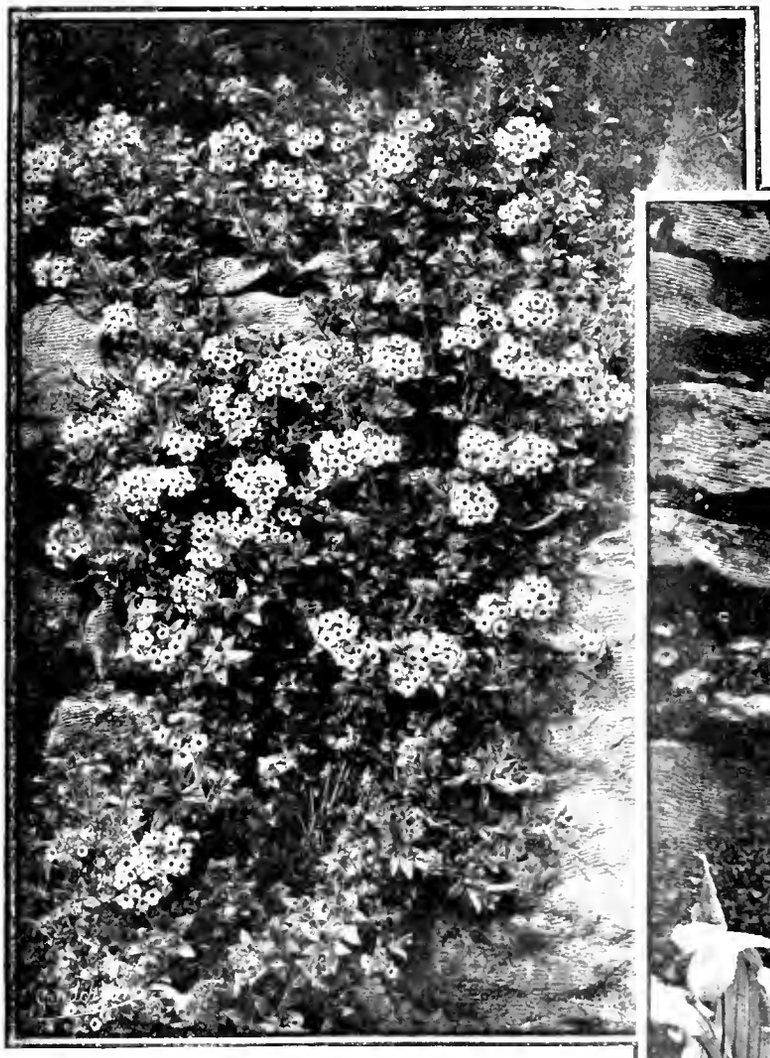

FIG. 94.—ANDROSACE LANUGINOSA IN LILFORD HALL GARDENS, OUNDLE.

RAMONDIAS AND CYPRIPEDIUM SPECTABILE IN LILFORD HALL GARDENS, OUNDLE.

MODERN BOTANY.

(Concluded from page 217)

"We now approach another aspect of the question. Much has been said on the value of anatomical characters in classification, and it is pretty generally conceded that they ought to be taken into consideration, though, like the other characters, they are beset with their own special difficulties. As Dr. Scott[1] who has always urged their importance says: 'Our knowledge of the comparative anatomy of plants, from this point of view, is still very backward, and it is quite possible that the introduction of such characters into the ordinary work of the herbarium may be premature; certainly it must be conducted with the greatest judgment and caution. We have not yet got our data, but every encouragement should be given to the collection of such data, so that our classification in the future may rest on the broad foundation of a comparison of the entire structure of plants.' This passage was written 12 years ago, and we are still awaiting its realisation.

"It is perfectly true that in the case of recent proposal to found a new natural [illegible] of flowering plants anatomical characters [illegible] consideration; still, on the whole, we [illegible] content to rely on the traditional [illegible] that have been transmitted from [illegible] old taxonomists. So much material [illegible] pass-

[1] D. H. Scott, Presidential Address [illegible] 1900.

ing under the hands of our systematists that they cannot devote the time for the elaboration of a fresh method. In particular there are the new things which require docketing and provisional description. Circumstances, as ever, place obstacles in our way and tend to make us unprogressive.

"Now it seems to be of the first importance that reform should come from within; that those problems, which are systematists' problems, should be solved by taxonomic specialists.

"I am sanguine enough to believe that much might be done by a redistribution of duties, especially if this were accompanied by the fusion of the great herbaria, to which reference has already been made. But the greatest hope, I think, must lie in the possibility of some form of alliance or understanding between the authorities responsible for the administration of the herbaria on the one hand and the local university on the other. For directly you give the keepers or assistants in the former a status in the latter, you place at the disposal of the systematists a considerable supply of recruits in the form of advanced students possessing the requisite training to carry out investigations under direction. And if this be true of the herbaria, it holds equally in all the branches of knowledge represented in the National Museum. Really, I fancy our Museum is rather anomalous in its isolation. I am confident that any understanding or arrangement that might be reached would be attended with great reciprocal advantage. Nor am I speaking without some data before me. The movement towards a closer relation between the museum and the university has already entered the experimental stage. For on several occasions during the last few years members of the Museum staff, from more than one department, have given courses of lectures in connection with the university schemes of advanced study. From all I hear, the experiment may be regarded as distinctly encouraging.

"Before leaving this subject it may be appropriate to recall that the English edition of Solereder's great work on 'Systematic Plant-anatomy' is rapidly approaching completion, and should be available very shortly. Its appearance cannot fail once more to arouse discussion as to the importance of anatomical characters. I hope the result produced may reward the devotion and labour with which Mr. L. A. Boodle and Dr. Fritsch have carried out their task.

"In another and even more fundamental branch of systematic work the future seems to be full of promise. We are beginning to recognise that a vast number of the species of the systematist have no correspondence with the real units of nature, but are to be regarded rather as subjective groups of plexuses composed of closely similar units which possess a wide range of overlapping variability. That such might be the case was apparent to Linnæus, but the proof depends on the application of precise methods of analysis.

"In the year 1870 our great taxonomist Bentham happened to meet Nageli at Munich, and, as we find recorded in Mr. Daydon Jackson's interesting life, 'had half an hour's conversation with him on his views that in systematic botany it is better to spend years in studying thoroughly two or three species, and thus really to contribute essentially to the science, than to review generally floras and groups of species.' Bentham does not appear to have been convinced, for his comment runs: 'He is otherwise, evidently, a man of great ability and zeal, and a constant and hard worker.' At the time of this interview Bentham was seventy years old, Nageli being about 9 years his junior. The views of the latter are now bearing fruit, as we see in the important results already obtained by De Vries and others who are following the methods of experimental cultivation with so much success.

"The supposed slowness of change has been a difficulty to many. This was one of the 'bars' left by Darwin in the way, and it has driven back many a 'Timorous' and 'Mistrust.' Now, as we are gradually perceiving, it is only a channel hon after all; a thing to avoid and pass by. The detection of the origin of species and varieties by sudden mutation opens out new vistas to the systematist, and along these he will open his way. It will take many years of arduous work this re-investigation of the species question. The collections of our herbaria form the provisional sorting-out from which we must start afresh. In the long run it may be that our present collections will prove obsolete, but that will not deter us. The scrap-heap is the sign and measure of all progress.

"The Garden thus becomes an instrument of supreme importance in conjunction with the herbarium, and that is another reason for the transfer of South Kensington to Kew. The resources of the latter could then be directed more fully than ever to the advancement of scientific botany, and the Gardens will be revealed in a new light: for the operations and results of experimental inquiries would form a new feature, very acceptable to the specialist and public alike. And, as I am on the subject, it may not be out of place to remark that we all look forward eagerly to the time when the multifarious activities of Kew will permit the development of other features of which traces are already discernible. The arrangement of the living collections is at present based largely on horticultural convenience, geographic origin and systematic affinity, happily subordinated to an artistic or decorative treatment. In time we shall go further than that and attempt in some degree to reflect current botanical ideas in the grouping of our plants. Let me illustrate my meaning by a good example. The Succulent House is generally conceded to form one of the most interesting and stimulating exhibits to be seen at Kew—not merely from the weird and grotesque forms assumed by the individual plants, but chiefly because here you have assembled together plants of the most varied affinity having the common bond of similar adaptation to a like type of environment. The principles that underlie the arrangement of the best sort of museum may be applied with advantage in the case of a garden, and with tenfold effect; for is not a live dandelion better than a dead Welwitschia? This feature, introduced as it would be with moderation and discretion, would immensely enhance the value of the Gardens both to the student and general visitor.

"But to return from this digression: on the whole the time seems ripe for the new departure. Fresh lines are opening up in systematic botany that call for special provision. Now it was evident from the circumstances of the botanical renaissance twenty-five years ago that when it acquired strength, some re-adjustment between the old and the new would have to be made. The thing was inevitable. The administrative acts of recent years all point in the same direction. The founding of the Jodrell Laboratory, the enhanced efficiency of the Gardens, the great extension of the Herbarium building, all help to pave the way. But more is wanted. Reference has been made to the advantages that would attend the migration from the Natural History Museum. But it is most important of all to devise a mechanism for securing a flow of recruits to carry on the work. This would follow in the wake of a rapprochement with the schools on the lines already sketched out. Difficulties, no doubt, will be encountered in the initial stages of a re-organisation, but these are inseparable from our bureaucratic system. A very hopeful sign is the readiness which the Government has shown in instituting inquiries in the past. That nothing has come of them may be attributed primarily to the attitude of botanists themselves. If they can unite on any common policy, there should be no serious delay in giving it effect."

FOREIGN CORRESPONDENCE.

IRIS TECTORUM.

In addition to Dr. Stansfield's remarks (see p 216) I may state that the plant is perfectly hardy and requires no protection at all. Even the rainy season will do it no harm. As its name implies, the plant grows in Japan on the straw-thatched roofs of the Japanese peasant-houses, and is exposed to all weathers. A mulch applied to the roots in summer is more beneficial than any other form of protection. It comes quite true from seed; among 100 seedlings not one failing. *Max Leichtlin*

The Week's Work.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Brussels Sprouts.—The plants will require to be looked over from time to time for the purpose of removing decaying leaves, for if this is not seen to much damage will be done to the Sprouts through contact with the decaying matter. This vegetable promises well this season. Dwarf Gem is again by far the best variety.

The Storing of Roots.—From now onwards the storing of many kinds of roots will demand attention. Beetroot may not be safely exposed to more than a few degrees of frost. Proper storage room should be provided in all gardens in the form of an underground pit or cellar, but in most gardens nothing of the kind exists, and gardeners are often pushed to know what to do with the crop. When the roots are stored in a root-house, the soil that is placed between the layers of roots should not be allowed to become so dry that the roots will shrivel, nor yet so wet that they would be liable to rot. Decay in these vegetables usually begins at the crown, therefore place the roots in neat layers with the crowns pointing outwards, in the form of a potato clamp, using a thin layer of soil between each layer. Any number of layers may be placed on the top of each other without suffering damage; the crowns will dry, and any decaying matter can easily be detected and the matter put right. Beetroot is best prepared by having the tops broken off, but not too closely to the crown—and at the same time being careful that the rootlets are preserved intact, for "bleeding" is very detrimental to the qualities of this vegetable. Carrots may be stored much in the same way, but Parsnips are better if left in the ground for some time to come, and supplies obtained from the open ground. This, however, is not practicable in time of severe frost, and when such a period is expected, it will be necessary to dig up a quantity of roots and store them. It may, however, be considered preferable to apply a thick covering of litter over the crop to prevent the frost getting into the ground.

Rhubarb.—Early frosts will soon cause the plants to lose their latest growths, and when this has taken place it will be safe to lift the roots which will be forced first, in order to give them a complete rest before they are required for that purpose, in which case they will then respond the quicker to the influence of heat. Seakale roots should be treated similarly before they are subjected to forcing.

Endive.—The blanching of this very useful salad will now require almost daily attention, for when the leaves become harder they will not blanch so readily. There is nothing worse than half-blanched salads of this description, and a greater quantity should therefore be taken in hand now than was necessary earlier in the season, when blanching could be accomplished more quickly. Use inverted flower pots—or straw bands tied round the plants—or any device that is found to be most useful. Lift the plants that are expected to yield a later supply and plant them in frames. A well-arranged succession of these batches will meet all demands. Remove decaying foliage from growing plants as soon as any can be detected.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

The Storing of Fruit.—Carefully attend to the storing of fruits as they become ready for gathering. They are now ripening in quick succession, and unless great care is exercised, some of them may be handled roughly owing to the pressure of work. In the case of Apples and Pears, keep the dessert and culinary varieties distinct. Trays are useful for small lots, and one variety only should be placed in a tray. A label with the name of the fruit and the date on which it was gathered should be placed to each variety. In storing them, it will be convenient if those now coming into use are placed in positions where they will be easy of access. The latest ripening varieties can be put on the top and bottom stages. Do not stock any speckled, or bruised fruits, or any that are very small. Soft Pears require to be placed on wood wool, which should be laid thinly over the stages. Each fruit should be lifted out of the basket by the hand and placed carefully in

position. I am speaking of selected fruits that will be used eventually for dessert. None but selected fruits should be given a place in the premier fruit room, and on no account should any other matter than fruit be stored in this room, which should be kept scrupulously clean, including the windows. Do not gather all the fruits from one tree at the same time, because some will continue to ripen after a few have been removed, and the particular variety will be available for use over a longer period. The dropping of fruits is not always an indication that they are ripe. Open these first and it will probably be found they are diseased. Fruits intended to be kept long should not be gathered until they are perfectly ripe. The later sorts of Apples and Pears will continue to increase in size yet for several weeks to come.

Orchard Trees.—Very fine fruit is generally obtained from the tops of large standard trees; they are not so large as usual this season owing to the drought, but the late varieties are swelling well. Any that are being gathered now should be selected, and for convenience of storing may be placed in tubs or boxes and stored in any dry place. Small, badly-formed fruits should be disposed of in some other way. Small-fruited and worthless varieties should be discarded, the roots grubbed up, and good varieties substituted. Or the old trees may be re-grafted. Be careful to select varieties that succeed best in the district. Newton Wonder is a large and solid Apple that should be given extended cultivation, being good in colour, and capable of keeping in excellent condition for a long period. The tree is a good grower and very prolific. Royal Jubilee is another fine Apple in season from November till March. Dumelow's Seedling (Wellington) is yet one of the very best, and is, moreover, a great bearer and second to none for culinary purposes from December to April. Annie Elizabeth is also a great bearer, and will keep in good condition till May. King Edward VII. seems likely to be a prolific variety, as it is bearing fruits on quite small trees.

The Lifting and Root Pruning of Fruit Trees.—Proceed with these operations as opportunities occur. The earlier they are accomplished the better chance will the trees be given to make fibrous roots quickly.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Dendrobiums.—Growers who have recently obtained imported plants of Dendrobium Bartoisianum, D. Bronckartianum, and D. tonkinense, which are supposed to be new species, should place them in pots just large enough to accommodate them for one season. Let such pots be nearly filled with broken crocks, and each plant be made quite firm by tying a few of the pseudo-bulbs to neat stakes. Place the plants in a cool, shady part of the Cattleya-house. Slightly spray them overhead occasionally, and let water be poured through the crocks every day to keep them moist, and so induce the plants to make roots. When the young growths and roots have started well the plants will require potting in the ordinary manner, placing them afterwards in the warmest house until they have completed their growth. The pseudo-bulbs of the first-named species resemble in some respects those of the rare D. signatum; those of D. Bronckartianum are like those of D. thyrsiflorum but darker in colour, the leaves being thicker and more leathery, while the general appearance of D. tonkinense is somewhat similar to D. revolutum, and it is probably a species of botanical interest only.

In the Cattleya-house, plants of Laelia elegans that have just passed out of flower should be repotted if necessary; the new roots which are emitted from the base of the flowering growth will at once enter the new compost, and the plant quickly become re-established. The pseudo-bulbs of this plant are more apt to decay from the presence of an excess of moisture at the root than others of the same genus. Plants of L. purpurata may also be repotted and old plants that require to be broken up may be thus treated. Plants of this species are sometimes seen in a poor condition. One of the principal causes of this is keeping them too long in a pot-bound condition. Previous to repotting each plant, be careful to remove as much of the old soil as is possible without disturbing the roots, cut away all leafless pseudo-bulbs and dead roots. Avoid overpotting, but let the pots be just large enough to allow for two seasons' growth. The two Lælias and their varieties will root thoroughly well in equal parts of fibrous peat and sphagnum-moss, with plenty of small, broken crocks mixed in the compost, to provide perfect drainage.

Plants of Lælia pumila and its varieties that have been in the cool house all the summer are now showing their flower buds in the young growths, and should at once be removed to a light position in the intermediate house, affording them liberal waterings until the flowers are faded and growth is completed. If white scale insects appear, these must be diligently eradicated or the plants will quickly deteriorate. The thin-bulbed Lælia harpophylla has started well into growth, and should be removed forthwith to the intermediate house.

In the cool house plants of Sophronitis grandiflora, also its varieties rosea and Rossiteriana that are growing freely, should be elevated well up to the roof glass at the warmest end of the house and shielded from cold. Afford them plenty of water at the roots all through the growing season.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

The Cooler Weather.—The re-arrangement of the plants in the houses will now require attention, the cooler weather necessitating the removal of all stove plants at present in other houses to their winter quarters. Such plants when returned to the warmer atmosphere should not be unduly excited into root action at this period by applying an excess of water. Any plants which have become unsightly should be discarded and young plants raised in their stead.

Hippeastrums.—Gradually withhold water from plants which have flowered, until, when the bulbs have matured, they may be stored away in pits where the atmospheric temperature is not lower than 48°. Keep in a growing condition any young plants which have been raised from seed, exposing them to full light and sunshine and keeping the foliage free from thrips by frequent light fumigations.

Herbaceous Calceolarias in small pots should be potted on directly the roots touch the sides of the pots, so that they may not experience any check. It is important that these plants should continue to grow steadily at all times, as insect pests are always ready to attack those that fall into a stunted condition.

Anthuriums which bloomed early in the season should be kept somewhat drier at the roots, and if placed at the cooler end of the stove or in an intermediate house to rest, they will be found to succeed much better, and flower with greater freedom, than if kept in a hot atmosphere all the year round.

Alocasias and Marantas now require less water at the roots. The foliage, when kept in a drier atmosphere, is liable to become infested with thrips and red spider, and should therefore be sponged occasionally during the winter months.

General Remarks.—Take advantage of fine days to get under cover the materials that will be required for potting purposes. Thoroughly decayed leaf-mould is one of the most important soil ingredients for the successful cultivation of most pot plants. The growth of the plants and the production of root fibres are more accelerated by leaf-mould than by any other substance. A space should be selected for the heaps, where they may be turned over occasionally to prevent excessive heating or fermentation. Let the manurial qualities of the leaves be preserved as much as possible by ensuring the gradual decomposition which will tend to prevent the presence of fungous growths.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Early Peach Houses.—The present is a suitable time for lifting or root-pruning any of the trees that require attention at their roots. Trees that have carried yellow, sickly-looking foliage will be much benefited by being lifted and root-pruned. All thick, deeply plunging roots should be cut away, and some sweet turfy-loam, lime scraps, a few wood-ashes, and a sprinkling of bone meal, if the loam is of poor texture, be incorporated in the soil about the remaining roots. If it is intended to replant, the best trees for the purpose are those that have been grown in succession houses. It is important that good drainage should always be provided and the depth of the soil should be about 2½ feet, the first layer to be freshly cut turves placed grass side downwards over the drainage, for these will prevent the finer soil from running into and choking the drainage.

Planting Young Trees.—It is better to plant in a rather poor compost than in one too rich, for young trees have a tendency to make gross growths during the first year or two after planting. The trees can always be mulched and otherwise fed when the fruits are swelling. Planting should be done with great care. Keep the roots near to the surface of the borders and cut away any bruised or broken roots, leaving all cut surfaces smooth and clean. Make the soil firm as the work proceeds, give each tree a good soaking of water to settle the compost about their roots, and syringe them twice daily. Afford temporary shade if necessary. Large trees that are in a bad condition may be attended to now. The better plan will be to prune one half of their root system this year and the other half next season, for this will prevent them receiving too severe a check. When the roots have been disturbed the work of replanting should be pushed on without delay, for if the roots are kept out of the soil for some time they become dry, and then they do not take hold of the new soil readily. Commence opening the ground at a distance of quite 3 feet from the stem of the tree, taking out a trench a spade wide down to the drainage and placing all the roots nearer to the surface when the trench is refilled. As soon as the work is completed the roof-lights should be replaced, but the maximum amount of ventilation should still be given. Cut out any crowded or weak growths and regulate the branches so as to leave a space of 5 or 6 inches between the shoots. Keep the borders in a moderate state of moisture, for this will largely prevent bud-dropping later.

New Peaches.—The variety Duke of York is a welcome addition for planting in the early house, as it ripens as soon as Alexander. The fruits are of fair size with highly coloured skins, and possess a better flavour than that of Alexander. Peregrine is a mid-season variety with large, well-coloured fruits that are of a rich flavour. This excellent variety is a suitable Peach for exhibition purposes.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Hardy Flower Borders.—In the preparation and re-arrangement of these borders, which is appropriate work for the present time, bear in mind the suggestion put forward last week, that in gardens where there are numerous borders of mixed herbaceous plants it is advisable to make each as unlike the other as possible. Nothing is more disappointing than to inspect a garden whose borders, though bright and gay, have nothing distinctive about them, being merely duplications of each other. If in a certain mixed border Hollyhocks, Kniphofias, Aconitums, Montbretias, Phlox, Dahlias, Sweet Peas, &c., are used, these plants should be made a feature of this particular border and not be repeated indiscriminately in all the others. By these means the interest in the different borders may be maintained throughout the garden. In order to obtain this dissimilarity in the borders it is a good plan to devote some of them to particular colours. A border which is so situated that it is not exposed to strong light might be made very attractive by being devoted entirely to plants bearing flowers of different shades of yellow. By making a careful selection of plants it could be made effective throughout the year, or if desired might be made particularly attractive for certain months only. Such perennials as Helianthus, Heliopsis scabra major, Achillea Eupatorium, Centaurea ruthenica, C. macrocephala, Rudbeckia "Golden Glow," and Inula would be suitable for planting at the back of the border, with yellow Sweet Peas and Dahlias interspersed. For the centre and front of the border the following plants might be used: Yellow Kniphofias, Montbretia (including varieties like Excelsior, Koh-i-Noor, Messidor, Geo. Davison, Roy d'Or, Golden Sheaf, and Solfaterre), Hypericum Moserianum, Asclepias tuberosa, Aster Linosyris, Chrysanthemum Horace Martin, Chrysogonum virginicum, Gaillardias (John Harkness and Canary), Senecio clivorum, S. tanguticus, Rudbeckia speciosa, Alströmeria, and many other earlier yellow-flowering plants that will readily occur to the reader. Spaces should be left for planting and sowing in the spring choose half-hardy annual yellow-flowering plants that are suitable for such a border.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for examination, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be published, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any communications or translations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

APPOINTMENTS FOR OCTOBER.

TUESDAY	Oct. 2	Nat. Amateur Gardeners' Assoc. meets.
WEDNESDAY	Oct. 3	Nat. Chrys. Soc. Exhib. at Crystal Palace (2 days).
SATURDAY	Oct. 6	Soc. Franç. d'Hort. de Londres meets.
		German Gard. Soc. meets.
MONDAY	Oct. 8	United Hort. Ben. & Prov. Soc. Com. meets.
TUESDAY	Oct. 9	Royal Hort. Soc. Com. meet.
THURSDAY	Oct. 11	Manchester & N. of England Orchid Soc. meets.
SATURDAY	Oct. 13	Dutch Gardeners' Soc. meets.
MONDAY	Oct. 15	Nat. Chrys. Soc. Com. meets 3 p.m.
TUESDAY	Oct. 16	R.H.S. Show of British Grown Fruits at Westminster (2 days).
WEDNESDAY	Oct. 17	Royal Bot. Soc. Show, Regent's Park.
SATURDAY	Oct. 20	German Gardeners' Soc. meets.
TUESDAY	Oct. 23	Royal Hort. Soc. Com. meet.
WEDNESDAY	Oct. 24	Royal Hort. Soc. of Ireland's Great Fruit & Chrys. Show in Ball's Bridge, Dublin (2 days).
THURSDAY	Oct. 25	Manchester & N. of England Orchid Soc. meets.
SATURDAY	Oct. 27	Dutch Gardeners' Soc. meets.
MONDAY	Oct. 29	Nat. Chrys. Soc. Com. meets at Essex Hall, 3 p.m.
WEDNESDAY	Oct. 31	Kent County Chrys. Soc. Annual Exhib. (2 days).

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—55.9°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, September* 26 (6 P.M.): Max. 62° Min. 42°

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September* 27 (10 A.M.): Bar., 35; Temp., 61°; *Outlook*—Fine.

PROVINCES.—*Wednesday, September* 26 (6 P.M.): Max 65° Bedford, Min 52° East Coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY—
Sale of Dutch Bulbs at Stevens' Rooms, King Street, Covent Garden, at 12.30.

MONDAY to FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY—
Sale of Greenhouse and other plants at Mill Lane Nursery, Cheshunt, by order of Mr. F. Rochford, by Protheroe & Morris, at 11.

WEDNESDAY—
The whole of the Greenhouse Plants, &c., at 213, Clapham Park Road, S.W., by order of Mr. T. D. Shuttleworth, by Protheroe & Morris, at 12.

Sale of Dutch Bulbs, Palms, Bay Laurels, &c., at Stevens' Rooms, at 12.30.

Standard and other Bays, Roman Hyacinths, Palm Seeds, &c., 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY AND FRIDAY—
Sale of Surplus Nursery Stock at Warren Nursery, High Road, Upper Tooting, by Protheroe & Morris, at 12.

FRIDAY—
Brazilian and other Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Sports. The word "sports" is, unfortunately, used by gardeners in more than one sense. Sometimes it is employed to denote variations in seedling plants, such variations being often due to cross-fertilisation in various degrees. At other times it is made use of to indicate those bud-variations which occur suddenly, and often without obvious cause. At present great attention is being bestowed on these sudden appearances, because they have been employed by De Vries as the basis of his theory of "mutation." According to him, in certain plants, at certain times, there is a period of "mutation," or instability, when sports are thrown off, and these sports or mutations are stated to have the characteristics of species, that is to say, they remain constant so long as the conditions of life are not materially changed, and they reproduce their peculiarities from seed. The evidence adduced by Professor De Vries and his followers, as far as it goes, is doubtless unassailable, and the Dutch naturalist's experiments must, of course, be accepted with all the respect that is due to the scientific position of the experimenter. But with the greatest deference to so keen and industrious an investigator, it may be alleged that much more extended and varied proof is required before cultivators can accept the inferences drawn from his observations. It is easy to understand that those people who were wont to call for "missing links" will now feel that there is no necessity, if the theory be true, for the existence of any such intermediate stages, and one source of difficulty is thereby removed. A "species" can, according to the new view, be produced suddenly and completely without any slow and gradual evolution or transition from one form into another. The question then arises, are these new forms such as systematists in general would adjudge to be of specific rank? Nature, said Linnæus, makes no leaps. Leaps are frequent and well defined, say the adherents of the new school. Among the orders of fossil plants there are wide gaps still unbridged, though much has been done of late years to fill up these voids, as, to cite one instance, by the discovery of missing links among Cycads and in Ginkgo in the shape of spermatozoids like those of the higher cryptogams. But, if the theory of mutation is to be generally accepted, there will be no need for the discovery of any such missing links, as the new species will be produced by mutation from the old one complete in all respects, as Minerva is fabled to have been when she sprang from the brain of Jove.

Before these views can be unreservedly accepted by gardeners and plant-breeders they must, we think, have a much larger body of evidence; we must know how and why mutation is set up; why it occurs occasionally and at particular times, and not at others; why certain species like the Œnothera Lamarckiana are particularly subject to it in some places and not in others; whilst, so far as we know at present, the majority of plants never show the phenomena at all. The experience of cultivators, whilst showing the occasional appearance of sports, yet on the whole goes to prove that the occurrence of these phenomena is relatively rare, and that when they do occur they do not remain constant, but very frequently revert to the normal condition. Weeping Ashes produce upright branches, pyramidal Poplars occasionally form spreading branches, curled-leaved Willows not infrequently form flat leaves of the ordinary character, cut-leaved Alders and Beeches very frequently revert to the "entire" form. Variations of this kind originate as sports, and are perpetuated by grafting or some equivalent process and not, as a rule, by seed. Peloriate Antirrhinums, on the other hand, are reproduced from seed, and will continue to be so long as they are watched over by the raisers. Left to themselves, they would probably, in the course of a generation or two, revert to the normal form.

As to the causation of these sports, it is still mysterious, though it is now well known that they are occasionally produced as a consequence of injury from wounds or parasitic intruders of vegetable or animal nature. In most cases, however, the consequences of such mutilations are of a pathological nature only. When one sees an Abies amabilis distorted by gouty swellings due to a coccus or allied insect, or when one meets with a fasciated stem, or malformed and distorted leaves, as one so often does in pollarded trees or old stumps, one recognises that they are either malformations or pathological conditions of no direct genetic significance, indeed, about as likely to form a "new species" as a man with a wooden leg is likely to produce offspring with a leg of a like character.

The trend of modern botanical science, nevertheless, is, as we have said, to assign a greater genetic value to "sports" than the all but universal experience of cultivators would accord to them. For instance, M. Blaringhem, in a recent number of the *Comptes Rendus* (July 23rd, 1906), after citing various instances wherein malformations have been produced in plants as a result of mutilations, as is generally admitted, goes a step further in stating that some of these forms may be perpetuated by hereditary descent in the same manner as the characteristics which constitute species. The instance he assigns is a variety of Maize, which in the north of France ripens its seeds at the end of August instead of at the end of October. This new variety—elementary species he calls it—originated as the result of cutting the main stem level with the ground just as the male flowers were about to appear. New shoots were at once produced from the base of the stock, and these shoots ultimately produced various malformed flowers, from one of which he ultimately obtained the early ripening variety before mentioned. Assuming the correctness of M. Blaringhem's observations (and there is no reason to do otherwise), we are confronted with the question—Was this new "form" a "species" that systematists in general would recognise as such? Or was it what they would call a variety only? Propagators well know that they often get different forms according as they propagate from the base of the stem or from a particular branch, but it would not occur to them to call the new form a new species. Even the most enthusiastic Chrysanthemum grower, who gets such varied results according to the particular bud he "takes" or selects, would hesitate to say that he had been instrumental in forming a new "species."

The whole thing seems to hinge upon the question whether these new forms can be and are perpetuated by inheritance, and that not for one or two generations but in perpetuity, and without the protecting care of the cultivator. If they can, then we must give them specific rank, and a separate name. If, after a longer or shorter interval, they revert, or when the protection and care of the cultivator are terminated, they die out, then of course they cannot rank as a species.

OUR SUPPLEMENTARY ILLUSTRATION depicts the beautiful Rose Gottfried Keller, for which Messrs PAUL & SON, Cheshunt, obtained an award of merit at the meeting of the Royal Horticultural Society on August 14. The flower's greatest charm, perhaps, is the beautiful tinting of its petals, the colour being a soft rose-pink which becomes lost in the base of the petals in coppery shades of yellow. The flower is semi-double and partakes largely of the shape of the Austrian Briar, which was one o

its parents, the other being a Tea-scented variety. The flowers are freely produced and the plant has the desirable quality of flowering late into the autumn. The variety was distributed by the late M. FRÖBEL of Zurich, a notice of whose death was published in our last issue. At the autumn show of the National Rose Society, on the 19th inst., two new Roses of merit were staged. One of these, named Dorothy Page Roberts, possessed tints somewhat similar to those of Gottfried Keller, and we should not be surprised if a similar cross had been effected to produce this flower. It was, however, a flower with many more petals than the one we now illustrate, but the older flowers displayed an open centre that reminded one of the Austrian Briar type.

D'OMBRAIN MEMORIAL.—It is proposed to provide—as a memorial to the late incumbent—an organ and choir stalls in the church at Westwell, of which Mr. D'OMBRAIN was vicar for 37 years. Subscriptions may be sent to the Rev. H. BOYS ROBERTS, Westwell, Ashford, Kent.

PRESENTATION TO MR. G. WYTHES, V.M.H.—On the 22nd inst., the garden staff at Syon House Gardens presented Mr. and Mrs. WYTHES with a richly engraved, antique, silver biscuit box and stand, with an expression of their regret at Mr. WYTHES' departure from Syon, and their best wishes for the future. Mr. TUBB, the senior foreman, made the presentation on behalf of the staff. Mr. WYTHES, in returning thanks, said he should not forget their kindness, nor the good work they had done during the time he had been at Syon.

SOUTH-EASTERN AGRICULTURAL COLLEGE.—The next session of the South-Eastern Agricultural College, Wye, for which 105 students have entered, will commence on October 1. The inaugural address will be delivered by Dr. H. E. ARMSTRONG, F.R.S., on October 2, at 8 p.m. A conference of Fruit growers will be held at the College on October 22, when there will be discussions on Methods of Planting, Fungus diseases, Insect attacks, and Strawberry culture. Those wishing to attend the Conference should send their names to the Principal of the College.

THE PYRAMIDAL HORN BEAM.—In the Solferino Garden at Rouen is a noble specimen of this tree. It is presumably about 40 feet in height, densely branched, the branches ascending and thickly clad with deep green shining foliage. It thus forms a gigantic bush rather than a tree, the general form being that of a globose Arbor Vitæ, and the appearance is very striking.

THE LATE MR. A. J. JORDAN.—The death is announced in the *Agricultural News* (Barbados) of Mr. A. J. JORDAN, Curator of the Government House Gardens. Deceased left the Royal Gardens, Kew, in 1899, to take charge of the botanic station at Montserrat, at the time when the Imperial Department of Agriculture was instituted in the West Indies, with Sir DANIEL MORRIS at its head. Subsequently he held an appointment at Antigua. Mr. JORDAN was well-known at Kew, having, previous to entering the Botanic Gardens, served at Forbes House gardens, Ham. He will be remembered by his contemporaries at Kew for his frequent contributions to the debates at the meetings held for mutual improvement. His genial manner caused him to be held in high esteem by his fellow students.

A PARASITIC ALGA.—Quite recently W. J. BEIJERINK has studied the special mode of life of an alga entirely deprived of green pigment, which, at first sight, would have been placed in the group of lower fungi called Prototheca. This alga lives in the frothy sap of the Elm which is poured out in consequence of the puncture of a moth, Cossus ligniperda. Under its peculiar natural conditions of life this albino plant multiplies without losing its characters. But cultivated in sterile tubes, in the froth of gelatinized beer, for instance, it gradually assumes the green colour and forms, in a few weeks, on the surface of the substratum, green masses edged with yellowish white, comparable to the leaf of certain variegated Maples. The green alga when isolated presents all the characteristics of the genus Chlorella. It forms endogenous spores, as do microbes, and BEIJERINK named it Chlorella variegata, a variegated microbe. Other superior plants deprived of chlorophyll sometimes survive in this condition so unfavourable for nutrition either by parasitism, as in Dodder, or by saprophytism, as in Neottia, &c.

THE BOIS DE BOULOGNE.—A beginning has been made in the famous Paris garden "Bagatelle" to turn it into a public botanical and cultural experimental garden, where the promenader interested in flowering plants, shrubs and trees will have the opportunity of observing them at his leisure. Masses of Roses grown in a natural manner and a special Rose garden are some of the projects entertained by the authorities.

ROSE OBERBÜRGERMEISTER DR. TRONOLIN.—A sport from Madame Caroline Testout was exhibited at a recent horticultural show at Munchen-Gladbach under the name given at the head of this note, which is exactly like the type in form and ground colour, but is marked with deep rose-coloured stripes. This mode of colouring is not quite constant, as occasionally petals appear which are whitish-rose on one half, whilst the other is deep rose. These markings and shadings make the flowers most interesting. The sport possesses all the good properties of the mother plant, which is well known as one of the best Roses.

CITRATE OF LIME IN DOMINICA.—Mr. AGAR, writing to the West India Committee from Dominica, in July, reported that the first shipment of citrate of lime on a commercial scale was being made, and stated that there was no doubt should the experiment be successful, the manufacture of citrate of lime instead of concentrated lime juice would rapidly develop.

FRUITING OF THE MANGOSTEEN IN GUINEA.—The *Revue Horticole* states that the Mangosteen (Garcinia Mangostana), which was introduced into Guinea in 1898 through the intervention of M. MAXIME CORNU, has fruited there this season for the first time, and it is believed that the culture of the plant in Guinea will prove to be successful.

CHILDREN'S CHRYSANTHEMUMS.—At the Show which was held by the *Evening News* Chrysanthemum League, at the Royal Horticultural Society's Hall, on September 20, 21, and 22, about 1,700 children contributed plants, but though many of them were moderately well-grown, there were very few in flower. It was quite evident that the date fixed for the Show was fully three weeks too early, for most of the plants having been grown under partial shade are later than those grown in the market nurseries. The want of colour in the children's plants was somewhat atoned for by the supplementary exhibits, which came chiefly from market growers. There were also floral designs from several leading florists. Messrs. W. WHITELEY, Ltd., Hillingdon, exhibited two large groups of foliage plants, in which the Codiæums were very bright. Chrysanthemums and Solanums in pots were also good. Mr. ERIC F. SUCH, Maidenhead, made a large display with Chrysanthemums which included some of the best new early varieties, and with other hardy flowers a good group was arranged. Messrs. CRAGG, HARRISON & CRAGG, Heston, had an extensive display of Chrysanthemums; pot plants of the varieties which were grown by the children were well represented, also cut flowers of the best sorts were well shown. A collection of Cacti, and various foliage plants from the same firm, filled one of the large tables. Messrs. WELLS & Co., Merstham, showed a praiseworthy collection of Chrysanthemums, including some new early-flowering single varieties. Messrs. R. H. BATH, Ltd., Wisbech, also showed a large group of Chrysanthemums composed of [illegible] varieties. Messrs. DOBBIE & Co., Rothesay, exhibited some very fine Sunflowers, Dahlias, &c. Messrs. CHEAL & SONS, Crawley, had a large collection of Dahlias. Mr. W. A. CUTT, Edmonton, exhibited a group of Ferns and foliage plants, Pteris Wimsetti "Distinction" and Aralias being worthy of note. Messrs. J. CARTER & Co., Holborn, showed a collection of dwarfed Japanese Trees, which created a good deal of interest amongst the children. Mr. R. F. FELTON, Messrs. B. SHEARS & SON, and Mr. HAYWARD, Kingston-on-Thames, were exhibitors of floral arrangements. There were not such crowds at the Exhibition as were seen last year, but this may have been due to the holding of the recent Show for three days. The *Evening News* informs us that the League was inaugurated last year at the suggestion of a Japanese child in Nagasaki, and it has now nearly seven thousand members.

THE CORRUPT PRACTICES ACT. We fear the firm that issued the subjoined notice is not aware of the passing of the Corrupt Practices Act, which will come into operation on January 1, 1907:—"Important. Gardeners' Discount. On all orders for goods as quoted in our price list (or any other good firm's catalogue, from which you may be pleased to give us an order) we allow a discount of 10 per cent. (2/- in the £) if paid within three months or 5 per cent. (1/- in the £) if paid within twelve months from date of invoice. This special discount is for gardeners only, whether orders are given by their employers or themselves. For goods advertised in gardening papers, prices are net, but 5 per cent. for c.w.o. may be deducted."

THE PLANE TREES ON THE THAMES EMBANKMENT.—*A. D.* writes us on this subject as follows:—I do not agree with those persons who say that the Plane trees on the Thames Embankment will be irreparably damaged by the tramway line which is now being laid within a few feet of their stems, although they will undoubtedly suffer greatly in consequence, and much of their beauty will be destroyed. Quite recently, by request, I walked along the Embankment from Blackfriars to Charing Cross and examined the trees, and I must say that I left the scene with feelings of regret deploring the fact that the trees in our noblest of London's avenues were being tampered with. In order to fully explain the situation I may say that the tramway line is being laid to within 6 feet of the stems of the trees, a hard bank of concrete coming still nearer than that to the roots. But this is not all, for owing to the line having been made so close to the trees, hard pruning of the branches will be inevitable in order that the cars may have an uninterrupted passage beneath. At certain places along the route, where there are tall trees whose branches are high up on the stems, this pruning may not be serious, but in such places as that opposite the Temple Gardens, where some of the trees do not greatly exceed 20 feet in height, nearly all the branches will require to be shortened. If the branches on the roadside only are pruned the trees will have a very unnatural, one-sided appearance, to obviate which severe pruning on all sides must be resorted to. It is not my intention to question why the tramline was laid so close to these trees, and especially in a wide thoroughfare like the Embankment, but I am sure that both the well being and the appearance of the beautiful Planes in this noble avenue will suffer greatly in consequence.

BEQUESTS TO GARDENERS.—It is reported that by the will of the late Earl of Iveagh, probate of which was granted on Wednesday last, his late lordship's gardener at Rochampton, who is described in the will as "my old friend and gardener at Roehampton," benefits to the amount of £500, and Mr. Mackenzie, head gardener at Glenferness, to the extent of £200.

THE PRIMULAS OF CHINA.

(Concluded from page 209.)

P. FORBESII is native of the Yunnan plateaux, at elevations between 4,000-7,000 feet. It affects open, grassy, or fully-exposed situations, and is often abundant by the wayside. The soil of the Yunnan plateaux is of a uniform red, clayey sand-stone, but it is in the more rocky places that P. Forbesii luxuriates.

P. pycnoloba is a very curious species, but of little horticultural value. It is native of the dry, warm valleys of West Szechuan, between 4,000-6,000 feet, in situations fully exposed to the sun. The scapes are 6-9 inches high, and arise from a tuft of leaves somewhat resembling those of P. obconica. The calyx is extraordinarily large, and out of this peeps a tiny yellow or bronzy corolla not much larger than a pin's knob.

P. violodora has rose-pink, violet-scented flowers, arranged in several whorls on a scape 9 inches to a foot high. This species is native of Hupeh, between 4,000-7,500 feet. P. etarinosa, with carmine-red flowers, is common in North-Western Hupeh, on grassy mountains, between 7,000-8,500 feet.

P. Wilsoni is a bog plant, with flowers and foliage intermediate between that of P. japonica and P. Poissoni. It is native of South-West Yunnan, at elevations between 6,000-7,500 feet, and Tatien-lu, West Szechuan, between 8,500-9,000 feet.

The well-known P. denticulata occurs in Yunnan between 5,000-7,000 feet.

The vigorous P. pulverulenta delights in marshy land, but in one locality the writer found it particularly abundant and happy in moist places formerly cultivated and now abandoned to coarse weeds. This species is native of West Szechuan, and extends from 6,000-9,200 feet. All the above, except P. etarinosa, are, or have been, in cultivation in this country.

Many of Delavay's species belong to the temperate grassland group, but are not yet introduced. Two of the most remarkable of these are P. blattariformis and P. malacoides. The first-named, as the specific name indicates, singularly resembles one of the sections of Verbascum. The flowers in size and colour resemble those of P. sinensis, and are arranged racemosely on scapes 9 inches to a foot high. A native of Yunnan, P. blattariformis occurs at elevations of 6,000 to 7,000 feet, and is not uncommon. It was described by the late M. Franchet in the *Gardeners' Chronicle*, 1887, series 3, Vol. i., p. 575.

P. malacoides has small white flowers, arranged in several whorls, and thin, roundish leaves. It is common in cultivated areas in the neighbourhood of Tali, Western Yunnan.

HIB. *Alpine*. In Western China, as in the Himalayan and European Alps, this is the group *par excellence*. A long article could easily be written on this class alone, but I have only space here to briefly mention the Chinese species now in cultivation in this country. P. sikkimensis, P. vittata, P. involucrata, P. nivalis and its varieties are essentially bog-loving species. In marshes, by the sides of streams and ponds, between 9,500 to 12,000 feet, they are abundant. P. vittata may be likened to a reddish-purple flowered P. sikkimensis. P. nivalis is a very variable and lovely species. One form—P. nivalis var. farinosa—has delicate blush-purple, delightfully fragrant flowers. In West Szechuan P. sikkimensis occurs in myriads, clothing the banks of streams and ponds, and in the early morning and evening the air is laden with delicious fragrance from its flowers.

In grassy and rather moist places are found P. longipes, P. orbicularis, P. Cockburniana, and P. Poissoni. The first named (*Bot. Mag.*, tab. 8,013) is a native of North-west Szechuan, between 11,000 to 13,000 feet. The flowers are arranged in several whorls, and are dark maroon in colour, with very narrow segments and a peculiar spice-like odour. P. orbicularis. (*Gardeners' Chronicle*, 1906, Vol. xxxix., p. 290) is a yellow-flowered species from West Szechuan. The scapes are 1 to 2 feet high, umbellate or sub-umbellate, with numerous flowers. P. Poissoni is well known in gardens. It occurs between 9,000 to 11,000 feet. P. Cockburniana (see fig. 96) has vivid orange-red flowers—a colour unique in the whole Primula genus. This species was recently figured in the *Bot. Mag.* (tab. 8,073), but the colour shown in the plate is far from being that of the plant itself. Apropos of this colour, is it not remarkable that amongst all the diversity of colour in Auricula and Polyanthus there should be no approach to the orange-red of P. Cockburniana? Hybridists should welcome such a novel colour, since it opens up great possibilities. P. Cockburniana is of somewhat slender habit, with the flowers arranged in several whorls. The scapes, which arise from a rosette of rather light green, membranous, obovate-oblong leaves, are 9 to 15 inches high, and clothed with white farina. Its altitudinal range is from 9,000 to 11,000 feet, so there can be no doubt of its hardiness in this country.

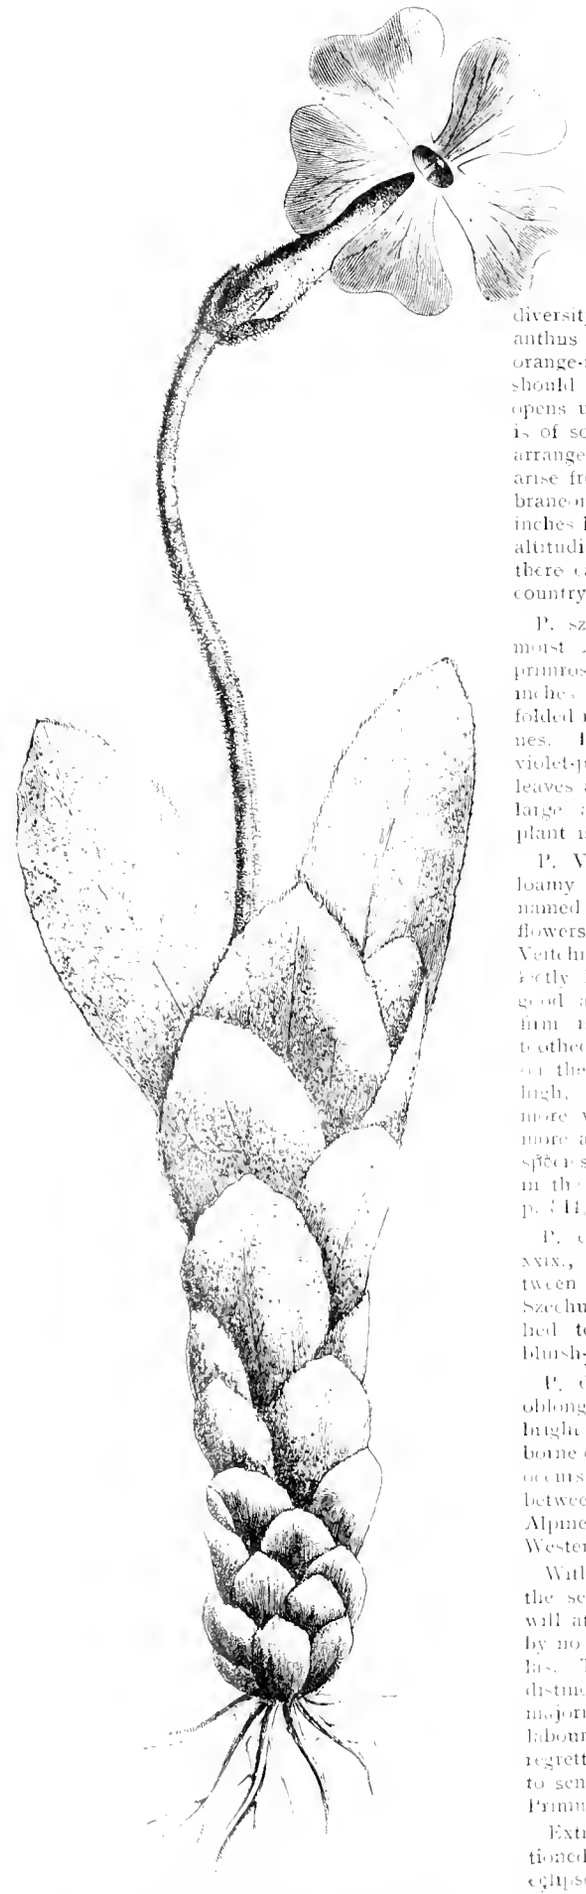

FIG. 95.—THE PRIMULAS OF CHINA: P. VINCÆFLORA; COLOUR OF FLOWERS PURPLISH-VIOLET.

P. szechuanica and P. amethystina frequent moist Alpine meadows. The first-named has primrose-yellow flowers on umbellate scapes 9 inches to a foot high. The corolla-lobes are folded right back in the most extraordinary manner. In P. amethystina the flowers are deep violet-purple on scapes 4 to 6 inches high; the leaves are small and coarsely toothed. To see large areas of moorland carpeted with this plant is something to remember.

P. Veitchii and P. incisa affect rather dry loamy banks exposed to the sun. The last-named is a gem, with deep rose-coloured flowers and small, deeply-cut leaves. P. Veitchii is a Primula with a future. It is perfectly hardy, perennial, easily grown, and as good as P. obconica. The leaves are large, firm in texture, rounded, deeply crenately-toothed, more or less felted with white hairs on the underside; scapes a foot to 18 inches high, usually umbellate, more rarely two or more whorled; flowers numerous, an inch or more across, bright mauve or rose-pink. This species is figured in *Bot. Mag.*, tab. 8,051, and in the *Gardeners' Chronicle*, 1905, Vol. xxxvii., p. 344, Suppl.

P. cognata (*Gardeners' Chronicle*, 1906, Vol. xxix., p. 378) affects moist, loamy banks between 10,000 to 12,000 feet in North-west Szechuan. This is a pretty species, closely allied to the widely-spread P. farinosa, with bluish-purple flowers 1 inch across.

P. dryadifolia is a tufted species with tiny oblong leaves, farinose on the underside, and bright carmine flowers, about ¾-inch across, borne on scapes 2 to 3 inches high. This species occurs on bare quartzose and granite boulders between 15,500 and 16,100 feet, and is the most Alpine of all the Primulas yet known from Western Szechuan.

With only about two dozen introduced out of the seven dozen known to occur in China, it will at once be seen that the Flowery Land is by no means exhausted in the matter of Primulas. The majority of the Szechuan species are distinct from those of Yunnan, and the great majority of the latter remain to reward the labours of some future collector. It is to be regretted that the late Père Delavay was unable to send home seeds of many of the remarkable Primulas he discovered.

Extraordinary as many of the species mentioned in this article undoubtedly are, they are eclipsed by such wonderful species as P. vincæflora and P. Delavayi. These two, with the Himalayan P. Elwesiana, are, in general appear-

ance, totally unlike the plants ordinarily regarded as Primulas. Indeed, the late M. Franchet, of illustrious memory, did propose a new genus for this group under the name of Omphalogramma. P. vincæflora is described in the *Gardeners' Chronicle*, 1887, Series 3, Vol. i., p. 574 (see fig. 95) The flowers are very large, tubular, solitary, on scapes 6 to 8 inches high; leaves oblong, with short-winged petioles. P. Delavayi also has large campanulate flowers, which are fringed, and borne on scapes 8 inches to a foot high, whilst the leaves are reniform with long petioles. Both species are moisture-loving subjects, and occur in North-west Yunnan at elevations between 12,000 and 13,500 feet. The introduction of these most strikingly distinct and extraordinary species is much to be desired. *E. H. Wilson.*

FIG. 96.—THE PRIMULAS OF CHINA: P. COCKBURNIANA; COLOUR OF FLOWERS ORANGE-RED.

WARREN HOUSE, STANMORE.

THE residence of H. L. Bischoffsheim, Esq., at Stanmore, is most pleasantly situated on an eminence, and possesses a charmingly undulated and well-wooded view to the south, where the magnificent Oak trees are a prominent feature. On the gently-sloping lawns there are some notable trees and shrubs. A huge specimen of Rhododendron ponticum covers a space of 90 yards in circumference. In the shrubberies there are many choice subjects in a flourishing condition, such as Eucryphia pinnatifolia, Clethra alnifolia, Buddleia Veitchiana and many varieties of hardy heaths which succeed remarkably well. A specimen of Cupressus lawsoniana alba spicata, 12 feet in height on the grass, is a perfect plant of this choice Conifer.

An interesting and effective method of planting under tall forest trees impressed me. The soil was thickly carpeted with Irish Ivy, over which Golden Hollies were dotted. The flower beds at the east end of the mansion are particularly well placed on the flat, grass terrace, and being backed up with shrubs, &c., the effect is excellent. Lantana delicatissima and L. salvifolia were most effective recently, being a mass of pale mauve colour. The former is especially dwarf in habit and free flowering, but the latter is grown as standards, 3 feet in height. Pelargonium "Constance," of deep pink colour, made an effective display, and so did the Ivy-leaved Pelargonium Souvenir de Charles Turner. Iresine Lindenii, 4 feet in height, intermixed with Lobelia cardinalis, was effective. A pleasing mixture of dark-leaved Cannas and the golden-blotched Abutilon Thompsonii was noticeable.

The glass department is extensive, and the orchard house, fully 100 yards in length, is well stocked with a variety of fruit trees. Peaches are cultivated on the back wall, and the variety Sea Eagle was carrying extra fine fruits. On the front of the house are trained cordon Pears, Cherries, and Plums. The Pear trees were in most instances loaded with handsome fruits. At the extreme west end of the same house there are cordon-trained Gooseberries. The existing crops of Grapes and the general appearance of the vines were very satisfactory. Muscat of Alexandria was especially fine. The new Grape Princess of Wales was carrying such large bunches and berries that the variety should be included even in a limited collection. It appears to be much easier of cultivation than its parent, Mrs. Pince. The variety Barbarossa was represented by some grandly finished bunches, with berries of the full size. The Peach crop was nearly over, but the trees appeared to be in a very satisfactory condition.

The Chrysanthemums numbered fully 1,000 plants. An extremely fine batch grown for the production of large blooms were in a praiseworthy condition. Bush-grown plants promised to flower well later on. A particularly healthy batch of Pelargoniums for winter flowering was noticed. Carnations were good, especially those of the Souvenir de La Malmaison type, flowers of which are required the whole year round. Orchids appeared in excellent condition, and Miltonia candida was finely in flower. The condition of the garden reflects credit on the head gardener, Mr. Ellis, who, I regretted to hear, is relinquishing this charge. *E. Molyneux.*

Publications Received.—*Imperial Department of Agriculture for the West Indies:* Reports on the botanic station, agricultural schools, experimental plots, and agricultural education at St. Lucia, St. Kitts Nevis, and Antigua (1905-1906).—*Agricultural Bulletin of the Straits and Federated Malay States.*—*How to Buy a Business*, by A. W. Bromley, published by T. Fisher Unwin, price 2s. 6d.

A YEW CROSS.

THE illustration at fig. 97 represents a view of the Yew Cross, in the gardens of the Carmelite Nunnery, Darlington. This Yew was planted about 50 years ago by Mr. Joseph Pratt, on the removal of Clare Abbey from Scorton to Darlington. The cross is 10 feet in height, and measures 9 feet across at the base. Each arm is 3 feet in length and 4 feet in thickness. The first step is 15 inches in depth and the second and third steps 12 inches. If this cross is intended as a mark to perpetuate the removal of the Order to its new home, no better subject could well be chosen than the Yew, for its longevity is proverbial. The Yew has long been a favourite plant for the topiarist, and many of the best examples of topiary work are executed in Yew. In Bedfont Churchyard, near London for instance, are two famous Yew trees, trained to represent peacocks, and they bear, in raised figures, the date of their planting, which was 1708.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

PEACH CULTURE OUT-OF-DOORS.—*A. H.* agrees with Mr. Ward, "that 'blister' in Peach trees is, to a great extent, preventable, not by netting at the critical period to which *North Devon* alluded, but by having the trees in a clean, healthy condition in the spring, and by giving them proper attention in early summer." *A. H.* might have included in the sentence an "if" or a "but." He described the condition of the trees in Mr. P. Veitch's garden at Exeter; these do not offer a fair comparison with trees growing in less-favoured situations. I have on several occasions seen Mr. Veitch's trees, which are growing against a wall of unusual height, and, if memory serves me well, a wall which faces to the south-west. The ground possesses natural drainage, and the position is warm and sheltered, and where one would scarcely expect "blister" to appear. On p. 210 of the *Gardeners' Chronicle* Mr. Molyneux contributed to this discussion. While agreeing with his remarks on the proper attention the trees should be given, one cannot ignore the effect which local conditions have in producing "blister." *A. H.* and Mr. Molyneux would probably alter their opinion if they had much experience of out-of-door Peach culture in certain parts of Devonshire. I can sympathise with *North Devon*, if his trees have suffered badly from "blister," for it is somewhat discouraging to see one's trees, which looked healthy and promising when the leaves were unfolding, suddenly subjected to north, or north east winds, causing partial paralysis of the trees' functions. *East Devon.*

——I was pleased to see the name of that thorough gardener, Mr. Alexander Lindsay, of Ditton Park, mentioned by *D.*, p. 184, in connection with this subject. I served as his general foreman for 5½ years, and under his supervision planted the whole of the trees on the south wall during October and November, 1878. I well remember the cause of replanting. All trees were unnailed in winter, and in the operation an old standard tree of Barrington, with only one branch, that covered well-nigh 300 square yards of wall, was split at the junction of branch and stem. The loss of this tree so spoilt the appearance of the wall, that Lindsay determined to replant the whole. I have seen this fine old tree carrying 12 score of fruits, each averaging ½ lb. in weight and of fine form and colour. We did protect against "blister" in those days, and on many occasions I have at midnight, when signs of frost were apparent, covered the trees with canvas which was always fixed ready for the purpose. During the prevalence of east winds the canvas was kept down in the daytime. Here, on the bleak Chiltern Hills, I find it best to keep the canvas down during the daytime, as well as at night, and though the weather during springtime was so inclement, I have now a good crop of Peaches and Nectarines, and have gathered excellent Apricots. Well-drained and warm borders in winter are the best preventives of "blister." I was for some 12 years in Kent, in a garden on a dry chalk subsoil, and exposed to the east. The trees were never troubled with blister in that garden, but here on a cold clay they are affected with it every spring no matter how well I protect them. I know of no better remedy than hand-picking and burning the diseased leaves. Good Peaches and Nectarines can still be grown on outside walls; the only difficulty is that of meeting the expense of properly preparing the borders. *W. Hancock, Chartridge, Bucks.*

THE PROPOSED CHAMPION VEGETABLE CLASS.—I have been somewhat interested and amused at the correspondence on this subject which has lately taken place in the pages of the *Gardeners' Chronicle*. That a better class has not been provided by such an important society as Shrewsbury is much to be regretted; at the same time, owing to the generosity of the various leading seedsmen, probably no finer vegetables are ever brought together in any part of the globe than have been seen at Shrewsbury, and I really cannot see that Mr. Gibson is asking for anything extraordinary, as *Nous verrons* implied on p. 184. I should like to answer his first question by asking him if he has ever known a keener interest excited in vegetable competition than at the two shows he mentioned, viz., Chiswick and Edinburgh, and did not some of the best growers enter into friendly competition on those occasions? His reference to the fact that certain growers did not compete against each other at Shrewsbury seems to imply that a kind of compact was arrived at between them. I, however, decided to compete for the two classes, viz., Messrs. Bull's and Carter's, immediately the schedule was issued, and I take it for granted that other exhibitors pleased themselves. I have on some occasions competed for most of the leading prizes offered for collections at Shrewsbury. What are *Nous verrons* criticisms as to this? Surely no arrangements could have been made in such a case. Then as to his accusation as to the wrong labelling of the various "dishes," I am inclined to ask myself if he is really a practical man. [He is. ED.]. If so, I am somewhat surprised that such a statement should go forth to the gardening Press; I do not for one moment wish to infer that wrong naming has never been practised, but I do strongly protest against the making of such general remarks without some proof being given. In my own case, only at the last Shrewsbury show I staged and named several varieties which were not of the firm's raising which offered the prizes, although the stocks were procured through them. Nearly all our leading seedsmen possess improved stocks of most of the best vegetables, and they are perfectly justified in sending such stocks out under the names they wish. I do not dispute that *Nous verrons* has overheard the interesting discussion between the visitors. I have on many occasions heard such remarks over stands of Chrysanthemums, Roses, &c. *E. Beckett.*

——I have read with interest, the letters of *A. D.*, *Mr. Gibson*, and *Nous verrons* on the subject of a champion vegetable class at the Shropshire Horticultural Society's show. *Nous verrons*, in his very interesting letter, p. 215, points out that in no class were Messrs. Beckett and Gibson found competing against each other, and apparently suggesting neither cared to risk defeat. But the produce which both these famous vegetable growers staged at Shrewsbury, as well as the artistic manner in which the exhibits were arranged, left nothing to be desired. However, *Mr. Gibson*, as shown by his communication, p. 184, has evinced his willingness to try conclusions with other expert vegetable growers in the event of the suggested champion vegetable class being provided. A reference to this year's schedule of the Shropshire Society, will show that 40 classes (open to all) were allotted for vegetables, eight of which were for collections, and in four of these six prizes were offered, five being offered in three others and three in one class, representing stated money value of £104 5s., in addition to the two cups given by Messrs. William Bull and Sons, of the respective value of fifteen and five guineas. Thus it will be seen that the vegetable classes in this society's schedule have been well and liberally provided for, and, in my opinion, no need exists for a champion vegetable class. But instead of this I would suggest that the management at Shrewsbury should consider the desirability of providing annually a champion gold medal to be awarded to the best collection of vegetables in the show, in addition to any monetary prizes it may win, and thereby proclaim the champion vegetable exhibitor at Shrewsbury for the current year. *H. W. W.*

——I am somewhat surprised at *Nous verrons* taking Mr. Gibson to task for his remarks concerning a champion vegetable class at Shrewsbury. He seems to overlook the fact that the discussion was not started by Mr. Gibson, but by a previous writer with whose letter Mr. Gibson practically expressed his agreement. Mr. Gibson, besides winning Messrs. Sutton's prize, exhibited successfully in the class, the prizes in which were offered by the society, and with no restrictions as from whom the seeds were purchased, a fact *Nous verrons* omits to mention. The proposal that all vegetables should be staged true to name is an excellent one. *Onlooker.*

FIG. 97.—A YEW CROSS IN THE CARMELITE NUNNERY, DARLINGTON.

OUT-DOOR TOMATOS IN 1906.—The weather at the time these were put out was cold at night, consequently the plants did not make very much headway during June, but in July and August they grew unusually fast. The first to ripen fruit was Carter's Earliest of All followed by the new variety "Sunrise." This latter Tomato is a very prolific variety and forces well. I had in the same plot Duke of York, Carter's Best of All, Sutton's Earliest of All, Market Favourite, Peach-Blow, and Carter's Perfection. The largest fruits were obtained from Peach-Blow and Best of All, but taken collectively there is very little to choose between them. The two that stood out most prominently were the two first-named, Earliest of All and "Sunrise." In a cool house Sutton's "Cascade" is very ornamental, some of the sprays of fruit being nearly a yard long. They are very pretty for garnishing and for decorative purposes. *W. A. Cook.*

A PROTECTION FOR FRUIT TREES IN THE BLOSSOMING SEASON.—Owing to the severe winds we experience from the east during the month of April at Shooters Hill, Kent, my Pear trees have produced practically no fruit for several years past. This year I tried the following experiment: I bought 12 hop poles and placed them in heavy drain pipes (stuffing them in with soil), three to each Pear tree at an angle. I then enveloped as much of the tree as I could with cheap, coarse muslin stretched round the three poles. The result has been a fair quantity of fruit on trees that have produced nothing for 10 years. *H. S. Bartlett, Severndroog, Shooters Hill, Kent.* [Probably the cheapest material for this purpose would be Shaw's Tiffany, a piece about 20 yards long, and about 38 inches wide, costing only about 6s.—ED.]

A BUSH TREE APPLE CENSUS.—We are having a great Apple season, and for that reason it offers an excellent time to obtain from all caring to furnish them selections of the best nine varieties dessert, and the same kitchen, to give a supply of fruit from September till April, those months inclusive. I ask for "bush" growths only, because the bush or dwarf tree on the Paradise stock is certainly the best habited tree for gardens, and is now most widely grown. Selections of this nature may well be made every 10 years or so, as experience of varieties continues to grow. I suppose the desire Equalities in the varieties are free and frequent

cropping, good average size, and quality in the fruits, and the latter ones good keeping also. Form of fruit also has some importance Conical, ribbed fruits are less handsome and more wasteful generally than are broader, round ones. All the same many growers will no doubt include in their lists good croppers, such as Lord Suffield, Lord Grosvenor, Lord Derby, and Golden Spire amongst the cooking section, the one of most importance perhaps so far as form or outline is concerned In the dessert section beauty has importance, and many regard colour highly. Still, quality and flavour, as well as good keeping and cropping qualities, have the higher value. With a view to starting such a census I submit, with becoming deference, the following selections as being in my estimation good ones. They will doubtless lead to abundant criticism. Dessert: Miller's Seedling, Worcester Pearmain, James Grieve, Allington Pippin, Cox's Orange Pippin, Cockle's Pippin, Lord Burghley, Lord Hindlip, and Sturmer Pippin. Cooking Frogmore Prolific, Stirling Castle, Warner's King, Royal Late cooking, Waltham Abbey Seedling, Hercules Pearmain, Bismarck, Lane's Prince Albert, and Newton Wonder. If, say, 100 selections are sent in, the ultimate selection should indeed be a good one. *A. Dean.*

THE POLLINATION OF PEACH AND PLUM FLOWERS.—In Mr. J. Hudson's notes on pot-fruit culture by means of bees (p. 193) mention is made of this method. During last spring I placed a hive of bees in an early Peach house where I had also Cherry and Plum trees in pots which were in bloom at nearly the same period as the Peaches The bees worked assiduously, and apparently saved me much trouble, but after about a week or ten days had elapsed I noticed that the woodwork and glass of the structure was completely spotted over with excrement from the bees, so much so that I had to move them out to save the appearance of the house, which was a new one There was abundance of ventilation all day. The marks were difficult to remove with a scrubbing brush Is this unusual? I have employed bees on several occasions previously, but without this disadvantage. Another thought struck me later on when one or two of the Peach trees failed to set their flowers. Is it possible that bees, by following each other, maybe a dozen times on the same flower, damage the stigmas and cause them to fall prematurely? In their hunger after a winter's rest, it is possible they may damage the delicate tissues of the flower-organs in their search after natural food *Geo Dyke, Garston Manor Gardens, Watford*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 25.—At the ordinary fortnightly meeting of the committees held in the Vincent Square Hall on Tuesday last, the three dominant features were Dahlias, Orchids and dessert Fruits.

The FLORAL COMMITTEE made only one award to a novelty, and this was a FIRST-CLASS Certificate to an Asplenium, but, in association with the committee of the National Dahlia Society, the FLORAL COMMITTEE recommended ten Awards of Merit to new Dahlias.

The ORCHID COMMITTEE recommended one Botanical Certificate and six Awards of Merit to novelties.

The FRUIT AND VEGETABLE COMMITTEE recommended an Award of Merit to an early Apple, a similar award to a variety of the Hessle Pear, and a Gold Medal to Messrs. GEO. BUNYARD & Co. for a magnificent exhibit of house-grown fruit.

In the afternoon there was a lecture on the "Distillation of Perfumes from Flowers" by Mr J. C. Umney.

Floral Committee.

Present: W. Marshall, Esq., Chairman, and Messrs. T. W. Turner, C. T. Druery, H. B. May, Geo. Nicholson, W. J. James, W. P. Thomson, Wm. Cuthbertson, H. J. Cutbush, Chas. Jeffries, C. J. Salter, W. Howe, R. Hooper Pearson, G. Reuthe, J. F. McLeod, Jno. Jennings, J. W. Barr, and R. C. Notcutt.

Kentia Belmoreana was shown as a basket plant by Mrs. STEWART MACKENZIE, Lyndhurst, Haywards Heath (gr Mr. A. C. Smith). There were four plants in a wire basket, the tallest plant being about 6 feet in height from the surface of the root medium. All the plants were of good colour, and appeared in perfect condition, although they are usually suspended in the conservatory. The committee recommended the exhibitor a Cultural Commendation.

Another somewhat unexpected exhibit was a Kale plant four seasons old, shown by Miss ROTCH, whose address did not transpire. The plant was only about 14 inches in height, was much branched, and possessed very much divided leaves.

Messrs. J. HILL & SON, Lower Edmonton, staged an excellent group of Asplenium nidus avis, the Bird's Nest Fern. Some of the plants were large specimens, others were in 48-sized pots, but whether large or small they were all equally well cultivated. One plant showed a remarkable sub-division of the fronds (See Awards.) (Silver Gilt Flora Medal.)

Messrs. W. & J. BROWN, Stamford and Peterborough, staged some of their narrow-petalled (Cactus flowered) varieties of Pelargoniums; a bright display of garden Roses, and a row of the pretty Clematis grata, the petals of which are tinted a delicate shade of mauve.

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, filled the same corner of the Hall with a similar display of Clematis as at the last meeting of the society. A basket contained plants of the ornamental-leaved Hypericum Moserianum tricolor, and other baskets held Colchicums and Crocus in flower. (Silver Banksian Medal.)

Mr. JAMES C. FORDY, Castleford House, Warkworth, Northumberland, showed some strong flower spikes of Gladioli, bearing flowers of many colours. (Silver Flora Medal.)

Mr. S. MORTIMER, Rowledge, Farnham, Surrey, staged vases of American or winter-flowering Carnations in many popular varieties Enchantress, Mrs. T. W. Lawson, &c., and two new seedlings—Victory, a promising scarlet flower, and Jessica with white petals striped with red. (Silver Flora Medal.)

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, showed a number of named varieties of Veronica Andersoni. Some were exceedingly pleasing, and among the best were Gabrieli (pink), Mont Blanc (white), Valiere (blue), Favourite (crimson), and Eveline (pink). Interspersed among the Veronicas were hardy Ferns, the majority being British species (Silver Flora Medal.)

Messrs. WELLS & CO., Merstham, Surrey, displayed early-flowering Chrysanthemums in variety from the open.

Messrs. JAMES VEITCH & SONS, King's Road, Chelsea, again showed Leonotis Leonurus, and Crowea angustifolia. In the front of the exhibit were some profusely-flowered Begonias, of the winter-flowering type. Large plants of Nerine Fothergilli major were carrying a plentiful supply of their showy umbels of flowers. (Silver Banksian Medal.)

Messrs. R. SMITH & Co., Worcester, showed a miscellaneous group of plants—trees, shrubs, fruits, and flowers. Ornamental Oaks, Elms, Poplars, Conifers, &c., formed the principal subjects.

Messrs. GEO. PAUL & SON, The Old Nurseries, Cheshunt, staged a group of interesting plants. Many sprays of large and ornamental-leaved trees and shrubs, Rose hips of various species, Euonymus latifolius, Rubus laciniatus, &c.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, N., showed a select number of American Carnations.

Messrs. HOBBIES, LTD., Dereham Nurseries, Norfolk, again showed a collection of choice varieties of Cactus Dahlias, and some of the large-flowered Peony type; also a very bright display of garden Roses in most of the well-known late-flowering varieties. (Silver Flora Medal.)

Mr. J. T. WEST, Tower Hill, Brentwood, arranged another large group of Dahlias as at the previous meeting. The varieties were chiefly Cactus Dahlias of the best kinds, and they were well set off by a row of Kochia scoparia.

Messrs. BAKERS, Wolverhampton, staged an imposing exhibit of Dahlias of all types. The exhibit occupied the whole of the platform end of the hall, and it was most effectively arranged exhibit-tripods, vases, epergnes, and rustic arches being utilised for the display. The flowers were relieved with sprays of Asparagus plumosus, A. Sprengeri, Ophismenus, Gynerium argenteum and other showy grasses; small Ferns, &c. (Silver Gilt Flora Medal.)

Messrs. J. CHEAL & SONS, Crawley, showed single-flowered and Cactus Dahlias in many choice varieties. (Silver Flora Medal.)

Mr. CHAS. TURNER, Royal Nurseries, Slough, staged a collection of the charming pompon Dahlias, including several new kinds, some of which will be found described under "Awards." (Silver Flora Medal.)

Messrs. CARTER, PAGE & Co., 52-53, London Wall, London, showed a very large and beautiful exhibit of single, Cactus, and pompon Dahlias. (Silver Gilt Flora Medal.)

Messrs. CANNELL & SONS, Swanley, Kent, also made a big display wth these seasonable flowers, some of which were of the large-petalled type. (Silver Flora Medal.)

Messrs. J. BURRELL & Co., Cambridge, and Messrs. J. STREDWICK & SON, St. Leonard's-on-Sea, exhibited new varieties of Cactus Dahlias.

Messrs. THOS. S. WARE, LTD., Ware's Nursery, Feltham, showed Dahlias of all types. The variety Grand Duke Alexis is noteworthy. The white florets are large and inflated, forming a highly decorative flower. Messrs. WARE also staged a very fine lot of bedding Begonias. (Silver Gilt Flora Medal.)

Messrs. WM. PAUL & SON, Waltham Cross, Herts., exhibited a large group of Roses from the open. The flowers were in good condition, many of the blooms being up to an exhibition standard. The beautiful Frau Karl Druschki was prominent; near by was Corallina, a pretty little Rose of coral-red shade; Warrior is a splendid bedding variety, and one that continues flowering late in the season. Mamam and White Maman Cochet were both in good form. Gottfried Keller, that forms the subject of our supplementary illustration, found a place in the collection that included over 100 distinct varieties. (Silver Flora Medal.)

Messrs. BLACKMORE & LANGDON, Twerton Hill Nurseries, near Bath, displayed baskets of several varieties of bedding Begonias of the tuberous rooting section. Some of the small, double-flowered kinds were exceedingly pretty and very floriferous. One labelled Hollyhock has small rosette-like flowers of a charming salmon-pink shade; Argus is similar, save that the colour is scarlet. Hilda is a larger flower of a delicate salmon-pink shade. Some single varieties at the back were of much merit.

Mr. A. LL. GWILLIM, Cambria Nurseries, New Eltham, Kent, staged flowers of tuberous-rooting Begonias, all of which were this year's seedlings. The varieties of scarlet, salmon, red, and yellow shades were exceedingly handsome, and these plants form splendid subjects for summer bedding.

Messrs. JOHN PEED & SON, Norwood, showed a large array of tuberous-rooting Begonias of excellent quality. The beautiful tints seen in these flowers were well represented: both double and single kinds were included in the exhibit.

Messrs. BARR & SONS, King Street, Covent Garden, London, showed a seasonable collection of hardy flowers, including a good assortment of perennial Asters (Michaelmas Daisies), and spikes of yellow and red varieties of Celosia pyramidalis. Some pans of Colchicum speciosum rubrum were prominent in the front of the exhibit.

Mr. G. REUTHE, Keston, Kent, staged hardy flowers, among which we noticed many of the best varieties of perennial Asters, hardy Heaths Liliums, the brilliant red-flowered Zauschneria californica, &c.

Messrs. WM. CUTBUSH & SONS, Highgate, London, N., showed a seasonable array of hardy flowers, of which perennial Asters formed the principle feature. Some good spikes of Pentstemons were noticed, and a batch of the showy Liatris pycnostachys.

Mr. AMOS PERRY, Winchmore Hill, and Enfield, London, N., showed garden flowers in variety. The beautiful Aster Amellus was shown in many varieties. A. A. Perry's Favourite is of a pink colour; and A. A. Ultramarine is of a very deep shade of blue; they are both excellent kinds. A big group of Solidago Shortii occupied the centre of the group. Other good things noticed were Helenium pumilum nudiflorum, Colchicum speciosum rubrum (very finely

loured), Amaryllis Belladonna, and Cedronella cana.

Messrs. GEO. BUNYARD & CO., Maidstone, Kent, showed their hybrid Physalis, which was figured in our issue for October 28, 1905. Some border Chrysanthemums and perennial Asters were also shown by Messrs. BUNYARD.

AWARD OF MERIT.

[illegible].—This is a very remarkable plant of the type of A. nidus, having the fronds divided on either side down to the midrib, almost as in the case of A. Ceterach, but the divisions are less regular. It is said to have been imported. Shown by Messrs. J. HILL & SONS.

AWARDS TO DAHLIAS.

The new Dahlias were judged by a composite body appointed from the R.H.S. Floral Committee and the National Dahlia Society's Committee. The following varieties were therefore awarded the R.H.S. Award of Merit and the First-Class Certificate of the National Dahlia Society:—

Rodney (Pompon).—An exquisitely formed flower, of deep amber colour, shaded with fawn.

Portia (Pompon).—A beautiful flower of a deep shade of rosy-mauve. The two varieties named above were exhibited by Mr. CHAS. TURNER, Slough.

Ruby Grinsted (Cactus).—An exhibition or "show" flower of the best type. The colour is a shade of rosy-fawn, with orange colour at the base.

Sunshine (Cactus).—The rosy-red flowers of this variety are of the best form and "finish."

Hyacinth (Cactus).—This variety has flowers of pleasing shades of pink and bronze with orange-coloured base.

Meteor (Cactus).—One of the fancy type in which the flowers are irregularly coloured a purplish crimson and white. These four varieties were shown by Messrs. J. STREDWICK & SON.

Daisy Staples (Cactus).—An excellent flower in all respects, with finely pointed florets. The deep shade of pink colour is very attractive. From J. CARTER & SONS.

Kitty (Single).—A perfectly circular flower of much merit. The colour is deep mauve, with a crimson zone at the base of the florets. Exhibited by Messrs. J. CHEAL & SONS, Crawley.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, De B. Crawshay, Francis Wellesley, H. Little, W. Boxall, R. G. Thwaites, Elijah Ashworth, G. F. Moore, Arthur Dye, H. G. Alexander, W. H. Young, T. W. Bond, J. Wilson Potter, Jeremiah Colman, W. A. Bilney, and H. T. Pitt.

Messrs. CHARLESWORTH & CO., Heaton, Bradford, secured a Silver-Gilt Flora Medal for an exceptionally bright and interesting group, the centre of which was composed of a selection of the Rose-tinted Brasso-Cattleya Mad. Chas. Maron and other Brassavola Digbyana hybrids. On each side were batches of the favourite Cattleya "Iris," whose showy colours always attract attention. With them were good specimens of varieties of Laelio-Cattleyas, Cattleya Leda, a pretty new hybrid between C. superba and C. aurea, and other hybrid Cattleyas, Zygopetalum maxillare magnificum, a fine flower with large violet-blue lip; the singular Cirrhopetalum appendiculatum, a specimen of the fine rose-tipped Vanda insignis, the brightly-coloured Sophro-Laelio Heatonensis, &c. Of the hybrid Odontoglossums the most remarkable was the very handsome O. Smithii, for which Messrs. CHARLESWORTH obtained a First-Class Certificate, December 5, 1905, and which was illustrated in the *Gardeners' Chronicle*, December 16, 1905, p. 427. It is the result of crossing O. Rossii rubescens and O. crispo-Harryanum, and for rich colouring and form it is unsurpassed. The flowers are white, with a broad purple border to the sepals and petals, which are heavily blotched with chocolate purple, the front of the lip being rose-purple. Another pretty hybrid was O. Phaedra Hallii × Pescatorei of O. Pescatorei shape; white, blotched with red-brown.

Messrs. SANDERS & SONS, St. Albans, were awarded a Silver Flora Medal for a group of Laelio-Cattleyas and other hybrids, which had in the centre several strong and finely-flowered plants of Vanda Kimballiana; varieties of their Cattleya Iris inversa, Cycnoches chlorochilon, and other species. Of the Cypripediums, the most remarkable were the new and handsome Cypripedium Victory (see "Awards"), and the finely-formed C. Fairrieanum splendens, whose white dorsal sepal was finely marked with purple lines. Others noted were C. Olga Bagshaw, C. Andronicus, C. Sir Redvers Buller, Cattleya Gaskelliana Adrianae, white with a yellow disc to the lip, which has a very small purple spot in front, &c.

Messrs. JAS. CYPHER & SONS, Cheltenham, staged an effective group, for which a Silver Banksian Medal was awarded. In it were some pretty varieties of Dendrobium Phalaenopsis and Oncidium varicosum Rogersii, Cattleya Iris, C. Massiana, C. Brownii, Brasso-Cattleya Mad. Chas. Maron, Laelio-Cattleya Berthe Fournier, &c. Of the Cypripediums noted were C. callo-Rothschildianum, a very pretty C. Phoebe (philippinense × bellatulum), with a pure white ground bearing many dotted purple lines; the fine C. Milo Westonbirt variety, and C. triumphans Westonbirt variety; the very singular and distinct C. insigne W. P. Bound of the unspotted C. Bohnhoffianum class, &c.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed Cypripedium Princess var. Wellesleyanum (Mons. Coffinet × Fairrieanum), one of the most delicately-tinted of the C. Fairrieanum crosses. The upper sepal is white, with fine purple lines, which branch towards the margin and have a rose tinge between the lines, the base being emerald green. The petals are broad, decurved, ciliate at the margin, which is rose colour, and bearing about a dozen fine dotted lines of dark purple. Lip greenish, tinged with brown on the face and spotted with purple on the side lobes. Mr. WELLESLEY also showed the curious Epi-Cattleya Figaro (E. falcatum × C. intermedia) having fleshy leaves as in E. falcatum and singular flowers, the narrow lanceolate sepals and petals of which are green; the distinctly trilobed lip white with indistinct rose lines on the side lobes, and a yellow tint on the front.

W. M. APPLETON, Esq., Weston-super-Mare (gr. Mr. Brooks), sent Cypripedium Rolfeae, C. Sir Redvers Buller, C. Francis Heygate, Cattleya Appletonae (elongata × aurea), and Zygopetalum maxillare.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), sent Cattleya Lord Rothschild superba, a very large and richly-coloured flower; Laelio-Cattleya Tums (L. cinnabrosa × C. Warscewiczii), with white, salmon-tinted sepals and petals, and purple lip, L.-C. Novelty superba, and a very finely-coloured L.-C. Berthe Fournier. (See Awards.)

Messrs. LINDEN & CO., Brussels, showed a flower of Odontoglossum crispum illustratum, said to be between O. crispum Vinicius and O. c. Perfection. The flower was very finely blotched with rose-purple, the colour covering the greater part of the sepals and petals.

Mr. H. SCHUSTER, Brussels, showed a small collection of hybrids, which included Cattleya Le Czar var. fortissima (granulosa Dubuyssoniana × labiata), a good large, light rose-tinted flower with broad, rose-purple front lobe to the lip; C. Capartiana, a pretty cross between Rex and Warscewiczii; C. Fallieri (Rex × Trianaei), C. Vulcani var. Elisabethae, Laelio-Cattleya bellula (pumila × maxima), and other hybrids.

Messrs. HUGH LOW & CO., Bush Hill Park, showed Cattleya Ariadne (dolosa × labiata) and Cypripedium Fletcherianum. (See Awards.)

AWARDS OF MERIT.

Laelio-Cattleya Berthe Fournier, Holford's variety, from Major G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A remarkable colour variation in Major Holford's fine cross between L.-C. elegans and C. Dowiana aurea, which has already produced some remarkable varieties. The flowers in the present variety had the sepals and petals of a deep coppery-rose colour, the showy lip being ruby-crimson with gold veining at the base.

Cypripedium Victory (Euryale Sanders' variety × triumphans).—A very fine hybrid, adhering closely in rich colouring to C. triumphans. The broad, dorsal sepal had the middle area heavily blotched with blackish chocolate colour on a green-tinted ground, the upper part of the spotted lines being continued by feathered rose markings, the same colour tinging the connecting surface, the margin being pure white. Lower sepals, large and circular; petals broad, tinged with purple and with blackish spots on the inner halves; lip tinged with reddish purple.

Cattleya Hardyana Rex, from the Marquis de WAVRIN, Chateau de Rousele, Belgium (gr. Mr. de Geest).—One of the very finest and darkest forms yet shown. Flowers large, sepals and petals rich rose colour, the large lip of an intense ruby-claret colour with gold lines at the base.

Cypripedium Fletcherianum (Godefroyae leucochilum × Lord Derby), from Messrs. HUGH LOW & CO., Bush Hill Park.—A very fine hybrid, excellent at all points, and most comparable with the fine C. Daisy Barclay of J. Gurney Fowler, Esq., which secured a First Class Certificate, July 4, 1905. The scape bore two fine flowers, the ground colour of which is cream-yellow with broad and heavy blotched lines of dark chocolate purple colour, the lip being of pale yellow with a slight freckling of purple on the face.

Dendrobium Arthur Ashworth (Brymerianum × Dalhousianum), from ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow (gr. Mr. Holbrook).—A singular hybrid, partaking largely of D. Dalhousianum. Flowers yellow, the lip being fringed and having light purple blotches at the base.

Odontioda Bohnhoffiae (Cochlioda vulcanica × Odontoglossum cirrosum), from Messrs. CHARLESWORTH & CO., Heaton, Bradford.—A very elegant little hybrid, of bright and novel colouring. The spike bore flowers with narrow segments resembling O. cirrosum, blood-red in colour, with some whitish ground showing in places, and a slight purple tint at the base of the sepals and petals. Crest of the lip yellow, spotted with red.

BOTANICAL CERTIFICATE.

Trevoria Chloris, from ELIJAH ASHWORTH, Esq., Harefield Hall, Cheshire (gr. Mr. Holbrook).—The remarkable new genus named by the late F. C. Lehmann in honour of Sir Trevor Lawrence, Bart., and described and illustrated from native specimens, sketched by Mr. Lehmann, in the *Gardeners' Chronicle* May 29, 1897. The illustration shows it to be a very singular and attractive plant, though under cultivation it has not yet appeared at its best. The flowers, which are greenish and fragrant, are produced in drooping racemes, generally of three flowers each.

DIPLOMA AWARDS.

Cypripedium Rothschildianum Hybrids.—1st Diploma.—Cypripedium Fletcherianum, from Messrs. HUGH LOW & CO. *2nd Diploma.*—Cypripedium A. de Lairesse, Westfield variety, from FRANCIS WELLESLEY, Esq.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq., Chairman, and Messrs. W. Bates, A. Dean, A. R. Allan, W. Fyfe, Ed. Beckett, H. Parr, Geo. Kelf, W. Pope, H. J. Wright, W. Barnes, R. Lye, Owen Thomas, Jno. Lyne, H. Markham, F. Q. Lane, Geo. Reynolds, P. D. Tuckett, Chas. Foster, J. Willard, J. McIndoe, W. H. Divers, W. Poupart, A. H. Pearson, Jos. Cheal, S. Mortimer, J. Davis, and Jas. Vert.

Messrs. HARRISON & SONS, Leicester, exhibited fruits of the Leicester Crab, a seedling from the Dartmouth. The fruits are chiefly of a yellow colour, and rather long in form. One might imagine the other parent to have been Kerry Pippin. It is recommended for the making of fruit jelly.

A Cultural Commendation was awarded to Mr. T. H. SLADE, Poltimore Gardens, Exeter, for excellent fruits of Michaelmas Nelis Pear.

Messrs. GEO. BUNYARD & CO., Maidstone, Kent, showed a group of fruits and fruiting trees in pots, of superior excellence. The trees were admirably-grown specimens, and they were well furnished with fruits. Plums, Apples, Pears, Figs, and Grapes were included, the most remarkable being the Apples; a dish of Gascoyne's Scarlet Seedling can only be properly described as superb. These fruits were not only large, but they carried a magnificent colour, and were covered with a delicate bloom; Peasgood Nonsuch, Twenty Ounce, Emperor Alexander, and others were almost as fine. The Pears were also large and shapely, showing high culture, prominent varieties being General Todtleben,

Marguerite Marrillat (some of these fruits must have weighed a pound), Souvenir du Congrès, Durondeau (an excellent dish), Doyenné du Comice, Conference, White Doyenné, &c. A curious Japanese Pear was shown—a tree in bearing—with globular fruits, and very russety skins, of a beautiful golden-brown colour. It was labelled Chiojuro. The Plum trees were especially good, such varieties as Coe's Golden Drop, Late Orange, and President being well furnished with fruits. Pot vines of Appley Towers, Diamond Jubilee, and Gros Maroc Grapes, and small Fig trees completed the exhibit. (Gold Medal.)

Mr. H. J. DOVER, Langley Fruit Gardens, Bath Road, Langley, Bucks., displayed six large bunches of Muscat of Alexandria Grapes.

A group of considerable interest was shown by A. E. SPEERS, Esq., Sandown Lodge, Esher, Surrey. It comprised a very complete collection of ornamental Cucurbitaceous fruits—Gourds, Squashes, Melons, Cucumbers, &c. The popular names were attached to the fruits, thus were seen the Powder Flask Gourd Lagenaria pyrotheca, the Fig-leaved Gourd Cucurbita ficifolia, the Gooseberry-fruited Gourd, &c. The Loofah—Cucumis cylindrica; the Spanish Gourd, the fruits of which are used as seats in Spain; Momordica charanta—the Balsam Apple; the Colocynth-Lagenaria colocynthis; Lagenarias in several species, &c., are some of the more interesting shown. (Silver Gilt Knightian Medal.)

AWARDS OF MERIT.

Apple, Miller's Seedling.—This is not a new Apple, but is apparently very little known throughout the country, although grown extensively in some districts of Berkshire and Sussex. The fruits are medium to large size, very slightly ribbed, of rich yellow colour, with pale-reddish markings on the side next to the sun. The skin is particularly clear and free from the least suspicion of russet. The stalk is thin, about an inch long, and it is set in a deep, narrow, funnel-shaped cavity. The eye was open in the specimens exhibited, and it was set in a very slight depression. The flesh is soft, sweet, and of agreeable flavour, but being fit for consumption at the beginning of August the fruits are scarcely so good at this later date. It appears to be a first-rate early Apple, and there is certainly an abundance of room for Apples of high quality fit for consumption in September and October. The specimens shown were exhibited by Lady WANTAGE, Lockinge Park, Wantage (gr. Mr. W. Fyfe).

Pear Collis's Hessle.—This variety is described as a sport which appeared on an old tree at Chiswick twenty-eight years ago. It is regarded as an improvement on the Hessle Pear, but the fruits as shown had very hard, rough skins, and could not in the least be compared satisfactorily with ordinary dessert Pears. Shown by Mr. FRED. COLLIS, Bollo Lane, Chiswick.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 7.—*Members of Committee present:* E. Ashworth (Chairman), W. Duckworth, Z. A. Ward, J. E. Williamson, H. Smith, W. Stevens, H. Thorp, C. Parker, A. J. Keeling, F. W. Ashton, E. Rogers, J. C. Cowan, and P. Weathers.

The meeting on the above date was held at the Royal Botanical Gardens, Old Trafford. Only a moderate display of plants was staged, although some were of exceptional merit.

First-Class Certificates were awarded to Mr. N. J. BROMILOW, Rainhill, for Cattleya × Iris var. "Marjorie," and to Mr. E. BOSTOCK, Stone, Staffs., for Cypripedium niveum Bostock's var., a very fine form.

Awards of Merit were awarded to Mr. W. THOMPSON, Stone, for Cypripedium × l'Ansoni var. inversum, and a new hybrid Odontoglossum, the parents of which were O. Harryanum × O. Vuylstekeanum. Mr. E. D. BOSTOCK had a similar award for a good form of Cypripedium Charlesworthi named "Holly House var." Mr. N. J. BROMILOW gained a similar award for Cattleya × Iris Mrs. J. Bromilow.

Dr. HODGKINSON, Wilmslow, exhibited the rare Zygopetalum × Roeblingianum, and a pretty variety of Cattleya × Iris. E. ROGERSON, Esq., Didsbury, exhibited Cypripedium × "Mrs. G. Fletcher." *P. W.*

GARDENERS' DEBATING SOCIETIES.

REDHILL, REIGATE AND DISTRICT GARDENERS'.—A general meeting of the above association was held on Tuesday, September 18, Archdeacon Daniells presiding. A display of fruit, flowers and vegetables bore testimony to the support accorded what is termed "Hospital Night," the produce being sent to the Redhill Cottage Hospital. Mr. W. P. Bound presented a brief report of the work of the summer session. Messrs. W. P. Bound and W. Rose were appointed delegates to attend a meeting in London to consider the advisability of uniting the various gardening mutual improvement societies into a central body. The meeting agreed that in future the annual meeting of the society shall be held in January of each year. Mr. Seldon, of Woodhatch House, Reigate, next read a paper on "The Cultivation of the Mushroom." The materials best suited for their growth, the preparation and the forming of the same into beds, spawning the beds, and the proper temperatures to observe, formed the principal items of the paper. The lecture brought forth a good discussion. *Frederick C. Legge*

CROYDON & DISTRICT HORTICULTURAL.—At the meeting of this society held on Tuesday, 18th inst., Mr. W. J. Simpson, a former member of the society, read a paper on "The Sowing and the Germination of Seeds." Three essential requirements for seed germinating are moisture, air, and a proper temperature. Light is not necessary, in fact it is a deterrent. Never sow too thickly—a mistake often made, for even if thinning is adopted, this cannot be done without disturbing the roots of the remaining plants. A good discussion followed the reading of the paper.

ANSWERS TO CORRESPONDENTS.

AGREEMENT IN RESPECT TO HIRING OF GREENHOUSE: *Annoyed.* 1, You can distrain for arrears of rent; 2, From the facts which you give it seems clear that you both looked upon the tenancy as a yearly one. Market gardens come within the Agricultural Holdings Acts, and these Acts require a year's notice to be given, but upon the special facts which you state it seems questionable whether the house is being used as a market garden within the meaning of the Acts. On the whole we do not think it is, and therefore we consider the notice you have given is sufficient, but it is possible that the judge might take a different view. If the tenant refuses to quit at the end of 12 months you had better instruct a local solicitor; 3, The tenant is only entitled to the same amount of water supply as was available when the tenancy commenced.

BOOKS: *W. Hazell.* *Dictionary of Gardening*, by George Nicholson, in five volumes, price £1 2s., or *The Gardeners' Assistant*, in six volumes, price 8s. 4d. each volume. Both books may be obtained from our publishing department.

CAULIFLOWERS BOLTING: *Eccles.* The dry season may have caused the plants to bolt, although at present we see no signs of an inflorescence. Send another specimen when the plants are further developed.

CONSTRUCTING A CHEAP GREENHOUSE: *Tropical Grower.* By your reference to a house measuring from 10 to 12 feet, we conclude that you only require one sufficiently large to admit of your raising 10,000 seedling plants of Chrysalidocarpus (Areca) lutescens, and that you contemplate sowing the seeds in boxes and allowing the seedlings to attain to a height of 6 inches before potting them. If we are correct in our supposition, a low, span-roofed house, 12 feet long and 10 feet wide, running north and south, will answer your purpose, and will be large enough to contain your 10,000 seedlings when potted into small pots measuring 3 inches in diameter. A 4½-inch brick wall, 9 inches high, resting on a 9 inch wide foundation, will be a sufficient base on which to construct the house. The woodwork should consist of 4½ by 3½-inch wall plates, bevelled on top, not only sufficient to receive the rafter at the proper angle, but also to prevent internal moisture settling thereon when covered with the glass. The end rafters should measure 3 by 4 inches; end and division bars, 1½ by 3 inches; ridge, 1½ by 7 inches, this being grooved in a line with the bed of the rafters to receive the top square of glass. The capping for the ridge must be 1 by 5 inches (bevelled off on both top sides); drip, 1 by 3 inches; door frames, 3 by 4 inches (the lintel being bevelled to prevent water lodging thereon), with oaken sills of the same size (height of door to be determined at the time of construction). The length of the rafters should be from 7 to 7½ feet; and a sunken pathway, 2 feet wide, should be provided along the centre of the house, in order to secure comfortable headroom therein. This will allow a space 4 feet wide on either side the pathway for standing the seedling plants on, after it has received a surfacing of sifted coal-ashes a few inches thick on the top of cinders or coarse gravel as drainage material. The rafters should be secured to the plates and ridge at intervals of 18 inches, nine rafters (including the two end ones) being required for a house 12 feet long. Two ventilators, 3 feet long and 19 inches wide, should be fixed in the roof, one on either side. Twenty-one ounce glass, in panes 18 inches wide and 20 inches long, should be used. This length includes an allowance for ¼-inch over lap, and extension of lower pane 1 inch on the drip board. Three squares will thus be required to glaze each pair of rafters; 54 panes in all. The glass should be bedded in best white lead putty, and be secured in addition with four brass brads to each pane, so fixed as to allow room for the expansion of the glass. In the 54 panes estimated for the roof are included four squares for the two ventilators. The woodwork should receive two coats of good white-lead paint before being fixed, and one more when erected. The cost of constructing such a house would be about £9. Either the "Loughborough," the "Ipswich" heating apparatus, the "Invincible," or such-like vertical heating appliances, which can be built into the wall, and be fed from outside the house, will answer your purpose; the cost of heating, including two rows of 4-inch piping, will be about £6.

COPPER COLOURED BEECH: *M. S.* The tree has been injured by a fungus which causes root-rot. Expose some of the roots and remove a portion of the bark. If the white spawn of the fungus is found to be present under the bark, it is practically impossible to save the tree. The only chance is by exposing the roots around the base of the trunk, and mixing with the soil a dressing of equal quantities of quick-lime and sulphur.

CROCUS SPECIES: *Basil Levett.* We do not know the exact limit of the depth to which the corms may descend, or that certain sorts are in the habit of burying themselves deeper than others. Our experience in the matter is that those that remain the longest time without disturbance will be found to have the corms deepest in the earth. It frequently happens that the strongest and tallest growth and best flowers are produced from very deeply-planted (or buried) corms. As an instance it may be pointed out that it is quite a common experience in nursery gardens to find stray corms at a foot deep in the ground, these having been overlooked and subsequently turned in during the work of tilling the soil. Much the finest plants of single Snowdrops we have seen were growing in large clumps of exceptional vigour, with the roots at 15 inches deep. These remarks apply equally to Scillas, Leucoums, Muscarias, Chionodoxa, and many other genera. In the wild state many bulbous plants as the Lily, Vallota, Erythronium, Narcissus, and others are found at depths varying from 15 inches to 24 inches, and these conditions appear to increase the top growth. We cannot say definitely, however, that deep planting will prove to be a perfect cure for the breaking down of the flower stems by wind, but it may assist them to withstand wind of ordinary power. The better way, we think, for garden purposes is to provide a thin evergreen "carpet," such as is formed by a moss-like Saxifraga, or dwarf-growing Sedum, for such a "carpet," whilst giving support to the flower stems, will also keep them clean and will not in any way retard their growth.

CUCUMBER LEAVES DISEASED: *W. C.* The plants are affected with the spot disease, so often described in these columns. You should burn all traces of the diseased plants, otherwise it will spread rapidly. Spraying with liver of sulphur, ½ oz. to two gallons of water, will do much good. Next year do not cultivate Cucumbers and Melons in the house in which the disease has appeared. Caution.—Liver of sulphur turns paint black, therefore spray with due regard to the woodwork.

DENDROBIUM CHRYSANTHUM: *R. H., Jamaica.* Your fine specimen, with over 1,000 perfect flowers, is superior to any of which we can find record.

FAIRY RINGS: *W. S. & Sons.* The fungus is Tricholoma gambosum. To destroy them thoroughly soak the ground with a solution of sulphate of iron, 1 lb., dissolved in three gallons of water. Loosen the turf with a fork so that the liquid can enter it freely, and treat the grass with the solution well beyond the rings.

PINE SHOOTS EATEN: *S. H.* The damage has been caused by the Pine Beetle, Hylesinus piniperda. You must cut down all dead or dying trees, for it is in these that the pest breeds. Place some small brushwood about the plantation or larger branches of the trees, and allow any fallen trees to remain until the following May, when they should be barked, and the exposed grubs be destroyed. The brushwood and the smaller branches that are too small for barking should be burned.

GARDENERS' ADDRESS BOOK: *J. S.* Send particulars to the editors of the *Horticultural Directory and Year Book*, 12, Mitre Court Chambers, Fleet Street, London, E.C., and *The Garden Annual*, 17, Furnival Street, High Holborn, London.

GRAPES DISEASED: *H. S., Hatfield.* There is no fungus present on the Grapes to account for the shrivelling of the berries. The injury is probably due to some root trouble that should be attended to. The Tomato shows the black-stripe disease. This fungus first appears on the stem and afterwards infects the young fruits. Diseased plants should be removed, or the adjoining ones will become affected. Spraying is of no use after the fruits are formed.—*A. H. H.* Owing to the decayed condition of the berries, we were unable to determine if a harmful fungus was present, but the berries were similar in appearance to those sent by *H. S., Hatfield.* We should certainly advise the cleansing of the house with some suitable fungicide, such as weak carbolic acid in warm water. Above all, see that the roots are growing in such conditions that they can perform their functions properly.

GRUBS IN POTATOS, &c.: *W. G.* The insects you send are the Common Millepedes. Dress the land late in autumn with gas-lime, and allow it to remain fallow for some time. See p. 129 of the *Calendar of Garden Operations* for a note on and illustration of these pests. This book can be obtained from our publishing department, price 7½d., post free.

IVY LEAVES DYING. *A. D. W.* Drought is the primary cause of the trouble, and red spider has also injured the leaves, but the latter alone would not have killed the plants.

ONION MILDEW: *D. K. D.* The bulbs are badly affected with this disease, the work of a fungus, Peronospora Schleideni. Collect and burn all diseased leaves, and do not throw any of the parings of the outer scales on the rubbish heap; these must also be burned. Do not grow Onions on the same land again for three years, but select a dry and exposed position for them. In the early stages of the disease, its spread may be checked by dusting the plants with powdered quick lime and sulphur, using twice as much lime as sulphur.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay both of time and money, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruits at one time; they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.*—*J. L.* 4, Golden Spire; 4, Yorkshire Beauty; 6, Bedfordshire Foundling; 7, Keswick Codlin.—*Lady M.* 1, Jolly Beggar; 2, Duchess of Oldenburgh; 3, King of the Pippins; 4, Cox's Orange Pippin; 5, Cox's Pomona; 6, Kerry Pippin.—*U. S. A.* Your fruit is not recognised. It is of excellent culinary quality, and has a pretty appearance. When cooked it greatly resembles Wellington.—*G. E. F.* 1, Kentish Fillbasket; 2, Ord's Apple; 3, Cox's Pomona; 4, Lady Sudeley.—*Insignis.* Whorle Pippin or Lady Derby.—*A. D. Roe.* 1, Not recognised; 2, Emperor Alexander; 3, The Queen; 4, American Mother; 5, Old Nonpareil; 6, Cox's Orange Pippin.—*Correspondent.* No letter. Fruits in an Ogden's cigarette box. 1, not recognised; 2, a small fruit of Worcester Pearmain.

NAMES OF PLANTS, *C. H. P.* Clematis brevicaudata. *W. C. M.* 1 and 2 send when in flower. 3, Colutea arborescens, the Bladder Senna. *A. M., Gateshead.* 1, Pulmonaria officinalis; 2, Saponaria officinalis (double-flowered variety).—*K. H., Hampstead.* Alnus glutinosa, the common Alder.—*A. M.* 1, Hemigraphis colorata; 2, Episcia cupreata; 3, Pellionia pulchra; 4, Cunninghamia cordifolia; 5, Senecio suaveolens; 6, Helenium Bigelowii.—*W. E. P.* 2, Teucrium fruticans.—*L. Wingate.* Sneda fruticosa.—*S. H. M.* The plant is properly named Eriogonum racemosum.—*Sam.* The leaf appears to be that of Ginkgo biloba (Salisburia adiantifolia), which is known as the "Maidenhair tree." Ascertain where the wood forming the post was obtained from, and if it has made roots. The flower is that of a species of Primula, but which species cannot be determined from such a specimen.—*H. M.* Solanum rostratum.—*F. T.* 1, Euonymus radicans variegata; 2, Cerastium tomentosum; 3, Achillea Ptarmica flore-pleno; 4, Lilium speciosum (lancifolium); 5, Monarda didyma; 6, Asperula odorata, Sweet Woodruffe.—*G. P.* Iris japonica (fimbriata). Requires to be potted in sandy loam.—*J. W. B.* 1, Cattleya Eldorado; 2, Cattleya Gaskelliana.—*H. M. V.* 1, Odontoglossum Lindleyanum; 2, Odontoglossum Wallisii; 3, Masdevallia militica; 4, Cochlioda Noezliana; 5, Pleurothallis Roezlii; 6, Brassia brachiata.—*W. J. H.* Cymbidium ensifolium.—*C. B.* 1, Adiantum trapeziforme; 2, Adiantum sulphureum; 3, Asplenium lucidum; 4, Selaginella Wildenowii; 5, Pteris hastata.—*M. H. L.* 1, Rudbeckia speciosa; 2, Tradescantia virginica; 3, Erigeron speciosum.—*H. S.* Saponaria officinalis, double-flowered variety.—*E. Y.* Caryopteris Mastacanthus.—*J. S.* We cannot name the specimen from the leaf only.—*J. W., Glasgow.* Cyclanthera explodens.

FIG. 98.—A POTATO PIERCED BY COUCH-GRASS.

POTATO TUBER PIERCED BY COUCH GRASS. *J. B.* Thanks for sending the specimen. We reproduce an illustration at fig. 98 of a similar case. The shoots of the grass are said to secrete a juice which softens the tissues of the Potato tubers, and thus facilitates the growth of the grass.

PEACH AND NECTARINE ON THE SAME BRANCH. *H. M.* We have previously received examples of these fruits growing on the same shoot, this is not to be wondered at, for there is no difference botanically between the Peach and Nectarine. In our issue for August 2, 1902, p. 70, there appeared an article on the subject with illustrations, one of which shows a fruit that is partly a Peach and partly a Nectarine.

POTATOS DISEASED. *E. E. M.* The tubers are affected with the black scab or warty disease. This is the work of a fungus, Œdomyces leproides, consequently you must destroy all diseased portions of the Potatos by burning, and be careful not to plant Potatos in the same soil for several seasons. Powdered sulphur mixed with the soil when the "sets" are planted will act as a corrective. See article with illustration of this and other diseases of the Potato published in the *Gardeners' Chronicle*, April 23, 1904, p. 257.

TEMPORARY TREATMENT OF FOUR ACRES OF LAND: *Inquirer.* If conveniently lying for the purpose of a garden the land might be formed into a square or an oblong, and be bounded with a wire fence (which need not be higher than 3 feet) so as to exclude rabbits and hares, and then a road, not necessarily metalled or gravelled, should be staked out about 20 feet distant from the fence, this roadway being made 8 feet in width to allow of a cart passing along it. The soil thus removed may be thrown on to the land between the road and the fence, thus making a slightly sloping border, very suitable for dwarf-growing plants, whether for decorative purposes or economic use. That done, the rest of the land may be divided into sections of rather less than one acre; footpaths, 5 feet wide, being arranged and planted on either side with fruit trees, preferably pyramids, or bushes of Apples on Paradise stocks, Pears on the Quince, and Plums as bushes, and as the number of these must be limited they may stand at 20 feet apart. The loss would not be great when portions of the land are taken for building purposes, because the fruit trees could then be moved to another site. There will thus be four pieces of land divided from each other by a path of the above-named width, so that there will be a path running, say, from north to south and one from east to west. At each angle a plot of 20 feet in width may be reserved for tall Dahlias of the Cactus and decorative types, Hollyhocks, the finest Sweet Peas, Rosa Wichuriana, and hybrids from this species, Perennial Asters, &c. Across the paths, at widely distant points, arches for climbing (Rambler) Roses may be constructed, peeled Oak branches to be employed in preference to iron for the making of these arches. The walks may be bordered with a line of Sage, Thymes in variety, Pot-Marjoram, Parsley, broad-leaved Sorrel, single and double flowered Violets, Primroses, Polyanthus, and behind these lines Narcissus in variety, Crocus, Anemones, Wallflowers in variety, intermediate and 10-week Stocks, Lunaria biennis, and many other annual and biennial plants that can be easily raised from seed may be planted. The main areas in the quarters may be cropped with early and mid-season Potatos, Cauliflowers, French Beans, Lettuces, Seakale, Asparagus, early and late varieties of Strawberries, Broccolis, Cabbages (not many of these), Cottagers' Kale, and Peas. Of flowering plants Montbretias, Gladiolus, Pæonies, summer-flowering Asters, also the perennial species and varieties, shrubby Phloxes, Gaillardias, and Sweet Peas should be grown in quantity, also the finer varieties of Mignonette, and many other plants that can be quickly raised from seeds and cuttings, and which would find a ready sale if not required at home. It should not be forgotten that some amount of levelling may have to be done first of all, and draining, if the land does not overlay a gravelly subsoil, or if it lies in a valley or depression. It may be necessary to trench a portion of the soil yearly until the whole has been done, but for the first year deep digging or bastard trenching would suffice after dressing it heavily with stable dung. Special manures might be applied to certain crops, during the season of growth, with advantage. Without some knowledge of the ground in question we are unable to afford more precise information.

ROYAL LILY NURSERY, DERSINGHAM.

AS an example of specialised culture begun in quite a small way, the nursery of Mr. T. Jannoch is remarkable in several directions. It was established ostensibly for the cultivation of Lily of the Valley, and the supply of roots, flowering plants, and blooms for cutting. The material supplied to the public, and to members of the trade, commanded great approbation from the first, and the proprietor soon became favourably known as a cultivator and forcer of, and an authority of repute on, Lily of the Valley.

Up to that date, now nearly 30 years ago, Lily culture in nurseries and private gardens was but little understood or practised, and the special production of flowering crowns by sorting out the one, two, and three year old crowns (buds) was scarcely known or thought of as being essential by the cultivators of the home-grown plants. At that period the late Mr. Herbst, of Richmond, and Mr. Iceton, then of Barnes, were the better known dealers in Lily of the Valley; and these men were forcers of roots—not growers—in the ordinary sense of the term. The supply of clumps and crowns came from the Continent. Mr. Jannoch was the first to show us how easy it is to cultivate the plant under suitable conditions in this country, and since that time others have followed in his footsteps; but owing chiefly to the dearness of labour, special cultivation of the plant has not made much progress, with the result that the Continental cultivators furnish the major proportion of crowns and clumps forced at the present day. The two methods—retarding in a freezing chamber and etherisation—are employed in the production of Lily of the Valley flowers during, practically, the whole year. Retarded Lily of the Valley can be had in bloom at any time during the autumn and summer months, and they will open their "bells" and develop fine foliage in the course of two or three weeks in a cold frame or a greenhouse, and even in a living-room they will come to perfection. After October, however, more heat is required from week to week, otherwise success is less certain; and the flowers are weak and stunted, and being too long in opening, many of the flower buds become yellow and finally drop off. The plants require no bottom heat before October, and in no case afterwards should the bottom heat be more than 75° Fahr.

Lilacs.

Of late years Lily of the Valley cultivation at Dersingham has given way to that of Lilacs, of which M. Lemoine's fine varieties form the bulk of those grown. Of single-flowered varieties there are about 50 of the best; and of double-flowered about the same number of varieties. The mother plants are grown in the ground in lines by the sides of the walks, forming a magnificent display when in bloom. The whole of the saleable stock of these plants is grown as potted plants fit for forcing or for planting out.

The largest of these are in small tubs 1 foot and 1½ feet in diameter, and in 8 and 10 inch pots; the biggest plants are furnished with from 25 to 35 shoots apiece, and strong, fat buds that are sure to throw four flower spikes on each shoot, giving a grand display when forced. All blind and weak shoots are carefully removed several times during the season of growth so that the strength of the plant is confined to the main shoots, hence the great size of the spikes and flowers, and the flowering shoots in general measure from 1½ to 2 feet in length, and are of great strength furnished with large, leathery leaves of a dark-green tint, when the flowers are dark-coloured and of a lighter tint in white and pale coloured varieties. It often occurs that triple terminal buds appear, and the centre bud is removed by hand in July if nature has omitted to suppress it.

Many, and indeed most, of the older plants are worked on stems of seedling Syringa vulgaris, 1½ to 2 feet in height. The second sizes of plants observed are standing in pots of 8 to 10 inches in diameter, and they are furnished with six to eight heads each, with 1½ to 2 feet stems. It is of the greatest consequence that a Lilac plant for forcing purposes should have the shoots well matured, and this can only be assured by full exposure to light and air, and with this intent the plants are plunged to three-quarters the depth of the pots, and are never top dressed with either soil or manure, although during the season of growth manure water is occasionally afforded. They are stood at 3 feet apart in the lines, with 2 feet spaces between the lines, there being three lines in a bed; smaller plants on 1 foot to 1½ feet stems are placed at 2 feet and 2½ feet apart. These plants looked very promising for bloom, and were showing from five to seven shoots per plant. Their ages ranged from three to four years. In every case the plants, after having bloomed, have the last season's growth cut back to within 3 to 4 inches of the base.

With the exception of two beds of 50 yards in length holding the largest plants, all the other portion of the stock stands on the soil, and thus secures perfect ripening, and there is complete control over the application of water, each plant getting what it needs, and that only. Continental cultivators invariably sink the pots deeply and mould them over, thus inducing roots to grow over the rim, which have to be removed on taking them out of the soil.

Miniature Lilacs.

These beautiful objects for room decoration, for the dinner table, and general greenhouse display were noted in considerable numbers, growing in 5-inch pots, and reaching a height of only 1½ feet, possessing four, five and six shoots, each furnished with two or more flower buds. These plants are plunged in the soil up to the rim of the pot at 9 inches apart.

There were several successions intended for flowering in succeeding years. The plants are never repotted. Miniature plants under ordinary conditions will keep in good bloom from three to five weeks.

Contrary to all practice, plants are taken from pots or the open ground, all the soil shaken from the roots, at once dipped into a thick mixture of cow-dung and water, and potted forthwith. This is carried out in the month of July, and the plants are stood in the full sun without wilting or the loss of a leaf.

Budding of Stocks.

This is an operation which is preferred by Mr. Jannoch, although at the start a year is lost as compared with the results obtained by grafting, but the ensuing growth is much stronger, as may be noticed in Peaches, Pears, etc., and at the first cutting back a strong bud of shoots is secured, much more so than from grafted plants.

Budding is commenced in July, and continued throughout August. The plants, according to the height at which the stocks are budded as dwarf bush, and to form quarter, half, and full standards, and miniature plants.

Remarks on Varieties.

The best white Lilac is considered to be Frau b. Dammann; it is single flowered, has very large spikes; Grand Duke Constantine has greyish-blue flowers, and is one of the finest doubles; the colour is that of the Marie Louise Violet. Belonging to the same class are Madame Abel Chatenay, a very beautiful, white flower; Mad. Casimir Perier, a quite new variety, white, and excellent for forcing; Mad. Lemoine, white, a large spike; Michel Buchner, pale lilac, a dwarf-growing plant; President Grévy, a very double, blue-tinted variety, with a long spike; President Carnot, large pale lilac spike, and free to flower; pyramidalis, large and dense spike of a fine mauve colour; Alphonse Lavallee, with very large spikes of blue shaded violet; and Charles Joly, a dark purple, one of the finest of the dark-coloured varieties. These mentioned force well whether retarded or not, and are fine out-of-doors objects in the garden.

Equally excellent in the same way are the following single-flowered varieties:—Charles X., a strong grower, in several shades of lilac, and one of the best for forcing; Claude Lorraine, very large spikes of a deep lilac tint; Madame Francisque Morel; Marie Legraye, large white spikes, forcing well; Reaumur, carmine, flowers of satiny texture, spike very large; Rouge de Marly, reddish-purple; Rouge de Trianon, very large spikes, the individual flowers large, and of a reddish-blue colour; Souvenir de Louis Spath, dark purple, flowers large, the finest of its colour; Ville de Troyes, dark purple, a fine variety.

A few other items may be named of which good stocks were noted of Cyclamens, Begonia semperflorens in variety; Phyllocactus Deutsche Kaiserin, a beautiful variety having pink flowers freely produced, which last a long time in perfection; "Malmaison" Carnations, Asparagus in all the well-known varieties and species; Violets, both double and single flowered; Hydrangeas in varieties, and numerous species of trees and shrubs for forcing, &c.

RETARDATION OF GROWTH BY MEANS OF COLD.

The action of continued cold upon plants is to keep in check, in actual suspension, the natural tendency of plants to grow at root and top in spring, and this suspension of the vital power may be prolonged from January to June, and probably for a much longer period. The application of the cold process is to a certain extent combined with a certain cost. By the cold process Lily of the Valley, Lilac, various species of Lilium, Hydrangeas, Ghent and Mollis Azaleas, Gueldres Rose, Prunus of species, Philadelphus hybridus Lemoinei, &c., may be kept till any period late in the year, and they will bloom just as well and as certainly as non-retarded plants: Lily of the Valley in about three weeks and Lilacs in about the same time.

ETHERISATION

produces a change in plants that causes them to grow more quickly and open the flowers sooner when they are put into warmth. It is applied in autumn and winter to plants that have not had their usual length of rest. The inventor of the original process was Dr. Johannsen. Ether causes the sleep or repose to be far deeper, and according to the duration and density the more easy and rapid is their recovery. The effect of ether or chloroform vapour is supposed to be due to the drying up of the food juices in the stems and bases of the buds. Before a selected plant is put into the ether-chamber, the soil, stems and foliage are thoroughly dried, so much as to be productive of a certain degree of withering. The ether is applied by being poured into a shallow vessel through a short length of pipe inserted in the centre of the arched roof of the etherising chamber, after the door has been hermetically closed; the fumes, being heavier than air, fall down among the plants standing on the floor. The ether is applied in most instances twice in 48 hours, a 12 hours' interval being afforded with the door opened. Not all species of plants require two doses. *L. M.*

PLANT PORTRAITS.

NEW OR NOTEWORTHY PLANTS.

DEUTZIA MOLLIS, DUTHIE, N. SP.*

This very distinct and beautiful species was discovered by Mr. E. H. Wilson in the Hupeh district of Central China, growing on cliffs (Nos. 1,917, 1,959, and 2,282a). It was raised by Messrs. Veitch & Sons at Coombe Wood, and flowered for the first time in this country during the summer of last year. In the shape of its leaves and in its rather flat corymbose panicles it resembles some of the forms of D. parviflora Bunge, but it can at once be distinguished by the softly pubescent under-surface of the leaves, and by the wings of the filaments not being toothed. The flowers are white, or sometimes with a tinge of pink.

DEUTZIA GLOBOSA, DUTHIE, N. SP.†

This species was raised by Messrs. J. Veitch and Sons from seeds collected by Mr. E. H. Wilson in W. Hupeh in Central China. It flowered for the first time in this country during the summer of 1905. The flowers, which are arranged in dense globose panicles, are medium-sized and of a creamy white colour. It differs from D. Vilmorini in its cup-shaped corolla, and from D. Wilsoni in the longer and narrower calyx-segments. The wings of the petaloid filaments are not produced at their apex.

DEUTZIA RUBENS, DUTHIE, N. SP.‡

This species was discovered by Mr. E. H. Wilson in Central China, and was raised by Messrs. Veitch and Sons in their nursery at Coombe Wood. It flowered for the first time in this country during the summer of last year. It is a small and somewhat slender-growing shrub with greyish bark and narrowly lanceolate serrate leaves. The flowers, which are pure white, are borne on slender pedicles and arranged in corymbose panicles. It differs from D. Wilsoni in its much narrower calyx segments, and from all previously described species by the reflexed lateral margins of its petals.

* DEUTZIA MOLLIS, *Duthie*. Frutex 9-24 dm. altus [illegible] glabris [illegible] rubro-brunnei [illegible] dense hispidulis. Folia petiolata absque petiolo 5-10 cm. longa et 2·5-5·5 cm. lata, elliptico-lanceolata [illegible] oblique et obtuse acuminata basi rotundata [illegible] utrinque pilis et squamis minutis stellatis [illegible] supra aspera, subtus pallidula densi et molliter [illegible] costam venasque [illegible] serratis, dentium apicibus callosis [illegible] 4-6; petiolo circa 6 mm. longo supra profunde [illegible]. Paniculae breves, laxe corymbosae [illegible] compositae, ramulis calycibusque dense hispidulis [illegible] stellatis obsitis. Flores 8-10 mm. diametro, albi vel pallide rubri. Calycis lobi breves [illegible] patentes [illegible]. Petala 5 mm. longa, sub-[illegible] extra stellato-pubescentia. Stamina alterna breviora sursum sensim attenuata, [illegible]. Styli tres [illegible] stamina longiora aequantes. Capsula matura subglobosa [illegible] mm. diam., hispidula et squamis stellatis dense induta.

† DEUTZIA GLOBOSA, *Duthie*. Frutex, cortice rubro-brunneo [illegible] breviter petiolata, 5-9 cm. longa, ovato-lanceolata [illegible] obtuse acuminata, basi cuneata, marginibus [illegible] denticulatis, supra scabrida, subtus pallida, costa [illegible] pilosis, petiolo 6-8 mm. longo. Flores in paniculis densas patentes globosas dispositi, luteo-albidi; bracteae lineares, pedicellis [illegible] breviores. Calyx 7 mm. longus, tubo hemisphaerico, lobis tubum aequantibus [illegible] triangularibus, demum reflexis. Corolla 15 mm. diam. [illegible] cyathiformis, petalis apice cucullatis, marginibus [illegible]. Stamina petaloidea alterna breviora, longiorum alis abrupte angulatis, haud productis; antheris [illegible]. Styli tres, infra medium haud [illegible]. Capsula 4 mm. longa, subglobosa, squamis stellatis dense obsita.

‡ DEUTZIA RUBENS, *Duthie*. Frutex parvus [illegible] gracilibus, cortice brunneo-cinereo [illegible] deciduo. Folia 5-6·5 cm. longa, 2-2·5 lata, anguste elliptico-lanceolata, acuminata, [illegible] stellatis [illegible] pallida, marginibus [illegible] costa venisque infra valde prominentibus, petiolis [illegible] 7 mm. longis, supra profunde canaliculatis. [illegible] 15 mm. in paniculis [illegible] dispositi, [illegible] squamis stellatis obsitis; bracteis 10-13 mm. longis, lineari-lanceolatis, persistentibus [illegible] marginibus [illegible] calycis tubus hemisphaericus, lobis circa 3 mm. longis [illegible] triangulari-lanceolatis, primum erectis, demum patentibus. Petala 6 mm. longa, ovato-oblonga, extra pubescentia, apice cucullata, marginibus lateralibus reflexis. Stamina petaloidea, alterna breviora, [illegible] apice abrupte angulata [illegible] antheris [illegible]. Capsula [illegible] 5 mm. diametro, sparse squamis stellatis [illegible].

THE FLOWER GARDENING AT HAMPTON COURT.

THE long herbaceous border on either side of the Palace facing east of the pleasure ground was looking remarkably well on September 12. I have seen the same annually for a number of years, but it has never before appeared to me so beautiful at this season of the year. The disposition and arrangements of the plants, and the grouping and harmony of colours, leave little or nothing to be desired. In addition to the usual autumnal occupants of such a border, a few specimen plants have been introduced here and there which are little cultivated now, but, though not so gorgeous in colour as the bulk of the plants in bloom, arrest attention and afford pleasure by their quaint habit of growth or curiously coloured flowers. Such a plant was the old "Mina lobata," its pendent yellow flowers and its Ipomœa-like growth contrasting pleasingly with the more formal and familiar flowers. The Coleus, grown ordinarily for its foliage alone, has beauty added to it by its long flower scapes of feathery blue, and helps to add a charm to this border. Here also are introduced patches of white Bouvardias growing luxuriantly and bearing a profusion of bloom. A happy use is also made of the single annual Aster—a flower of the most artistic form and delightful shades of colouring. I saw a little front garden of a small cottage on the Bath road near Slough planted wholly with this Aster last year. It appealed to me as being the prettiest little garden picture I had seen for a long time.

I have one fault to find with this fine border at Hampton Court, and that is the poor way in which the wall at the back of it is furnished with climbing plants. This is not so apparent now; but in the spring the bareness of this wall is painfully conspicuous. The effective covering of such a wall, I know, is attended with many difficulties, the crowded condition of the border during summer being a bar to successful growth. Still, I think something might be done to improve matters in this respect. For instance, the beauty of even this fine border might be enhanced by the introduction of masses of Clematis at short intervals on the face and top of the wall. The rich and glowing colours of the best varieties of these would add a brilliancy and charm of colouring to the whole, and the stems of the Clematis growing against the wall would occupy but little space.

The bed which took my fancy most was a long one with square ends planted with columnar trained plants of Streptosolen Jamesonii and Calceolaria Burbidgei alternately, having liberal and adequate spaces between, admitting full development of each plant. This bed was carpeted between the columnar plants with Verbena Miss Willmott, and edged with golden coloured Pelargoniums. Each column was clothed with splendid foliage and a profusion of bloom, and measured from 5 feet to 5½ feet high. Again I am inclined to be critical: the edging was not worthy of the bed. Had a bold margin of Centaurea candidissimus, or a broad band of Iresine Herbstii been substituted a lovely harmony of colouring in gold, orange, and white, or in gold, orange, or deep bronzy crimson, would have resulted. Each column is formed of five plants, each about 4 feet high when planted out. They are planted round a circle about a foot in diameter. I have seen those when planted out in June, and poor starveling looking things they then appeared, having of necessity been crowded close together under glass during the winter and spring, but the transformation in a few weeks when planted in well enriched and well prepared soil is simply magical. The plants break into growth from base to top, and, as already mentioned, become during the summer pillars of dense foliage and lovely bloom. There is one other matter which pleased me much. I

refer to the hybrid Water Lilies growing in the large basin of the ornamental fountain facing the east front of the Palace. I have observed these for the last two or three summers, and I had an impression that the plants flowered more profusely in this position than I have ever seen them flower anywhere else, and having again seen them this year I am confirmed in the correctness of that impression. The flowers are not so large, but they are more numerous, and I think the colours are brighter and more intense. It is a hot, sunny spot where they grow, and perhaps this extra brightness in colouring may be the result of the abundance of light and heat to which they are exposed. I think there is a lesson to be learned in the successful growth of this plant from the floriferous condition of these Nymphæas, and also from the limited leaf growth they make. It is that they flower more freely when confined to a comparatively limited root space, as these are, rather than when given unlimited room to grow in, as is frequently the case, when the energies of the plant are expended in the growth of leaves at the expense of flowers. But these beautiful Lilies should have more conspicuous labels attached to them; some of them are a good way from the edge of the basin, and I had to invoke the help of younger eyes than my own to find out their names. *O. T.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM × EUPHROSYNE.
(Sceptrum × Crispo-Harryanum).

This is another hybrid from the Uccle establishment of MM. A. A. Peeters et fils, raised by M. F. Peeters, who sent me the two first varieties of it that bloomed. It is not one of the great surprises or wonders we get so used to seeing in these days of great progress in Odontoglossum raising, but is a very pretty thing nevertheless, and when grown into strong plants will be a very useful and decorative form, though not of any high value. The ground colour of both sepals and petals is a lighter yellow than is a good Sceptrum, which is heavily marked by brown blotches separated by 2-inch bars of yellow, as in Sceptrum.

The colour section of the petals is similar, but with more evidence of the crispo-Harryanum tint of violet in the frond. The principal blotch is at two-thirds distance from the base, and is encircled by spots which form a line from the base all round the margin, being connected across the petal at one-third length from base. The lip is of Sceptrum form, with the frill almost absent, as would be expected from the influence of the hard outer edge of crispo-Harryanum. It is pale cream white, with a small blotch in front of the crest. This latter is very reduced from that of Sceptrum. The form generally of the bloom is that of Sceptrum somewhat elongated, that gives a look of crispo-Harryanum to it, from which and its substance there is no doubt as to its identity to even an ordinary observer. *D. B. Crawshay.*

BULBOPHYLLUM GRANDIFLORUM.

This large and singularly-formed species when grown into a strong specimen is a very striking object. Although the flowers are not showy, they are very attractive. A fine example of it in the Hon. Walter Rothschild's collection, Tring Park (gr. Mr. A. Dye), has seven flowers, each over 6 inches at the greatest width. The flowers are pale-green reticulated with sepia-brown, the dorsal sepal, which is concave and projected forward, being 4 inches in length by 2 inches in width; the narrow lateral sepals are curved downward. Its nearest ally, B. longisepalum, which was lately in flower at Tring Park, has narrower flowers heavily marked with reddish purple. The B. Ericssoni (January 23, 1897) and Cirrhopetalum Rothschildianum (November 23, 1905), both of which supplied the material for the illustrations in the *Gardeners' Chronicle*, are thriving well, and B. virescens, and a large number of other species, are in excellent condition.

CYPRIPEDIUM FAIRRIEANUM.

When announcing the arrival of an importation of this pretty Cypripedium we suggested that it should be tried in a cool house, as the few plants previously in gardens seemed to have been killed by being kept too warm. The experiment was tried by J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), the greater number of his plants being placed with the C. insigne varieties, which several are now in bloom, and all with sturdy foliage, equal in vigour to the specimens of C. insigne. One of the best plants was allowed to remain in the warmest Cypripedium house, and this is not nearly so vigorous or healthy-looking.

In this collection the unique Cypripedium Leeanum J. Gurney Fowler is thriving; two fine plants of C. I'Ansoni; the handsome C. callosum Rothschildianum, which obtained a First-Class Certificate at Holland House; good examples of C. Miss Louisa Fowler; a fine C. Maudiae, the graceful C. Bella Westfield variety; C. Lawrenceanum Hyeanum and a fine collection of other rare Cypripediums are in splendid condition, some of them being in flower.

CATTLEYA CHAMBERLAINIANA
(Leopoldii × Dowiana).

A very fine example of this beautiful hybrid, which was originally raised and flowered by Messrs. Jas. Veitch & Sons [illegible], is flowering in the collection of J. Gurney Fowler, Esq. It has the general aspect of the favourite C. Iris, and considering that it was first raised and flowered a quarter of a century ago, it is noteworthy as still retaining its place in the front rank of hybrids of its class. The inflorescence bears several fine flowers, each 5 inches across, the sepals and petals of a coppery-orange tint flushed with rose, and the large labellum bright claret-purple.

There is a fine collection of hybrid Cattleyas, Lælio-Cattleyas, Brasso-Cattleyas, &c., at Glebelands, and all in fine health; among those in bloom being the new Lælio-Cattleya Woodfordiensis, L.-C. Clonia superba, Lælia Iona ig-[illegible], a beautiful and fine-coloured flower, Cattleya Iris, and many others.

The large collection of fine varieties of Cattleya Schröderæ, which flowered so profusely last year, promises to be still finer this season, the plants having from six to twelve flower sheaths.

FRUIT REGISTER.

MILLER'S SEEDLING APPLE.

This comparatively unknown early dessert Apple is certainly one of the very best of its section in cultivation. It presumably originated in the neighbourhood of Newbury, Berks., and in that district it is largely grown, and has a very high local reputation. It is one of the misfortunes of this Apple that it got into circulation quietly and without the customary trade booming, hence we have heard so little of it. I have seen it fruiting finely at Maiden Erlegh, Reading, in Mr. Turton's time, and at Highclere Castle, and Lockinge. In the latter garden it this year fruited splendidly, and the sample of fruit seemed almost unequalled for beauty of form and delicacy of colouring. Mr. Fife speaks highly of it. The fruits have the merit of keeping sound, juicy, and crisp for a month, which some other praised early Apples have not. The tree is of moderately strong growth and is a regular fruiter. It is odd that so good an Apple—outwards at least—should be so little known generally, yet there are growers at Wantage who have crops from this variety by the ton. It is ready to gather at the end of August. *A. D.*

Fig. 99.—Apple Miller's Seedling.
(See text, also description, published in last issue, page 235.)

NEW ZEALAND PLANTS.

THE CHATHAM ISLANDS.

The following extract is made from an interesting article by Dr. L. Cockayne, recently published in the *Auckland Star* (New Zealand) —

"Sailing from this interesting but most desolate group of islands, at a distance of about 500 miles from the coast of New Zealand, and almost due east from Lyttelton, the Chathams are encountered. This group has a flora quite as interesting as its subantarctic sisters, but of a different character. Subalpine meadows, fields of herbaceous plants, 'rata' forests—all these are absent. A forest of another character flourishes, distinct, too, from any other of New Zealand. The trees have a very familiar appearance, they look old friends, but are different somewhat. Surely this is the well-known 'Koromiko,' but never did one see that as a tree 50 feet in height. Here is the Lancewood, but where is the well-known juvenile form? Here, too, the Korokia of the north, still its leaves seem larger and its yellow fruits bigger. The truth is that long isolation from the mainland has led to slight differences between many Chatham Islands and New Zealand plants. They have certainly come from a parent stock, perhaps one or the other is the actual parent, but now, although closely related, they are for the most part distinct species. The Lancewood is neither Pseudopanax crassifolia or P. ferox; it is P. chathamica. The Koromiko is not Veronica salicifolia; it is V. gigantea; while the Korokia is named Corokia macrocarpa, and is distinct from C. buddleioides of the North Island.

"The commonest of all the forest trees is the Karaka, but here called Kopi (Corynocarpus laevigata), whose smooth bark was frequently adorned with the figure of a three-fingered man by the Moriori artists. Then come the Matipo (Suttonia chathamica), the Mahoe (Hymenanthera chathamica), an indigenous Daisy tree (Olearia Traversii), the tree-Karamu (Coprosma chathamica), the Lancewood (Pseudopanax chathamica), the Ribbonwood (Plagianthus chathamica), the Nikau (either Rhopalostylis sapida or Baneri). There are two distinct classes of forest on the island, that on the higher ground containing fewer species and having the large Heath, Dracophyllum arboreum, as its dominant tree.

"There is no shrubby undergrowth, but tree-Ferns and Ferns of all kinds are very abundant. The only lianes are the Supplejack, the climbing Convolvulus, and Muehlenbeckia australis. Many most characteristic New Zealand forest trees are quite absent, e.g., all the Taxads, the Beeches, the Palm-Lily, and the Pittosporums.

"The despair of the settler and the delight of the flower lover are the very numerous bogs of the Chatham Islands. These are frequently occupied by a close growth of the Chatham Island Aster (Olearia semidentata), a truly lovely shrub in every respect. Covered in the summer time with flower heads of the most intense purple, these Olearia shrubberies are an entrancing spectacle. Olearia chathamica is not so common, but occurs in quantity on the summits of those precipitous cliffs forming the south coast of Chatham Island; its flowers are white. Growing in company with O. semidentata is Dracophyllum paludosum, a needle-leaved shrub 3 or 4 feet tall, but which, when growing on sphagnum, sometimes blooms when only an inch or two high.

"In the neighbourhood of these Olearia bogs, the margin of the forest often consists entirely of the Rautini (Senecio Huntii), a magnificent tree-groundsel, which produces immense bunches of yellow flower-heads. For many hundreds of yards at a time this belt extends, and when covered with its golden blossoms forms a gorgeous mass of colour.

"On the dry, open ground, a Heath 'society' occurs, in which the rounded bushes of Styphelia robusta, covered in the autumn with white or red "berries," are conspicuous. Here, too, is the Australian Styphelia Richei, which, strange to say, does not occur in New Zealand proper.

"The most famous of all the Chatham Island plants is the giant Forget-me-Not Myosotidium nobile, frequently called by the absurd name of Chatham Island Lily, or, what is worse, Macquarie Cabbage. This wonderful plant, found nowhere else in the world, is now almost extinct. Formerly it formed a broad belt on the seashore, just above where the dry Seaweed marks the high-tide limit, extending almost round the main island. The massive, shining, broad, green leaf-blades, a foot or more in length, raised high from the ground on stout leaf-stalks, and the numerous blue flowers, each half an inch or so in diameter, render this plant a most conspicuous object. The seeds germinate rapidly if fresh, and seedlings are raised with the greatest ease. The writer has long thought this noble plant might easily be naturalised on our northern seashores—for instance, on the Little Barrier Island and on Kapiti. Also, surely some effort could be made to fence a piece of the Chatham Island shore from sheep and pigs, so that it could once more reassert itself in its natural station.

"Other interesting Chatham Island plants are:—The Mutton-Bird plant (Cotula Featherstonii), which grows only near the holes of the petrels; the shrubby Speedwells, Veronica Dieffenbachii, V. Barkeri, and V. chathamica, this latter a charming little plant, which creeps over rocks close to the sea; the great Sowthistle, Sonchus grandifolius; the Bog Grass, Poa chathamica, an important fodder plant; the Chatham Island Cranesbill, Geranium chathamicum, of which there are white and pink varieties; the Swamp Matipo, Suttonia Coxii; the Gentian, Gentiana chathamica, and two Spear-Grasses, Aciphylla Dieffenbachii and A. Traversii.

"Settlement has, in many places, quite changed the face of the country. In some places are fine Grass paddocks; in others the Bracken Fern has become a weed. Phormium was originally very common, but is now a thing of the past in most cases.

THE KERMADECS.

"Science is especially indebted to Mr. T. F. Cheeseman, F.L.S., for a knowledge of the most northern members of the New Zealand biological region, the Kermadec Islands. The following account is based on Mr. Cheeseman's admirable paper on the subject published in 1888.

"From the subantarctic islands to the subtropical Kermadecs is a long step, and yet the dominant tree in this latter is also a Metrosideros (M. villosa), a relation, however, of the Pohutukawa, and not of the southern rata. But with this the similarity between the two regions ends, and there is no more any outward resemblance between the plant-forms than there is between the climates.

"As seen from the sea, there is nothing in the appearance of the plant-covering of the Kermadecs to recall the tropics. No featherly Cocoanut Palms fringe the shore. On the contrary, the rather dull hue of the New Zealand foliage, as seen from a distance, is everywhere manifest.

"Sunday Island, the largest of the group, is forest-clad, while Macaulay Island is almost entirely without arborescent growth. The whole group is of volcanic origin, and the small Curtis Island is still in the solfatara state.

"A certain number of tropical plants have reached the Kermadecs, but nothing like what might be expected. Amongst these are: Ipomæa pes caprae (which forms the well-known plant society on so many tropical shores), Canavalia obtusifolia (a climbing leguminous plant), Ageratum conyxioides (which bears the name of Cherry-Pie or Wild Heliotrope), Aleurites moluccana (the Candlenut of the Polynesian Islands), also some Grasses and one or two Ferns.

"Certain plants are peculiar to the group. Amongst these are two Coprosmas, C. petiolata and C. acutifolia, the former closely related to C. chathamica of Chatham Island; Suttonia kermadecensis, related to a Norfolk Island plant; Homalanthus polyandrus, a tree of the Spurge family, and a fine tree Fern, Cyathea Milnei.

"But the rank and file of the plants are such as would be met with in the North Island, for example, the Karaka, Ngaio, Wharangi (Melicope ternata), Mahoe, Tutu, Ivy-Tree (Nothopanax arboreum), &c., &c. In fact, about four-fifths of the flora consists of ordinary New Zealand plants."

CORDYLINE BANKSII AT CASTLEWELLAN.

I send a photograph of Cordyline Banksii (see fig. 100), a very fine species which was introduced from New Zealand in 1860. It has been planted out here for 12 years without any protection, and has never been injured in the least by the severest winter; it is in fact perfectly hardy. In its habit of growth it differs from most of the Cordylines, as the plant branches into several stems at a point close to the ground. The plant illustrated has 15 stems; it is 8 feet in height, and has a circumference of 42 feet. The leaves are 5 feet in length, and over 3 inches in width. The colour is dark green, with the midrib of a lighter shade. The plant does not require any special compost, as it thrives well in ordinary garden soil. *T. Ryan, The Gardens, Castlewellan, Co. Down.*

TWO MONMOUTHSHIRE GARDENS.

Mathern Palace was built some 500 years ago by the then Bishop of Llandaff, but after the Reformation, the bishops fell upon evil days and were obliged to relinquish the Palace as a residence. It then became a farmhouse and remained such until about a decade ago, when it was bought by Mr. H. Avray Tipping. He most artistically restored the building, which was in a very dilapidated condition, with the old grey stone found in adjacent ruins and out-houses, so that now, though complete in every respect, it retains all its ancient and time-honoured appearance, while the interior, which is furnished in the best of taste with old Oak, strikes the same note of antiquity. The gardens, though not large in extent, contain many interesting plants, some of these exhibiting a vigour that is rarely attained in other localities. Situated on high ground about two miles from Chepstow, it might be thought that the climate would not be sufficiently mild to permit of tender subjects being planted in the open air, but it is astonishing how robustly many of these grow without protection. The soil is a rich and porous loam, and this has, doubtless, much to do with the well-being of the plants. On a gentle slope leading downwards to the old fish-ponds is a large and irregular bed, partially shaded by Apple trees, in which a varied collection of plants were growing. Campanula Raineri, covering a piece of ground about 6 feet in length and the same in breadth, was marvellously strong, the plants being about 7 inches in height. This unusually vigorous habit has led several visitors to question the correctness of its naming, but, upon Mr. Tipping sending a plant to the late Mr. Wolley-Dod, that authority said there was no doubt that it was the true species. Several of the Primulas were perfectly at home. P. rosea was growing strongly and numbers of self-sown seedlings were springing up around. P. Poissoni, P. capitata, and others were likewise in the best of health. Cypripedium spectabile had attained unwonted proportions, and Lilium superbum towered high aloft. Several plants of Rehmannia angulata were in flower and doing well, Tricyrtis mac-

ropoda was in bloom in groups, and close by T. æstivalis and T. hirta were growing. Sanguinaria canadensis had spread into a large mass and was evidently happy, as was the scarlet-flowered Ourisia coccinea, and Sidalcea Listeri was a tall pyramid of flesh-pink. Over the chinks of the rocks, in a portion of the bed, numbers of Ramondia pyrenaica had spread their wide green rosettes, and tuberous Begonias and Platycodons gave colour to the scene. Dierama (Sparaxis) pulcherrima held arching flower wands fully 6 feet in height, and Muhlenbeckia complexa, climbing was in bud, and Nicandra physaloides, Fostoca purpurea, and Paracaryum tibeticum were in flower. Calceolaria integrifolia was doing well, as were Myrtles, Pomegranate, Sollya heterophylla, and Veronica Hulkeana against walls, but the plants mentioned do not form a tithe of those to be found in this interesting garden.

MOUNTON.

A few years since Mr Tipping bought some property in the hamlet of Mounton, about a mile and a half distant from Mathern Palace, and this fine old Yews and other trees. By the ... numbers of water-loving plants find a home. The yellow and the crimson Mimulus grow here in masses, Rodgersia podophylla displays its handsome bronzed leaves, and Saxifraga peltata its noble foliage. Spiræa gigantea reared its white plumes fully 8 feet high, S. palmata and S. venusta were very vigorous, and Astilbe (Spiræa) japonica showed numbers of self-sown seedlings, as did Primula japonica and P. rosea, while P. sikkimensis was very strong. In July, Ranunculus Lingua was flowering freely in the water, near

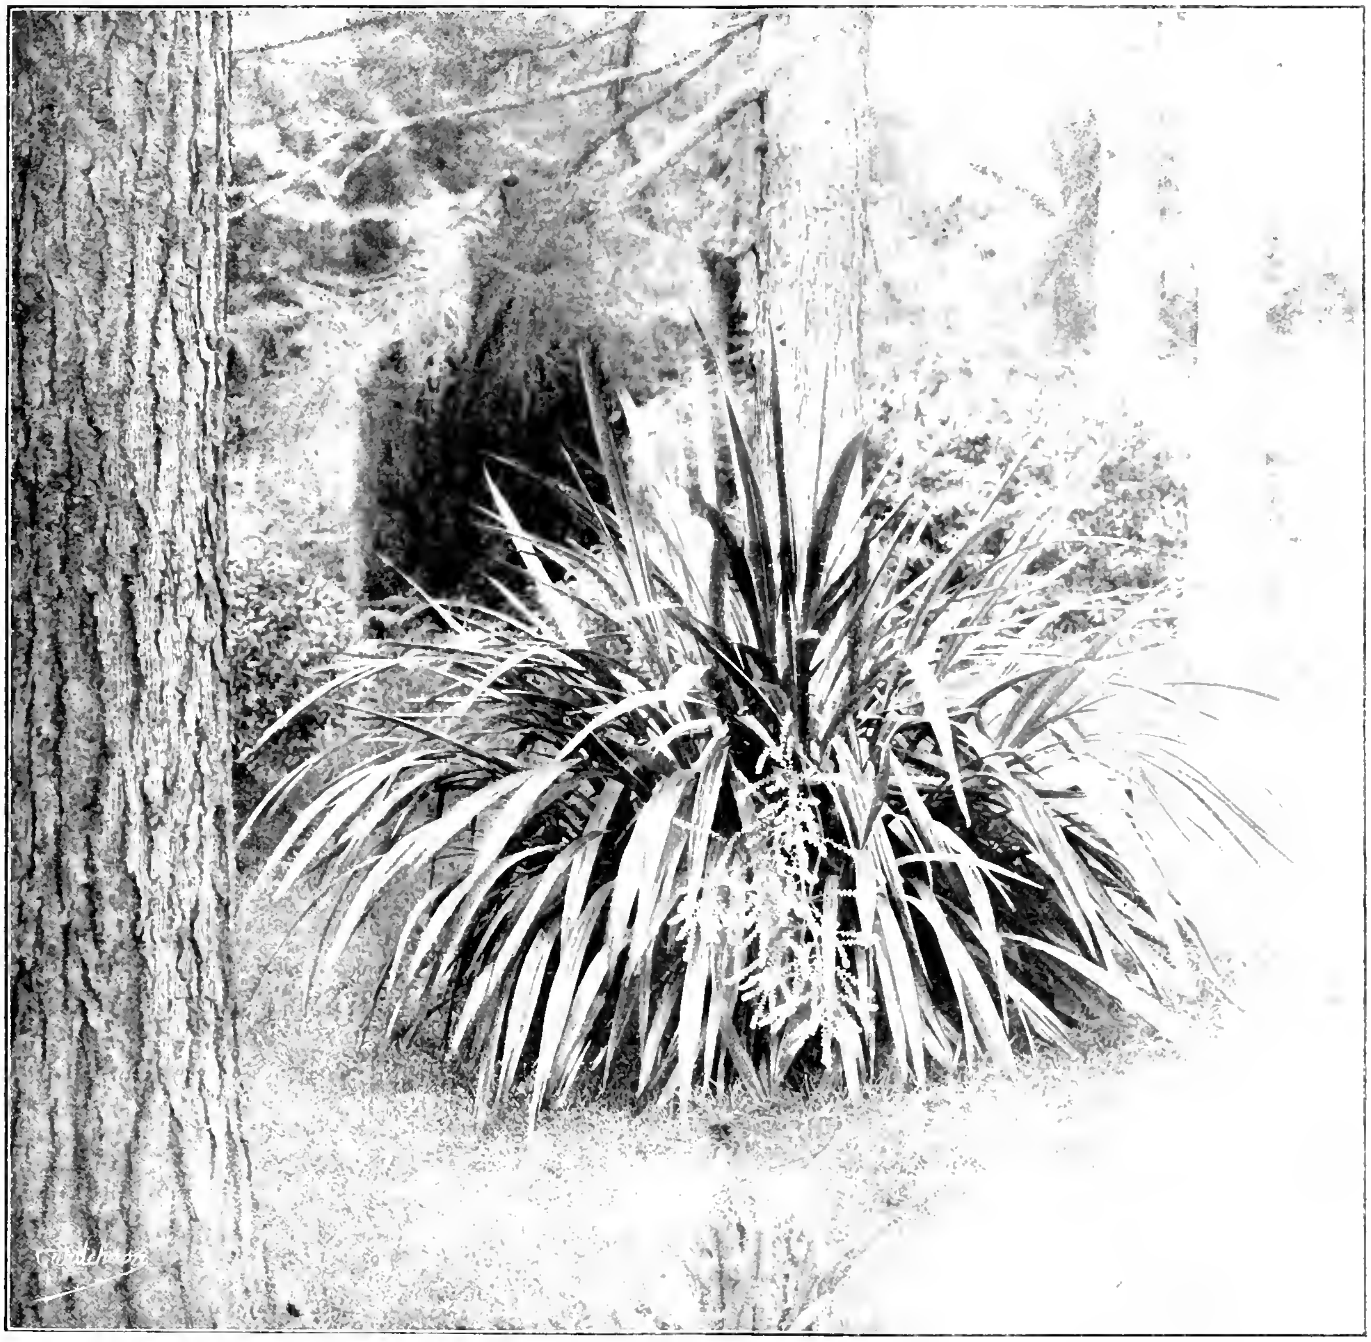

FIG. 100.—CORDYLINE BANKSII IN THE EARL OF ANNESLEY'S GARDEN AT CASTLEWELLAN, CO. DOWN. (See page 240.)
(From a photograph kindly sent by the Earl of Annesley.)

high over a ruined wall made a pretty picture. In a wall-backed bed several plants of Alstrœmeria pelegrina and its white variety were in fine flower. These are rarely seen in the open, even in the south-west, but no fault could be found with the vigorous condition of the plants in question. Diascia Barberæ is held to be an annual, but here, at Chepstow, the plants had been out three years in their dozens, and, being in full flower at the time of my visit, formed clouds of flesh-pink very restful to the eye. The Giant Plantain of North America, Cacalia tuberosa he has been developing into a garden. The situation is a charming one, and offers great facilities for picturesque treatment. It is bordered on the side of the country road by a narrow meadow, beyond which a wide stream meanders through the low land. At the further side of the stream the ground gradually rises until it reaches the foot of a line of cliffs rising to a height of from 20 to 50 feet. These cliffs form a right angle and face west and south, sheltering everything beneath them from the north and east and giving two exposures. They are crowned here and there with which Iris sibirica, I. lævigata, I. orientalis and I. cuprea were growing, as were Anemone ... and Gillenia trifoliata. In the same ... Liatris pycnostachya was 6 feet in height ... Gunnera manicata spread its huge leaves ... white-flowered Rosa Wichuraiana ... over the stream bank, and M... formed handsome clumps ... bordering the stream, ... in profusion. On a steep ledge ... ing the ground, and M... and its white variety were ... health.

On another rocky slope was a fine collection of Saxifrages, a large group of about four dozen plants of S. Burseriana in the most vigorous condition, while S. Boydii alba, S. Elizabethæ, S. Salomoni, S. apiculata and others were equally good, and in a damp spot S. Fortunei was flourishing. S. Mawcana, at the time of my visit, was quite brown and apparently dead, but with the autumnal rains, its foliage soon recovers its rightful colour. In the loamy soil full of stones, Helianthemums were at home, Convolvulus mauritanicus clothed the banks with flower and foliage, and the rough, rocky steps were covered with blossoming Thyme. One slope was hidden by the foliage of the double Arabis; Oxalis enneaphylla had been increased from one plant to six and was the picture of robust health. Galax aphylla was throwing up its flower-buds, Anturrhinum sempervirens was in profuse flower, and Linum campanulatum a sheet of yellow. Of shrubs, Abutilon vitifolium was in the best of health, Romneya Coulteri was in flower at the base of the cliff, Nandina domestica was in blossom, Carpenteria californica was making healthy growth, Coriaria terminalis was affording a fine display of bright orange berries on its 4 foot shoots. Mitraria coccinea, Leptospermum bullatum, Grevillea sulphurea, Veronica Hulkeana, V. anomala and others, Desfontainea spinosa, Indigofera Gerardiana, Pittosporum nepalensis, Andromeda japonica, Abelia rupestris, Rubus deliciosus and Polygala chamæbuxus were all doing well, while Azalea mollis and indica and Rhododendrons appeared suited by the soil. Among the Lilies, L. speciosum, grown in leaf-mould and decayed peat-moss manure, showed unusual vigour, having stems over 7 feet in height though only in bud. Kniphofia Northiæ had a 7-foot flower-shoot, and a collection of Sprenger's Yuccas gave a good promise for future effect. *S. W. Fitzherbert.*

KEW NOTES.

TECOMA MACKENII.

THIS is a vigorous-growing climbing plant, but little known in English gardens. Dried specimens were received at Kew as long ago as 1867 from South Africa. The plant has received several names, the one at the head of this note being the oldest, and the one by which it is known at the Cape, where it is a common plant in the gardens. The names, T. Ficasolana and T. rosea, have also been given it. Under the latter name Mr. Bull distributed the plant in 1886. It is easily grown, but, like the majority of Tecomas, the plants will not flower unless the wood is first well ripened. The plants must be exposed to all the sunlight and air possible during the growing period. Under the scorching influence of the sun at the Cape, the plants flower profusely. At the present time it is flowering on the roof of No. 4 Greenhouse.

The leaves are pinnate, the flowers 2 inches or more in diameter, lilac-pink in colour, with a deeper shading in the throat. The racemes of flowers are said to be 3 to 4 feet in length at the Cape. In this country they do not attain to anything like that length.

ZEPHYRANTHES CANDIDA, &C.

Formerly this plant was not considered quite hardy, but this was a mistake, at any rate, as far as the south is concerned. The chief reason of non-success in its cultivation lies in trying to grow the plant in unsuitable places. Given a sunny position, a sandy soil, and a well-drained border, it grows like a weed, flourishing and multiplying rapidly. At Kew the plant is used largely as a substitute for box edging. When once planted, beyond keeping down weeds, no other attention is necessary for several years, here as box edging, if it is to be kept neat and tidy requires careful clipping, and it will never be so effective as a border of Z. candida in

One of the prettiest sights in the gardens at the present time is the border of Belladonna Lilies in flower in front of House No. 1, edged with Zephyranthes candida. When the sun is shining, and the zephyr flowers fully expanded, it forms a beautiful picture. The rush-like leaves are evergreen, and the flowers resemble those of a white Crocus. In gardens where the soil is heavy, the Zephyranthes may be grown on the rockery, or in the cool greenhouse.

DAHLIA KAISERIN AUGUSTA VICTORIA.

This Dahlia is a good grower, but seldom exceeds 4 feet in height, and produces an abundance of medium-sized, pure white flowers, borne well above the foliage. Besides being useful for garden decoration, the white flowers are valuable for the making of wreaths and crosses. A bed of it not far from the succulent house has been a mass of flowers for the last two months, and promises to continue so till cut down by frost. *J. D.*

The Week's Work.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

The Hardy Flower Borders.—In addition to the "yellow" border recommended in my note of last week, for the purpose of imparting variety and interest to the flower garden, distinctive borders might be made of pink flowers, blue flowers, and white flowers respectively. Regarding the period at which these borders of colour are to be most effective—whether they are to continue attractive more or less throughout the year, or be particularly so during a restricted period—must depend entirely on the requirements of the proprietor, therefore the borders in each garden must be planted accordingly. An excellent effect in pink shades during the months of July, August and September might be obtained from a border planted with 8-feet standard plants of "Dorothy Perkins" Rose in the background, whose pendant branches, covered with the delightful blossoms, should commence to flower in the middle of July and continue in beauty until the end of September. Slightly in front of these standards place a broken line of "Lady Gay" Rose, trained around stakes sufficiently high and broad to be effective, and again, plant in advance of these, 4-feet standards of a Rose similar to "Caroline Testout." In the middle of the border a good pink-coloured Phlox would be effective, and perhaps in front of that a dwarf free-flowering pink Rose. In the spring the border could be completed by planting Sweet Peas of the best pink varieties, in round clumps, and the rose-coloured Cosmos at the back of the border. Lavatera rosea splendens, tall, pink varieties of Antirrhinum, Nicotiana Sanderæ, Clarkia elegans and pink Pentstemons might be planted in the middle, while towards the very front of the border the rose-coloured East Lothian Stock, Verbena Miss Willmott, Diascia Barberæ, Dianthus and pink flowered Phlox Drummondii could be freely used.

White Flowered Border.—In the border devoted to white flowers, standards of tea-scented Roses, Sweet Peas, Nicotiana sylvestris, Campanula pyramidalis alba, Paris Daisy, Anemone japonica alba, Gaura Lindheimeri, Chrysanthemum maximum and white Scabious might be used to give height at the back of the border, and towards the front, according to their heights, such plants as Chrysanthemum Queen Alexandra, Phlox Tapis blanc, East Lothian Stock, the Hyacinth-flowered Candytuft, Alyssum "Snow Carpet," Phlox Drummondii and white Verbenas.

The Blue Border, which should be situated in a position exposed to the full sun and light, might be planted with Sea Hollies (Eryngium), standard plants of Ceanothus "Gloire de Versailles," Campanula pyramidalis, and Sweet Peas as a background, afterwards filling in to the front with blue-flowered Salvias, Lobelia, Commelina, Anagallis Philipsii and other half-hardy and annual plants in the spring.

The "mixed" Borders.—Having made a feature of the distinctive-coloured borders, the mixed coloured borders can be made dissimilar in their arrangement by modes of grouping. One border might be grouped in bold masses of colour, using a limited number of kinds of plants each of a striking and definite colour, while another border might be devoted to obtaining a desired colour effect by bringing together numbers of different kinds to form separate colours. Herbaceous plants, whether perennial, biennial, or annual, which possess charm and beauty suitable for embellishing such borders, are of an infinite number.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Potatos.—Complete the lifting of this vegetable, for after the present time the tubers should not be allowed to remain in the ground. If there is not sufficient accommodation for the tubers to be stored in outhouses, &c., they should be placed in clamps, and there is no doubt that Potatos retain their flavour better when stored in immediate contact with the earth. Keep a look-out for diseased tubers, which soon work destruction amongst the whole. Carefully burn all the Potato haulm, for with it will be destroyed any disease it may bear.

Winter Onions.—The seed of these in many instances has germinated well. A soaking of water will help to swell the roots. Encourage growth by keeping the soil between the lines well loosened.

Cauliflowers.—Seedlings from last month's sowing will now be large enough to transplant into the cold frames forming their winter quarters. This system of growing Cauliflowers is becoming less practised now that some of the newer, early varieties can be had almost as quickly when sown later in January. Slugs must be guarded against in the frames, as these young plants being tender may be soon destroyed. Autumn Cauliflowers, now ready for use, will require their leaves broken over the curds, or loosely tied up, to prevent damage by frost. This trouble will be well repaid. Any "heads" that have reached their full size should be pulled up, root and all, and be hung in a cool shed, where they will keep quite fresh for use for a week or longer. Remove any decaying foliage, for this is detrimental to the colour of the flower.

Peas.—Any remaining crops of this vegetable fit for gathering should be protected from severe weather in view of keeping them in bearing for as long a time as is possible, for, as a rule, Peas can never be had too late or too early in the season. There is just a danger of their becoming too hard if they are not carefully watched. The Gladstone has been our latest cropper, and it is still giving a few good "dishes." Pea sticks should be pulled up as soon as the crops are finished, and the ground be cleared ready for the next crop. All rubbish, such as Pea haulms, Pea sticks of no further use, weeds, &c., should be burned on the ground, and the ashes scattered as manure.

Celery.—This vegetable requires much labour at this period of its growth, for applications of soil are necessary almost weekly in order to secure well blanched "sticks." The earliest plants will, in most instances, be now fit for use, and the latest rows almost ready for their first instalment of soil for blanching purposes. Side growths should be carefully removed, for it is an easy matter to injure the "heads" if they are roughly handled. All the leaves should be tied before the soil is applied about them, and the ties should be cut immediately after the earthing is finished. If the soil is dry, apply, before earthing, a soaking of liquid manure to the roots. It is a mistake to grow the latest batches of Celery too strongly; I have always found plants of medium growth stand the changes of weather better than those of a coarse, sappy nature.

Digging.—The continuation of dry weather affords a splendid opportunity of proceeding as far as is possible with the digging or trenching of any clear spaces. The wheeling or carting of manure can now be done with little damage to paths or to the soil, and it is much better to turn up the soil dry than when soaked with rain or snow water in the depths of winter. A rotation of crops should be decided upon, and the ground be manured accordingly. Half-decayed manure can be safely dug in now, and this will be well decayed before next spring arrives, and all its good qualities will be incorporated in the soil, instead of perhaps some being washed down the drains leading from the manure heap. I strongly advise that liquid manure, which would otherwise be wasted, should be thrown over the ground intended for Onions, Cauliflowers, or Cabbages.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Fruit-gathering.—Many varieties of fruits will now be quite ripe, and others are ready for gathering and storing. In some cases the trees must be visited more than once, as the fruits will not all be ready to gather at one time. Pears require careful handling, and especially so if the bloom is to be preserved intact, as will be required if the fruits are wanted for exhibition. A little wood wool of the softest texture should be placed in the baskets or trays in which the fruits are placed, so that in transit from the tree to the fruit-room they will not be shaken or bruised. If Pears are grown for show purposes, several trees of each variety selected for the purpose must be grown in order to obtain a selection. Louise Bonne of Jersey is still one of the best varieties, and the tree is a good grower and cropper. Beurré Superfin produces on most soils very melting, and deliciously-flavoured fruits. Comte de Lamy is a small Pear of great excellence, and at the great Fruit Conference it was selected as the best-flavoured Pear. Although it is not a showy fruit, it sometimes develops a little colour on the side next to the sun. The tree requires careful pruning, as it produces its fruit buds on the ends of the shoots. Emile d'Heyst is another good variety: it produces fruits of considerable size either on bush, pyramid, or wall-trained trees. The flavour is first-class, and the tree is a good bearer, and much more to be depended upon for a crop of fruits than is Marie Louise. This latter variety is still difficult to surpass in its season, and especially in places which suit it. The above varieties, with many others, will soon be ready for harvesting, but they should not be gathered till the last moment that is safe. Many of the October varieties that are not suitable for dessert purposes will be useful for cooking or for preserving. The above remarks on gathering apply also to Apples, of which some of the more tender varieties require very careful handling.

Root-pruning may be proceeded with as soon as the crops have been gathered. The roots should be kept as near to the surface as practicable, but Pears upon the Quince stock should be planted sufficiently deep to allow the union between stock and scion to be just below the surface of the soil. In commencing root-pruning, take out a trench 5 or 6 feet distant from the tree—4 feet will suffice for cordon trees—then carefully fork away the soil, and examine the roots. It may become necessary to lift the tree altogether to ascertain that no large roots strike straight down into the soil from the centre of the root system. This done, cut off any long and useless roots; then replace the soil. If the ground is at all impoverished, supply a portion of new loam, to which has been added some bone meal and a little basic slag. Cover the roots, and well ram the soil about them, finally giving a good watering. Leave sufficient earth round about the tree to allow for sinking. Large trees, 30 or 40 years old, are often quite rejuvenated by this treatment. Apples, Pears, and Plums can all be successfully root-pruned in this manner; in the case of old trees some nice good loam should be placed about their roots.

Strawberries.—There has been little rain in this district, and newly-planted Strawberries have required watering in order to keep them growing. The ground about them should be lightly stirred.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Repotting.—The repotting of species requiring a cool temperature will now occupy much time, but there are also other Orchids which will require attention. Plants of some species of Cattleyas, including C. Trianæ, C. Mendeli, C. Mossiæ, and several of the rarer hybrids which have out-grown their pots should be afforded larger receptacles. Soon after the leading pseudo-bulbs of these Cattleyas have completed their growths, numerous young roots push from their bases, and when these become visible, the pot should be broken, as much of the old compost taken away as is possible without disturbing the drainage material or the roots, and the plant be placed in a larger pot, filling up around the roots with ordinary Orchid compost. Plants in the warmer houses of various Cypripediums that have recently flowered, and which are pot-bound, also Selenipediums in a similar condition, may now be repotted or top-dressed according as is found necessary. Offsets of Cypripediums should be removed, and be planted in small pots or pans, and if this is done at once, they will become established before winter.

Dendrobiums that have completed their growths should be removed to their resting quarters. Any that have been gradually dried and hardened may be exposed to full sunshine; very little water will be needed to maintain their pseudo-bulbs in a plump condition. Some plants of Dendrobium Phalænopsis have completed their growths and are sending out their flowering spikes. When the flowers commence to open they should be placed in the drier atmosphere of the Cattleya-house.

Thunias which have been standing out-of-doors should, now that the nights are chilly, be taken inside every evening at dusk, but removed outside again in the morning whenever the weather is warm and bright. They will still require a little water at their roots until their leaves drop, and they must be kept free from insect pests.

Pleiones have now completed the growth of their pseudo-bulbs, and as soon as the leaves turn yellow and fall, the amount of water afforded them must be lessened to such a quantity as will keep the soil just moist, but when the flowers are open, watering should be discontinued altogether. Species in the cool house, such as P. humilis and P. Hookeriana, are still growing freely, and they will require copious waterings until the leaves fade. Plants of Miltonia vexillaria that have passed the summer in the cool house should now be removed to their former positions in the intermediate house.

Temperatures.—The following should be the night temperatures for October:—East Indian house, 65° to 70°; Cattleya house, 60° to 65°; Mexican and intermediate houses, about 60°. The higher readings should be maintained only when the external air late at night is about 45°. When below 35° the minimum temperatures given are the most suitable. The cool house, 50° to 55°, or warmer if the weather is mild, and will permit of the lower ventilators being left wide open; but in the event of cold weather rendering fire-heat necessary, the warmth should not exceed the minimum reading. Dendrobiums, &c., that are resting in a cool greenhouse must not be subjected to a temperature lower than 50°.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

Soft-wooded plants.—The structures in which these plants are grown must receive careful ventilation in order to keep the plants as sturdy and as compact as is possible. If they are growing in unheated pits, care must be exercised that they do not suffer from an excess of dampness in the atmosphere, and in the case of Primula sinensis and Cyclamen, it will be better to remove the plants to a more airy structure, and one in which a little artificial heat can be applied for the purpose of maintaining a suitable temperature. Show and Fancy Pelargoniums, also Cinerarias, should be transferred to a shelf near to the glass in one of the plant houses rather than be left in a pit. Zonal Pelargoniums which are intended for flowering during the winter months should be given a position near to the glass, and one that can be afforded an abundance of air on all favourable occasions. Circulate a little warmth in the pipes should the temperature fall below 50°. If not wanted now, the flower spikes showing should be removed, for after the Chrysanthemum season is over these bright flowers would be much appreciated.

Chrysanthemums.—The fine weather we have recently experienced in the North has been favourable to the ripening of the wood and the development of the flower buds, which promise to be open early this season. Many growers in this district have their plants already housed, and advisedly, as it is neither safe nor wise to run the risk of injury to the plants from frost or heavy rains. In housing, it is imperative that the plants receive the maximum amount of light obtainable until the flowers are well advanced, when they should be protected by some thin shading material from bright sunshine. At all times a constant current of air should be allowed to circulate freely among the plants, and if damp weather sets in, a little fire heat should be applied by day to dispel damp. If the plants are at all crowded, mildew will most certainly be present: as a preventive the plants should be syringed with a little sulphur and soft soap (2 oz. to a gallon of water), as each plant in turn is taken indoors. Watering should be done early in the day time to ensure that all moisture is dried up by the evening: should any florets be injured by damp, they should be removed at once, otherwise the whole of the florets will become similarly affected. Late varieties may remain out of doors till a later date, but means should be taken to secure them against injury by frost or high winds.

Salvias are very useful plants for placing at the base of groups of Chrysanthemums. They should be given frequent applications of manure water with a little nitrate of soda added, for these stimulants will materially add to the vigour of the flowering spikes.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Cucumbers.—Autumn-fruiting Cucumbers must be grown in genial conditions, and, in order to avoid a too close and moist atmosphere, judicious ventilation must be provided, but not such as to admit of cold, drying currents of wind. Keep the growths well thinned out, and attend to the plants at least twice a week in stopping and removing any superfluous growths, being careful also not to over-crop the plants. Be sparing in the application of water upon the foliage, but damp all available spaces of the house both morning and afternoon, gradually reducing the amount of such moisture as the days shorten and the sun's heat declines. Add a little fresh soil over the roots about once a fortnight, and apply tepid liquid manure once or twice a week, as may be necessary. Fumigate the plants slightly on the first appearance of aphides, and, in the case of red-spider, white-fly, or mildew appearing, paint the hot-water pipes with a mixture of milk and flowers of sulphur. For canker rub quick-lime on the affected parts as often as may be necessary. Maintain the night temperature at about 65 degrees. If Cucumbers are required for consumption during November and December, it is now time to prepare the house for the reception of the plants. Wash all woodwork with paraffin and soft soap, and place a bed of long litter and leaves in the pits, which will furnish a suitable bottom heat. When the material has finally settled down, the rooting medium should be placed on it in the form of mounds, and at this season of the year a little peat mixed with the loam, leaf soil, and decayed manure will be beneficial. The plants should now be occupying 4-inch pots, and when the soil on the bed is warmed through they should be planted, and afterwards treated as was advised for the autumn-fruiting plants.

Figs.—Early-fruiting trees will now be in their resting stage, and will require keeping as cool as is possible by means of free ventilation. If either scale or mealy-bug become troublesome, they can be destroyed by some insecticide. Few fruit trees bear more freely than the Fig, but it is not advisable to allow late fruits to remain on early trees: these must be sacrificed if a good crop is desired next season. If the roots are not kept too moist, fire heat will not be necessary to aid the ripening of the growths. Later trees, however, may require a little artificial heat in order to enable them to mature the fruit-bearing wood. Any root-pruning or overhauling of the borders that is required to be done should be undertaken with [illegible]. If too much rooting space be allowed to such kinds as Negro Largo it is often fatal to good cropping. Such kinds must therefore be restricted at their roots. If new soil is provided, it should not contain manure, but a little lime, chalk, or old mortar rubble are [illegible] ingredients for mixing with the compost.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* EDITOR, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *and as early in the week as possible, and duplicated by the writer. If desired, the signature will not be published, but left as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, etc., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Oct. 6	Soc. Franc. d'Hort. de Londres meets. German Gard. Soc. meets.
MONDAY,	Oct. 8	United Hort. Ben. & Prov. Soc. Com. meets.
TUESDAY,	Oct. 9	Royal Hort. Soc. Com. meet.
THURSDAY,	Oct. 11	Manchester & N. of England Orchid Soc. meets.
SATURDAY,	Oct. 13	Dutch Gardeners' Soc. meets.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—52·7°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, October* 3 (6 P.M.): Max. 64°, Min 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London. *Thursday, October* 4 (10 A.M.): Bar., 29·9, Temp., 62°, *Weather*—Fine.

PROVINCES.—*Wednesday, October* 3 (6 P.M.): Max. 69° Southampton; Min. 50° North-east Coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Bulbs at Stevens' Rooms, King Street, Covent Garden, at 12.30.

MONDAY TO FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY AND WEDNESDAY—
Annual Sale of Nursery Stock at Sunningdale Nurseries, Windlesham, Surrey, by Protheroe & Morris, at 12.30.

WEDNESDAY—
Bay, Box, Palms, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY AND FRIDAY—
Sale of Nursery Stock at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.

FRIDAY—
2,000 Odontoglossum crispum and other Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

George Bentham.[*]

To the present generation of gardeners, and even to botanists of the new school, George Bentham is little more than a name; nevertheless, he will ever take rank among the foremost botanists of the world, and as one almost unrivalled in the extent of his experience, his perspicacity, the soundness of his judgment, and the excellence of his method. This is not the place to speak of him from the point of view of pure botany. It is rather of his relations to horticulture that we would allude, for, like so many who have served horticulture well and truly, the memory and the appreciation of his work is now confined to a few, and is wholly ignored by the majority. This savours of ingratitude, but it is "the way of the world." We are therefore grateful to Mr. Daydon Jackson for enabling us to realise our obligations to this distinguished man of science. To those of us who remember Bentham's shy and unattractive manner in his later life, and his unvarying, mechanical, routine method of work, the present book will come as a revelation. It is devoted to the life-history, not of one Bentham, but, as it were, of more than one personality. In the earlier chapters we have a sketch of the man of business, the agriculturist, and the manager of an estate in France. Later on we have the logician and the law student.

At this period of his life he entered freely into the gaieties of society, and nothing is more surprising to those who knew him in later years than to read of the zest with which in earlier years he enjoyed the social amenities and even the innocent frivolities of life. To the last, however, there was beneath his reserved manner a most kindly, helpful temperament, always ready to assist and encourage, but never ready to make his benefactions known.

For a time there was a struggle between his legal studies and his growing addiction to botany. Possessed of sufficient private means, the issue of the struggle was not long left in doubt. Botany won the day. The extensive acquaintance he soon made with the leading botanists of Europe and America confirmed the victory. From that time forth his labours in the pursuit of botany were marvellous in their extent, and at the same time models of perspicacity and trained judgment. The seven volumes of *The Flora Australiensis*, the invaluable *Genera Plantarum*, drawn up in co-operation with his life-long friend Sir Joseph Hooker, may be specially mentioned as among the greatest and most valuable of his labours, but they form, after all, but a small portion of his monographs and other publications.

Inheriting, as it were, from his predecessors the dogma of the immutability of species, it is no wonder that Bentham was not an immediate convert to the Darwinian views of evolution. The change came gradually, till at length no worker was more fully imbued than he with the principles of evolution as now recognised. How greatly the assent of such a working naturalist as Bentham influenced the minds of others may readily be conceived.

Bentham's presidency of the Linnean Society for a number of years was truly a noteworthy epoch, so far as the history of that society and the progress of botanical science is concerned. His was no nominal Presidency: he worked hard even at details usually undertaken by subordinates. His annual addresses were, and still remain, most remarkable for their range, their grasp, and their philosophic insight.

All this, and much more to which we cannot here do more than allude, is detailed in Mr. Jackson's narrative.

We must specially advert here to Bentham's services to horticulture.

In 1823 he visited Chiswick for the first time, and there met Lindley, then Garden Secretary. Bentham's note relating to the Society at this time was:—

"If well managed, this may become the most useful and extensive of all scientific societies. They must only remember what their brother societies are apt to forget—I mean the old proverb, "Out of debt out of danger."

"Unfortunately," adds the Editor, "they were not long clear of it."

In 1827 we find the following further note having reference to the Society:—

"On Saturday, 24th June, the Horticultural Society inaugurated their *fêtes* at Chiswick, about 3,000 being present; the chief attractions were bands in the gardens, and a splendid show of fruit in a tent, which exhibit was not to be touched till six o'clock; at that hour the company made a rush at the tables and cleared off everything, carving the pineapples with their penknives. Soldiers were there to act with the gardeners should need arise (the new police were not then in existence). The people departed from seven onwards in about 1,200 carriages, and Bentham walked home."

In 1827 also, Bentham made the acquaintance with Lindley's family at Acton Green—"the real commencement of a long and valuable intimacy." At Lindley's he met David Douglas, whose delicate features, as represented in his portrait, ill agrees with the account here given of his character[*]:—

"He was quite rough in his manners and longing to go out (to N.W. America). His cost of maintenance during three years came to £66 (!) Most of his food he shot, and in time of scarcity he ate the skins he had reserved for home, and on two occasions he ate his horse."

In 1830 Bentham's relation to the Horticultural Society became more intimate:—

"April brought in events which turned Bentham's thoughts and occupations into yet another channel. He had joined the Horticultural Society some months before, and was on the most friendly footing with Sabine, the Secretary, and Lindley, the Assistant Secretary, the head of the executive. Sabine had for some time been the actual manager and dictator of the Society, the Council being expected merely to acquiesce in his views; he had brought the Society to a high degree of success and popularity, but he could not calculate ways and means; he was over-sanguine as to support from the wealthy and fashionable crowd who thronged the Chiswick *fêtes*, and expenditure became lavish without regard to income. A large debt of £22,000 had accumulated, and this coming to the knowledge of the Council, great indignation was expressed. At this juncture Mr. Barnard, a Vice-President, called on Bentham, informed him of the state of affairs, pointed out the need of help from men who had not taken part in the recent disclosures, and begged him to take up the post of Councillor. On finding it would probably only take up a few hours once a fortnight, he consented; finally he was induced to become Honorary Secretary, in which he continued till the spring of 1841. The Council met on the 19th April, when Sabine brought forward his motion for reconstructing the offices, namely, a Garden Secretary, and a Head Clerk in Regent Street, each at a low salary. This was aimed at Lindley, the outcome of the feud between the Honorary and the Salaried Secretaries; Lindley would have refused either of those posts, while Bentham would not undertake the new duties without Lindley. The matter was adjourned for a week, and in a Council of thirteen, Sabine's proposal was put to the vote, when the ballot box showed fourteen balls, seven for and seven against; the Chairman, Dr. Henderson, sent the box round again with the same result: on which the Chairman requested all present, two earls among them, to turn up their cuffs, and on the third time of voting seven came out against the plan and six for it. Dr. Henderson quitted the chair in anger, one Councillor resigned, while Lord Carnarvon (the second Earl) congratulated Bentham. Sabine predicted that Bentham would rue the day when he had saddled himself with Lindley. At the end of the month, Mr. T. A. Knight, of Downton, the President, came to town for the anniversary on 1st May, Bentham entered on his new duties, and the Society

[*] George Bentham. By B. Daydon Jackson. London: J. M. Dent & Co.

[*] By an unfortunate oversight the portrait of Robert Fortune was given in one of the recent volumes of the *Journal* of the R.H.S. as that of Douglas. Moreover the error was attributed to the *Gardeners' Chronicle*, which was in no way responsible for it.

rapidly quieted down. The financial question was grappled with, Bentham suggested that £4,000 to £5,000 should be raised on 5 per cent. bonds by the Council, and put down £2,000 himself. The coal merchant, who threatened execution, was paid off, as were other troublesome creditors, and the bondholders, realising the altered conditions, ceased to clamour for their money, and conciliatory words brought back many withdrawing members. Ladies were admitted to fellowship, and reduction in the staff, both at the garden and in the London office, became possible, when it did not look like compulsion by pecuniary distress. Bentham drew up a new set of bye-laws, which were discussed; finding that two members were resolved to object to everything, Bentham resolved on strategy; he brought forward a few verbal points of no practical importance to be hotly discussed, on which, after long talk, Bentham gave way, which satisfied the objectors, and the important parts passed unchallenged. By these means harmony was restored, but Bentham found that the Honorary Secretaryship was no sinecure."

"The horticultural *fête* in June was a success, 5,362 visitors being present. It was the custom for all tickets to be signed by Bentham as Secretary, which entailed many hours of mechanical labour. No fewer than 3,800 attended the Chiswick *fête* on the 7th July."

Another extract of great interest may here be given:—

"On 12th February, 1846, he was 'engaged the greater part of the morning at the Horticultural Society about a proposal made by the Secretary of the Treasury for our taking the Kew collection on certain conditions.' Elsewhere he wrote that this note came with an intimation 'that if refused they would be offered to the Botanic Society of Regent's Park. We both felt that this breaking up of the Kew collections would be a disgrace to the nation, and that if it were desirable to prevent it there was no time to be lost.'"

"Lord Melbourne" (we are told) "put a stop to it immediately after having seen the Duke of Devonshire, and that the offer never was made to the Regent's Park Society." (*Gardeners' Chronicle*, N.S., v. 1876, p. 400. John Smith's account of the transaction will be found in the same volume at p. 364.) "The state of the gardens had been under consideration for some years previous, and Dr. Lindley, with Messrs. Paxton and Wilson, had inspected the Royal Gardens and reported in February, 1838, to a Treasury Committee."

In 1841 Bentham resigned his post as Secretary to the Horticultural Society. During his tenure of office, in addition to his official work, he contributed very largely to the determination and description of the numerous plants sent home by Douglas, Hartweg, and other collectors.

In the same year, 1841, the *Gardeners' Chronicle* was established by Lindley and others, and Bentham at once became one of its most valued contributors. Many of his articles are unsigned, others marked with initials only. They comprise descriptions of new plants, a translation of Rè's Treatise on Vegetable Pathology (1840-50), and numerous accounts of foreign botanic and other gardens visited by him in the course of his prolonged autumnal holidays, when he came in contact with, and indeed became intimate with, most of the botanists of the day. Bentham continued to be an occasional contributor for many years, and the present Editor, like his predecessor, has reason to hold him in grateful recollection.

"In October, 1855, the Benthams came back to London, after a round of visits extending over two months. No sooner was Bentham back in town than he joined in discussing the plans of the Horticultural Society; it was proposed to give up Chiswick, which the Society could no longer support: 'painful as it is thus to break up a Society in which one has taken so much interest.' But the Society was not doomed then to this fate; not only was the catastrophe averted on the occasion, but it overcame a much more threatening, overwhelming one some years later."

"On 29th January, the collections of dried plants belonging to the Horticultural Society were sold by auction: 'Brown for the British Museum, and Planchon for the Paris Museum, and Delessert were the principal bidders, and paid very high prices for some lots. Pamplin also bought a good deal . . . . and I bought several collections for Agardh and some for de Candolle.'"

Our notice has extended to a greater length than we intended, but it is indeed difficult to know where to stop. As it is, we have not alluded to Mr. Bentham's resignation, under painful circumstances, after many years of devoted and distinguished service, of the Presidency of the Linnean Society. It was ultimately decided by high legal authority that Bentham, whose conduct at a certain juncture had been impugned, had been strictly correct in his decision. Nor can we do more than allude to the wretched insolence of an ignorant Minister of State towards Sir Joseph Hooker, a matter which caused a great commotion at the time, and one in which Bentham was naturally greatly concerned.

Mr. Jackson has done his task well. He has evidently been hampered by wealth of material and by difficulty of selection. He has here and there inserted details of minor general interest, but we do not find that he has omitted any important particular. He may be cordially congratulated on having produced a work which will be consulted by the future historian of the botany of the nineteenth century along with the classical life and letters of Asa Gray and the masterly summary by Sir Joseph Hooker of the life and labours of his father, Sir William. It is the fashion now to speak of these men, as well as of Robert Brown, the Decaisnes, the Martius, the de Candolles, and others, as botanists of the old school; and in a sense this is, of course, true, but it must be long, indeed, before the new school can be in a position to show such a record as that achieved by their predecessors.

Mr. Jackson has greatly facilitated the researches of the reader by the excellent tables of contents and elaborate index which he has provided.

Our Supplementary Illustration shows a handsome plant of Cordyline indivisa growing in the Earl of Annesley's garden at Castlewellan, concerning which his lordship's gardener, Mr. T. Ryan, writes as follows:—"The plant was raised from seed sown in these gardens. In the spring of 1897, the late Mr. Burbidge, of Trinity College Gardens, Dublin, had seeds sent to him from New Zealand, and he sent some to the Earl of Annesley. Eighteen plants were raised from the seeds received, some of which were sent to Mr. Burbidge, as his own seed failed to germinate, and some to Kew and Glasnevin Gardens. We found them most difficult to keep alive through the winter during the first few years. We lost several plants, and it is probable that we should have lost them all had we persisted in growing them in pots during the winter. Instead, we turned them out of the pots and planted them in the border of a cool orchard house, and covered up the roots with leaf-soil. After that we had no more trouble. When planting them out in the nursery border the following spring the 'balls' were a mass of young roots. We treated them in a similar way the following winter, and they increased to such an extent that it took a couple of men to lift them on their removal to a permanent place. They have been in the pleasure grounds at Castlewellan for seven years, and during that time they have received no protection, and have not been in the least injured by frost or snow. This magnificent plant requires shelter from prevailing winds to prevent the leaves being broken. The plant photographed is 8 feet in height, with a circumference of 27 feet, the leaves are 5½ feet in length and 7½ inches in width; dark-green above the midrib, and the secondary nerves of orange colour, the under surface is glaucous with orange-coloured nerves. In a letter I received from Mr. Burbidge at the time, he said it was the first time Cordyline indivisa had been grown from seed in Europe since Lee, of Hammersmith, raised a few seedlings in 1857." An illustration of C. Banksii growing at Castlewellan will be found on reference to p. 241.

Royal Horticultural Society.—The next meeting of the committees will be held on Tuesday, October 9, in the Society's Hall, Vincent Square, S.W. A lecture on the "Origin and Peculiarities of Climbing Plants," illustrated by lantern slides, will be given by the Rev. Prof. G. Henslow, V.M.H., at 3 o'clock.

The thirteenth annual show of British-grown fruit will be held in the Society's hall, Vincent Square, Westminster, on Tuesday and Wednesday, October 16 and 17. Fellows of the Society will, on showing their tickets, be admitted at 1 p.m. on October 16, and at 10 o'clock on October 17. The public will be admitted at 2 o'clock on October 16 on payment of 2s. 6d., and at 10 o'clock on the 17th on payment of 1s. The show will close at 6 p.m. on both days. On the first day a lecture on the "Food Values of Fruit" will be given by Dr. Josiah Oldfield. The judges will assemble in the entrance hall at 10.15 a.m. on October 16. The Fruit Committee will meet at 11. The other committees will not meet, and only exhibits of fruit will be staged. Exhibitors can commence staging on Monday, October 15, at 1 p.m., or at 6 a.m. on the 16th. Exhibits can be removed at 6 p.m. on the 17th. We are requested to state that the Society will unpack and stage exhibits if notified three days previously of the owner's inability to do so, but in no case can the Society undertake to repack or return any exhibits. Copies of the schedule can be obtained on application to the Royal Horticultural Society, Vincent Square, Westminster. Entries close on Tuesday, October 9.

British Gardeners' Association.—We are informed that at the last meeting of the executive council of this association, held in the Horticultural Hall, Westminster, Mr. W. H. Divers, from Belvoir Castle Gardens, presiding, eighteen new members were elected, bringing the total up to 943. Four applications for membership were declined. The question of forming a junior branch of the association for the admitting of apprentices was discussed, and a scheme will be formulated for consideration at the next meeting. An application having been received to hold a meeting of the association at Bournemouth, it was decided that arrangements be made accordingly. The executive council wish it to be known that a delegate will be sent to address meetings in any part of the country where a reasonable number of gardeners can be got together. Applications from anyone interested in such meetings are invited, and should be addressed to the honorary secretary, Talbot Villa, Isleworth.

BOTANICAL MAGAZINE.—The following plants are figured and described in the issue for October:—

ODONTOGLOSSUM NALVIUM, tab. 8,097.—This Colombian species was originally figured and described by Dr. LINDLEY, in 1850, from a plant which was exhibited at one of the spring meetings of the Horticultural Society. The plant dropped out of cultivation, and after many years was reintroduced from the mountains near Santa Martha. The flowers are white, with numerous dark purple blotches, and a bright yellow disc to the lip; sepals spreading, narrowly lanceolate, very acuminate, recurved undulate, about one inch and a half in length, the petals being very similar, but of rather shorter length. The plant now figured flowered in a temperate Orchid house at Kew in February last. The present description is by Mr. R. A. ROLFE.

ABIES MARIESII, tab. 8,098. This handsome Japanese silver Fir, allied to A. Webbiana, was first figured and described in *Gardeners' Chronicle*, December 20, 1879, p. 788, fig. 129. The present figure and description by Dr. M. T. MASTERS have been prepared from a tree growing on the estate of the Earl of ELGIN, Dunphail, near Nairn, and it is believed to be the first occasion on which this species has produced cones in this country. The species was originally discovered in the mountains of Northern Japan by the late Mr. CHARLES MARIES, who introduced it to the Coombe Wood Nurseries of Messrs. JAMES VEITCH & SONS. It differs from A. Webbiana in the hairy shoots, denser, shorter, less horizontally spreading leaves, and in the shorter, cask-shaped cones.

BLAKEA GRACILIS, tab. 8,099. Mr. S. A. SHAW describes this species from a plant purchased in 1901 from Messrs. LEMOINE & SONS, of Nancy, which flowered in a greenhouse at Kew in February last. It is a glabrous, much-branched shrub, 9 to 13 inches in height, or sometimes a small tree. The leaves are obovate-elliptic or elliptic, 2½ to 4 inches in length, and about 1¼ inch in breadth. The flowers are axillary, solitary or rarely geminate, about 1½ inch across; white, slightly tinted with pale rose colour. The plant was first described by HEMSLEY from material collected by ENDRES for Messrs. JAMES VEITCH & SONS. B. trinervis, tab. 451, is the only other species in cultivation.

CHLOREA VIRESCENS, tab. 8,100.—This species originally appeared in cultivation in the Birmingham Botanic Garden in 1815, when it was exhibited at a meeting of the Horticultural Society, and figured in the *Botanical Register*, but was soon lost sight of. It was recently re-introduced by Mr. H. J. ELWES, of Colesbourne. He found the plant growing on sandy flats near Coronel, Chili, in December, 1901, and sent plants to Kew, which flowered in a greenhouse in April, 1903, and on subsequent occasions. The flowers are of large size, yellow in colour, varied with green. They are borne on racemes measuring 4 to 6 inches in length. The present description is by Mr. R. A. ROLFE.

PASSIFLORA PFUGLEA, tab. 8,101.—Mr. T. A. SPRAGUE describes this South American species from a plant which was received in 1904 from the State Botanical Gardens, Brussels, under the name of P. maculata, which flowered at Kew in the autumn of 1905. The plant has variegated leaves, being marked with purple between the veins, on both surfaces. The flowers are yellow.

THE LATE CHARLES WILLES WILSHERE.—The death of Mr. WILSHERE, of The Erythe, Welwyn, is announced at the age of 92 years. He could was much interested in horticulture, and was a frequent occasional correspondent to these pages.

WINTER-FLOWERING CARNATION SOCIETY.—The first show of the Winter-Flowering Carnation Society will be held on December 4, in the Royal Botanic Gardens, Regent's Park. The schedule of prizes to be competed for may be had on making application to the Hon. Secretary. The competition is open to members only. All interested in this class of Carnations, and not yet members of the society, are asked to communicate with the Hon. Secretary, Mr. HAYWARD MATHIAS, Rodown, Medstead, Hants.

EVENTS IN 1907. The secretary of the Royal Horticultural Society writes us as follows: "The council of the Society have fixed the following dates for the exhibitions of the Society in 1907.—January 8, 22; February 12 (annual meeting); March 5, 19; April 2, 16, 30; May 14, 28 to 30 (probably in the Temple Gardens); June 11, 13, 14 (colonial grown fruit and vegetable show), 25; July 9, 10 (Holland House), 23; August 6, 20; September 3, 17; October 1, 15, 17, 18 (British grown fruit), 29; November 12, 26, 28, 29 (colonial grown fruits and vegetables); December 10, 31. There will be no colonial fruit and vegetable show in March as the governments of the South African colonies, in whose interests the show has been held, have combined and hired the Royal Horticultural Hall for a great exhibition of products in February and March, 1907. Negotiations are also in progress for the autumn Rose show, the Sweet Pea show, and the exhibitions of the other kindred societies to be held at the Hall as usual. The Sherwood Cup will be awarded at the Holland House show on July 9 for the best collection of herbaceous and bulbous plants shown in pots or tubs on a space not exceeding 400 square feet."

BURBANK AS A PLANT BREEDER.—We take the following extract from the pages of *Nature*: "The review of Mr. LUTHER BURBANK's work, written by Prof. HUGO DE VRIES in the *Biologisches Centralblatt*, September 1, gives the opinion of the foremost scientific plant-breeder on the work of one of the most successful practical plant breeders. While fully recognising the remarkable acumen of BURBANK's judgment, and the practical value of his work, Prof. DE VRIES finds a marked contrast between the aims and methods of the two types of worker. Careful experiment in the cultivation of crossing on a limited scale of pure types with definite characters the task of the scientific investigator; the hope of the nurseryman lies in the chance possibilities arising out of the production and selection from a vast number of variations; for instance, Mr. BURBANK selected his Plums from 300,000 hybrids. One of the most important features of Mr. BURBANK's work has been the cultivation of remote species with possibilities that have escaped the consideration of less [? more] conventional cultivators. The stoneless Plum was obtained from crossing some plants, 'Prunes Sans Noyau,' at one time cultivated in France. An intuitive genius for selection of promising varieties is the key to Mr. BURBANK's success."

THE NATURE OF FERTILISATION.—The discussion at the British Association (conjointly with Section K) on the nature of fertilisation was initiated by Dr. V. H. BLACKMAN, who gave a brief account of the recent work on which the present views of fertilisation are based, dealing specially with the role of the chromosomes, and taking as a starting point the theory put forward by MONTGOMERY (1901), that in synapsis the maternal and paternal chromosomes unite in pairs, and are later separated by the reduction division, which thus divides the somatic chromosomes into two groups. Fertilisation appears to be incapable of exact definition, for apogamy and parthenogenesis link it on to vegetative reproduction, and, indeed, nuclear fusions and reductions occur in plants apart from reproduction, *e.g.*, in graft hybrids of Mespilus and Crataegus there is evidence that the fusing of vegetative cells has led to the mixing of characters.—*Nature*.

WILLIAM MITTEN.—The *Journal of Botany* for October contains a photograph and appreciative notice by Mr. HEMSLEY, of WILLIAM MITTEN, the accomplished bryologist, who died on July 27 last in his 87th year. By profession he was a pharmaceutical chemist, but at the commencement of his career developed an affection for the study of botany. Encouraged by BORRER and Sir WILLIAM HOOKER, he paid special attention to mosses and liverworts generally, and soon became one of the leading authorities on these plants. He made many contributions to the literature on such plants, some of which were published in separate volumes by the Linnean and other societies. His greatest work was the *Musci Austro-Americani* published in 1869, which occupies the whole of the 12th volume (upwards of 650 pages) of the *Journal of the Linnean Society*. The basis of this was the very fine collection made by RICHARD SPRUCE; about 1750 species belonging to 127 genera are described. Mittenia Lindberg was founded on Minopsis Plumula, the name Minopsis being already in use.

DR. FRANZ SCHUTT, Director of the Royal Botanical Garden and Museum at Griefswald, on the occasion of the 150th year's festival of the establishment of the University, was made the recipient of the Red Eagle Order of the IV. Class.

THE PHYLLOXERA IN SWITZERLAND.—This pest of the Vine has appeared at Sitten, in Valais, the finest wine district in the country; a patch of about a hundred Vines being attacked. The district of Valais had remained uninfected hitherto, and the authorities have not failed in taking every precaution to prevent an extension of the plague, the importation of Vines, cuttings and table Grapes being strictly forbidden. There is an insurance fund against the Phylloxera danger, and every vineyard proprietor has to pay into it annually 5 *rappen* for every 100 francs' value of his Vines; and the fund has at the present time at its disposal the sum of Fr. 93,000.

PENTAS CARNEA VAR. ALBA AND SANCHEZIA NOBILIS.—We remark in *Die Gartenwelt* for September 15 an illustration consisting of three plants of Pentas carnea var. alba, shown by Herr RECKTENBEN, gardener at Cassel, at the recent horticultural show at that town. The plant exhibits much decorative value, the flowers being very abundant, of the shape of the longer-tubed Bouvardia, as B. candidissima, or B. Humboldtii, and coming in loose terminal, erect panicles. We would recommend this plant to florists and gardeners for decorative uses in warm houses and apartments, and for its graceful habit, pure white flowers and abundant foliage. Three illustrations in the same journal of Sanchezia nobilis, shown by the same gardener, indicated the usefulness of this old inhabitant of our stoves as a table plant. Apparently they stood about 1½ feet high, the foliage was large with the colouring well brought out and almost hiding the pots from view.

THE POISONOUS PROPERTIES OF PRIMULA OBCONICA AND P. SINENSIS.—An account of the researches made by Herrn. K. WEYHAHL is given in the *Gartenflora* for September this year as to the causes of the irritation and inflammation of the skin produced in some persons when handling these two species of Primula. The actual work was carried out under the direction of Herrn. Dr. HANSTEEN, at the Botanical Institute of the Agricultural High School of Norway. Herrn. WEYHAHL says that the hairs found on the leaves, and chiefly on the upper surface of the leaves, are alike in both species. KAMENSKI, who, in 1875, carried out an anatomical examination, says of the hairiness of P. sinensis that the epidermis carries two sorts of hairs with globular heads or ends. These hairs consist each of two cells, a cylin-

drical short one forming the stalk, and a globular one above it containing the poisonous secretion. The cells consist of frothy liquid, together with large vacuoles, and are, as is the epidermis, covered with a thin cuticle, beneath which is situated a fragrant substance. This

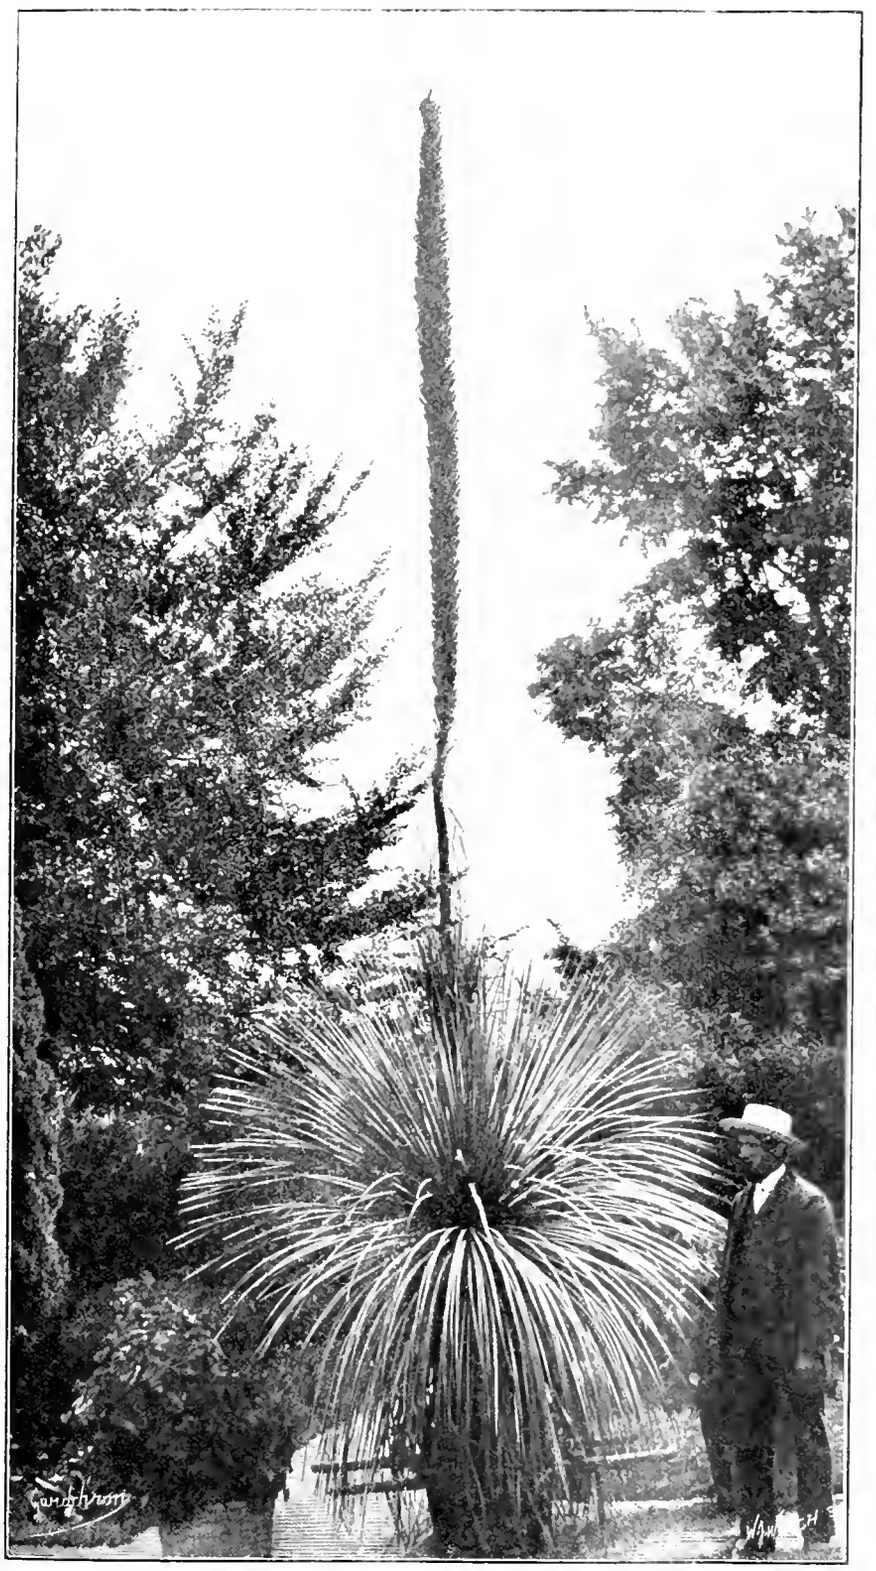

Fig. 101.—Dasylirion glaucophyllum flowering in the garden of Lady Theodore Guest, at Templecombe.

sub-tabular forms at the top of the hairs, and in the same manner as Hansteen has described as occurring in Syringa vulgaris; and is exuded at the point of the hairs between the cuticle and the membrane of the cell. The other hairs resemble these, but have longer stalks, which consist of two, three, and four cells; the two lower ones are drawn out at some length, and are broader than the upper cells, but they secrete no poisonous substance. Kamienski's interpretation of the anatomical and physiological nature of the hairs of these species of Primula is, that they are identical. The researches were carried out in dry air and warmth, moist air and warmth, and in cold air and moisture, and in other methods, in order to show which had the greatest influence on the development of the poisonous property of the hairs. The results showed that the formation depended largely on the method of cultivation adopted, as the plants were more free from the irritating poison when grown in moist warmth, and that in dry heat or under cool conditions it increased. These facts may account for the infrequent complaints made by commercial cultivators who grow their plants quickly, as compared with private gardeners who have not the same reasons for developing rapid growth in their plants. The article from which we quote is of considerable length, and it is illustrated in a very instructive manner with figures of the poisonous and non-poisonous hairs.

Mr. F. Jordan. We are pleased to hear that Mr. F. Jordan, late gardener at Impney Hall, Droitwich, and writer of our weekly calendar last year on the cultivation of "Fruits Under Glass," has been appointed Gardener to Lord Nunburnholme at Water Priory, York. Our readers will remember that on many occasions Mr. Jordan exhibited fruit from Impney and met with gratifying success.

Another New Tomato.—The Fruit and Vegetable Committee, on September 25, recommended another Award of Merit to a Tomato of the Duke of York type. It was named Lye's Early Gem, but as the fruits were, contrary to custom, removed from the hall early in the day, we were not able to describe them in our last issue.

New Pest on Black Currant Leaves.—The Black Currant, one might have supposed, was already sufficiently preyed upon by the destructive bud-mite (Phytoptus ribis), but according to our correspondent, M. C., a new pest has attacked the leaves of the plant. He writes as follows:—"During September the leaves of Black Currant bushes in a garden at Hasselmere have been attacked with the uredo and teleutospores of a fungus to nartium ribicolum. As far as we know it is the first time of its appearance in Britain, although it has been known on the Continent, perhaps, for a century. It is affirmed by some authors that the Æcidium found produced on the Weymouth Pine. The species of Cronartium exhibit a peculiar form of teleuto-peridium, another species is found on leaves of Peonies."

Publications Received. [illegible] *Handbook* [illegible] *Shrubs*, by E. M. G. [illegible], published by [illegible] & Co.; price 3s. 6d.

DASYLIRION GLAUCOPHYLLUM.

The Dasylirions are very ornamental plants by reason of their beautiful linear, drooping foliage, which forms a crowded tuft, as will be seen on reference to fig. 101. They are very suitable plants for sub-tropical gardening, or for decoration of the conservatory. They are all, with one exception, natives of Mexico, and belong to the same natural order of plants as the Yuccas, namely, Liliaceæ, which plants they somewhat superficially resemble. One of the commonest species met with in gardens is D. glaucophyllum, but it is not often that the plant develops its tall inflorescence. The specimen shown at fig. 101 was flowered in the gardens of Lady Theodore Guest, at Inwood, Templecombe. Her ladyship writes: "I enclose a photograph of Dasylirion glaucophyllum in flower. Mr. Watson, of Kew, informs me this species flowered in the Royal Gardens, Kew, two years ago. The rapidity with which the inflorescence grew is astonishing. On Monday, June 11, the beginning of a flower stalk was first noticed, in a fortnight on June 26, it had grown fully 16 feet, and we had fears it would grow through the glass roof of the conservatory. However, the flower buds around the stalks began to thicken rapidly, when the growth of the latter became less rapid. By July 1 it had completed its full height of 18 feet 10 inches. The circumference of the stalk at the lowest point was only 6 inches, but at the thickest part, where it was closely covered with flower buds, it measured 16 inches [illegible] circumference. The

individual flowers are excessively minute, three-sided in shape, exactly like the calyx of the tuberous rooting Begonia. They are of a pale green colour, triquetrous, and have a pistil apparently at the apex, with inconspicuous stamens at the base. The flowers are apetalous, but the pistil is so minute it might possibly be a rudimentary corolla. The plant during the summer has been placed out of doors."

PRIMULA COCKBURNIANA.

Owing to a mischance, a figure of P. tangutica was given in our last issue (fig. 96) as P. Cockburniana. We hasten to remedy the error by giving at fig. 102 an illustration of the true P. Cockburniana, one of the most remarkable of all Primulas by reason of its orange-coloured flowers.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

Burbank's Giant Prune.—I send three fruits of "Burbank's Giant Prune" from three-year-old trees in my nursery. Several of the trees carried four and five fruits each, which certainly seems to promise that the variety will be a good bearer; the tree is a strong and shapely grower and appears to be perfectly hardy. I think it will prove a valuable variety to follow Monarch and Pond's Seedling, as it is later than these. *Geo. Pyne, Dewer Nurseries, Topsham, Devon, September 24.*

[The fruits are rather long, not broad, purple in colour, and rather acid to the palate. They are suitable for culinary purposes. Ed.]

Tomato Carter's Sunrise.—In the early part of the present year I raised plants of this variety for the purpose of comparison with standard varieties and with a view to testing the wonderful cropping and other good qualities which Sunrise was said to possess. As the result of this test I may say the qualities of this Tomato were in no way overrated in the recommendations with which this novelty was introduced. It is a good grower and a prodigious cropper, the stems being furnished, from within 6 or 9 inches of the ground upwards, with large clusters of from 9 to 13 handsome and brightly coloured fruits. The fruit is of a good size, the flesh being deep, solid, and fine in quality. The individual fruits, moreover, are even in size and shape, the apex or crown of fruit being in every case scarcely discernible. Sunrise is by far the best all-round Tomato among the many that I have grown, and I can recommend it to all who cultivate this fruit and especially to those who, like myself, grow for market. *H. W. Ward, Lime House, Rayleigh, September 19, 1906.*

Sutton's Evergreen Dwarf Bean.—I have grown this Bean this season with standard varieties such as Canadian Wonder, Ne Plus Ultra, and Perfection, and it has been far superior to any of them. The chief quality possessed by the variety is the length of time it remains in bearing, and it produces a supply of deliciously tender pods which keep fresh longer than those of any of the older kinds. It is of excellent table quality. It does well grown either as an early, mid season, or late kind, and it stands drought in a light, sandy soil better than any other Bean known to me. I am sending two plants from a batch that was sown on July 21, from which we have been gathering for three weeks. *G. H., Caversham Park, Mildenhall.*

[The plants sent were still in bearing.—Ed.]

Chrysanthemums. I called at Messrs. Cragg, Harrison & Cragg's Nurseries, Hounslow, on the 28th ult., before the plants were removed into their winter quarters. The frost of the early morning had made the firm busy, and the moveable narrow-gauge railway with the handy low trucks was being worked by all available hands. There were 20,000 pot plants to be removed inside. The plants had well-ripened wood, well set with buds, and most of the plants had been disbudded. They therefore appeared very promising for the production of suitable blooms for marketing. Of the market type Moneymaker—of which the firm has about 200 plants—is among the best of the early varieties. The flowers are white, of large size, and broad petalled. La Triomphante, in white, pink, yellow, and bronze sports, were very prominent. Of Sunshine there was a batch of 5,000 plants, some of them having nine flower buds on each. Queen of the Earlies, and white, yellow, and terra-cotta coloured sports were good. Mrs. F. Judson, Miss A. Byron, Improved Ryecroft, Ryecroft Glory, Mrs. J. Thompson, Lord Brooke, Western King, Nellie Pockett, and Souvenir de Petite Amie are all favourite varieties for market supply. *Stephen Castle.*

Proposed Federation of Gardeners' Mutual Improvement Societies.—The forthcoming meeting of delegates on October 16th will be held at the Royal Horticultural Society's Hall, Vincent Square, at 4 15 p.m. Mr. Reid, president of the Croydon Society, will preside. I have heard from a number of local societies who are sending delegates to the meeting, whilst others at a longer distance from London write me approving of the proposal, but cannot send representatives owing to the expense of travelling, &c. *Harry Boshier.*

An Interesting Rock Garden.—I have seen many good rockeries and have constructed some, but the one at Swaylands House Gardens, Penshurst, Kent, is beyond anything of the same kind known to me. Mr Hosier, the gardener, told me that nearly £80,000 had been spent on this rock garden alone. It was begun in 1891 and was finished about four years ago, and more than 8,000 varieties of plants have been placed upon it. The gardens at Swaylands House are very large and extremely beautiful. *W. Earp, Bayham Abbey Gardens.*

Rare British Fungus—Latticed Stinkhorn.—I have just received intimation, and verification, of the appearance of Clathrus ancellatus in a garden at Truro during the past June and July. It was stated to range from the size of a pheasant's to that of an ostrich's egg. "The shape of a puff ball, only not solid, but just a network. It was orange in colour outside, and bright red inside." It came up under a Datura and some shrubs in a dry, sunny border. This fungus has only rarely been found in this country, and mostly in the south, as in the Isle of Wight, and at Torquay, and is certainly of a most singular and beautiful form, a figure of which is given in "Plain and Easy Account of British Fungi," plate 19, and also fig. 3 on Worthington Smith's sheet of "Poisonous Fungi." It is reputed to be a virulent poison, and is extremely foetid. *M. C. Cooke, September 29, 1906.*

Some Effects of the Extreme Heat on Vegetation. The summer of 1906 will be remembered as one of the hottest and driest known in this part of Kent. During the three months, June, July, and August, 4·09 inches of rain was registered, with four registrations in the month of September amounting to 1·30 inches. But, although the past summer cannot be said to have been phenomenally dry, it has surely shown a maximum of sunshine over any corresponding period of three months for many years. For the past three weeks leaves have been falling from the Elm, Chestnut, Beech, and Ash in great numbers, and especially is this noticeable in the case of the older trees, many of which are almost bare of foliage. Vegetation during the first week in September presented an appearance such as is usually seen a month later, for the foliage was down and lying in drifts. Pears on south walls are disfigured with sun blisters that range in size from a sixpence to a five shilling piece, and these fruits generally have not grown to their normal size by one-third. The flavour in Pears this season should be very good, and unless the drought has caused a high percentage of grittiness in the flesh, the majority should be entirely to the satisfaction of the most exacting consumer. The general appearance of many of the fruit plantations is such as one would expect to see at least three weeks later. *H. R., Maidstone, September 18, 1906.*

——The past summer will long be remembered as one of the driest for many years, and the remarks on "Rain" (p. 212) will no doubt have been of much interest to many readers. In some parts of Gloucestershire this summer people have been obliged to go three miles to obtain water for drinking purposes, and doubtless many of our large towns have had a considerably reduced supply. The effects of the dry summer are to be seen in the gardens, and nearly all the vegetable crops, including Cabbage, Cauliflower, Turnip, Lettuce, Spinach, Peas, Carrots, Beet, and others have presented a semi-starved appearance. Violet plants, of the single varieties growing on south and west borders, present a crippled appearance, red spider having almost ruined them; but the double varieties on an east border that is partially shaded by tall Elm trees have not suffered to any great extent. This teaches one a useful lesson. Few plants suffer more quickly in a dry season than Violets, and a partial shading is really necessary for them, especially during such a dry season as the past, to obtain a bountiful supply of flowers during winter and early spring. On the farm similar failure must be chronicled. Mangolds had their foliage yellow by the middle of August, while Swedes and common Turnips are much below their normal size at Michaelmas. Pasture lands appear as though they have been without rain for six months, and scarcely a green blade of grass is to be seen, except on the marshes or on very low-lying ground. The corn crop has been exceptionally good, and better than it has been for some years past, which will partly recoup the farmer for the partial failure of his root crops. Up to September 26, and since the beginning of the year, 20.19 inches of rain have been registered here, the month of July proving the driest. In the year 1905, 18½ inches were recorded for a similar period, so that we have had close upon 2½ inches more rain this year than we had last, July of that year proving the driest month with only half an inch. *J. Mayne, Bicton.*

Pelargonium Mrs. Lawrance.—The new Zonal Pelargonium "Mrs. Lawrance" appears to be gaining popularity. It has been mentioned in all the Covent Garden Market reports, both in trade papers and in the *Gardeners' Chronicle*. It is the best variety I have grown, being more compact and free-flowering in habit than "Denmark." The flowers also last longer and are of a very pleasing shade of pink. It was raised by a young nurseryman named Lawrance, a school friend of mine, who was at the time about to be married, and Messrs. Clark, Ltd., of Dover, who first recognised the merit of the new variety, named it after the future Mrs. Lawrance. Some hitch occurred in the matrimonial engagement, and young Lawrance gave up his business and left the country, and so far as I know there is still no "Mrs. Lawrance." The plant was the result of a cross between "Maggie Hollock" and "Hermione." *Collegian, Kent.*

Nymphæa zanzibarensis rosea.—This beautiful rose-coloured Water Lily, which was illustrated in the *Gardeners' Chronicle*, November 25, 1905, from Lord Rothschild's gardens, Tring Park, Tring (gr. Mr. A. Dye), has been almost continuously in bloom in the warm Lily tanks at Tring Park. It proves to be not only one of the most beautiful and free-flowering varieties, but is also a very free grower. One of the plants now in flower was from seed gathered just a year ago. The Hon. Walter Rothschild, M.P., observed the first leaves seven months ago, and the first to bloom is now in flower well within the year from sowing. There is variety of tint in the seedlings, but none have as yet proved finer than the original illustrated. The Nymphæa tanks have many other fine varieties in bloom, from white to blue and rose. One of the finest of the magenta-rose coloured is N. O'Marana, which is large, broad-petalled and much like N. gigantea in shape. *J. O'B.*

The Proposed Champion Vegetable Class.—On p. 215 *Nous verrons* credits me with "asking for something of an extraordinary nature in inviting the Shrewsbury authorities to provide a special class for the vegetable champions." Surely he is aware that I did nothing of the kind, but simply lent my support to the suggestion of *A. D.* He also suggests that I must have forgotten the Chiswick and Edinburgh classes which were provided for such a purpose. I ask *Nous verrons* in what sense were either of these considered as championships? These classes were provided in the ordinary way with good prizes offered, and were sternly competed for in both instances by many of the best growers, but no suggestion was made in the schedules of either being championships. *Nous verrons'* remarks would almost lead one to infer that they were failures, instead of which they were voted by the judges and Press alike as the finest exhibits of vegetables that had been shown up to that time. *Nous verrons* considers the suggestion of a vegetable championship as extraordinary, and also finds fault with the best growers when they compete in classes

for which their seedsmen offer the prizes, but they do not happen to meet each other. Does *Nous verrons* suggest that these growers should come to some arrangement that they each get their seeds from one or two firms in order that they should meet in competition? This is exactly what they would have to do to meet that idea, or otherwise get seeds from all of them, which would be ridiculous. For my part, I would sooner give up exhibiting than have to do anything of the kind. *Nous verrons* asks how many would compete in such a class. Well, I venture to say it would be well competed for, and all the best growers would be honourably bound to enter or lose their reputation. He need not fear of it being a one-man show; besides, it affords a splendid opportunity for many of the older growers to compete there and relieve them of the necessity of competing in the smaller classes, thus giving greater encouragement to beginners, of whom there are too few. The suggestion that all vegetables staged should be correctly named is exactly what we find in nearly all schedules, and is nothing new. It is another thing, however, to name them correctly and to get the general public to believe they are correct, and it requires more than the mere naming to make them believe that Cranston's Excelsior Onion is not Ailsa Craig, or vice versâ; Duke of Albany Pea, the Alderman, Perfection Tomato, Eclipse or the Polegate, and so on. I venture to say that such varieties, if treated to exceedingly high culture, their true character becomes somewhat altered, and if selected to a particular type according to the exhibitor's own ideas, they may seem, and reasonably seem, quite another variety, and yet be perfectly true to name. The exhibitor may then be blamed for his honesty. *James Gibson.*

——To me it seems hard on the Shrewsbury Society when we find even Mr. Beckett bewailing its want of liberality in not providing a class of such magnitude as would satisfy these champions. Perhaps the committee is waiting to hear what sum in prizes will satisfy competitors! *H. W. W.* shows what liberality is shown at Shrewsbury in respect to vegetables. There are a number of classes in open competition at this society's show, and who provides them is surely quite immaterial to exhibitors. Mr. Beckett admits that the vegetables generally seen at Shrewsbury are of an extraordinary character; hence my surprise that Mr. Gibson seemed dissatisfied. This correspondence illustrates how difficult it is to satisfy exhibitors. At Shrewsbury there are more classes, more value offered in prizes, and the finest produce, yet a drastic alteration is required. I may well sign myself *Nous verrons.* Yes, I well remember the Chiswick and Edinburgh shows, and know also what little chance a small grower had at either place. Classes should be reserved for smaller growers. The public would be equally well interested in seeing Mr. Brown stage a collection from his two-acre plot as they would be in witnessing the display of the giants from their ten-acre fields. No one will deny that it is all a question of money and space in the production of choice vegetables. Mr. Beckett says: "I decided to compete for the two classes, etc., immediately the schedule was issued." Will Mr. Beckett tell us if he kept his decision a secret, or did he tell his exhibitor friends of his intention? If he will take the public into his confidence now, they can judge for themselves. Now, as to the wrong labelling of some of the dishes, I am pleased to find that Mr. Beckett does not infer that wrong naming has never been *practised*. This is surely a tacit admission that such is done (of course I do not say by himself); but mark the word he uses—*practised*. Surely there is great similarity in many varieties, and even Mr. Beckett, with his vast experience, would be puzzled to know sometimes where Tweedledum ends and Tweedledee begins? Does Mr. Beckett think there is as much similarity in varieties of Chrysanthemums as there is in Tomatos or even in Runner Beans or Onions? *Nous verrons.*

FIG. 102.—PRIMULA COCKBURNIANA; FLOWERS ORANGE-COLOURED.

The Ray Asters.—This is one of those very pretty varieties of the summer annual Asters which should be found in every garden, and especially where Asters are grown for cutting. The petals or rays are rolled up at the margins as in the so-called "thread" Chrysanthemums, to which the flowers bear a strong resemblance: and the first flowers begin to expand towards the end of the month of August. Herr. F. Roemer, Quedlinburg, has for a number of years been endeavouring to raise an earlier flowering variety, and he has at last raised that which he rightly names the July Strahlen (Ray) Aster, which begins to bloom the first week in that month, and lasts for a long time in perfection of bloom. The colours thus far raised by Herr Roemer are light blue, white, and pale pink, to which he hopes to add salmon pink and cinnabar carmine. Some flowers in all three colours, that I saw in a Norfolk garden, pleased me greatly. *F. M.*

Scarcity of Dessert Apples.—For the dessert after Worcester Pearmain is finished there is a great scarcity of desirable Apples. Previously we have Lady Sudeley, Beauty of Bath, and Devonshire Quarrenden, all of which possess that most desirable point for commercial purpose, rich colour. After these there is a lack of variety until King of the Pippins is ready at the end of October. I am aware there are two or three that may be supposed to fill the gap, such as Duchess's Favourite and Summer Golden Pippin, but these are much too small to satisfy the ordinary fruiterer. At one time I had great faith in Benoni and planted it largely, but I regret to say it is much too shy in bearing to be of value, although of a desirable tone of flavour, and ripening quite at the right time—end of September. Ben's Red I have fruited this year for the first time, and value it highly. It grows to a moderate size, is richly coloured, and of satisfactory flavour. If this Apple could be obtained in large quantities just now it would be a desirable variety. Langley Pippin is another good Apple, and ripens a few days before Worcester Pearmain, and has all the attributes of a desirable market Apple. James Grieve is said to be of a desirable character. Sufficient can hardly be known of it yet to warrant its being largely planted. King Pippin is an excellently flavoured variety, but too small. The catalogue I have in front of me contains no fewer than one hundred and thirty varieties, and even then there is not what is exactly required at this season. It is not so with kitchen varieties, for in these there is abundant choice of varieties having excellent quality even in September and October. *E. Molyneux.*

The Late Dean Hole.—A memorial to the late Dean Hole was dedicated by the Bishop of Rochester in the cathedral of that city on the 29th ult. The memorial is in the form of a recumbent figure of the late Dean in statuary marble. He is represented in his robes with eyes closed and hands clasped, and at his feet is a wreath of his favourite Roses. Mr. F. W. Pomeroy, A.R.A., is the sculptor of the memorial, which rests upon an altar base of alabaster designed by Mr. C. Hodgson Fowler, F.S.A.

SOCIETIES.

ROYAL HORTICULTURAL.

Fruit and Vegetable Committee.

SEPTEMBER 28.—A deputation from the FRUIT AND VEGETABLE COMMITTEE visited Wisley Gardens on the 28th ult. to examine Potatos and Kales. The trial of Potatos, although a very extensive one, has proved to be unsatisfactory, arising from spring cold and summer drought, and in selecting from the large collection a few varieties to be presented in a cooked condition to the full committee on the 9th inst., the deputation wish in no way to reflect on others, but simply to show that under existing conditions these few were the best. Several well-known varieties previously certificated were seen in good form also. The selected ones are Klondyke, Alpha, Russett Queen, Conquering Hero, The Scott, Breydon's Crompion, Dr. Gillespie, Ardcairn Beauty, and the popular Up-to-date, a splendid variety which, oddly enough, has not yet received an award.

If, however, the Potato trial was unsatisfactory, that of Winter Kales is exceptionally fine. Under no conditions could better examples in great quantity be seen. The Kales include the well-known Scotch types, tall and dwarf Arch Kales, green and purple, these latter showing exceptional merit, the broad-leaved or Chou de Milan type, Asparagus, Breda, Cottagers, and others. Whilst some few were just now exhibiting special excellence of stock and quality in growth and leafage, it was agreed that no true test of the merits of any one variety as a winter green could be furnished until the winter was well advanced, as, apart from productiveness, capacity to withstand severe weather and frosts was an important feature.

Scientific Committee.

SEPTEMBER 25.—*Present*: Mr. G. Massee, F.L.S., V.M.H. (in the chair); Dr. A. B. Rendle, Messrs. E. M. Holmes, G. Nicholson, J. T. Bennett-Poë, G. S. Saunders, E. A. Bowles, J. Douglas, W. B. Hemsley, and F. J. Chittenden (hon. sec.).

Disease of Iris from Kew.—Mr. MASSEE reported that the disease of Iris referred to him at the last meeting was due to the fungus Heterosporium gracile (Saccardo). The best treatment is to spray early in the season with dilute Bordeaux mixture. Other fungicides seem to be of no avail against this fungus. Injured leaves should be cleared away, otherwise there will be a return of the disease next season; probably even with these precautions the disease will return.

Leaves of Chrysanthemum, &c.—Mr. HOLMES showed leaves of Chrysanthemum having pale brown patches and lines upon them, particularly near the midrib. Mr. SAUNDERS took them for further examination.

Montbretias Dying.—Mr. E. A. BOWLES showed some further specimens of dying Montbretias similar to those shown at a recent meeting, in which the first symptom of trouble is the browning of the leaves. The disease appears to be a physiological one, no specific organism, either animal or vegetable, having been found associated with it.

Rust on Plum Leaves.—Mr. J. DOUGLAS showed leaves of Plum very badly infested with the Plum rust, Puccinia pruni. No leaves should be allowed to remain on the ground through the winter, as upon these the spores of the fungus hibernate, and the trees should be sprayed with a fungicide in the spring.

"Wheatear" Sweet William.—Mr. DOUGLAS also showed on behalf of Rev. W. WILKS an inflorescence of Sweet William, in which all the flowers were malformed as in the "Wheatear" Carnation; the bracts being repeated again and again at the expense of the flower.

Black Fungus on Apple Leaves.—Apple leaves covered by a black, sooty material were received from Brumerton, Norwich. The cause of the appearance was the presence of a species of Fumago upon the leaves, a fungus which grows upon the honeydew formed through the attacks of aphis. Attention should be paid to keeping the aphis in check. The variety King of the Pippins was the one chiefly attacked.

Apple and Wasps.—Rev. Prof. G. HENSLOW sent some Apple skins left after wasps had consumed the whole of the cellular tissue, abandoning the core and particles of grit which formed a layer at the bottom. After falling from the tree the skins became the domiciles of earwigs. He also sent the following note: "It has occurred to me that the presence of 'grit' disclosed by the wasps not being able to eat it (but undiscoverable to us human beings, being too small), proves the last differentiation between Apples and Pears to go! I take it that 'grit' is the degraded state of an original stone fruit; the cores being the internal lining only of the carpels. In a Pear which has decayed the grit is clustered round the five carpels, resembling that of other stone fruits; but in Apples it has degraded so much further that only wasps can discover it!" The members of the Committee agreed with Dr. MASTERS, who wrote: "This is a most ingenious idea; but as the 'grit' or mechanical tissue in a Pear is not confined to the neighbourhood of the carpels, but diffused in the parenchyma, and especially beneath the epidermis, I cannot quite see how it can be phylogenetically connected with the stone. The 'grit' is an integral portion of the fruit branch, not of the carpels."

NATIONAL CHRYSANTHEMUM.

OCTOBER 3, 4.—The early autumn exhibition of this Society was held on the foregoing dates in the Crystal Palace, Sydenham. The number of entries and the displays generally were equal to those of former years, notwithstanding the very exceptional weather of the past summer. It was interesting to note that Scottish exhibitors met with much success in the classes for flowers from the open. Among several seedling varieties, four were of sufficient merit to obtain the Society's First-Class Certificate, and these will be found described below.

GROUP CLASSES.

Class 1 called for a group of Chrysanthemums arranged for effect, to be shown in the form of a half-circle, and to occupy an area of 11 feet by 7 feet. Suitable decorative foliage plants were allowed in the group. Mr. Howe (gr. to Lady TATE, Park Hill, Streatham Common) had the better of two, the other competitor being Mr. FOSTER, Nunhead Cemetery, S.E., who was awarded the 2nd prize. Mr. HOWE staged tall plants of large flowering Japanese varieties—Mrs. W. Knox, Mrs. A. H. Lee, Geo. Mileham, &c., among which were interspersed Ferns, Palms, Asparagus, &c., while Mr. FOSTER had dwarfer plants of yellow and white Niveum intermixed, and relieved with decorative foliage subjects.

Only one exhibit was forthcoming in a class for 12 pot plants of early flowering Chrysanthemums, this being shown by Messrs. WELLS & Co., Merstham, Surrey, but, as the majority of the flowers were unopened, it only received the 2nd prize.

CUT BLOOMS.

The principal class for cut blooms was that for 24 blooms of Japanese Chrysanthemums in not fewer than 18 varieties, not more than two flowers of any one kind to be included. Two groups only were staged, and these were put up by Mr. A. C. Horton (gr. to T. L. BOYD, Esq., North Frith, Tonbridge, Kent) and Mr. G. Halsey (gr. to Mrs. JEREMIAH LYON, Riddings Court, Caterham Valley), who were awarded the 1st and 2nd prizes in the order named. The premier collection included some good flowers, notably those of Marquis V. Venosta, Mrs. H. Emmerton, Mrs. T. Dalton, Mafeking Hero, Mrs. Geo. Mileham, Alice Byron, and Bessie Godfrey. The 2nd prize collection contained good specimens of Mrs. Geo. Mileham (a fine, full flower), General Hutton, and Miss Elsie Fulton.

The smaller class of 12 Japanese blooms was contested by four competitors. The quality of the best three exhibits in this class was very good, the flowers shown by Mr. W. Mease (gr. to A. TATE, Esq., Downside, Leatherhead) being a remarkably fine dozen, and these were awarded the 1st prize. A magnificent flower of Mrs. W. Knox (sulphur yellow) deserves special mention, although Eric Crossley, President Viger, Sappho, Mrs. A. T. Miller, Mrs. Geo. Mileham, Miss Elsie Fulton, Bessie Godfrey, and A. R. Knight were also remarkably good. 2nd, Mr. T. Stevenson (gr. to E. MOCATTA, Esq., Woburn Place, Addlestone); 3rd, Mr. J. Kirkwood (gr. to L. WORMALL, Esq., Grass Park House, Finchley, N.).

VASE CLASSES.

The class for two vases, each containing 12 blooms of large flowering Chrysanthemums, and decorated with suitable foliage, brought forth a good display, although not so large as might be wished. Three growers competed, the premier award being taken by Mr. J. KIRKWOOD for very fine quality flowers, relieved with Asparagus Sprengeri, Ampelopsis Veitchii, Cyperus longifolia, Arundo donax, Ferns, &c. 2nd, Mr. G. HALSEY, with slightly smaller flowers, that were very bright in colour.

The best 12 bunches of early-flowering Pompon Chrysanthemums, arranged in vases, in not fewer than eight varieties, were shown by Mr. E. F. SUCH, Maidenhead, who had larger flowers than the other exhibitor, Mr. D. B. CRANE, Archway Road, Highgate, N., who secured the 2nd prize. Mr. SUCH had Anastasia (rosy purple, very finely coloured), Yellow Lefort, Blushing Bride, Mrs. Selly (rose pink), &c.

CHRYSANTHEMUMS FROM THE OPEN.

Two classes were provided for border varieties from the open, the one for a dozen bunches of flowers that were not disbudded, the other for a similar number of bunches disbudded.

In the first-named class good competition was seen, and six exhibits filled a long table. The two principal prizes were carried off by Scotch growers, Mr. JOHN SMELLIE, Pansy Gardens, Busby, and Mr. GEORGE BOWNESS, Riverside Nursery, Busby, who won the 1st and 2nd prizes respectively. The flowers from this town were certainly ahead of any of the others seen in this class, due, no doubt, to the heavier rainfall experienced in Scotland this summer. Mr. SMELLIE had Nina Black (bronze), White Massee (really a shade of yellow), Goacher's Crimson, Polly (bronzy yellow), Improved Massee (very fine), Mrs. Baird, &c.

A vase of Roi des Blancs and another of Nina Black, in Mr. BOWNESS's group, were of especial merit. 3rd, Mr. T. BRAZIER, Caterham Hardy Plant Nursery, Caterham.

Not so many groups were seen in the class for disbudded flowers, four exhibits being staged; and of these that shown by Messrs. W. WELLS & Co., Merstham, Surrey, easily outdistanced the others in point of quality. They had some splendid flowers, their size being remarkable. Pale Rose, Polly (incurved, bronze), Lily, Goacher's Crimson, Mytchett's Pet (reddish brown), and Jimmie are some of the best examples. The only fault we had to find with this group was in the manner of its staging, the bunches were too crowded, and were not sufficiently elevated.

AMATEURS' CLASSES.

Mr. T. W. Stevens (gr. to W. H. STONE, Esq., Lawrie Park, Sydenham) was the only exhibitor in a class for 12 blooms of Japanese Chrysanthemums in distinct varieties, and he was awarded the 1st prize.

Better response was seen in the class for 12 bunches of early-flowering Japanese varieties, the 1st prize being secured by Mr. A. HOGGAN, Busby, near Glasgow, although the 2nd prize exhibit ran close for premier position. It was shown by Mr. W. H. CLARK, 224, High Street, Slough. Mr. HOGGAN also won in the class for 12 bunches of early-flowering Pompon Chrysanthemums, in bunches of five blooms.

DECORATIVE CLASSES.

Miss COLE, The Vineyard, Feltham, arranged the best decorated table in the open classes, and she also showed the best three epergnes of Chrysanthemums in Class 12, the best hand-basket of Chrysanthemums arranged with other foliage, the best hand-basket of flowers other than Chrysanthemums and Roses, and the best hand-basket of autumn foliage and berries from the open. Mr. C. CONN, Birmingham, staged the best table decoration in the Amateurs' Classes.

CERTIFICATED FLOWERS.

Mrs. J. R. Scott.—An ivory white market variety of considerable size. The flowers are somewhat globular in shape. The growths attain to a height of about 4 feet 6 inches, and they are said to be very free in flowering; it is claimed that some of the plants have carried two dozen good blooms. Shown by Messrs. LOWE & SHAWYER, Uxbridge.

Tapis de Neige.—A pure white decorative variety. It was shown as a pot plant, without disbudding. The height is about 2 feet 6 inches,

and the growths are crowned with a profusion of flowers. Shown by Mr. H. J. Jones, Lewisham.

Hector.—A decorative variety, with narrow florets of a soft pink shade. Shown by Mr. G. Bowness, Busby, N.B.

Dorothy Gouldsmith.—A Japanese seedling from Mrs. F. W. Vallis. The florets are exceptionally long; some of the longer were almost a foot in length. The colour is sulphur yellow. The flowers as shown were very large, and the centres had many undeveloped florets. Shown by Messrs. W. Wells & Co.

Non-Competitive Groups.

Mr. H. J. Jones, Hither Green, Lewisham, staged an attractive group of Chrysanthemums, interspersed with perennial Asters. Blooms of Mrs. W. Knox (sulphur yellow) and of Mrs. A. T. Miller (white) were remarkably fine (Gold Medal.) Mr. Eric F. Such, Royal Berkshire Nurseries, Maidenhead, displayed a number of border Chrysanthemums in the best varieties. (Silver-Gilt Medal.) Messrs. T. S. Ware, Ltd., Ware's Nursery, Feltham, showed a very large exhibit of Chrysanthemums, Dahlias, tuberous-rooting Begonias (very fine), Carnations, Pentstemons, &c. (Gold Medal.) Mr. S. Mortimer, Rowledge, Farnham, Surrey, exhibited popular varieties of winter-flower Carnations. (Silver-Gilt Medal.) Mr. Frank Brazier, Caterham Hardy Plant Nursery, Caterham, showed hardy flowers, Dahlias, Chrysanthemums, &c. (Large Silver-Gilt Medal.) Messrs. Hugh Low & Co., Bush Hill Park, Enfield, N. exhibited flowers and plants of American Carnations. (Small Silver Medal.) Messrs. J. Peed & Son, West Norwood, London, staged a circular group of pot Chrysanthemums, and boxes of tuberous-rooting Begonias. (Large Silver Medal.) Messrs. Hobbies, Ltd., Dereham, Norfolk, staged Dahlias, Chrysanthemums, and Roses. (Silver-Gilt Medal.) Messrs. Wells & Co., Merstham, Surrey, arranged a diamond-shaped group of border and Japanese Chrysanthemums of exceptional quality. (Gold Medal.) Messrs. J. Cheal & Sons, Crawley, exhibited single, Pompon, and Cactus Dahlias and hardy flowers. (Large Silver Medal.)

THE WEATHER.

THE WEATHER IN WEST HERTS.

A splendid rain.—The days during the past week were all warm, and two of the nights very warm. Previously there had been a good many cold nights, and on one of these the exposed thermometer indicated five degrees of frost—the greatest cold as yet this autumn. The ground has again become warm, the temperature at 1 foot deep being three degrees, and at 2 feet deep four degrees, higher than is seasonable. After nearly a fortnight of dry weather there came two consecutive days which were exceptionally wet, the fall on each of those days amounting to an inch—a very rare occurrence at any period of the year. It is somewhat remarkable that in such a dry season there should have been two occasions when the rainfall has been exceptionally heavy. The first took place on June 28, when there was a record fall of 2½ inches, and the other on the two first days of the present month, when 2 inches fell. Taking these two amounts together, representing as they do the fall of three days only, the amount of rain which then fell is nearly 2 inches in excess of the total rainfall of July, August, and September taken together. To show the difference at this season of the effect on percolation of uncropped soil, and that on which short grass is growing, it may be stated that during the past week less than half a gallon of rain-water came through the turfed soil percolation gauge, whereas as much as six gallons found its way through the 2½ feet of soil in the bare soil gauge. The sun shone on an average for nearly 6¾ hours a day, or 2½ hours a day longer than is usual at this season. The winds have been mostly light, but on two nights the wind rose and the gusts were for a time rather strong. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 6 per cent.

September.

Singularly warm, dry and sunny.—In the last twenty years there have been only three Septembers warmer than that month this year. The highest temperature, 92°, was a very remarkable one, being the highest yet recorded here at any period of the year. Rain fell on only eight days, all but one in the middle of the month, to the total depth of 1¼ inches, or less than half the average rainfall for September. This was with two exceptions the sunniest September of which I have here any record, the duration of bright sunshine exceeding the average for the month by 1¾ hours a day. At no time did the mean velocity of the wind in any hour exceed the 13 miles. The atmosphere continued unusually dry, the mean amount of moisture in the air at 3 p.m. being less than the average by 7 per cent.

The Summer Rainfall.

The total rainfall of the summer half of the drainage year, which ended with last month, fell short of the average quantity for those six months by 5½ inches, which is equivalent to a loss of 25 gallons of rain on each square yard of any garden. *E. M., Berkhamsted, October 3rd, 1906.*

MARKETS.

COVENT GARDEN, October 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

Remarks.—The supply of Grapes is more than equal to the demand. West Indian Red Bananas arrived this week after a lapse of a week or so, and their condition being rather ripe a ready sale is required for them. The first consignment of Brussels Sprouts arrived last week. The average price made was 2s. 6d. per ½-bushel. Trade generally is quiet. *E. H. R., Covent Garden, Wednesday, October 3, 1906.*

Potatos.

Lincolns, 60s. to 70s.; Bedfords 60s. to 65s.; Blacklands, 50s. to 55s.; Kents, 70s. to 80s. *John Bath, 32 and 34, Wellington Street, Covent Garden.*

COVENT GARDEN FLOWER MARKET.

Mr. J. Rochford is the first to send Erica hyemalis; well finished plants make from 15s. to 18s. per dozen. E. gracilis is good from several growers. Messrs. H. Evans & Sons have good plants of the variety that was named alba, but the flowers have a decidedly pink tint; nivalis, however, keeps its character better and is a good white flower. [illegible] has not been so plentiful this season, and those I have seen at nurseries have been backward and unpromising. Chrysanthemums predominate over everything else for early winter use, and well-flowered plants sell at good prices. They did not clear out quite so well on Tuesday, owing to the wet weather, but previously all well-flowered plants [illegible] sold well. It is surprising that growers [illegible] the dwarf and intermediate shoots [illegible] great advantage to buyers, as well as [illegible] care were taken in the selection of stock [illegible] particularly to the varieties which vary (or sport) [illegible] Pelargoniums in well-flowered plants are [illegible] others are now passed for the season. [illegible] foliage plants and Ferns are abundant.

Cut Flowers.

The [illegible] trade is very [illegible] last week and on Monday the [illegible]

prices. Lilium longiflorum went up to 4s. and 4s. 6d. per bunch, but they are now down to 3s., and probably some were sold for less than this. Roses are over plentiful. I was offered good blooms at 6d. per dozen, but this would not be a fair quotation to give, for the same quality will, probably, make 1s. 6d. or 2s. per dozen on Saturday. At closing time this morning there were more Roses left on hand than I have ever seen for some time past. Carnations are also over plentiful; they must be very fine blooms to sell for more than 2s. per dozen, and ordinary samples have to go at very low prices. Chrysanthemums now spoil the trade for all other flowers. We get them in all conditions; the best are very fine. In yellows, there is nothing to equal Miss B. Miller; Queen of the Earlies is a fine white. Crimson Pride is a good red. For flowers of medium size Roi des Blancs is one of the best whites. Asters are still plentiful; the mauve and the purple varieties make better prices than the white flowers. Bouvardias in various colours are plentiful, the most noticeable is Humboldti corymbiflora, but some growers make the mistake of not cutting it soon enough. If cut when the first flower of a truss is open, it will last well and the buds will open in water. *A. H., Covent Garden, Wednesday, October 3.*

CATALOGUES RECEIVED.

[illegible] and Co., 150, 152, Finchley Road, London, N.W.—Bulbs and Flowering Plants.

J. Attwood, Foster Street, Stourbridge—Improved Hot Water Pipes and Coils, Boilers, etc.

Ant. Roozen and Son, Overveen, near Haarlem, Holland. Agents: Mertens and Co., 3, Cross Lane, St. Mary-at-Hill, London, E.C.—Dutch and Cape Bulbs, etc.

C. Sprenger, Naples, Vomero, Italy—New and Rare Plants.

ANSWERS TO CORRESPONDENTS.

Begonias: *W. Y.* The appearances are not due to fungus or mite, but to some fault in the cultivation.

Begonias with Clubbed Roots: *J. D.* The plants are affected with eelworm, and as they have been grown in a Melon pit, we suspect they have contracted the pests from the old soil in which the Melons were cultivated. Turn out the inmates of the pit, together with the old soil, and thoroughly cleanse all the interior with a weak solution of carbolic acid and warm water, taking care also to bake the old soil, or remove it to some distant part of the garden. You will be well advised to propagate a new stock of the Begonia, and destroy the affected plants by burning.

Books: *Mrs. H. The Fruit Manual*, by Robert Hogg, is out of print and cannot be obtained unless from the second-hand booksellers.

Bouvardia: *M. P.* The plant is attacked by the parasite Cuscuta europaea. It is a very interesting parasite, and will not cause you very serious loss.

Chrysanthemum Leaves: *J. R.* Cylindrosporium chrysanthemi, a minute fungus, is injuring the foliage. Spray with a rose-coloured solution of Condy's fluid.

Coloured Bean: *G. C.* The variety is Firefly.

Cucumbers: *E. J. M.* The scaly Cucumber is the result of some irregular treatment. There are no fungi or insects concerned in the disfigurement.

Dahlia Daisy Staples: *F. C.* This variety was shown by Messrs. J. Carter & Sons.

Double Flowers: *T. F. R.* Double-flowering varieties have frequently arisen from the influence of high cultivation upon plants that previously produced single flowers only. Occasionally double flowers have arisen as seedling or vegetative sports, and have then been selected and fixed by the care of the cultivator. For information on the other questions see *Plant Breeding*, by L. H. Bailey, price 4s. 4d. post free, obtainable from our publishing department.

Flowers for Cross-breeding: *A New Reader.* At the present time more profit is obtained from the successful crossing of Orchids than any other section of plants, but to be in a position to engage in this work the cross-breeder must have a collection of the finest species and varieties to work upon, and possess an intimate knowledge of what has been already effected in the different genera. A novice would hardly be likely to make much profit until he has spent many years at the work, for it should be remembered that almost all the skilful cultivators of Orchids are also engaged in the raising of seedling hybrids and varieties, most of which are from carefully selected crosses. The raising of seedling varieties of any popular plant, however, is profitable in proportion to the degree of success obtained by the individual breeder, with such plants, for instance, as Roses, Narcissus, Dahlias, Carnations, Sweet Peas, &c.

Fumigating with Tobacco Paper: *T. A.* If you have become thoroughly used to the nicotine vaporisers we are unable to sympathise with your desire to go back to the old system of burning tobacco paper, which is certainly more dangerous to the plants, and is also most disagreeable, if not positively injurious to the operator. The quantity of tobacco paper requisite varies according to the degree in which the glass and woodwork are capable of excluding air, and the amount of wind blowing at the time of the operation. The general practice used to be to employ as many "machines," as they were termed, as were thought necessary, each of which was under the care of a separate man, and the "machines" were withdrawn as soon as the structure was so full of smoke that one was unable to see through it. All the plants should be perfectly dry in the leaf before they are subjected to fumigation, and during the process extreme care must be exercised to prevent the paper from flaring, which would be likely to scorch the plants nearest to the fumigator. Do not commence fumigation until after sunset; select a quiet evening, when the weather is inclined to be wet, and it will be better to apply two moderate fumigations on successive evenings rather than one severe application.

Grapes for Naming: *Constant Reader.* We cannot undertake to name Grapes from a few berries only; you must send whole bunches of characteristic growth and shape, as these form valuable guides in determining the variety.

Greenhouses and the Glazing: *T. A.* The moisture you have observed on the outside of the glass is caused by the panes not fitting so closely together as they might do. The hot atmosphere of the house rises to the top of the structure and is replaced by cooler and heavier air that finds its way in through the crevices at the doorway and other possible inlets. The hot atmosphere, which is generally in a more or less moist condition, escaping through the small spaces between the panes is immediately met by the cooler atmosphere outside, and, becoming cooler, is unable to support the amount of moisture it could do previously, hence the moisture is condensed at the point of outlet.

Midland Reafforestation Society: *Gardener.* Address: Professor Hillhouse, The University, Birmingham.

Names of Flowers and Fruits.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruits at one time; they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *J. M. F.* Round Winter Nonsuch.—*Carnarvon.* 1, Harvey's Wiltshire Defiance; 2, Lemon Pippin; 3, Newton Wonder.—*T. A. F.* 1, Striped Beefing; 2 & 3, Dumelow's Seedling (Wellington); 4, Dean's Codlin; 5, Lady Sudeley.—*A. Robinson.* The Pear had decayed.—*W. H. H.* Round Winter Nonsuch.—*W. B. M.* Prince Albert.—*Penhurst.* Pear Joséphine de Malines, Apple Gravenstein.—*T. H. B.* 1, Hambledon deux Ans; 2, Annie Elizabeth; 3, Ribston Pippin; 4, Not recognised; 5, Cornish Aromatic; 6, Beurré Clairgeau.—*W. T. F.* The flat fruit is Stirling Castle, and the other with the flushed cheek Mabbott's Pearmain.—*Surbiton, Surrey.* 1, Mère de Ménage; 2, Dumelow's Seedling (Wellington); 3, Small's Admirable; 4, The fruit had decayed; 5, Cox's Orange Pippin; 6, King of the Pippins.

Names of Plants: *G. H.* 1, Mesembryanthemum cordifolium, variegated variety; 2 and 3, Alternantheras, bedding varieties; 4, Sedum carneum; 5, not recognised; 6, Iresine Lindeni.—*J. C.* Centranthus ruber.—*R. D., Dublin.* Sempervivum tortuosum variegatum. A native of the Canary Isles.—*V. F. P.* Alisma Plantago.—*E. Y.* Hibiscus syriacus, double purple variety.—*C. B.* Solanum jasminoides and Ginkgo biloba, formerly called Salisburia adiantifolia; a Coniferous tree commonly known as the Maidenhair tree.—*Vitis.* 1, Zygopetalum crinitum; 2, Bifrenaria Harrisoniæ; 3, Sarcochilus unguiculatus; 4, Octomeria diaphana.—*J. C.* 1, Acæna microphylla, sometimes called A. Novæ Zealandiæ in gardens; 2, Linaria Cymbalaria (Toadflax).—*J. P.* Cypripedium Rothschildianum. The flowers you describe, and also the Cattleya, are equal in size to the largest we have on record.—*C. E. F.* Xylobium species probably. We will reply more definitely later. The Cypripedium leaves are infested with the small thrips, which often attack them when grown too hot. Cut off the worst leaves and spray the plants occasionally with a safe insecticide.—*R. M. L.* 1, Exacum affine; 2, Juglans nigra.—*C. B. S.* The flowers are those of Achillea ptarmica flore pleno, a well-known hardy perennial plant. These are, however, pure white in their natural condition, and the specimens you have sent have been made to appear purple by treatment with an aniline dye.—*X. Y. Z.* 1, Selaginella uncinata, more often called C. cæsia in gardens; 2, probably Adhatoda cydoniæfolia; 3, Æchmea fulgens; 4, Cyperus alternifolius; 5, Colchicum autumnale.—*Durham.* 1, Cestrum aurantiacum; 2, Polygala Dalmaisiana; 3, Apple next week.—*J. J. F.* Kölreuteria paniculata.—*Stellata.* Cratægus Pyracantha var. Lelandi.—*J. H. B.* 1, Hoya carnosa; 2, Statice latifolia; 3, Corylus colurna; 4, Taxodium distichum.—*L. C.* 1, Kolreuteria paniculata; 2, Ampelopsis next week; 3, Berberis next week; 4, Berberis sp. next week; 5, Rhus Cotinus; 6, Pulmonaria officinalis.

Nectarine Roots: *A. G.* The roots are attacked by fungus which has undoubtedly started from old decaying roots in the soil. After getting out every bit of old root that can be found, quicklime should be mixed with the soil before other trees are planted. The Plum trees you suggest would probably succeed better in the position than Nectarines.

Pruning: *Old Subscriber.* What you say is perfectly right when regarded as a general statement. At the same time, it may be conceded that in many gardens pruning is overdone to the detriment of the trees and limitation of crop. The matter is greatly affected by the local conditions of soil and climate, the varieties of fruit cultivated, and by the kind of stocks they are worked upon.

Sycamore Tree with Ivy: *Very Old Subscriber.* The relationship is not mutual. The Sycamore supports the Ivy and obtains nothing in return, but on the contrary the effect of the Ivy upon the tree is harmful. Like the indulgence of many other dangerous practices that of allowing the Ivy to grow on the Sycamore tree may not be followed with disastrous results for many years to come, but the danger to the well-being and even the life of the tree will be just in the same proportion as the growth of the Ivy. It is a question for the owner to decide whether, for the picturesque effect in winter, he is prepared to risk the health of the host plant. If he decides to consider the Sycamore tree first, then we do not hesitate in advising him to remove every vestige of Ivy.

Weights at the Covent Garden Market: *T. M., Shrewsbury.* The following fruits and vegetables, if consigned for sale at the Covent Garden Market, should weigh (nett) as undermentioned. *Half-Sieves:* Gooseberries, 28 lbs.; Cherries, 24 lbs.; Currants, 24 lbs.; Plums, 28 lbs.; Damsons, 28 lbs.; Mushrooms, 12 lbs.; Brussels Sprouts, 20 lbs. *Bushels:* Apples, 46 lbs. to 50 lbs.; Walnuts, 48 lbs.; Pears, 56 lbs.; Scarlet Beans, 40 lbs.

LEONARDSLEE.

IN the neighbourhood of Horsham may be found some of the prettiest lanes in the county of Sussex, and the drive from the town towards Leonardslee affords an illustration of the fact, for it passes through country scenes of the most picturesque description. The estate of Leonardslee is the property of Sir Edmund G. Loder, Bart., and we may say at once that it is one of the most interesting it has been our good fortune to visit. There are presented most, if not all, the characteristics that are essential to making a country residence attractive. The locality is one in which the comparatively mild weather conditions and the pure atmosphere enable one to cultivate out of doors a very large number of plants that in less favoured districts would need the shelter of the glasshouse; the estate is extensive, and the pleasure grounds are of such an undulating character that they lend themselves naturally to the gardener to be moulded into the most charming effects it is possible to conceive. Anyone who has stood in midsummer at a point near to the residence, where a view can be obtained over the pond which lies in a hollow amidst the delightful banks of Rhododendrons and other flowering and foliage plants, and has seen the effect of the plants grouped on the opposite bank which slopes towards the house, or who has enjoyed the privilege of seeing the reverse of this picture, which is equally satisfying, must share our opinion that these grounds offered such natural advantages as the landscape gardener but rarely finds available for the practice of his art.

But there has been another factor at Leonardslee which has had the greatest influence upon the gardens. In Sir Edmund Loder the estate has an owner who possesses zeal for everything concerned with its betterment, and, as he is an enthusiastic gardener, he has brought to his work such knowledge and experience as few proprietors of similar establishments could command. In scientific circles Sir Edmund is well known as a zealous naturalist, and his name is as familiar among members of the Zoological Society as it is to horticulturists. It is to this fact that Leonardslee owes something of the interest it possesses for the average visitor. The park itself contains kangaroos, gazelles, prairie dogs, and mountain sheep, all naturalised under conditions in which they remain during summer and winter. Near the water there are badgers and beavers, possessed of considerable liberty, yet confined to certain areas. These animals have been brought from their native habitats at a great expense, and their successful acclimatisation can only have been effected after repeated trials, during which experience of their requirements has been gradually but certainly acquired. A museum containing an extensive collection of natural history specimens would interest for a long time those who make a study of animals, birds, insects, or reptiles, and some of the most remarkable of these specimens are animals that have been shot by Sir Edmund himself and his friends during their hunts abroad after "big game."

But for ourselves and readers of this journal Sir Edmund's efforts in the direction of the acclimatisation of plants have even greater interest than the kangaroo. The number of tender and half-tender species of plants now successfully cultivated in these gardens is quite extraordinary, and, in order to make a study of them, or obtain an accurate estimate of them, even, it would be necessary to spend a season, at least, in the locality, for, as the flowering period changes, fresh species continually come into bloom and are conspicuous, which previously would be likely to escape notice. The first feature that attracted our attention during a visit in June last was the Palm Walk, a winding path leading away from the residence on the west side, and which is flanked by borders planted with the choicest of flowering shrubs very plentifully interspersed with Bamboos, and excellent, tall specimens of the hardy Palms Chamærops humilis and C. Fortunei. The reader may form some idea of the unusually exotic appearance of these gardens from the statement that there are 400 of these Palms, many of them being large plants that have a considerable effect on the scenery from every point. On the sides of the path we have mentioned some of the more remarkable plants were Eucryphia pinnatifolia, big specimens of Fatsia (Aralia) japonica, high and spreading bushes of Camellia, also Stuartia japonica, that effective green-leaved Holly (Ilex latifolium), several species of Deutzia, great bushes of Choisya ternata, Photinia serrulata, Phormium tenax (which blooms well here), and Halesia tetraptera (the Snowdrop tree) in flower. In addition to these and many other plants such as Ericas, of which E. arborea is an excellent specimen, are numbers of choice Rhododendrons, chiefly Himalayan species and hybrids, which, indeed, form one of the grandest features of the gardens throughout.

The conservatory is joined to the residence on the south-west side, and on the lawn in front of this is a magnificent Tulip tree (Liriodendron tulipiferum, about 100 feet in height, but turning to the south-east front there is an infinite number of plants of the greatest interest, both near to the residence itself and in the grounds extending from the building. On the walls of the buildings are fine plants of the Pomegranate (Punica Granatum), which has borne fruits; Romneya Coulteri, 14 feet in height, bearing many flower buds when we saw it; Fremontia californica, quite 20 feet in height, and bearing a good display of its richly-coloured, yellow flowers; Carpenteria californica, a plant introduced in 1880, and exceedingly popular for its pure white, saucer-shaped flowers, wherever it can be induced to thrive; Bignonia grandiflora in flower, and Banksian Roses (very high). Other rare plants, either on or near to a wall which extends in a line from the south-east front, included the Loquat (Eriobotrya japonica), Azara microphylla, Camellia Donck elarii, Pernettya mucronata, a small plant of Quercus nigra, an excellent bush of Lyon odendron, Gaultheria Shallon, Trachelospermum (Rhyncosphermum) jasminoides, Pittosporum Tobira variegatum, Vitis Coignetiæ, Exochorda grandiflora, Olearia stellata, the very beautiful Rosa sinica, Eucalyptus unigera 25 feet in height, E. arborea, Phlesia buxifolia bearing several of its Lapageria-like flowers and Umbellularia (Orcodaphne) californica, a half-hardy tree remarkable for the strong odour of camphor it emits. We have already spoken of the glorious view obtainable from the south-east front. Standing on the terrace, with the back to the residence, there is a fine Cedar to the right-hand, and on the quickly-sloping lawn are a few flower beds, but beyond are other beds and groups of Rhododendrons, Kalmias, and many other similar plants. At the bottom of the valley is the winding lake or pool, and beyond this the ground rises again quickly, thus providing a slope facing to the terrace, which has been planted with a selection of flowering plants, the varieties of which are massed together to yield a brilliant display that is well within the view from the house windows and from the terrace. There are also some of the more brilliant leaved species to be seen here that particularly in autumn are very effective when seen from a distance or at closer quarters. The art of the gardener has been to furnish attractive pictures in whichever direction the eye may look, and these floral pictures find most appropriate relief in the densely-wooded land in the distance.

The Alpine Garden.

By proceeding round to the west side, and through the "evergreen" walk, the large rock-garden, north-west of the residence, is reached, and in this again Leonardslee possesses a feature that is rarely excelled in private estates.

It is very extensive, portions of the structure are of considerable height, and it has been so designed that there appear to be appropriate places for little and big plants, and suitable "habitats" for the most variable species in the Alpine flora. The general effect, as we saw it in June, was extremely satisfactory, and the pleasure was none the less when particular attention was directed to individual varieties of plants, for most of them were growing with unusual freedom, and there were few that were not more or less in flower. The one plant that impressed us most at the time was Olearia Gunniana. The effect produced by this species when flowering as it does at Leonardslee cannot be over described. Specimens 4 feet in height and upwards, growing on the summit and in suitable positions near the top of the rockery presented a cloud of snow-whiteness; not a leaf was visible, and the effect was perfect. It is surely the best species of a very good garden-genus. Upon entering, however, we were immediately impressed with the beauty of a splendid collection of Saxifragas in flower, which included such species as S. aizoides, S. aizoon and many of its varieties, S. arctioides, S. Burseriana, S. Cotyledon with its variety pyramidalis, S. Macnabiana and S. mutata. There were several very fine plants of the beautiful S. longifolia in flower, including the specimen figured in the *Gardeners' Chronicle* on March 10, 1906; this had an inflorescence about 18 inches in length and 10 inches in diameter. But it is a pity that plants of this incomparable species flower but once, and then die. The blue Alpine Starwort, Aster alpinus, with its varieties albus and speciosus, together with the charming little evergreen Alpine plant usually known by the name of Hutchinsia alpina (Noccea alpina), and Hutchinsia petræa, had a very pretty effect. Between the crevices of the rock was a good collection of Ramondias looking their best. R. pyrenaica with its white variety, and Haberlea rhodopensis blooming profusely. On the higher parts of the rockery were noticeable big clumps of Helianthemums, Dianthus, and Mesembryanthemums, all in full flower; Oncocyclus iridoides, with its masses of golden colour, together with O. alboroseum, also looked well. In the dump part of the garden, shaded to some extent by the huge rocks, were groups of Primulas, some of those in flower including P. farinosa, P. sikkimensis, and the new P. Veitchii. In this part of the rockery are also to be found Cypripedium Calceolus, C. acaule, and C. spectabile, large clumps of the latter species being very strong. There were beds of Sarracenia and Darlingtonia in flower, and the little Sundews, and Pinguiculas, with their pretty blue flowers, between them. Further on were huge clumps of Lithospermum prostratum, L. Gastoni, and the distinct L. graminifolium. Among other plants in flower may be mentioned Potentilla tridentata, P. nitida, and its variety atrosanguinea, Saponaria ocymoides splendens, and the variety alba. The pretty little Androsace lanuginosa, and A. sarmentosa, with Leontopodium alpinum and its Himalayan variety, Arnica montana, Aspernla nitida, several different species of Campanula, and Erigeron aurantiacum were all exceedingly attractive. Among the choice flowering rock shrubs, in addition to the Olearia already mentioned, particular notice may be made of the good specimens of Fabiana imbricata, Kalmia rosea, Ononis rotundifolia, Azalea pontica, Veronica Decori, Vaccinium Martinetii, and the lovely Rhododendron ferrugineum and R. f. album, R. hirsutum, and R. h. album. Potentilla grandiflora, Lupinus arboreus, and Convolvulus Cneorum must conclude our enumeration of a few of the most effective plants in the alpine garden at that date.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM FLETCHERIANUM.

This handsome hybrid Cypripedium, the result of a cross between C. Godefroyæ leucochilum and C. Lord Derby, was awarded a first Diploma and an Award of Merit at the meeting of the Royal Horticultural Society on September 25, when exhibited by Messrs. Hugh Low and Co. These distinctions were well merited, for it is an excellent flower in all respects and comparable with the fine C. Daisy Barclay for which J. Gurney Fowler, Esq., secured a First Class Certificate, on July 1, 1905. The inflorescence carried two fine flowers, the ground colour being creamy yellow, and this is heavily blotched with dark chocolate-purple coloured markings, the lip being of pale yellow with a slight freckling of purple on the face.

ODONTOGLOSSUM SCEPTRUM.

A fine flower of this handsome species, which was originally described by the late Professor Reichenbach under the above name, is sent by F. W. Moore, Esq., from the Royal Botanic Gardens, Glasnevin, Dublin. Later, Professor Reichenbach included it under O. luteo-purpureum as the variety Sceptrum. Still later, in *Gardeners' Chronicle*, April 22, 1882, p. 525, on receiving flowers which bloomed out of the first importation by Messrs. Sander and Sons, he returned to the original specific name beginning the note in the *Gardeners' Chronicle*: "When degrading this fine thing to a variety of luteo-purpureum, I may have been guided by some hybrids between the two varieties or species. At all events, it well deserves to rank as a distinct garden form." Odontoglossum specialists and hybridisers are now agreed that it is better to return to the name originally given to this distinct plant, which is easily distinguished from the typical O. luteo-purpureum by the broader petals, which are handsomely spotted with red-brown on the inner halves, and the broader much crimped and fringed lip. The Glasnevin flower has a primrose-yellow ground colour, the sepals being nearly covered by large chestnut-brown blotches and the petals having the tips pale yellow, the inner halves being spotted with reddish brown. The lip is 1 inch

withheld until it only receives enough to keep the pseudo-bulbs from shrivelling. The leaves should be sponged and kept perfectly clean, as they are liable to attacks of red spider and thrips. It is propagated by division of old plants. *George Adlam.*

Fig. 103.—Cypripedium Fletcherianum.

STANHOPEA OCULATA.

This beautiful Orchid is not grown so much as it deserves to be. I believe this is due to the flowers (which are large and fragrant) lasting but a very short time. Owing to the peculiar manner in which the flowers are produced, it requires to be grown in a basket, the bottom and sides of which are made as open as possible, and suspended from the roof of a house, with the temperature of 70° to 75° Fahr. by day and 65° to 70° by night in summer, and 60° to 65° by day and 55° to 60° by night in winter. It does well in a compost of two-thirds sphagnum, one-third turfy peat, with a little charcoal. During its growing period a good supply of water should be given. Immersion of the plant in water of the same temperature as that of the house for a few minutes about once a week will prove beneficial. As the plant approaches its resting period (from November till February) water should gradually be

and a quarter broad, and has some small, brown blotches on each side of the crest; also a large one in front.

O. facetum Rchb. f. is generally represented by small forms of O. sceptrum in gardens, and probably the type was a similar form.

ODONTOGLOSSUM CRISPUM.

A very fine type of this favourite species is in flower in the Orchid nurseries of Mr. H. A. Tracy, Amyand Park Road, Twickenham. The plants have been freshly imported, and the flower spikes are produced from the imported pseudobulbs. The form of the finely-rounded, broad-petalled flowers is remarkable, and all are characterised by very large and broad labellums, several of which are handsomely blotched. Two specially fine flowers have blotched sepals and petals, and one has pure white flowers with no other colour than the yellow crest. It has been thought that the locality from which the best round-flowered O. crispum came had been almost worked out, so that it is satisfactory to see again a large batch of the best forms. *J.O'B.*

SEED-PACKING FOR THE TROPICS.

As referring to the question of seed-packing discussed some time ago in the pages of the *Gardeners' Chronicle*, the following communication from Mr. Sands, of the Agricultural Department, St. Vincent, West Indies, may be of interest:—

Dear Mr. Watson,—With reference to the collection of vegetable seeds received from you last year for trial in this island, I now beg to enclose a report of the result by Mr. Patterson, Resident Master, Agricultural School, St. Vincent. The plan he adopted in testing the seeds was somewhat more comprehensive than that carried out elsewhere at the same time, the results of which were published a few months ago in the *Gardeners' Chronicle*. In most cases three trials were made—one on receipt, two at the end of a month, three at the end of two months, and in the case of the Beans and Peas, there was a further trial three months after receipt. The seeds germinated well in the first two trials, and a number gave a fairly good germination in the third trial. In the case of the Beans and Peas the larger proportion grew well after being kept for three months.

I would not venture to keep seeds of any description more than three months after arrival, unless they were packed so that they would not be affected by local conditions; but the fact that you wish to demonstrate, as I understand it, is, that seeds may be sent to the tropics with safety in paper packets. These experiments clearly prove that you are right, and further that even after the seeds have been kept two or three months they germinate well.

The practice adopted here and in some other islands is to order fresh supplies of seed every three or four months according to requirements, and good results are usually obtained if the seed comes from a trustworthy firm. I have never yet obtained seed in specially sealed packets, but hope to try some shortly and will note results. *W. N. Sands, Agricultural Superintendent, St. Vincent, W.I.*

"From time to time a controversy has arisen as to whether seeds of English vegetables should be transmitted in ordinary paper packages, or in hermetically sealed tins. During the year a box of seeds packed in ordinary paper packets was received from the Royal Gardens, Kew, in order that the seeds might be tested as to their germinating powers. The results are given below. From personal observation I do not consider that it is so much a question of temperature and moisture as a question of ravages of small ants and weevils after arrival in the tropics. It would be advisable if this experiment could be carried farther, and seeds tested weekly, some being exposed to atmospheric moisture and insects, some being kept as a control, under more rigid conditions.

LIFTING PEACH TREES.

Unfruitful trees can often be made fruitful by lifting and replanting, and few subjects respond better to these operations than the Peach. I have known strong-growing Peach trees of great size fail year after year to produce satisfactory crops, but after they have been taken up and root-pruned they have commenced to fruit freely. In such unfruitful trees exist, I strongly advise this work to be taken in hand at once, whether the trees are under glass, or trained outside on the open walls. Make preparations for the work by having a supply of fresh soil in readiness, and then dig a trench at several feet distance away from the stem and well down to the drainage material. When taking out the soil be careful to preserve intact as many of the roots as is possible. Get well beneath the root system with the fork and raise the roots nearer to the surface of the ground level. This operation should not be hurried, but should be carried out with care and skill, for it sometimes happens that one or two deep-plunging roots are left unsevered, and these are often the means of rendering the work futile. If the trees are growing in the Peach house, the border in which they are planted should receive a gentle watering, more or less, according to the state of dampness in which the soil was found to be. Keep the trees shaded during bright sunshine, and syringe them overhead two and three times daily until they have somewhat recovered from the disturbance, after which they may be gradually allowed more sunshine. Plum trees and others bearing stone fruits may be treated exactly as described above, and with excellent results. I know of no better compost for the Peach than a sweet, rather sandy loam, with some old brick mortar, burnt earth, and a little well-decayed manure, and, if the soil is of rather poor quality, a sprinkling of half-inch bones will be an advantage. The new soil should be made somewhat firm, in order that the roots may readily lay hold of it. The following list contains an excellent selection:—Dymond (one of the best), Stirling Castle, Violette Hative, Bellegarde, Crimson Galand, Barrington, the Nectarine Peach, and Royal George. Among the best early varieties is Hale's Early, and this is followed by Sea Eagle, Walburton's Admirable, and Princess of Wales. The pale-skinned kinds, no matter how excellent they may be when ripe, are unsuitable for market purposes. They will not travel long distances in good condition unless they are gathered and packed unripe, for they readily bruise and show every finger mark. *H. Markham, Wrotham Park, Barnet.*

TREES AND SHRUBS.

THE HARDY HEATHS.

Probably no class of hardy plants is more popular with those who know them well than are those known collectively as the hardy heaths, and represented by the genera Erica, Calluna, and Dabeocia. To those who are not well acquainted with the plants, they may be recommended for any soil that does not contain lime, though one species, Erica carnea, will grow if there is not very much lime present, and I have found it succeed better when a little mortar-rubble is mixed with the soil than when it is planted in ground entirely deficient of lime. Sandy peat is the best soil for Heaths, but heavy soils can soon be brought into suitable condition for them by the admixture of peat or leaf-mould and a proportion of sand. The hardy Heaths vary in height from 6 inches to 6 feet, but occasionally some of the tall-growing species have been known to attain to 20 feet in height. A height of from 6 feet to 8 feet, however, is more general in this country. The plants should be planted singly or in clumps of three at about a yard apart, but the dwarfer-growing species should be put in clumps of ten or a dozen, or they can be used as a groundwork for the taller ones if planted in beds.

It is possible to have Heaths in flower nearly all the year round by making a proper selection of the species and varieties. From about the middle of October to, perhaps, the middle of December there are no Heaths in flower, but during the remainder of the year they are more or less in bloom. During frosty weather Erica carnea and E. mediterranea hybrida may be in bloom, but the frost does not affect the flowers to any appreciable extent, and they bloom away freely again with the advent of milder weather.

Propagation is effected by division (where possible), by seeds, by cuttings, and by layering. The last-mentioned method is the best, as from layers the young plants are large enough to handle, and are ready to take off in about 18 months from the time of putting them down. Where only a few plants are required some of the shoots can be layered and a stock obtained without in any way spoiling the old plant. Division is effected by pulling the old clumps to pieces in early spring, when practically every bit that has a few roots attached will grow. This method of propagation can only be used with the dwarf-growing Heaths, which spread laterally and make roots wherever the stems touch the ground.

Seeds should be gathered as soon as ripe, and, after being cleaned, they should be put away in a dry place until required for sowing, which should be done in March in gentle bottom heat, and they soon germinate. Cuttings can be taken during August and September and put in pots of sandy soil in a cold frame until the following spring, when they will have formed a callus, and can then be put in a moderately warm atmosphere to induce root action. Care must be taken to prevent the cuttings from damping off during the winter, giving air on every possible occasion, and remembering that a little frost does not harm them half so much as a damp, stagnant atmosphere.

Erica.

E. arborea is a native of the Mediterranean region, and in favoured localities of the south

and west of this country has been known to attain to 20 feet and more in height. It is not very hardy, and would probably not grow satisfactorily north of the Thames, though it is such a handsome plant that it is well worth a trial. The individual flowers are small, globular, and nearly white, but are produced so freely as to compensate for their lack of size. The leaves are short, soft to the touch, and are produced in whorls of three. The young wood is dark brown and hairy. The wood of this species is used in the production of the so-called Briar pipes, a corruption of the French Bruyere, though it is doubtful if E. arborea has much to do with the ordinary sixpenny Briar pipe found in gardens.

E. AUSTRALIS.—It is a pity that our gardening friends in Cornwall, Devon, and such-like favoured localities should have a monopoly of this Heath, but, unfortunately, it is somewhat tender, and can be grown only in warm, sheltered districts. When in bloom in April and May it strongly suggests some of the Cape Heaths, with its terminal clusters of bright, rosy-red flowers, each about a quarter of an inch long, and sweet scented. It is a native of Spain and Portugal.

E. CARNEA.—If only one Heath were to be grown in the garden this is the one which ought to be selected, as it is thoroughly hardy and wonderfully free blooming. The flowers open at a time when they are most valued, from January onwards, and are of a bright red colour, which forms a welcome change to the yellow or white of our early flowers. It only grows about 6 inches or so in height, forming a dense, tufted mass entirely covered with flowers. It is a native of the mountains of Europe. There is a variety of this with white flowers (E. carnea, var. alba).

E. CILIARIS (the Dorset Heath).—This is a native of south-western Europe, but is also found in Dorset and Cornwall, and in some parts of Ireland. It makes a round, spreading plant about a foot in height, with slender, semi-prostrate branches, on which the erect flower stems are borne in racemes. The flowers are of a rich purple-red colour, opening in July and continuing till autumn. The leaves are produced in threes, and, together with the younger wood, are clothed with fine hairs.

E. CINEREA (Scotch Heather).—This is one of our most common native Heaths, and is found abundantly on mountains and moors from Scotland to Cornwall. In this district it is found all over the moors in conjunction with E. Tetralix and the Ling (Calluna vulgaris). It grows about a foot to 18 inches in height, and from June to September is covered with terminal clusters of reddish-purple flowers. There are several varieties, of which alba (the white Scotch Heather), atropurpurea (deep purple), and atrosanguinea (crimson) are perhaps the best. Alba minor, coccinea, purpurea, and rosea are sufficiently described by their names, and are well worthy of cultivation.

E. LUSITANICA (E. codonodes).—This is a tall-growing plant, obtaining a height of from 6 feet to 10 feet, and somewhat resembles E. arborea in general appearance, but differs in the longer and less globular flowers and paler and more feathery foliage. The flowers are white, faintly tinged with pink, and are borne in great profusion during April and May. It is a native of Spain and Portugal, and is rather more tender than E. arborea.

E. MACKAII.—This is a native of Spain and Galway (Ireland), and is a dwarf-growing plant less than a foot in height. It is very like E. Tetralix in general appearance, but the flowers are of a paler shade of rose and more globular in shape.

E. MAWEANA was discovered in Portugal by Mr. G. Maw about 40 years ago, but is still by no means a common plant. It is very closely allied to E. ciliaris, of which it is probably a variety. It has a short, sturdy growth, and bears rich crimson flowers in comparatively large racemes.

E. MEDITERRANEA is a native of south-west France and Spain, and is a tall-growing species, reaching a height of 6 feet or more with age. It is the hardiest of the taller Heaths, and is very effective when planted in large clumps. The flowers are of a bright rosy red, but have a purplish look in the mass, and are freely produced from the middle of March to May. It makes a good evergreen when not in flower, as the foliage is of a soft, plumose character, and of a pleasing green hue. There are three varieties of this, viz., alba, glauca (with bluish foliage and rosy-red flowers), and hibernica (a native of Ireland), and an upright-growing plant 3 feet or 4 feet in height

FIG. 104.—CORYLUS COLURNA AS SEEN AT KEW IN WINTER.

E. MEDITERRANEA HYBRIDA is a hybrid between E. mediterranea and E. carnea, and grows about 18 inches in height, with pale, rosy-purple flowers opening from January onwards, though a few flowers can sometimes be seen as early as November. It is a free-blooming and thoroughly hardy Heath, and is deservedly popular.

E. MULTIFLORA.—This is usually met with under the name of E. vagans alba, but it is a true species from southern Europe, and has nothing to do with the Cornish Heath, though it has a strong resemblance to it. It differs chiefly in the shorter and more compact growth and the shorter and fuller racemes of flower. The latter are nearly white, and are borne profusely from July to October.

E. SCOPARIA.—This plant is only useful as an evergreen, as its greenish-white flowers are very small and insignificant, though very freely produced. It is a tall grower, reaching a height of 8 feet or more, and quite hardy. It is a native of the Mediterranean region, and is found chiefly on the mountains.

E. STRICTA is a native of south Europe, and is a plant reaching a height of 5 feet or 6 feet, with terminal clusters of pale purplish-pink flowers borne in profusion from the end of June onwards. The stems are erect, and are clothed with deep green plumose foliage. It is thoroughly hardy, and can be recommended for cold districts.

E. TETRALIX (cross-leaved Heath).—This is found practically everywhere where Heaths will grow. It makes a plant a foot or rather more in height, with downy leaves arranged in whorls of four. The flowers are of a bright shade of rose, and are borne in erect, terminal clusters from July to September. There is a white form, another with very pubescent foliage, known as alba mollis, and rubra has red flowers

E. VAGANS (Cornish Heath).—This is one of the best of the Heaths when in bloom, and is also a useful dwarf evergreen when not in flower. It grows from 1 foot to 2 feet in height, and bears racemes of rosy-purple flowers from July to October. It is a very easy species to grow and is thoroughly hardy. It is a native of south-western Europe, but is also found in Cornwall and some parts of Ireland. The variety grandiflora has rather larger flowers than the type, and rubra has red flowers and a straggling habit.

E. WATSONI was discovered growing wild in Cornwall by Mr. H. C. Watson, and is generally held to be a hybrid between E. Tetralix and E. ciliaris. It bears pale crimson flowers, and in every way is intermediate between the two species above mentioned.

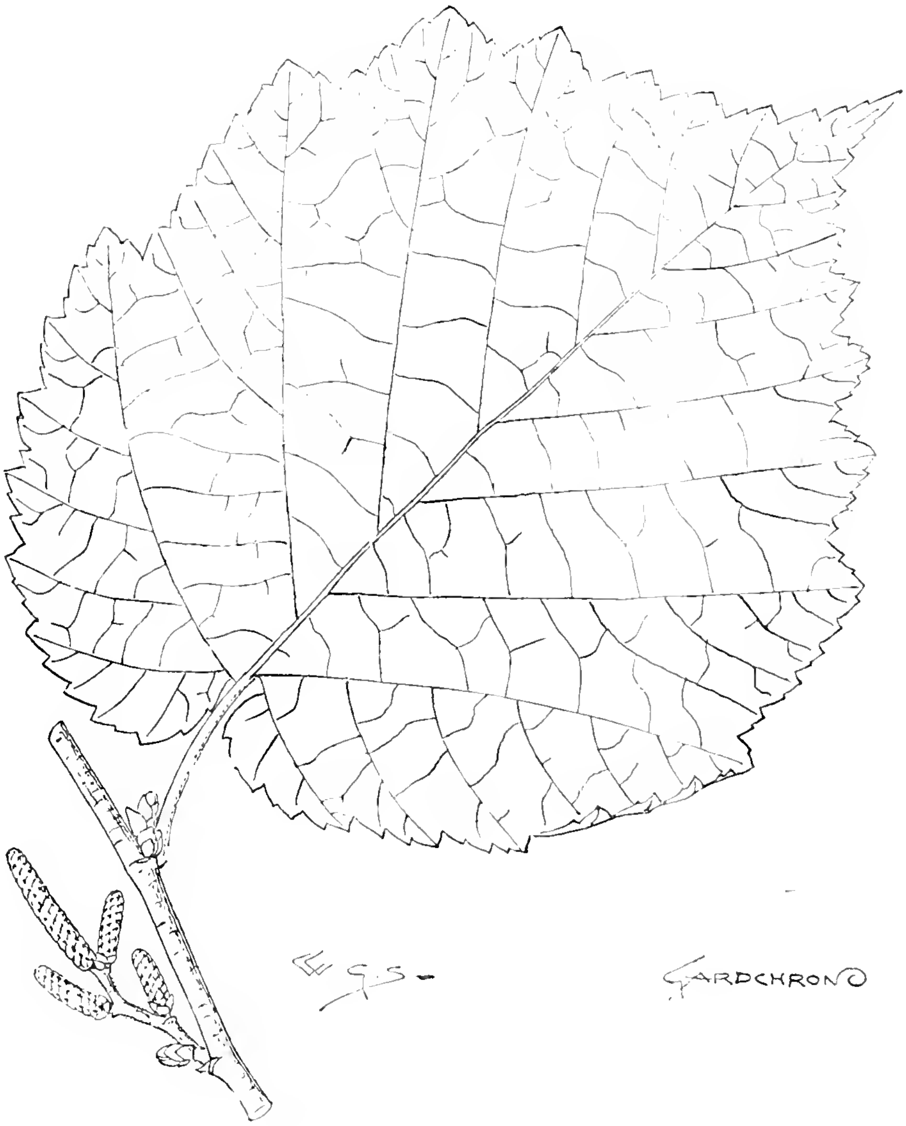

Fig. 105.—Corylus colurna: leaf and male catkins.

E. Veitchiana (E. arborea × E. lusitanica) was raised in Messrs. R. Veitch & Son's nursery at Exeter, and is intermediate between the two parents. It is very floriferous, but, unfortunately, inherits the tenderness of its parents.

Calluna.

C. vulgaris (Erica vulgaris) (The Ling).—This is a common plant on mountain and moor throughout the British Isles and the greater part of Europe, and though in itself it is not a particularly handsome plant, yet it has given rise to many fine varieties. The type has small flowers of a pale purple tint, produced in racemes from August onwards, but which are very effective when seen in masses on the moors. The varieties are some 20 or more in number, and a good selection is comprised by alba minor, alba rigida, and alba pumila (dwarf-growing, white-flowered); alba pilosa, and Hammondi (taller-growing whites); Alporti (crimson); tenuis (red); aurea (with bright golden foliage); flore pleno (with double purple flowers); and minima, hypnoides, and pygmaea (dwarf growers, with purple flowers).

Daboecia.

D. (Menziesia) polifolia (the Irish Heath).—This is a native of the west of Ireland, south-west Europe, and the Azores, and is a handsome little shrub growing about a foot in height, with terminal spikes of comparatively large bell-shaped flowers borne in great abundance from June to October. There are three varieties of this, viz., alba (with pure white flowers), bicolor (in which the flowers are variously purple or white), and atropurpurea (with deep purple flowers). The white form has of late years deservedly become popular. *J. C., Bagshot.*

CORYLUS COLURNA.

The Constantinople nut is more ornamental than useful. It forms a tree up to 60 feet in height with a stout trunk, branches more or less horizontal, heart shaped, glossy green leaves 5 inches by 4 inches, and small, hard-shelled nuts enclosed in fleshy, hairy-green involucres (see fig. 106, prepared from the Kew plant). It grows freely, and has a robust appearance in the gardens of this country, where it has held a place here and there since 1665, when, according to Loudon, it was cultivated by a Mr. Rea, florist, who had "many goodly plants of the filbeard of Constantinople." Although a vigorous grower with us and usually very free in the production of flowers, both male and female, it is a shy fruiter. The Kew tree, represented at fig. 104, as it appeared when covered with catkins in February this year, had scarcely a score of fruits upon it in October, although the tree is in the best of health and moderately old, the trunk measuring 4 feet 10 inches in girth at 2 feet from the ground. This tree stands on the site of the original botanic garden of nine acres, then enclosed by walls, with the Temple of the Sun in the centre, which was laid out by John Haverfield and William Aiton, who had been recommended by Philip Miller of the Apothecaries Garden, Chelsea, to take charge of the new botanic garden at Kew. This was in 1759. Now Kew consists of some 300 acres, and the Apothecaries Garden, shorn of some of its importance, but still doing good, is under the capable superintendence of a young gardener who was trained at Kew. It is possible that the Constantinople nut is one of the few trees that remain of those presented to Kew in 1762 by the Duke of Argyll from his then famous garden at Whitton, near Hounslow.

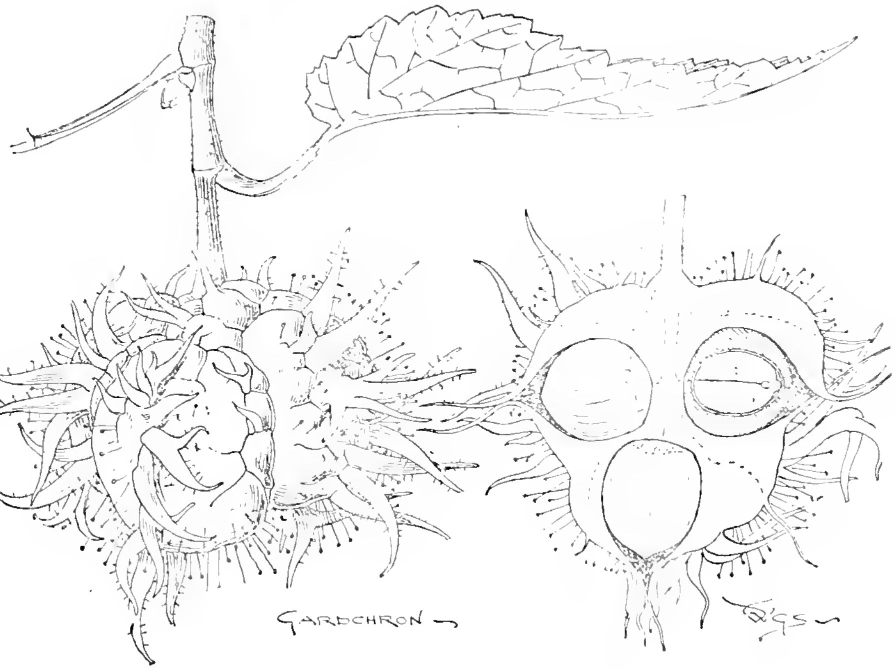

Fig. 106.—Fruits of Corylus colurna gathered at Kew this season.

NOTICES OF BOOKS.

THE FLORA OF NEW ZEALAND. By T. F. Cheeseman, F.L.S., F.Z.S., Curator of the Auckland Museum. Published under the authority of the New Zealand Government New Zealand: John Mackay, Government Printer, Wellington, 1906. 8vo, pp. xxxvi. and 1199.

It is now upwards of forty years since the first part of Sir Joseph Hooker's "Handbook of the Flora of New Zealand" appeared, and, apart from the fact that it has long been out of print, a new "Flora" was required, as subsequent explorations have doubled the number of known species of certain genera of flowering plants, and increased the total by about a third. Botanists have been expecting such a work for the last twenty years, and the announcement in 1894 that the late Thomas Kirk had been commissioned by the New Zealand Government to write a "Students' Flora" was received with great satisfaction. But he died in 1897, when about two-fifths of his work was in type, so that it was considered necessary to begin afresh. It was not till April, 1900, that the task was entrusted to Mr. Cheeseman. Like Mr. T. Kirk, Mr. Cheeseman commenced his work after many years' study of the flora, both in the field and in the herbarium, and, judging from a necessarily cursory examination of the result, it will be found that he has produced an admirable book, which will be hailed with satisfaction both by botanists and horticulturists. Of course, the quality of the details can only be judged by practical use. Briefly, the contents are: Preface; History of Botanical Discovery; Descriptive Enumeration of the Native Vascular Plants; Synoptical Key to the Orders; List of Naturalised Plants; List of Maori Names; Glossary; Additions and Corrections, and Index. The general plan of the descriptive part is that of Hooker's "Handbook," with somewhat longer descriptions. Typography and paper are excellent, and the weight of the volume, in spite of its thousand pages, is only 2lb. 9oz. Kirk's "Students' Flora" included descriptions of introduced, as well as of native plants, which is a very great advantage, because the young student cannot be expected to distinguish the foreign plants from the native ones, and in some districts the foreign element predominates, "and there is no part of the country, however remote, into which some plants of foreign origin have not penetrated." Mr. Cheeseman fully realises the importance of equally accessible descriptions of the foreign plants, and hopes to publish them in a companion volume; but it was a condition of his undertaking that it should be so limited. Altogether, he states, upwards of six hundred foreign species have succeeded in establishing themselves; therefore, to include them, a second volume would have been necessary.

Here are some interesting statistics, concerning vascular plants only, be it remembered:—The total number of species described is 1,571, or 512 more than Hooker's "Handbook" contains. Of these 1,415 are flowering plants and 156 Ferns and allies; the former under 382 genera and 97 orders. Of the total, 1,571, no fewer than 1,143 are endemic. Of the remainder 366 extend to Australia and 108 to South America. As to the local distribution of the species, 789 are common to both islands; 219 occur in the North Island, which are not known to occur in the South Island, and 456 species are recorded from the South Island, but have not been found in the North Island. Twenty-three species are found in the Kermadec Islands only; 25 in the Chatham Islands; 10 in Stewart Island, and 48 in the outlying islands to the south of New Zealand, including under this the Auckland, Campbell, Antipodes, and Macquarie Islands.

Coming to the ordinal distribution, the Compositæ are first, with 221 species, or 14 per cent., followed by Ferns, which are represented by 138 species, including 20 species of Hymenophyllum.

The genera most numerously represented are as follows:—The left-hand column being the number in Hooker's "Handbook," the right-hand column the number in Cheeseman's "Manual," thus showing the increase.

	Hooker.	Cheeseman
Veronica	40	84
Carex	23	54
Celmisia	24	43
Coprosma	24	40
Ranunculus	20	38
Olearia	20	35
Senecio	19	30
Epilobium	17	28
Poa	9	25
Myosotis (including Exarthena) ...	13	23
Hymenophyllum ...	15	20
	224	420

Thus these eleven genera, mostly of world-wide distribution, have been nearly doubled, and now furnish nearly a quarter of the total number of species. A considerable number of new species are described in the "Manual," and one new genus, Townsonia, Orchidaceæ, placed between Adenochilus and Corysanthes. The arrangement and limitation of the genera is almost the same as in Bentham and Hooker's Genera Plantarum; but in the appendix the author repeats the Loranthaceæ under Engler's modified classification, in which the number of genera is five instead of three. *W. Botting Hemsley.*

The Week's Work.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Fig Trees in Pots.—The wood on these trees has matured more perfectly than usual. There should be no further delay in the re-potting of the trees if the work has still to be done. It is not necessary to re-pot a tree annually, especially if it has a tendency to make strong growth for by affording top-dressings and suitable manures good crops can be obtained. It is better to keep the trees somewhat restricted at their roots than to over-pot them, for in this latter condition the soil would become sour, and some of the fibrous roots would decay. We have not employed any fire-heat to assist the trees in maturing, and if the roots are not kept too moist it will not be necessary.

Orchard-house Trees.—Carefully examine each tree. Young trees may be given a slight shift, and the older ones turned out of their pots, the roots reduced, and the trees replaced in pots of the same size. Use clean pots and provide each with good drainage. The roots need a compost consisting of rough turfy-loam, a liberal quantity of old mortar-rubble, and a sprinkling of bone-meal, the employment of the latter being preferable to the use of animal manures. Let ample room be left when re-potting for a good collar of loam and cow-manure to be applied later on as a top-dressing, and to provide a kind of basin for holding liquid manure when this is required. If young trees are required from the outside fruit-quarters to fill blank spaces, let these be potted up without delay. It is essential to pot such trees firmly, using a flat rammer. If the house can be spared, arrange the trees in it as soon as potted, and employ liberal ventilation by day and night. Should house-room not be available at present, place the trees outside in an open, but sheltered place. Apply a good watering to settle the soil about the roots, and syringe them daily on fine afternoons.

The Fruit-room.—If not already done, this room should now receive its annual cleaning. Thoroughly scrub the shelves and windows with hot water and soft soap. The work is better performed on a fine day, so that the doors and windows may be thrown wide open, so that the floor and shelves may dry quickly.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

The Planting of Roses.—Whether it be the formation of a new rosary that is contemplated, or the renovation of one already existing, or simply the addition of extra Roses to the flower borders, the work must be considered now in all its details, and operations commenced without further delay. If it is proposed to make a new rosary, a situation should be selected that is exposed to the sun and air, but, at the same time, is provided with sufficient shelter to protect the plants from violent winds. If it is impossible to choose a site with existent protection, means must be adopted to provide the same. A fencing 8 to 10 feet in height made of some durable material, and afterwards clothed with Roses and other hardy climbing plants, would make a very pleasing and artistic protection, or even a fence made of stout bamboo canes nailed securely to strongly-formed double rails, and so covered, would answer the purpose admirably. Failing the convenience to erect something similar to these fences, then hedges of Holly, Beech, Hornbeam, or Thuya gigantea could be planted. The Thuya would be especially suitable, as it is capable of growing quickly, and of forming a dense hedge of good appearance. It will easily bear close clipping, and this becomes essential when the hedge has attained to the requisite size. The best soil for Roses is strong, tenacious loam, so on a poor ground the beds should be excavated to the depth of 3 feet, and filled with some soil of this character. Broad turf-walks if maintained in good condition, seem always to be the most in keeping with a rosary, and to some are preferable to ordinary gravel walks, but this is a matter of opinion.

The laying-out of the ground.—Having selected the position for the new rosary, and determined upon its size and boundaries, the next important step is to produce the whole of the design on paper, describing to scale the plan of the different beds and borders, the positions of trellises, poles, pergolas, arbours, and seats. In planning Rose gardens much depends on the size and shape of the ground, and upon the individual taste of the designer, but it may be stated as an accepted principle that simple figures, and avoidance of sharp angles in the formation of the beds are in accordance with the best taste, and that intricate schemes of laying-out are not to be commended. My notes on this subject of forming a rosary written in the early part of the year (see p. 86 in the issue for February 10) may here be repeated, namely, that the best effects are obtained by providing beds to contain each its own particular variety, and that they should be large enough to hold from 20 to 30 plants each. Larger beds might be planted with a number of varieties, taking care not only that the flowers will agree in colour, but also that the plants will be of the same habit of growth. In these larger beds half-standards could be used with advantage for planting amongst the dwarfs. When it is practicable to do so, exclude hybrid perpetuals from the rosary, and also the rampant-growing Polyantha varieties, and cultivate principally the decorative Roses of the Tea-scented Hybrid Tea, China, Noisette, and Dwarf Polyantha types, because of their perpetual blooming habit. The season of blooming of hybrid perpetuals is comparatively so short that it is generally desirable that they should be grown in the "garden for cut flowers," and the strong-growing Polyantha Roses should be restricted to the rosary in the wild garden.

Obtaining the plants.—In commencing to make a new rosary now, one cannot think of its being planted before next February, and as, generally-speaking, most of the Rose planting is done in the last two weeks of October and in the month of November, it is apparent that if the selection and buying of Rose plants is left till then the chances of obtaining good plants will be remote. Herein is an advantage of having a complete plan of the rosary on paper, and the varieties and the numbers of each required for planting and filling the beds determined upon, as it is then an easy matter to despatch the order at once, and thereby have the first choice of plants from the nurseries. As soon as they are received from the nurseryman they should be carefully planted in a spare piece of ground in the most favoured part of

the kitchen garden, where they can remain until the spring. In spring they can be taken up and planted in their permanent quarters without suffering in any way from the enforced sojourn in the kitchen garden.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Preparations for Winter.—The necessary preparations for the forcing of vegetables in winter should now be made. Mushroom houses should be examined and any repairs that are needed executed. I prefer the use of wood-laths for Mushroom beds rather than slabs of slate, which are made of a much colder material. The wood-laths, however, require renewing frequently; but this expense is compensated by a greater crop, for if the laths are placed 2 inches apart and the beds are spawned on the bottom, as well as on the top, an additional supply is secured from beneath the bottom of the bed. It is surprising how Mushrooms will grow head downwards almost as readily as upwards. Bins should be made for the forcing of Seakale, Rhubarb, Chicory, &c., and if they are constructed with a lid, after the manner of a large chest, they will be found very convenient. Small saladings—such as Mustard and Cress, and Radishes—may still be sown in a heated frame. For a winter supply, the former salad is best sown in boxes of a convenient size.

Jerusalem Artichoke.—This vegetable, having now completed its growth, should be lifted and stored. The tubers should be graded and the sets for next year's planting selected. Be careful that no small tubers remain in the ground, for these would grow next year and become a nuisance to the succeeding crop. Store Jerusalem Artichokes in the same manner as that advised for Potatos.

Globe Artichokes will now be benefited by having some long litter or leaves placed around their crowns, which will act as a protection from frost. It is advisable to put up a quantity of the offsets in case a severe winter should kill the parent plants, an occurrence which frequently happens. The young plants can be protected in a cold frame, and be planted out during the following April, and as the heads from these young plants will not be fit for cutting until the autumn, they will form a succession to the older plants.

Stachy's tuberifera (the small Chinese Artichoke) should now be lifted and be stored until wanted. This vegetable, so far, has not enjoyed any great popularity, perhaps on account of its small size and apparent trouble in its preparation for cooking; but it makes a useful change and deserves to be more largely grown. Select the largest tubers and store them in sand until they are required. Do not allow too much air to reach them, as they are somewhat given to shrivelling. Any position that is just free from frost will suit them well.

Leaves have now commenced to fall from the trees, and provision should be made for storing them as fast as they are collected. Select all the Oak and Beech leaves for hotbeds, as these produce a far more lasting heat than other kinds. In many establishments the collecting of leaves is an important item, but more often than not all sorts are put together. By a judicious selection a much better use could often be made of this valuable heating material. Select some of the best, and keep them in a dry place for the purpose of blanching Endive, &c. Leaves of last year's gathering should be turned over in readiness for wheeling on to the land during frosty mornings. The frequent turning of fresh leaves is one of the best aids to their rapid decay.

Herbs.—Any shortage in the supply of dried herbs should now be made good, and before the plants are finally cut down by frost. Cut the growths when they are quite dry, and expose them well before their final storing.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Insect Pests.—In some districts it will be found that early in October many Apples fall to the ground, ripened prematurely by the presence of the grub of the Codlin moth (Carpocapsa pomonella). Upon examining the fruits that have dropped there is seen a small hole near to the "eye" of the fruit, which leads to the seeds. The marauder may not be present when the fruit has dropped, in which case it has escaped by another aperture near to the stalk. It is a well-known fact that fruits with large, open eyes are most liable to be attacked by this pest. After the damage is done the insect generally rests in the soil at the base of the tree until the next season, when it ascends the tree again by means of the stem. The old-fashioned practice of placing grease bands around the stems of the trees is a good preventive against the ascent of the pest, as are old hay-bands, pieces of cloth, &c., similarly placed. These bands should be at once placed around the stems of any badly-affected trees, and the soil underneath the trees should be dressed with a small quantity of gas lime, or with a like proportion of ordinary lime. Sprayings of an alkali wash applied both early and late in the season do much to keep this pest under, and tomtits, although they are very vexatious when they attack the ripe fruits, are helpful in destroying many of the larvæ. Another insect, called the Apple sucker, Psylla mali, also does much harm, for these pests in the spring suck the juices of the flower buds, causing the flowers to drop. These insects are very busy during October, when they may be seen leaping from leaf to leaf. They deposit their eggs in small crevices in the bark, where they remain, if unmolested, until the following spring. The trees should receive a thorough syringing with petroleum emulsion as soon as the fruits have been gathered. Richards' XL-all winter wash is another very suitable insecticide for this purpose.

Plums, Currants, Gooseberries, Raspberries, and even Nuts will all benefit by being washed with a suitable insecticide. A calm day should be chosen for the operation: it is better for the operators, and less waste is incurred.

Bands or ties that have done duty for the past year should be removed and dipped in a strong caustic solution, as many insects choose these for their hiding-places. Any that are worn out should be removed.

Repairs to Old Walls.—After the fruits have been gathered is a suitable time to undertake this kind of work. The trees should be nailed-in and made secure to a few stakes driven in the ground in front of them. The walls can then be re-pointed, or, if this cannot be done, they should receive a good coating of limewash, well rubbed in to the crevices. A good wash consists of 1 peck lime, ½ peck soot, ½ gallon parathin, well mixed up together to the consistency of paint.

Late Fruits.—Late Pears still remaining on the trees should have some nets placed over them to protect them from the birds and frost.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

The Cool House.—The Brazilian Oncidiums, O. Forbesii, O. crispum, and O. varicosum, are now rooting freely and developing flower spikes; they will require a considerable quantity of water at the roots until the flowers open. These plants are very apt to become weakened from over-flowering, and therefore no extra strong spikes should be allowed to remain on the plant for a period long after all the flowers have expanded. Very weak pseudo-bulbs will be greatly benefited if the spikes are removed as soon as they appear. Plants that produced an exceptionally strong inflorescence last year, and whose new pseudo-bulbs have deteriorated in size, should also be relieved of their spikes this season. O. concolor has completed its growth, and should be kept rather on the dry side during winter. Lycaste Skinneri and its varieties are growing freely in this house, and will require to be kept thoroughly moist at the root until their pseudo-bulbs are fully made up. When the Odontoglossums have been re-potted, carefully look over them every evening for slugs, because some are almost sure to have been introduced into the house by means of the fresh sphagnum-moss used for potting. Baits of young Lettuce and Cabbage leaves, also pieces of Potato hollowed out, are always useful, and many slugs may be caught by placing shallow pans half filled with bran about the stages. No trouble must be spared in this matter, especially for the first two months after repotting; if only a few are destroyed occasionally, their reproduction will be checked, and many young roots and valuable spikes will be saved. Some of the Odontoglossums are showing their spikes, and these may be protected by wrapping a piece of dry wadding around their base. At this time of the year when the weather is cool and moist, a dark, powdery fungus sometimes appears on the under sides of the leaves of the Odontoglossums, which, if not immediately checked, will quickly distribute itself all over the house and cause great disfigurement to the plants. Examine the plants carefully every day, and on its appearance cut off the part of the leaf affected and burn it; then turn the valve of the hot-water pipes sufficiently to keep them just lukewarm; additional ventilation may then be afforded. It is also advisable to use less water at each damping down.

In the intermediate house Zygopetalum maxillare is showing its flower spikes, and must never be allowed to get dry at the root. This plant in its native country (Brazil) grows on the stems of tree-Ferns, and the grower can therefore imagine the small amount of light the plants obtain. In cultivation it is well to keep the plant on the tree-Fern it was imported on, grow it in a shady position in the intermediate house. Keep it free from mealy-bug insects, which are nearly always imported with it. Strong plants of Cymbidium giganteum and C. Lowianum that are producing flower spikes must now be given every encouragement, placing them in a light position on the stage, and gradually increasing the water supply, damping frequently between the pots. Plants that are not showing spikes may be kept rather dry for several weeks longer, otherwise they may recommence to grow and fail to produce any spikes at all.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

The Resting Season of Plants.—The season has arrived when most plants are preparing for a period of rest, and to the plant-grower the study of rest in plants is important. It is essential for success in their culture to have a knowledge of the plants as they grow in their native habitat, and such details as their seasons of growth and of rest, and whether the plant is deciduous, bulbous, or evergreen are points to be studied. To bring about a gradual rest in plants high temperatures at night time must be avoided, for excessive artificial heat causes the plants to become very dry, and renders watering necessary, thus preventing the proper resting of the plant. In resting Allamandas, Dipladenias, Stephanotis, Ixoras, and other plants of a similar kind, care should be taken not to withhold water to such an extent as to kill the young fibrous roots and shrivel up the tissues of the plants. When any of the above-named plants require water, let a thorough soaking be given, so that the whole of the roots may receive a wetting, after which no more water should be given for a period of some days, the length of which will depend upon the amount of moisture in the atmosphere. The resting of tuberous and bulbous plants, such as Gloriosas, Gloxinias, Begonias, Caladiums, and Achimeneas requires different treatment to the above, for, although all the roots of these subjects may die during a period of rest, the plant has the power of forming new roots from its store of reserve material. Very often these bulbous plants are carelessly treated after their period of flowering, and are allowed to remain in some neglected corner of the pit, under the shade of other plants, where they are given no water, although this is just the time they need attention so as to enable them to flower again the next season.

The Stove.—The temperatures in this structure should be gradually reduced during the winter months until they reach 68° to 70° by day, and 62° to 65° at night. Open the wall ventilators on all favourable occasions. The temperature in the conservatory and greenhouse should range from 58° to 60° by day, and 55° to 58° by night. Circulate a little heat in the hot-water pipes on cold nights to keep a buoyant air in these structures.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Oct. 13	Dutch Gardeners' Soc. meets.
MONDAY,	Oct. 15	Nat. Chrys. Soc. Com. meets at Essex Hall, Strand, 3 p.m.
TUESDAY,	Oct. 16	R.H.S. Show of British Grown Fruits at Westminster (2 days).
WEDNESDAY,	Oct. 17	Royal Bot. Soc. Show, Regent's Park.
SATURDAY,	Oct. 20	German Gardeners' Soc. meets.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—50·7°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, October* 10 (6 P.M.): Max. 69°; Min. 59.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October* 11 (10 A.M.) Bar., 29·8, Temp., 65; Weather—Fine.

PROVINCES.—*Wednesday, October* 10 (6 P.M.): Max. 69° Southampton; Min. 55 Northeast Coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Bulbs at Stevens' Rooms, King Street, Covent Garden, at 12.30.

MONDAY TO FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY AND WEDNESDAY—
Two days' Sale of well-grown Nursery Stock at Shortlands Nursery, Ash, Surrey, by order of Mr. H. Fleet, by Protheroe & Morris, at 12.

WEDNESDAY—
Azaleas, Rhododendrons, Palms, Roman Hyacinths, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY—
Fourth Annual Sale of Nursery Stock at Old Nursery, Spring Grove, Isleworth, by order of Mr. H. A'Bear, by Protheroe & Morris, at 12.

FRIDAY—
Brazilian Orchids and others, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Potatos.

So long as Potato tubers continue to form such an important part in the food of the nation as they do at the present time, so long will all matters connected with their improvement and cultivation have a commercial as well as a scientific interest and value. Trials of Potatos, therefore, although often inconclusive, and by no means a sufficient basis upon which to build theories and make rules that are applicable to all districts with their extremely variable conditions, have nevertheless an interest in proportion to the thoroughness of the tests and the efficiency of the means taken to safeguard the trials from the influence of circumstances that might tend to confuse the issues. Mr. Arthur W. Sutton, on Monday last, when addressing a party of about 80 gentlemen who had journeyed to Reading to inspect some trials Messrs. Sutton and Sons have carried out during the present season, said that the firm had made the trials in order to afford interesting results that the visitors might see and interpret as they felt disposed, and it was not claimed that the results of all the experiments had any commercial importance or could be applied usefully in practice. But we believe there are some questions that can be conclusively proved or disproved by simple, well-conducted trials, whilst there are others that must necessarily be inconclusive, and likely to mislead those who choose to regard the results as affording an infallible guide for cultivators. To this latter class belong the trials of the cropping qualities of the different varieties. Our experience of Potatos has proved this much: that Northern Star may be the best cropping variety in one garden and a very indifferent cropper in another. The same may be said of other varieties. In regard to flavour the case is similar. Sir John Llewelyn may yield the best-flavoured tubers possible in Glamorganshire, but when cultivated in a garden at Kew the tubers were scarcely eatable. The local conditions of soil and climate have such an overwhelming influence upon yield and flavour that, after an extended trial of a large number of varieties in the same soil, the results amount to little more than proving what are the best varieties for cultivation in that particular plot. For these reasons we think that the trials of this nature were the least interesting of those conducted by Messrs. Sutton; some of the others, however, were of far more permanent value. The trials were inspected by some members of the Scientific Committee of the Royal Horticultural Society in July last, and a report of the proceedings was published in the issue of the *Gardeners' Chronicle* for July 28.

In many respects the later inspection served to confirm the conclusions arrived at in July, and we need, therefore, only refer on this present occasion to some of the trials that were not remarked upon then, and to some in which additional information was forthcoming. The experiments were carried out in specially-selected ground attached to Southcote Manor, an old, dismantled residence of considerable historical importance, about two miles out of the town of Reading.

The first series of trials inspected had reference to Solanum Commersoni and the Potato which M. Labergerie asserts originated as a sport or mutation from that species in his nursery. After examination of the lifted tubers and of growing plants, nothing material was discovered by which the tubers of M. Labergerie's S. Commersoni "Violette" could be distinguished from those of the German variety of S. tuberosum, known as Blue Giant. This was also the opinion formed by the Scientific Committee when the plants were in active growth. The evidence that M. Labergerie's plant really originated as a sport from S. Commersoni is not conclusive, and seems very improbable.

MATURED AND ONLY PARTIALLY-MATURED TUBERS.

Comparative trials were made of eight varieties grown from seed (tubers) harvested last season in the South of England, Lincolnshire, Scotland, and Ireland respectively. Since the earlier inspection the tubers had been lifted and weighed. In five instances the heaviest crop was obtained from Irish tubers, and in the remaining three instances from Scotch tubers. The difference between the results obtained from South of England tubers and "seed" from Ireland or Scotland was very considerable, and may be regarded as conclusive, proving the greater value of those from the less warm climates. Take an instance: In Sutton's Ninety-fold the produce from the South of England tubers was 10 lbs., that from Lincolnshire sets 1 qr. 25 lbs., from Scotch tubers 2 qrs. 9 lbs., and from Irish 3 qrs. 14 lbs.

A further experiment to show the effect of seed (tubers) fully and only partially matured was undertaken because there existed a well-based impression that the result of the trial just alluded to would prove the superiority of northern-grown seed-tubers. If these are more productive, why are they so? The trial served to show that the difference is due to the tubers becoming harder, or more mature, in the southern climate. In all but two instances in this trial the immature tubers gave the greater yield, and in the two exceptions the "mature" sets were obtained from Scotland, and would, therefore, be less fully matured than southern-grown tubers. The variety May Queen yielded from mature tubers only a crop of 9 lbs., but from immature tubers the yield was 1 qr. 18 lbs., and most of the varieties furnished similar results. It may be pointed out here that the mature and immature tubers used for this particular trial were all southern-grown specimens, but in the one case the tops (haulm) had been removed whilst still growing, or the tubers were lifted at that stage. By the terms mature and immature is signified a condition of unripeness, which has nothing to do with the size, or even age, of particular tubers. It is not known with certainty what is in the mature tuber that renders it less productive. From frequent remarks made by those present at Reading we gathered that most growers believe it to be due to its harder skin, but it is much more likely to be caused by chemical changes that take place in the tuber itself. In any case, the cultivator of large areas who plants his ground with tubers that have been grown in the South of England cannot expect to obtain anything like the yield that it is possible for him to obtain. Surely this fact is one of the utmost importance.

SETS AFFECTED WITH FUNGUS.

Some experiments with sets which were known to be affected with the common fungus disease (Phytophthora infestans), also with tubers affected with brown streaks along the fibro-vascular bundles, and with internal brown spots, were of less practical use, although the results were somewhat unexpected. The variety Early Rose, for instance, yielded 2 qrs. 25 lbs. from healthy tubers, and 2 qrs. 16 lbs. from tubers slightly affected with Phytophthora infestans. But, although the difference in the yield was but slight, no discreet cultivator would knowingly plant tubers that are unsound, it being to his interest to keep the ground as free from the taint of disease as possible.

WITHY-PEELINGS AS MANURE.

Of much greater practical interest was an experiment with two varieties to test the relative value of withy rod-peelings and farmyard manure. The varieties were Ninety-fold and Superlative, and there were six rows of each variety, 12 plants in a row. Half the sets were planted in soil manured with rod-peelings at the rate of 30 tons per acre, and half in ground manured with an equal weight of farmyard manure. Ninety-fold yielded 1 cwt. 0 qrs. 10 lbs. with the rod-peelings, and only 3 qrs. 18 lbs. with farmyard manure, whilst Superlative produced 1 cwt. 2 qrs. 7 lbs. from the rod-peelings and 1 cwt. 1 qr. 11 lbs. from the ground treated with farmyard manure. We believe that these peelings are used for manure in most of the districts where they are obtainable in large quantities, but

what supply there would be for commercial purposes has to be determined. The peelings are allowed to rot for one year before they are dug into the land.

The question as to whether it is most profitable to plant small, medium, or large-sized sets is one that has been debated for years past. The results obtained at Reading show that in each instance the largest sets produced slightly heavier yields than those obtained from the medium or small sets. To take one instance, Epicure yielded 2 qrs. 12 lbs. from small sets (2 ozs.), 2 qrs. 14 lbs. from medium sets (3 ozs.), 2 qrs. 26 lbs. from large sets (4 ozs.) and 2 qrs. 13 lbs. from large sets which had been cut. The practical man will probably find that the extra yield from the large sets would not be more profitable, because the cost of the "seed" would be much greater than for medium tubers, which yield almost as heavy a crop. At the same time, it may be pointed out that there were fewer "chats" or small tubers in the produce from the large sets than in that from smaller ones.

The value of earthing-up Potatos was not shown to great advantage in a trial made with the variety Superlative. The earthed-up plants produced 3 qrs. 20 lbs., and those growing on the flat 3 qrs. 14 lbs. It must be remembered, however, in connection with this subject that earthing-up has also the effect of preventing any of the tubers from getting "greened," and it serves to protect the tubers from the Phytophthora, which is believed to attack the foliage of the plants in the first instance.

THE REMOVAL OF FLOWERS.

The variety Flourball, having the habit of blooming freely, was subjected to a test to show the effect on the crop of picking off the flowers immediately they appeared, and before berries were formed. The result was in favour of the plants that were relieved of their flowers, the weight being 2 qrs. 21lbs. against 2 qrs. 15 lbs. Mr. Herbert Sutton, who explained the trials on the experimental plots, remarked that Thomas Knight, in a paper published in the *Royal Horticultural Society's Journal* in 1810, stated, in reference to this question, that probably the saving of sap that might be thus obtained would result in increasing the yield of tubers by about one ounce per root. Messrs. Sutton's experiment showed an increase of nearly four ounces per root.

A question of botanical interest, and of practical interest, so far as cross-breeding is concerned, was raised in an experiment to prove the possibility, by removing all tubers as they are formed, of causing varieties which do not usually do so to set their blooms and form berries. Knight wrote about 100 years ago that he had found the removal of the tubers had this effect, and it may be granted theoretically it would not be surprising that if a plant having two methods of reproducing itself, and finding one means continually rendered ineffective, should make an extra effort to secure its reproduction by the other means. But Messrs. Sutton's experiment was less convincing. The varieties were Ringleader, which formed trusses of bloom, but no buds opened; Harbinger, which also formed weak trusses; and Evergood, which opened a few very weak flowers. It has to be pointed out, however, that the tendency had to be created in these varieties, for, whilst no bloom has been seen on Ringleader for 15 years past, Harbinger has never been known to bloom at all. For the purpose of inducing such varieties to flower, it might be advantageous to start them very early in the season in pots, and starve the roots somewhat, over a long period of growth.

A trial of sprouted sets as against non-sprouted and shrivelled sets resulted in all cases in favour of the sprouted sets.

An interesting trial bearing on the question of deterioration of varieties was that of some Magnum Bonums from a stock which was purchased from Messrs. Sutton's in 1876, when this variety was first distributed. The stock had been grown continuously on the same soil, or, at least, in the same locality, and crops now as well as it ever did. In all that time the sets were never cut, and care was taken to plant each year sets which had not become fully matured before lifting.

Further trials were shown of Potato species upon which notes have already been published in these pages, and of varieties resembling Abundance and Up-to-Date, and of Potatos which gave the best results in the Reading University College Trial Grounds and County Council trials last season.

OUR SUPPLEMENTARY ILLUSTRATION represents the inflorescence of Bulbophyllum virescens, a fine species for which Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr. Mr. W. H. Young), was awarded a First Class Certificate at the Holland House show on July 10 last, an award which has only been accorded to two other Bulbophyllums, viz., the allied B. Ericssoni (which also received the much more appropriate award of a Botanical Certificate), and was illustrated in the *Gardeners' Chronicle*, January 23, 1897, and B. Dearei of the Lobbii section. The type Bulbophyllum virescens was first described by Mr. J. J. SMITH of the Buitenzorg Botanic Garden, Java. A few years ago Messrs. Hugh Low & Co. imported, from the New Guinea region, a Bulbophyllum which was taken to be the closely allied B. Ericssoni, but on flowering the plant proved to be B. virescens, and it is probably from Messrs. Low's stock that the few plants in cultivation have been derived. The flowers of this species differ mainly from those of Ericssoni in that they are narrower and unspotted, those of B. virescens being greenish white veined with pale green, the face of the column and the hinged labellum being tinged with rose-purple. The other known ally of B. virescens is B. Pahudii, which is probably not in cultivation. All the species thrive best grown in baskets or on rafts and suspended in a warm, moist house. They are evergreen, and require a liberal supply of rain water, especially when they are making their new growths.

FORESTRY AT OXFORD.—The University now provides a complete course of instruction in scientific and practical forestry, and grants a diploma in forestry to successful students. This course is recognised by the Secretary of State for India, and includes special instruction by Professor SCHLICH and Mr. FISHER, formerly of Cooper's Hill College. Two years of this course are taken in Oxford, and a third (nine months) on the Continent. Candidates for the diploma must (1) have passed Responsions, or an equivalent examination, or give evidence of having received a good general education satisfactory to the committee appointed for that purpose; (2) have satisfied the examiners in the preliminary examination in the Honour School of Natural Science in Mechanics and Physics, Chemistry, and Botany, or in some examination accepted by the delegates as equivalent. The diploma can be combined with the University degree of B.A., by keeping a year's residence previous to the commencement of the course (which would be devoted to passing Responsions, and the science-preliminary examinations indicated above), and by obtaining a class in the Honour School of Natural Science, in either botany, geology, or zoology. The selection of candidates for the Indian Forest Service is at present done (1) partly by an examination held by the Civil Service Commissioners; (2) and partly by nomination. At the end of the three years' course, successful candidates receive £100 for passage-money and outfit, and are appointed Assistant Conservators of Forests at a salary of Rs 350 a month, which, with exchange compensation, may be placed at £300 a year. The grading of the department is such that they can rise to a salary of Rs. 2,500 a month, or about £2,000 a year. Indian Forest officers can retire after 22 years' actual residence in India on a full pension, with a *maximum* of £525 a year, and after 18 years' residence on a proportionate pension. There is also a provident fund managed by Government. The recruiting of the Forest Departments in Ceylon and in the Federated Malay States is effected on lines similar to those applying to the Forest Department of India. Further details can be obtained by applying to the secretary of the delegacy, Professor SCHLICH, 29, Banbury Road, Oxford. *Times.*

GLADIOLUS WHICH FLOWERS IN THE SAME YEAR FROM SEED. We have received from M. ROEMER, Quedlinburgh, specimens of Gladiolus which have flowered and produced seeds in the same season as raised from seeds. The strain has been named Praecox, and was obtained by constantly selecting early-flowering varieties from the general collection of Gladioli. Seeds are sown in March in a warm pit or frame. The young seedlings commence to show themselves at about the beginning of April, and this season three plants opened their first flowers on July 12. The young plants should be planted in the month of May, in order to obtain strong flower spikes, and the methods of cultivation followed must be those found suitable for summer-flowering plants. There is great variety in the colours of the blooms, and their size leaves nothing to be desired. Corms of the size of a Hazel nut produce spikes with 12 to 16 blooms. One of the specimens received had a small corm at the base and partially-ripened seeds on the flower spike.

THE KING'S BOUQUET.—Messrs. LITTLE & BALLANTYNE forward us a photograph of the basket of flowers presented by Miss WATT to the King on his recent passage through Carlisle. It shows a light and elegant arrangement in which Orchids predominate. Among the flowers were Dendrobium Phalaenopsis, Cattleyas, Odontoglossums, Phalaenopsis, and Roses with a setting of Asparagus.

PRESENTATION.—Mr. W. R. PRINCE, for the past 5½ years gardener to General Sir R. POLE-CAREW, K.C.B., Antony House, Devonport, was presented, on his retirement, with a watch and chain by the garden, household and estate employees.

APPOINTMENTS.—According to the *Kew Bulletin*, No. 6 (1906), the following appointments have been made recently: Mr. HARRY DODD as Curator of the Botanic Station at Onitsha, Southern Nigeria, and Mr. W. HEAD and Mr. RUPERT BADGLEY as Probationer Gardeners for service in India.

MRS. THEODOSIA SHEPHERD.—American papers record the death of this lady at Ventura, California. Beginning as an amateur with little knowledge and no capital, she eventually succeeded in building up a business of which all Californians are proud. She was the pioneer seed grower of the State, and became almost as well known as BURBANK himself.

Chrysanthemums in Paris.—A great exhibition of Chrysanthemums, together with Orchids and other flowers, fruits and vegetables, will be held in the Conservatories at Cours la Reine from November 3-11.

Dr. Oudemans.—The death of this botanist is announced. He died at Arnhem, where he had resided since resigning the professorship of botany at Amsterdam. Prof. Oudemans took a leading part in the botanical congress and exhibition at Amsterdam in 1865, the immediate precursor of the memorable Congress of 1866 in London. Dr. Oudemans' later researches were principally confined to the fungi.

Trafalgar Day Celebrations.—The Nelson Column in Trafalgar Square will be decorated largely this year with autumn tinted Oak leaves, which will take the place of the Laurel formerly used for the festoons and wreaths. The decorations will be completed by 8 a.m. on the 20th inst. and be removed on the 24th. Messrs Geo. Bellgrove & Co., Hammersmith, have been entrusted with the work for the seventh consecutive year.

Ammonia Vapour and Plant Growth.—The practice of placing ammonia in Orchid houses in order to ensure vigorous growth is according to Prof. Bottomley, in a paper read before the Botanical section of the British Association of York, due to the presence of bacteria in the spongy covering of the roots of the Orchids. These bacteria utilise both the nitrates and the nitrites, and absorb the ammonia vapour along with the watery vapour normally condensed by the spongy root covering.

The Forest Flora of New South Wales.—Mr. J. H. Maiden continues the publication of this work, to which we have often referred. In Vol. II., part X. (part XX. of the complete work), we find additional information in regard to the trees dealt with in the preceding 19 parts, no new species being added, the part being supplementary. Vol. III., part I. (part XXI. of the complete work), contains letterpress and plates of Flindersia Bennettiana, Eucalyptus Andrewsi, and Casuarina inophloia.

A Pendulous Wellingtonia.—The *Revue Horticole* for September 1, 1906, publishes a description and illustration of a very remarkable pendulous form of Sequoia gigantea growing in the gardens at the Trianon, Versailles. It resembles an umbrella, the bare stem representing the handle, the pendulous branches being comparable to the ribs of the umbrella when closed. As a curiosity it is very striking.

Berberis stenophylla ×.—The *Revue Horticole* announces the occurrence of fruits on this shrub, a hybrid between B. empetrifolia and B. Darwinii. The berries are small and globose, purple in colour. Whether the seeds will prove fertile remains to be seen.

The Classification of Plants.—It was a "happy thought" which induced the authorities of the botanical department of the Natural History Museum, Cromwell Road, to illustrate the chief epochs in the development of a natural system of classification, that is to say, a system which shows the actual (or assumed) relationships of plants as contrasted with an artificial system which is based on the differences presented by one set of organs. This has been done by exhibiting a series of works from the time of Dioscorides, A.D. 40, to that of Engler, 1903. The authors, whose principal works are thus shown, are Brunfels, Turner, Gerard, Bauhin, Caesalinus, Morison, Ray, Tournefort, Linnæus, Adanson, de Jussieu, A. P. Candolle, Robert Brown, Lindley, Endlicher, Hofmeister, Bentham, J. D. Hooker, Eichler, and Engler. It is obvious that the selection has been a rigid one since Brongniart, Decaisne, Baillon, von Mueller, von Martius, Alphonse de Candolle, and others whom we might expect to find in such a collection are not represented. It may be hoped that the idea here broached may be extended and followed up, and that physiologists such as Grew, Hales, Knight, to name only Englishmen, may find a place in the museum by the side of the systematists.

The Importance of Lime-wash on Fruit Trees.—It is common belief that the whitewashing of the stems and limbs of fruit trees was one of the means of killing parasites of various kinds—animal and vegetable, their eggs and spores—and the action of the lime is rendered more effective by the addition of copper sulphate, which, however, does not make the whitewash any darker. Perhaps better than a brush is the application of the wash by means of the garden engine or force pump, or a large syringe. The limewash, according to Dr. Koch, of the Royal and Imperial Plant Protection Station at Vienna, does something more than this in preventing the severe frosts of early spring causing injury to the bark and the consequent frost canker that admits water and frost. In early spring the sun, in that part of the world, warms the bark to a considerable degree, and to a certain extent the wood likewise, and the stem increases in bulk. In the following night, if cold, the bark of the stem parts with its warmth rapidly, and is drawn together round the stem, &c., with the result that the bark splits and the injury has begun. Whitewashing of the bark prevents the warming of the same to a great extent, and its injury by night frosts.

American Mildew in Sweden.—The Swedish Pomological Society is taking vigorous measures for the extermination of the American Gooseberry mildew (Sphærotheca mors uvæ), which has been devastating both nursery and private gardens throughout the country. The Minister of Agriculture granted the sum of 1,000 kronen (£55) towards the publication in the newspapers of a full description of the disease and instructions for ridding gardens of this pest. Gardeners are recommended to root up and burn all infected bushes and to prevent, as far as possible, the spread of the mildew by spraying the bushes thoroughly with a strong mixture of sulphur. Care has also to be taken to guard against the dissemination of the fungus through the clothes and tools of the workmen. Moreover, the Government is forbidden to import or to transplant Gooseberry bushes and to offer them for sale before the end of the year 1907. Compensation will be given to growers for the loss they have sustained through the uprootal and destruction of their plants, precedence being given to those who have cultivated them for the purposes of trade. The utmost vigilance is necessary, for, were the disease allowed to remain for a year, it would be practically impossible to conquer it. In the neighbourhood of Stockholm large areas are devoted to the growth of standard bushes. These require special attention, as Ribes aureum is often cultivated beneath the trees. Nurserymen are charged not to introduce any wild stock. Currants are also liable to this disease, especially the red and black, and in one instance Raspberries also have suffered.

Publications Received.—*Report of the Director of Agricultural Education, Monmouthshire.* In addition to the ordinary branches of agriculture encouraged by the education committee we note that phenological notes have been taken and tabulated relating to the date of the appearance of flowers, birds, &c. These, it continued, will be of increasing value.—*Reports on Experiments with Crops and Stock.* Midland Agricultural and Dairy College, Kingston-on-Soar. The experiments dealt with manuring of seeds, Hay, varieties of Barley and Potatos, manuring Potatos, Mangels and Swedes, and spraying Potatos. The results are carefully tabulated, and afford a satisfactory proof of useful work.—*The Jamaica Bulletin of the Department of Agriculture* for August contains notes on Para, Lagos, and Castilloa Rubber, on cocoanuts, coffee, camphor, and tobacco dust as a fertiliser and insecticide.—*The Queensland Agricultural Journal* for August includes articles of the usual type upon crops and stock.—Porto Rico Agricultural Experiment Station. Bulletin No. 7, *Vegetable Growing in Porto Rico*, by H. C. Henricksen. A carefully prepared handbook, which should lessen some of the difficulties attendant upon growing vegetables in Porto Rico, where the chief drawbacks are the scarcity of good seed, and a prolonged wet season. Mr. D. W. May is the agent in charge of the station.—*Proceedings of the Academy of Natural Sciences of Philadelphia.* January to April, 1906. The contents include papers upon various species and genera of fish, molluscs, and birds.—*Agricultural Bulletin of the Straits and Federated Malay States.* Edited by H. N. Ridley and J. B. Carruthers. May and June. These deal chiefly with rubber cultivation.—*Bulletin of Miscellaneous Information, Trinidad*, edited by J. H. Hart, F.L.S. A quarterly publication full of notes and articles of local value.—*A Concise Handbook of Garden Shrubs*, by B. M. Gwyn Lewis. (Methuen & Co.)—*A Text Book of Fungi*, by George Massee. (Duckworth & Co.)—*Woburn Experimental Fruit Farm*, sixth report, by the Duke of Bedford, K.G., and Spencer Pickering, F.R.S. (Eyre & Spottiswoode.)—*A Book of English Gardens*, by M. E. Gloag. Illustrated by K. M. Wyatt. (Methuen & Co.)

LAW NOTE.

FLORISTS AND THE FACTORY ACT.

At the Marylebone Police Court recently a case of importance to florists was decided by Mr. Paul Taylor. A florist, of Crawford Street, Marylebone, was summoned by Charles C. W. Hoare, a factory inspector, for contravening the Factory and Workshops Act by failing to affix an abstract of the Act in his workshop.

Mr. Muir, barrister, instructed by Mr. Freke Palmer, defended. The proceedings were in the nature of a test case, it having been an open point hitherto whether the work carried on in florists' shops brought those shops and the workers within the Factory Act. Evidence was given that the defendant company employed a number of young women permanently all the year round for the purposes of making up bouquets, wreaths, and floral decorations. This work, it was contended, brought the workers within the Act, but no abstract of the Act was exhibited in the workshop, and the company refused to exhibit it. Mr. Muir submitted, in defence, that the work done was not "manual labour" within the meaning of the Act, but required a highly artistic sense. He also contended that natural flowers adapted for sale in the form of bouquets, &c., did not come within the meaning of an "article," which was a thing that had been subject to manufacture. That being so, the company claimed that they were not subject to the Factory and Workshops Act, and for that reason they refused to exhibit the extract.

Mr. Paul Taylor referred to the fact that he had already held that the company's workshop did not come within the Act by reason of the work carried on there; but after going more fully into the matter, he said he was decidedly of opinion that it did not come within the Act, and the summons would therefore be dismissed.

THE FERNERY.

SOME CHOICE ASPLENIUMS.

It is twenty years since Messrs J. Hill & Sons, Edmonton, first took up the cultivation of Asplenium nidus, and one of the original plants was in the group exhibited at a recent meeting of the Royal Horticultural Society. Plants about two and a half to three years old find the most ready sale in the market, and these are contained in large 60-size pots. A. nidus has become one of the most popular market ferns, but few growers succeed so well

Fig. 107.—Asplenium l. ceratum.
(See text.)

with it as do Messrs. Hill & Son. When visiting the nursery some time ago I saw thousands of plants in various sizes from seedlings just germinated onwards to those in 5-inch pots.

Asplenium laceratum (see fig. 107), which was shown in the group already referred to, was awarded a First Class Certificate. At first sight it would appear to be a variety of A. nidus having thick fronds with a bright surface, but narrower, and cut down into irregular lobes, but instead of the leafy portion extending to the base, each frond has a black stripe about 3 inches long. It was introduced from Brazil, and may prove to be a distinct species or a natural variation of a known species. The descriptive name may be a little misleading, as there is a variety of A. præmorsum already named laceratum. The plant shown had fronds about 15 to 18 inches long, but, as with A. nidus, with age they may attain to much larger proportions. The nearest description of any Brazilian species I can find is that of A. serratum, which does not appear to be in cultivation; it is referred to in Hooker's *Species Filicum*.

Asplenium lucidum.—This is a useful Fern for market supply. In a small state it is very pretty, and one of the most serviceable. When fully developed it has pinnate fronds about 15 to 18 inches in length and about 6 inches in breadth; the fronds, which grow nearly erect, are of a thick, coriaceous texture, and will last almost as well as the leaves of an Aspidistra. It is of very slow growth. Some authorities consider the plant to be a variety of A. obtusatum, but as I have known them, they are very distinct in appearance.

Asplenium Mayi.—This appears to be of hybrid origin, and was raised by Mr. H. B. May, Edmonton; it was given a First Class Certificate in 1894. It is somewhat intermediate between A. pteridoides and A. Baptisti; it is of more lax growth than the above, and the deeply serrated pinnæ are narrower and longer. I saw this in large quantities when visiting Messrs. May & Sons' nurseries a short time ago; it appears to come true from spores. I may add that the fronds of this plant have the bright, deep-green surface, and are of good substance. A. Herbsti is another from the same parentage, with rather broader pinnæ and more erect fronds. A. Drueryi is another, with crested fronds, which distinctly shows its affinity to A. Baptisti. There are also several other distinct varieties of the same type. The one disadvantage is that they are of very slow growth, but once they attain to a useful size they keep in good character for many years. *A. H.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

The Royal Gardens, Frogmore.—The completion of the work of improvement undertaken in the Royal gardens since the King ascended the throne is rapidly nearing completion; indeed, it is probable that ere the year closes the conversion will be completed. It is the King's wish that Frogmore, as a garden, shall be of the most perfect and complete description, and he has been enthusiastically supported by his Treasurer, Sir Dighton Probyn, who is an earnest and devoted gardener, and by Mr. McKellar, the gardener at Frogmore, who has, indeed, cause to look upon the results of his work with the greatest satisfaction. From Orchids and stove plants down through fruit houses and vineries, even to Tomatos, everything is in splendid condition. In one long span-roofed house are some 200 Tomato plants in 10-inch pots of the variety Veitch's Dwarf Red. The plants are standing in double rows on either side of the house, and their average height is 30 inches. So short-jointed and compact in habit are they that each plant is carrying in that short length of stem fully 6lb. of very handsome and particularly solid, rich-coloured fruits. The whole of these plants were raised from seed sown in June,

It would indeed be difficult to find an equal show of such perfectly-developed fruits on an equal number of such dwarf plants. Those readers of the *Gardeners' Chronicle* who, in spite of some recent correspondence, still seem to think that the days of successful outdoor Peach and Nectarine culture have passed, should next year endeavour to see the Peach wall at Frogmore, as that would demonstrate the fallacy of their belief. A wall in the Royal gardens of good height and 1,000 feet in length has three-year-old trees trained on it, and these trees now average 10 feet in breadth, and they are of a corresponding height. There are scores of these trees, and they are all in robust health, and they have generally this year fruited well. In another three years the wall promises to be so furnished that hardly a brick will be seen through the trees. The long border is now cropped, one half with Cauliflowers and the other half with Spinach. Perhaps the most remarkable sight of all in these gardens is the splendid herbaceous borders. Imagine a broad roadway, 15 to 16 feet in width and 1,000 feet in length, and on either side a border of the same great width, planted to the fullest extent with thousands of hardy plants, intermingled with which are a few tender plants and annuals. Lovers of hardy flowers would indeed revel in a sight of such beauty. *D.*

CHRYSANTHEMUM ELEANOR DUCHESS OF NORTHUMBERLAND.—This is a good, large, white variety. The only fault I can find with this variety is that it flowers too early. Flowers from first crown buds are now (October 2) at their best, the blooms being 25½ inches in circumference. I shall be glad to know if any grower has found it come good and large on second crown buds. It is certainly one of the best Chrysanthemums of recent introduction. *A. J. Long.*

POLYGONUM POLYSTACHUM.—Why is not this Himalayan Polygonum more frequently grown? It is both beautiful and sweetly scented, and most valuable at this season. *A. Kingsmell, The Hall, Hanwell Wood, October 3, 1906.* We agree with our correspondent as to the merits of this plant, and the fragrant flowers he has sent us are much appreciated. ED.

FRUIT GATHERING.—As the season advances the work in the fruit garden increases. The fruit has to be gathered, the late kinds to be stored for future use, and the soft (non-keeping) kinds prepared for immediate sale. Most of the late varieties of Apples are ready for gathering, and if wet weather sets in after the season of long drought, a large quantity will fall and have to be sold as wind-falls, and although "drops" always find a ready market at home, prices for them rule very low. We have been gathering Bramley's Seedling, and although the fruits are not such a fine sample as they were last season, they are a valuable asset both for home use and for marketing in the New Year. This Apple is a first-rate grower, a gem tree in the plantation, being sturdy and of symmetrical shape, developing with a minimum quantity of inside spray wood. It is certain to be a favourite variety as a good late Kitchen Apple for a long time to come. Lord Derby is another variety which as a rule crops heavily, and the fruit keeps well until December. The fruits are now ready to be gathered and will be stored. Late Apples are being gathered a trifle earlier this year. Blenheim Pippin is ready and must be got in. Cox's Orange Pippin is all harvested. Tom-tits have spoiled many of the fruits and wind caused quantities to fall. They will need a lot of attention while in store this year. Cox's Pomona were a good sample and sold well. Gascoyne's Scarlet Seedling, a lovely Apple, has been in a fortnight and will soon be fit for marketing, in fact they are quite ready now. Lane's Prince Albert and Allington Pippin are both still hanging on the trees, as is also Smart's Prince Arthur. The tree is not a first-class doer in a plantation, and it requires much room, is loose and fine in growth, but produces fine, late keeping Apples. Wellingtons are small and are all picked. Pears are hanging well, but they will require a lot of attention in keeping. Tom-tits have been a great plague among these fruits, but they will have their numbers thinned during the winter shooting. The time for pruning operations is at hand. Raspberries are cleaned ready to cut, and many of the Gooseberry bushes are finished. Black and Red Currants will be the next to receive attention, and those behind follow the manure and diggers. *H. B., Maidstone, October 5, 1906.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 9.—The ordinary fortnightly meeting of the Committees took place on Tuesday last in the Society's Hall, Vincent Square, Westminster.

Orchids were shown in considerable numbers, and the ORCHID COMMITTEE recommended two First-Class Certificates and five Awards of Merit to novelties.

The FLORAL COMMITTEE recommended one First-Class Certificate and four Awards of Merit.

The FRUIT & VEGETABLE COMMITTEE recommended an Award of Merit to a variety of Potato.

In the matter of display the chief features were those of Dahlias, tuberous-rooted Begonias, early-flowering Chrysanthemums, and even Roses, all from the open garden, proving that very little frost has yet been experienced. But growers realise that we are now in the danger zone, and a scene of more or less destruction may greet them on some morning when they least expect it.

In the afternoon a lecture on "The Origin and Peculiarities of Climbing Plants" was delivered by the Rev. Prof. Geo. Henslow.

Floral Committee.

Present: W. Marshall, Esq. (chairman), and Messrs. T. W. Turner, Jno. Green, Chas. E. Pearson, H. B. May, James Walker, C. T. Druery, R. W. Wallace, W. Howe, J. Jennings, H. J. Cutbush, C. Blick, C. Jeffries, W. Bain, Chas. Dixon, E. T. Cook, R. C. R. Neville, J. T. Bennett-Poë, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, Geo. Paul, Wm. Cuthbertson, Ed. Mawley, and R. Hooper Pearson.

Messrs. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton, showed a very complete collection of Davallias, Polypodiums, and Nephrolepis. The exhibit was of very large proportions, and it was probably the best group of Ferns the Hall has up to the present contained. Twenty-four species and varieties of Nephrolepis, 60 of Polypodiums, and 40 of Davallias found a place in the group, and these numbers will convey some knowledge of the importance of the exhibit. We can only enumerate a few of the very choicest, such as Polypodium lepidopteris sepultum, the tall P. aureum giganteum, the drooping P. rigidulum, P. aureum Mayii, P. Dryopteris, &c. Then of Davallias there were seen such gems as D. parvula alpina, D. tenuifolia Veitchii a magnificent plant, D. epiphylla, D. polyantha (the younger fronds being tinted red). The Nephrolepis were represented by the graceful N. Piersonii, N. Fosteri (a very fine specimen), N. davallioides furcans, N. crispata congesta, &c. (Gold Medal.)

Mr. L. R. RUSSELL, Richmond, Surrey, showed a collection of Ivies, principally in the arborescent form. Golden and silver-leaved varieties were freely represented, one of the best of the latter type being Hedera arborea elegantissima. A common variety is Hedera arborea Russelliana, the growths being fastigiated, and the foliage arranged alternately and in a most regular manner. H. a. angularis aurea, H. a. lati-maculata, H. a. digitata aurea, and H. grandis are among the more handsome varieties shown. (Silver Banksian Medal.)

MESSRS. THOS. ROCHFORD & SONS, Turnford Hall Nurseries, near Broxbourne, Herts, showed a magnificent group of Codiæums (Crotons). The colouring in the foliage of the various varieties was remarkable, and, in addition, the plants were clean, well furnished with leaves at their bases, and altogether they showed excellent culture. The variety turnfordiensis has a ground-work of gold colour, and this is bordered by a broad band of deepest green. Some grand specimens of C. Reidii are deserving of especial mention. Messrs. ROCHFORD also showed a number of Nephroleps, these plants also being in splendid form. (Silver-Gilt Flora Medal.)

Mr. J. BRUCKHAUS, Twickenham, staged a bright collection of Codiæums (Crotons) in most of the best decorative varieties. The plants were in small pots, and they were well furnished with their showy foliage to the surface of the potting medium. A row of Pandanus Veitchii formed a suitable finish to the group. (Bronze Flora Medal.)

Messrs. WM. BULL & SONS, King's Road, Chelsea, showed a dozen plants of the beautiful Dracæna Victoria.

Mr. GEORGE PRINCE, the Oxford Rose Nurseries, Longworth, Berks, showed an excellent group of Roses, Rose-hips, and Rose foliage. The Roses were very bright, and of very good quality considering the lateness of the season. The display of foliage was interesting, and showed the great diversity of form that exists between the several species: R. rubrifolia has very dark-coloured leaves, R. sinica has very broad leaf segments. The centre of the exhibit was occupied by a number of blooms of Frau Karl Druschki and the pink-coloured Amadis. (Silver-Gilt Banksian Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, N., showed plants and cut flowers of Carnations, Ericas, Statice profusa, Chironia ixifera, Bouvardias, &c. (Silver Banksian Medal.)

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, showed a large number of Bouvardias in many varieties: Veronica Andersoni with white, red, and blue flowers, and interspersed among the flowering plants a number of hardy Ferns. Bouvardia President Garfield is a double-flowered variety of a soft rose shade; the variety Vulcan is of beautiful scarlet colour. (Silver Banksian Medal.)

Miss WILLMOTT, Warley Place, Great Warley (gr. Mr. J. Orton), showed a batch of hybrid Nerines of much merit. The colours of some of the flowers were charming, especially those of soft shades of pink, &c.

Mr. ROBERT BOLTON, Warnton, Carnforth, set up a number of vases of Sweet Peas of some of the newer varieties.

Messrs. HOBBIES, LTD., Dereham Nurseries, Norfolk, displayed a very large number of Cactus Dahlias, and some good garden Roses. (Silver-Gilt Banksian Medal.)

Messrs. CARTER PAGE & Co., 52 and 53, London Wall, London, E.C., showed some good Cactus and other Dahlias. Adjoining these flowers was a beautiful display of border Chrysanthemums—the variety Horace Martin (yellow) was exceptionally fine. (Silver Banksian Medal.)

Messrs. CHEAL & SONS, Crawley, Sussex, staged single, Cactus, and Pompon Dahlias, sprays of coloured foliage and branches with berries of shrubs and trees. The charming colours seen in such subjects as Quercus coccinea, Acer erioearpum, Liquidambar, &c., were much admired. (Silver Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited Dahlias extensively. The flowers were chiefly of the Cactus type, but some of the broad floret kind were noticed, and some of these appeared to possess considerable merit. One labelled Mad. Van der Dael is very pretty, the florets are suffused and tipped with pink on a white ground; Yellow Colosse is another good flower. Mad. A. Lumière is an attractive flower of this type, the white florets are flushed with red. Messrs. CANNELL also exhibited a pink form of Anemone japonica. (Silver Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, showed a number of choice border flowers. Spikes of Cimicifuga simplex were very handsome. Asters, Rudbeckias, Sunflowers and other Composites formed the principal subjects in the exhibit.

Messrs. WM. CUTBUSH & SON, Highgate, London, N., arranged an exhibit of seasonable hardy flowers in a highly decorative manner, the group being exceedingly pretty. The principal subjects were border Asters, and of these a very complete collection was staged; Pentstemons, Sunflowers, Chrysanthemums, Physalis Franchetti, &c., were also included. On an adjoining table the same firm arranged vases of winter-flowering Carnations, and baskets of the dwarf Polyantha Rose Mrs. W. H. Cutbush. (Silver-Gilt Banksian Medal.)

Mr. FRANK BRAZIER, Caterham Hardy Plant Nursery, Caterham, Surrey, staged a very large group of hardy plants—Chrysanthemums, Dahlias, Phloxes, and other border flowers. (Silver Banksian Medal.)

Messrs. J. PEED & SONS, West Norwood, staged a beautiful array of tuberous rooting Begonias in single and double-flowered varieties. Adjoining the Begonias were many pans of Alpine and rock-garden plants, including many succulents. (Silver Banksian Medal.)

Mr. Eric F. Such, Royal Berkshire Nurseries, Maidenhead, staged an extensive display of Chrysanthemums, principally of the border and Pompon types. Nellie Blake (red) and Murillo (pink) are two decorative kinds that were shown well by Mr. Such.

Messrs. Cragg, Harrison & Cragg, Merrivale Nurseries, Heston, Middlesex, put up a very large exhibit of Chrysanthemums from the open. The collection included all the best border kinds, and also varieties suitable for market purposes. Crimson Pride, King of the Earlies (white), Etoile d'Or, and Soleil d'Octobre (yellow) are good varieties of the large flowered market type. The display also included flowers and plants of the decorative and Pompon types. Perennial Asters interspersed among the Chrysanthemums added further beauty to the group. The same firm also displayed a good strain of Pansies, such as are sold largely in the spring for bedding purposes, and an interesting collection of Cactaceous plants. (Silver Flora Medal.)

Mr. G. Reuthe, Hardy Plant Nursery, Keston, showed many of the best varieties of perennial Asters, and other hardy flowers.

Mr. R. C. Notcutt, Woodbridge, Suffolk, showed a seasonable assortment of hardy flowers, among which the long, drooping sprays of Desmodium penduliflorum were conspicuous objects. (Bronze Flora Medal.)

Miss M. H. Day, Guildford (gr. Mr. R. Sinnard), displayed a dozen vases of border Chrysanthemums.

Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, exhibited his new Chrysanthemum Tapis de Neige, and another white variety named Moneymaker.

Messrs W. Wells & Co., Merstham, Surrey, had most of the best varieties among border Chrysanthemums—Polly (bronze) and Lille (pink) are two desirable kinds. A few of the larger-flowering Japanese kinds such as Mrs. A. T. Miller, Miss Elsie Fulton (white), A. L. Stevens (yellow), and Amy Laidman (a new white flower) were also displayed by this firm. (Silver Banksian Medal.)

AWARDS.

Carnation Mrs. Robert Norman.—A pure white, winter-flowering Carnation, with slightly fringed petals, and possessing a moderate degree of fragrance. The Committee considered the variety to be better than that known as Lady Bountiful. Shown by Messrs. W. Cutbush & Sons. (Award of Merit.)

Colchicum Bivonae.—This, as shown growing in a pan, is a very strong-habited Colchicum, with sufficiently strong flower stems to hold the blooms in a perfectly erect position. The flowers are of very large size, possess much substance in the segments, and the colour is of an unusually rich shade of purple, becoming whitish towards the centre of the flower. From Messrs. Barr & Sons. (Award of Merit.)

Nephrolepis Todeaoides.—There have been many new Nephrolepis shown during the past year or two, but we think this one will be appreciated with the best of them. Its name very well describes the appearance of the fronds, the older ones especially being so plumose, so divided, and yet so overlapping as to resemble the beautiful fronds of Todea superba. Shown by Messrs. Thomas Rochford & Sons. (First Class Certificate.)

Nerine "Crimson King."—A very large flowered variety, with broad, recurved, slightly-twisted segments of brilliant crimson colour. Shown by Mr. H. Elliott, Hassocks Nursery, Sussex.

Rose Nellie Johnstone.—A pretty tea-scented variety, with moderately-sized flowers of good form as a bud, and possessing a very attractive shade of pink colour. It was raised by the exhibitors, probably from the varieties Madame Berkeley and Catherine Mermet. The committee welcomed the variety as a good autumn bloomer and pure "Tea." From Messrs. Paul & Sons, The Old Nurseries, Cheshunt. (Award of Merit.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, De B. Crawshay, H. Little, W. Cobb, J. Colman, Francis Wellesley, R. G. Thwaites, A. A. McBean, J. Wilson Potter, H. T. Pitt, J. Charlesworth, A. Dye, H. G. Alexander, W. H. Young, W. H. White, G. F. Moore, J. W. Odell, W. Bolton, C. J. Lucas, and W. Boxall.

Messrs. Sander & Sons, St. Albans, staged a good group, for which a Silver Flora Medal was awarded. Cattleya bellatula (Warscewiczii × Iris) was a pretty novelty, in which the shape and colours of the flower follows C. Warscewiczii closely, but the labellum is trumpet-shaped. Several good forms of Cattleya Hardyana, including the handsome variety augusta, C. Ella, C. Pittiana, C. Boadicea, Brasso-Cattleya heatonensis, and other good hybrids, including the handsome Odontoglossum amabile Bella, which has clear white flowers handsomely blotched with claret-purple, were noted; and among species and varieties, Vanda Sanderiana, Cattleya Gaskelliana alba, C. Warscewiczii Sanderiana, Miltonia vexillaria Lawrenceana, with a very distinct dark crimson mask at the base of the lip, &c.

Messrs. Heath & Sons, Cheltenham, staged a very effective group, composed mainly of Dendrobium Phalænopsis, with a few of the allied D. Statterianum, and nicely-flowered examples of D. formosum, at one end being a selection of Cypripediums, &c. (Silver Banksian Medal.)

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. Smith), arranged an interesting group in the centre of which was a specimen of Oncidium ornithorhynchum album with several spikes. Other interesting species were Pleurothallis lateritia, Stelis pubescens, Lælia Dayana delicata, Phalænopsis violacea, and Cypripedium Godefroyæ leucochilum. Of hybrids noted were Cattleya Mrs. J. W. Whiteley, Lælio-Cattleya Parysatis, L.-C. Perrensa (L. Perrinii × C. granulosa), and L.-C. tene-Gottoiana (L. tenebrosa × L.-C. Gottoiana). (Silver Banksian Medal.)

Major G. L. Holford, C.I.E., C.V.O., Westonbirt, Tetbury, showed a very beautiful light-coloured form of Cattleya Hardyana with six flowers on one spike and four on the other. The plant, which was in robust health, had been grown from a very poor specimen. A Cultural Commendation was voted to Mr. H. G. Alexander (Orchid grower at Westonbirt). Major Holford also showed the curious Brasso-Cattleya Digbyano-Forbesii, with greenish flowers slightly marked with purple.

Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins), showed Cattleya Mantinii The Premier, with large and finely-formed bright rose flowers with rich ruby lip having gold lines at the base, and Cattleya Mrs. Frederick Knollys (granulosa Buyssoniana × C. Bowringiana), a neat and pretty hybrid of novel shape. The flowers, which are of thick texture, have flatly-arranged sepals and petals of rose-purple colour. The labellum, which is closely folded over the column at the base, is white in that portion. The broadly ovate front lobe is purple with a white, slightly-fringed margin and a few purple lines on light ground at the base.

Jeremiah Colman, Gatton Park (gr. W. P. Bound), showed three new hybrids, viz., Cattleya McMasterae (Schilleriana × Mendelii), a large reconstituted flower of good substance, the extended labellum being white at the base, the isthmus yellow, and the front rose-purple; Lælio-Cattleya Goodyii (C. Wendlandiana × L.-C. Clive var. broomfieldiensis), and which has the shape of C. Mantinii, the rich dark rose flowers having an intensely dark ruby-claret lip with gold veining at the base, &c.

H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), sent Cypripedium H. S. Goodson (Swinburnei × T. B. Haywood), a good large flower; Cattleya Gossensiana, and a very fine form of C. Wendlandii.

Messrs. Stanley & Co., Southgate, showed Miltonia Binotii var. Harrisii, with broad segments closely barred with light-brown, and finely displayed violet-purple labellum.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent Odontoglossum Una (crispum × nevadense) rosefieldiense. The flowers are white, with very distinct blotching of brown colour on the sepals and petals, the bases and tips of which are white, and on the basal half of the fringed labellum. Miltonia Bluntii rosefieldiensis, a very fine form, &c.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, arranged a small group, in which were Cypripedium highfieldense, Low's variety (Lawrenceana × Diurne), with greenish-yellow flower having some purplish markings; C. Niobe, Westonbirt variety, C. Juno, Cattleya St. Gilles, and other hybrids.

E. Roberts, Esq., Park Lodge, Eltham (gr. Mr. Carr), showed Cypripedium Bingleyense superbum, a large and richly-coloured flower.

A. Huth, Esq., Oakley House, Putney (gr. Mr. Fisher), showed a splendid specimen of Odontoglossum grande with five spikes, bearing together twenty-three flowers, and for which a Cultural Commendation was given.

AWARDS.

First-Class Certificate.

Cymbidium erythrostylum, from J. Gurney Fowler, Esq. (gr. Mr. J. Davis), and J. Bradshaw, Esq. (gr. Mr. Whitelegge). A very beautiful new species of the C. eburneum class, introduced from Annam by Messrs. Sander & Sons, and now exhibited for the first time, although it was described from Glasnevin last year. The foliage is very graceful and the flowers, which are produced on arching spikes, resemble in some respects those of C. eburneum, but are borne from three to seven on a spike, the fine specimen shown by J. Gurney Fowler, Esq., having two spikes of five flowers each, one of six, and one of seven. The broad sepals are white with a slight blush tint and some light rose spots at the base. The petals are extended over the column, and are similar in colour to the sepals. The three-lobed lip, in which the front lobe is short, is yellowish, closely lined with red purple, and the column is bright crimson.

Cattleya Mrs. J. W. Whiteley, Rosslyn variety (Bowringiana × Hardyana), from H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood). A very handsome, large, and finely-coloured variety. Sepals and petals of a bright magenta-rose colour, lip dark ruby-crimson with gold lines at the base. The plant bore one spike of 16 flowers.

Award of Merit.

Lælia Cattleya Phryne, Gatton Park variety (L. xanthina × C. Warscewiczii), from Jeremiah Colman, Esq., Gatton Park (gr. Mr. W. P. Bound). One of the best of the L. xanthina crosses. Flowers of good shape. Sepals and petals light canary-yellow; front of the lip dark rose; disc yellow.

Miltonia Clowesii rosefieldiensis, from De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables). A very large and well-marked variety. Sepals and petals Indian yellow, with broad chestnut-brown bands; lip tinged with lilac at the base, changing to white on the broadly-expanded front lobe.

Cattleya Hardyana Our Queen, from Messrs. Thos. Rochford & Sons, Turnford, Cheshunt. A remarkable variety with cream-white sepals and petals, and claret-purple lip with fine gold veining from the base.

Lælia Cattleya G. G. Whitelegge (L.-C. callistoglossa × C. Hardyana), from J. Bradshaw, Esq., The Grange, Southgate (gr. Mr. G. G. Whitelegge). A very handsome hybrid and one of the best Lælio-Cattleyas. Flowers large, sepals and petals white tinged with lilac, the broad and finely expanded lip dark claret purple, with only some fine orange coloured lines at the base, and a narrow lavender-coloured margin.

Cattleya Pittiana, Low's variety (Schofieldiana × Dowiana aurea), from Messrs. Hugh Low & Co. A remarkable variation of rich and peculiar colour, the sepals and petals being rosy-red with an orange shade, and the lips also finely coloured.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the chair), and Messrs. Jos. Cheal, A. R. Allan, W. Bates, S. Mortimer, Alex. Dean, W. Pope, R. Lye, H. Parr, H. J. Wright, J. Davis, Geo. Kelf, G. Reynolds, P. D. Tuckett, J. McIndoe, and H. Somers Rivers.

Mr. J. A. Nix, Tilgate, Crawley, Sussex, staged a group of fruits, principally Apples and Pears, of first-class quality. A few bunches of Grapes and two Melons were included. The Apples, both dessert and culinary varieties, were remarkably fine produce, some of the best "dishes" being Royal Jubilee, Lane's Prince Albert, Golden Noble, Lord Derby, Peasgood's Nonsuch, Tower of Glamis, Mère de Ménage; and among dessert varieties Allington Pippin, Cox's Orange Pippin, Cornish Gilliflower, Dutch Mignonne, Mother, Charles Ross, &c. The Pears were also of good quality, but many, of course, were unripe. (Hogg Memorial Medal.)

Mr. R. W. Green, Wisbech, Lincolnshire, showed a very comprehensive collection of Potatos. All the more prominent and newer varieties were exhibited in clean-skinned, well-matched samples. (Silver-Gilt Knightian Medal.)

Mr. R. Comyns, Heath Farm, Watford, showed some very large bulbs of Ailsa Craig Onions. (Silver Knightian Medal.)

Some excellent bulbs of Onion Ailsa Craig, weighing between 2lbs and 3lbs each, were shown from Lady WANTAGE's garden at Lockinge, Berkshire.

AWARD OF MERIT

Potato Dr Gillespie.—This variety was recommended an Award of Merit after the Committee had tasted in a cooked condition some tubers that had been grown in the Society's gardens at Wisley. From Messrs BARR & SONS

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 9.—The twentieth anniversary dinner of this society was held on Tuesday last in the Royal Venetian Chamber, Holborn Restaurant, when about 90 members and friends assembled. The chair was occupied on this occasion by J. Gurney Fowler, Esq., treasurer of the Royal Horticultural Society.

After the usual loyal toasts had been proposed, the Chairman gave the principal toast of the evening, that of "The United Horticultural Benefit and Provident Society." Mr. Fowler, as is well known from his successful treasurership of the premier horticultural society, is quite at home among matters financial, and at the commencement of his remarks he plunged into the subject of figures. He had, he observed, been looking into the accounts of the society, and had compared its position 25 years ago with that of the present day. The advance the society had made is wonderful. The funds, tested by standard tables upon which friendly societies are usually judged, show a remarkably healthy condition. Whereas the average amount which these tables would credit to a society of such proportions as the United Horticultural Benefit and Provident Society as sick allowance for five years is £3,590, the sum actually paid has only amounted to £1,531. This condition undoubtedly points to the healthy nature of the gardener's calling. He regretted there was not a life assurance scheme connected with the association, for he believed such a scheme would be equally successful as the other policy of the society had been. He might mention, however, that, as the Government require a deposit of £20,000 before a society can operate life assurances, it would have to be done through some other society, but that would cause no difficulty, for he knew a friend who would willingly insure in a body the first 1,000 persons who passed his office door, and in the case of a society whose members have such a healthy occupation as gardening he would do so with pleasure. He wished the society every success, and expressed his pleasure at being with them on this occasion. Mr James Hudson, who replied, thanked the Chairman for his kind remarks and for his suggestion on the question of life assurance. He himself was strongly in favour of it, and he promised it should receive the careful consideration of the management committee. The society was to be congratulated on the health of the members, and it was only second to the clerical associations in the longevity of its members. The society has been existent for 40 years, and, although progress was slow at the first, it was now secure, but he appealed for increased membership, and urged each member to obtain one new member during the coming year. The invested funds of the society now amount to £28,000, which gives an average of £23 to each member. The institution was in no sense a charity, and their only object was brotherhood. The toast of "The Honorary and Life Members" was proposed by Mr. Thos. Winter, and responded to by Mr. Arthur Hennig. Mr. Wm. Marshall proposed the toast of "The Chairman," and other toasts included that of "The Visitors," proposed by Mr. E. F. Hawes, and responded to by Mr. Alex. Dean, and "The Press," proposed by Mr. W. Woods, and responded to by Mr. J. Harrison Dick.

The musical part of the programme was again carried out by the Kew Glee Singers.

BIRMINGHAM AND MIDLAND COUNTIES' GARDENERS' MUTUAL IMPROVEMENT.

OCTOBER 3, 4.—An exhibition of early-flowering Chrysanthemums and Dahlias was held at the Botanical Gardens, Edgbaston, on these dates, under the auspices of this society. The honorary exhibits were a great feature of the show. The weather, unfortunately, was wet, and the attendance was, in consequence, below the average.

COMPETITIVE CLASSES.

There were three exhibitors in a class for a group of Chrysanthemums cut from the open and arranged for effect in a space measuring 12 feet by 6 feet. Messrs. GUNN & SONS, Olton, were awarded the 1st prize for a tastefully-arranged exhibit; 2nd, Mr. C. H. HERBERT; 3rd, Mr. A. W. THORPE, Birmingham Road, Lichfield.

In a class for six vases of yellow Chrysanthemums, three sprays to each vase, Mr. C. H. HERBERT won with the variety Horace Martin; 2nd, Mr. C. WALL.

Mr. C. H. HERBERT also won in a similar class for the variety Goacher's Crimson; 2nd, Mr. R. USHER; 3rd, Mr. C. WALL.

Mr HERBERT also staged the best six vases of a white Chrysanthemum, having the variety Roi-des-Blancs, and the best six vases of Chrysanthemums of any colour.

Several classes were open to members of the association only, and in this section Mr. J. SCEANEY was placed 1st for a group of Chrysanthemums arranged for effect, and occupying a space measuring 6 feet by 4 feet.

In classes for three vases of Chrysanthemums of especial colours Mr. J. JEANS won with a crimson-coloured variety, and for yellow and white varieties; and Mr. J. SCEANEY for three vases containing flowers of any other colour than those mentioned.

The best six vases of Pompom Chrysanthemums were staged by Mr. R. USHER, and he was followed by Mr. J. SCEANEY.

Competition in the Dahlia classes was very poor, owing, no doubt, to the frosts of the preceding week. Messrs. PEMBERTON & SONS, Bloxwich, were awarded the 1st prize for a nicely-arranged group of Cactus Dahlias occupying a space 10 feet by 3 feet, and the same firm were also 1st for a collection occupying a space measuring 6 feet by 3 feet

HONORARY EXHIBITS.

Messrs. BAKERS, Wolverhampton, put up a magnificent exhibit of Chrysanthemums and Dahlias that occupied a space of 54 feet by 4 feet. (Gold Medal.)

Messrs. SIMPSON & SONS, Birmingham, arranged a very fine exhibit of Chrysanthemums. (Silver Medal.)

Messrs. IVIEY & SONS, Droitwich, put up a nice exhibit of Chrysanthemums and Asters. (Bronze Medal.)

Messrs. GUNN & SONS, Olton, showed hardy flowers and Violas. Mr. C. H. HERBERT, Acocks Green, also showed border flowers.

Mr. E. BURDEN, King's Heath, staged an exhibit of local-grown Apples. Mr. J. UPAGE, the Experimental Gardens, Droitwich, displayed dishes of Apples and Pears.

GARDENERS' DEBATING SOCIETIES.

CROYDON AND DISTRICT HORTICULTURAL.—Mr. W. J. Pritchard (District), one of the staff from the gardens of Addiscombe House, was the reader of a paper on "Vegetables for Exhibition," illustrated with lantern views. Whether vegetables are grown for exhibition or for general use, it behoves the gardener to do his utmost to produce the best. The preparation of the ground and location of crops were well expounded, for these play an all-important part in producing those attractive specimens. Many are the variety of vegetables one may grow, but in the short time at his disposal the lecturer was obliged to treat of the kinds most useful, and in doing so he explained the time of seed-sowing, transplanting, and general cultivation under each heading. Some of the varieties under observation were Leeks, Celery, Cauliflowers, Onions, Carrots, Parsnips, Beet, Brussel Sprouts, Potatos, Peas, Beans, Turnips, &c. Preparing specimens for the exhibition board also received attention, and useful hints on this were much appreciated. There was a good display of exhibits.

ACOCKS GREEN AMATEUR VEGETABLE.—This society held their third annual show at the Old Manor House, Acocks Green. The classes were well filled and generally, the exhibition showed a marked improvement upon the previous ones. A Gourd exhibited weighed 58 lbs. 8 ounces, and a second fruit 57 lbs. 4 ounces.

REDHILL, REIGATE AND DISTRICT GARDENERS'. A meeting of the above society was held on Tuesday, October 2; Mr. W. P. Bound in the chair. Mr. F. Phillips, of Craigendown Gardens, Reigate, gave a lecture on "The Cultivation of Fruits Under Glass." Peaches, Pears, Plums and Figs were all dealt with. Mr. Phillips gave details for the formation of the border, and the proper material for their construction. He also dealt with the questions of Varieties, Planting, Pruning, Thinning, Disbudding, Training and Watering. A discussion followed the lecture. *Frank C. Legge.*

MARKETS.

COVENT GARDEN, October 10.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

Cut Flowers, &c.: Average Wholesale Prices.

REMARKS.—Some fine Californian Apples have arrived and they were sold to-day (Wednesday) by auction, at 11s. per case. According to reports, large quantities of foreign Apples are to be consigned to this country during the coming season. English Peaches will undoubtedly finish this week. English Figs are over, but a plentiful supply of these fruits is arriving from Italy. West Indian Red Bananas are more plentiful and command a better trade. Owing to the recent heavy rains and the mild weather vegetables are excessively plentiful. *E. H. R., Covent Garden, Wednesday, October 10, 1906.*

POTATOS.

Bedfords, 60s. to 65s.; Blacklands, 50s. to 55s.; Kents, 70s. Trade is very dull, although large supplies are arriving. Many of the tubers are badly diseased. *John Bath, 32 and 31, Wellington Street, Covent Garden.*

COVENT GARDEN FLOWER MARKET.

Yesterday morning (Tuesday) larger supplies of plants were noticed than I have seen for a long time. Most of the stands in the new portion of the market were well filled, but the salesmen complain that the light in this new wing is bad, and the passages between the stands are too narrow. Chrysanthemums were never seen in better quality, or in such large numbers as at present. It is difficult to quote prices, for some salesmen will sell blooms from 4s. to 6s. per dozen and others refuse 6s. to 9s. for the same quality flowers. I find the prices for cut Chrysanthemums more uniform than those for plants. When buying Liliums some few days ago I found 4s. per dozen was the price asked all round the market, but some were of better quality than others at the price. Liliums in pots are of good quality, but they are not in much demand. Chrysanthemums are still the more numerous among pot plants. Ericas include E. calfra (which has come in later than usual this season), E. hyemalis (which is seen in very well-blossomed plants), and E. gracilis, which is good in all its varieties. Small Ericas in 60's and thumb pots sell well, and are now almost as prominent as small Ferns, which they are to some extent superseding. Asters and Marguerites are both plentiful and good. Lily of the Valley in pots has rarely been seen in better condition. Spiræas are chiefly the old S. japonica, but some good plants of S. multiflora compact are to be had. Ferns and Palms are very abundant. Aralia Sieboldii is arriving from several growers. Some of the plants will prove disappointing to their purchasers. Codiæums (Crotons), hardy shrubs, climbers, &c., are now coming from several growers.

CUT FLOWERS.

To instance how the prices of cut flowers fluctuate from week to week, a few days ago I could not buy Lily of the Valley under about 10s. per dozen bunches, but this morning I could purchase better flowers at 6s. per dozen bunches, and some for considerably less. Lilium longiflorum is plentiful again, and prices are a little lower. A day or two, however, may see a rise again; it is apparent that for some time to come they will keep up to fair average prices, and they may possibly exceed them. Pancratiums are now over plentiful. Better quality Violets are seen. Chrysanthemums are seen in great quantities. Mrs. J. W. Scott (white), to which a First-Class Certificate was given by the N.C.S. last week, has been making 4s. per dozen for best quality blooms. Miss B. Miller still takes the lead as a yellow variety. Lutz was the name given me for the best pink market kind. Market White is still extensively grown, but it withers quickly, and once the florets droop they never recover again. La Pactole is again a favourite, and of this variety some good plants are seen. Roses continue plentiful; a few of special quality make good prices, but many are cleared at low figures. The same may be said of Carnations. Growers who wish to be up-to-date must cultivate the American varieties. An abundance of foliage of all kinds is seen, including well-coloured sprays from hardy subjects. Pernettyas in berry are plenty. *A. H., Covent Garden, Wednesday, October 10, 1906.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

A week of growing weather.—All the conditions during the past week have, considering the time of year, favoured rapid growth. Since the month began the days and nights have been more or less warm. The uniformity of the day temperatures has been remarkable, in fact, for six consecutive days the highest readings only ranged between 63° and 64°. It is the nights, however, that have been so exceptionally warm. On two of them the expected thermometer never fell lower than 55°, which is the highest minimum reading recorded here in October for 13 years. The ground has also continued very warm, and is now 4° warmer at 2 feet deep and 6° warmer at 1 foot deep than is reasonable. Three and a quarter inches of rain has already fallen this month, or rather more than the average rainfall for the whole of October, the wettest month of the year. Less than half a gallon of this rainfall has come through the percolation gauge on which short grass is growing, but 1¼ gallon or about three fourths of the total fall, through the bare soil gauge. The sun shone out on an average for 2¾ hours a day, which is about half an hour a day short of the October average. Light airs have mostly prevailed during the week, but on one or two occasions for a short time the gusts have been moderately strong. The mean amount of moisture in the air at 3 p.m. exceeds the seasonable quantity for that hour by as much as 10 per cent. *E. V., Berkhampstead, October 10th, 1906.*

SCHEDULES RECEIVED.

ECCLES, PENDLETON, AND DISTRICT CHRYSANTHEMUM SOCIETY'S 20th annual exhibition to be held in the Town Hall, Eccles, on Friday and Saturday, November 9-10, 1906.

BIRMINGHAM AND MIDLAND COUNTIES CHRYSANTHEMUM, FRUIT AND FLORICULTURAL SOCIETY'S exhibition to be held in the Bingley Hall, Birmingham, on Tuesday, Wednesday, and Thursday, November 13-14, 15, 1906.

ENQUIRIES AND REPLIES.

CLAY FOR HOT-WATER PIPES.—Can any of our readers inform *M. P.* where to obtain the clay that is used for covering hot-water pipes, and also the name of it.

ANSWERS TO CORRESPONDENTS.

AN ACRE OF ECLIPSE CAULIFLOWERS: *W. E.* Assuming that your plants of Eclipse Cauliflower have been planted in rows 2 feet apart and at the same distance from plant to plant in the rows, this would give a total of 10,890 plants to the imperial acre, and would contain 181½ tallies, consisting of five dozen Cauliflowers each. Prices in Covent Garden Market at the end of last week ranged from 7s. to 9s. per tally. So at the lower figure your Cauliflowers would be worth £63 10s. 6d., and at the higher quotation £81 13s. 6d. per acre (gross). But in a near eastern county the best wholesale current price is 5s. per tally: £45 7s. 6d. per acre. Therefore we should say that £63 10s. 6d. per acre is a fair average price, always bearing in mind that an over-abundant supply of produce dumped in the market necessarily tends to reduce prices. Probably the prices in your district would be slightly higher than the average indicated above. Still, the question of supply and demand must always govern prices.

APPLES DISEASED: *T. M.* The fruits are affected with brown rot disease, caused by a fungus, Monilia fructigena. Thoroughly drench the trees and the surrounding ground during the winter with a solution of one pound of sulphate of iron, dissolved in four gallons of water. When the leaves have just unfolded, spray the trees with Bordeaux mixture, made at half the usual strength. The fungus appears first on the leaves. Collect and burn all the diseased fruit.

D. H., Fife. The fruits are disfigured with Apple scab, the work of a fungus, Fusicladium dendriticum. Apply the same remedial measures as are recommended to *T. M.* for brown rot.

APPLES FROM SAME TREE: *A. B.* We do not recognise either of the Apples. The particulars you give are most interesting, but without seeing the tree we cannot account for the difference in the fruits. Apples do not often produce bud sports, most varieties having been obtained by seedling variation. They do occasionally produce sports, and if you turn to p. 235 of our issue for September 29 you will see a description of what is supposed to be a vegetative sport upon the well-known Hessle Pear. Our selection in a class for six varieties from the sorts you mention would be as follows: 1, Cox's Orange Pippin; 2, Ribston Pippin; 3, James Grieve; 4, Allington Pippin; 5, King of the Pippins; 6, Blenheim Pippin. Barnack Beauty is classed as a dessert kind by the Royal Horticultural Society, and may be used instead of any badly coloured dish of the above-named varieties.

BEECH BARK: *A. R. G.* The trees are badly infested with the Beech coccus. Scrub the bark with caustic alkali wash, working the fluid well into the crevices.

BEGONIA ROOT: *T. E. H. H.* This diseased condition is the result of the attack of mites. Dip the plants in tobacco water.

CARNATIONS DISEASED: *C. M.* and *G. H. B.* The plants are attacked by a fungus. Burn the affected plants and spray the healthy ones with weak Bordeaux mixture or liver of sulphur, 1 ounce to a gallon of water.

CELERY DISEASED: *J. W.* The plants are affected with the Celery disease which is caused by a fungus named Cercospora apii. Spraying with Bordeaux mixture is the only known preventive.

CHRYSANTHEMUMS: *Mum.* If you are a Fellow of the R.H.S. we should advise you to avail yourself of the services of their consulting chemist to ascertain what is the cause of the malady. The fee is moderate. *H. E.* We find neither insect nor frost. The appearances are consistent with the application of some caustic solution. Have you been using some insecticide of too great a strength? *J. P. R.* The flowers are reverting to their original so-called single form, but we are unable to say why they are doing so.—*E. D.* The rust is caused by a fungus, Puccinia Pheraea. Spraying with potassium sulphide (liver of sulphur), half-ounce to a gallon of water, is the best remedy. See article on, and illustration of, this disease in the *Calendar of Garden Operations*, to be obtained from our publishing department, post free, price 7½d.

CORRECTION.—In the note "Constructing a Cheap Greenhouse," on p. 235, instead of the number 10 000 which occurs on line 13, read "about 1,500."

CUCUMBERS: *X.* There is no trace of any disease and the falling is probably due to some fault in treatment. Too much water at the root often is the cause, but we cannot be certain of the exact cause without seeing the plants.

CYCLAMENS: *G. H.* If you dip the plants occasionally in tobacco water, the thrips will be killed.

DIMENSIONS OF SHOW BOARDS: *D. T.* The regulations of the National Rose Society fix the dimensions as follow: 4 inches high in front and 18 inches wide, and of the following lengths, all outside measurements. For 24 blooms 3 feet 6 inches long, for 18 blooms 2 feet 9 inches long, for 12 blooms 2 feet long, for 9 blooms 1 foot 6 inches long, and for 6 blooms 1 foot long. For 8 trebles 3 feet 6 inches long, for trebles 2 feet 9 inches long, and for 4 trebles 2 feet long. The National Chrysanthemum Society's regulations state that exhibitors *must* have their stands made

of the following dimensions, viz., stands for 12 Incurved blooms to be 24 inches wide from left to right, and 18 inches deep from back to front, with holes 6 inches apart from centre to centre, to stand 6 inches high at back, and 3 inches high in front. Two "twelve boards" may be used for 24 blooms, 3 for 36 blooms, and so on. The stands for 6 Incurved blooms to be 12 inches wide from left to right, and 18 inches deep from back to front, for 12 Japanese blooms to be 28 inches wide from left to right, and 24 inches deep from back to front, the holes 7 inches apart from centre to centre. Stands for 6 Japanese blooms to be 14 inches wide from left to right, and 21 inches deep from back to front. The height at the back to be 7 inches and 4 inches in front. To add to the general effect, the blooms in the front row of a stand to be just clear of the board. All stands and their supports to be painted green, and the supports must be secure. All cups or wires for exhibiting Japanese blooms shall be limited to 3 inches in diameter and no extra supports of any kind shall be allowed.

DOUBLE RICHARDIA: *G. F. M.* The abnormality is of common occurrence. The leaf on the flower stalk has become spathaceous.

ERICAS: *G. C.* The plants have indications of a slight attack of mildew. Probably the position out of doors, selected for them to occupy during the summer, was hardly suitable. Under the shade of the wall you mention, the atmosphere may have been somewhat stagnant, and Heaths will not succeed under such conditions.

FERN FRONDS INJURED: *T. C.* The Fern is attacked by common thrips. Thin-fronded varieties, such as the specimen sent, are more liable to attack than some others.

GRUBS IN LAWN: *H B.* The grubs are the larvæ of the cockchafer and they are most injurious to the roots of grasses. Starlings are their natural enemies, and you should encourage these birds by the placing of nesting-boxes in suitable positions about the golf links, for in the birds will be found the best means of keeping down the cockchafers, although sowings of nitrate of soda and soot are said to be useful in reducing the number of larvæ.

HYACINTH BULBS DISEASED: *H. S. E.* The bulbs are affected with a kind of bacteriosis caused by Pseudomonas hyacinthi. You will find a full account of this disease in our issue for May 12, 1894, p. 592. No remedial measures are known; you had therefore better burn the bulbs to prevent the disease from spreading.

LAND FOR FRUIT TREES: *W. N. B.* Fairly good results could be obtained from your piece of grass land if thoroughly well prepared before planting the trees. It would be necessary to apply farmyard manure very liberally, not only by incorporating such manure with the soil before planting, but also by applying periodical surface-dressings to the roots of the trees. Such mulchings as they are termed would help to conserve the moisture in the soil during dry weather. We cannot advise you to plant on the grass under the circumstances, but would recommend you to trench the ground, and chop up the turf to be mixed with the soil constituting the top spit 18 inches thick. This is an expensive operation, but in the end may be expected to repay the outlay over and over again. If you do not care to go to the expense of trenching, make large holes, varying from 6 feet to 8 feet across, digging these to a depth of 18 inches, saving the turf to be chopped up and mixed with the soil when refilling the hole. When the holes have been refilled the trees may be planted, and a good mulch of dung placed over the roots for about 3 feet from the stem of the tree. The whole of the surface of such holes should be kept free from grass and weeds for four or five years to come, or until such time as the trees have become thoroughly established. If the ground were trenched, you could plant small fruits, such as Gooseberries and Currants, between the Apple trees, and these would soon yield some return. On no account plant any trees on the ground unless you are prepared to either trench the soil or make very large holes, adding liberal dressings of farmyard manure, in conjunction with artificial manures, as thought desirable.

MILFOIL OR YARROW [ACHILLEA MILLEFOLIUM] IN LAWNS: *A B, and D. F., Sussex.* You will find a full account of the mode of growth of this plant and of the circumstances which favour its growth, or the reverse, in the *Philosophical Transactions of the Royal Society*, 1883, vol. 173, p. 1274. Speaking generally, it was found that where ammonia salts were mixed with mineral manures it was nearly banished. It follows from this that sulphate of ammonia, in conjunction with salts of potash and soda, lime, magnesia, form a suitable dressing more especially as the manure conduces to the growth of the grasses, which overcome the weeds. The mineral manure may be composed of three parts sulphate of potash, two parts sulphate of soda, one part sulphate of magnesia, one part superphosphate of lime, and one part sulphuric acid, to which four parts of ammonia should be added. Any druggist would mix these ingredients for you. Or you may apply a dressing of finely sifted fowl manure at once. In the month of February give a dressing of sulphate of ammonia 4 ounces per square yard of surface lawn. An application of soot at the rate of 40 bushels per acre would be of great advantage. This may be given in March or April and in addition to the sulphate of ammonia. Do not use nitrate of soda as this manure encourages the growth of Yarrow.—*B.* Read what is said in the answer to *A*, and as your lawn is of small dimensions we can only suggest that you dig up the roots, taking care to extirpate the plant, thoroughly filling the holes with finely sifted soil in which grass seed have been mixed. As Milfoil bears cutting well, and does well in a dry season, many people do not object to its presence on a lawn. A liberal dressing of farmyard manure will tend to promote the growth of the grasses at the expense of the weeds.

MILLER'S DICTIONARY: *H. S. H.* Your edition is the eighth, and botanically the most important. We do not know its commercial value; apply to some secondhand booksellers or advertise it for sale.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruit at one time; they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.*

H H B. 1, Kerry Pippin; 2, Old Nonsuch; 3, Pitmaston Pine; 4, Louise Bonne of Jersey; 5, Brockworth Park; 6, Fondante d'Automne.—*E. Freeman.* 1, 2, 3 and 5, Cellini Pippin; 4, Warner's King; 6, Domino.—*Mrs. Horne.* 1, A grand fruit of Hollandbury; 2, Alfriston.—*L. T.* Round Winter Nonsuch.—*Durham.* King of the Pippins.—*J. T. S.* 1, Wormsley Pippin.—*Orton.* 1, Pott's Seedling; 2, Cellini Pippin; 3, send again later; 4, Summer Pearmain.—*T. W. C.* 1, Yorkshire Beauty; 2, Norfolk Beefin; 3, American Mother; 4, Broad End; 5, Scarlet Golden Pippin; 6, Minchull Crab.—*G. NAMES OF PLANTS: *C. F. T.* Aster levis.—*L. C.* (from last week) 2, Vitis serjaniæfolia; 3, Berberis Thunbergii; 4, Berberis vulgaris var. *Atropurpurea*; and *C. P.* Viburnum Opulus, a British shrub. The berries are not good to eat, but we are not aware that they are actually poisonous to man or fowl.—*G. A. C.* A very good form of Miltonia Clowesii.—*F. C. L.* Clematis coccinea.—*F. R.* 1, Pear, imperfect specimen not recognised; 2, Amaryllis Belladonna; 3, Hedychium Gardnerianum; 4, Dimorphanthus mandschuricus; 5, Cratægus orientalis, 6, Sarcanthus paniculatus; 7, Polypodium subauriculatum; 8, Ficus stipulata.—*H. W.* Ceratostigma plumbaginoides; syn. Plumbago Larpentæ.—*F. T.* 1, Send fertile frond; 2, Lastrea trichodes; 3, Nephrodium molle; 4, Lastræa Sieboldii; 5, Selaginella Wildenovii; 6, Lastrea tsus-simensis.—*C. E. F., Bristol.* The Jamaica Orchid, referred to last week as Xylobium species, is Xylobium decolor (Maxillaria decolor) syn. Xylobium palmiforme.—*H. H.* 1, Miltonia Regnelli purpurea; 2, Oncidium tigrinum; 3, Oncidium Forbesii Borwickianum (illustrated *Gardeners' Chronicle*, April 26, 1879, p. 525); 4, Oncidium ornithorhynchum; 5, Ornithidium Sophronitis.—*Upcott.* Chrysanthemum uliginosum.—*H. G. H.* Cattleya Bowringiana and Adiantum tenerum.—*A Reader.* 1, Chrysanthemum uliginosum; 2, Helxine Soleiroli.—*W. W.* 1, Polygonum Persicaria, annual; 2, not found; 3, Ranunculus acris perennial; 4, Rumex Acetosa, perennial; 5, Cerastium vulgatum, annual; Prunella vulgaris, perennial. You can only hoe them up and burn them before they seed, or plough them in.

ORNAMENTAL BERRIES: *W. C. M.* You can only ensure the safety of the berries by protecting them with netting, which, in such cases as yours, is not desirable, the Cratægus being grown against the wall for ornamental purposes only. Have you tried spraying of the trees with a solution of quassia extract, in order to make the fruits distasteful to the birds? Such sprayings would have to be repeated almost every day during showery weather, or they would be ineffective. Even then, the birds being so mischievous, they might pull off the fruits, although refusing to eat them.

POPLAR CASTING ITS SHOOTS: *T. B.* It is quite a well known habit of the Poplar as of the Oak to cast many of its latest formed shoots, but trees do not do this under all conditions. It appears as if certain trees shed them in a natural effort at thinning, and to prevent the shoots developing into a thicket. At any rate, the process, like the shedding of leaves, is a natural one, and is described by botanists as chaloptosis.

PTERIS WIMSETTII: *T. C.* The injury has been caused by the common thrip. Fumigate the house in which they are growing, with some insecticide, such as the XL-All vaporiser.

PUFF BALL: *D. McD.* The specimen you send is the Giant Puff Ball, Lycoperdon giganteum, one of the most delicious of edible fungi when in its young state, the flesh being then snow white. It should be cut in slices less than half an inch in thickness, smeared with the white of an egg and sprinkled with breadcrumbs before being fried in butter, season with pepper and salt according to taste. A full account of this fungus, and a figure, is given in *Gardeners' Chronicle*, 1860, p. 289.—*M. C. C.*

VINES: *R. C. T.* We have examined the roots very carefully, but have failed to discover any indications of Phylloxera. If this pest is present in the roots, it usually produces gout-like swellings. It is more probable that the roots have got into some soil that is unsuited to them, and are dying in consequence of this.

VIOLETS DISEASED: *F. C. L.* The plants are affected with the disease that has recently become so common among Violets. It is caused by a fungus, Ascochyta violæ. Spraying with a weak solution of potassium sulphide—1 ounce to 2 gallons of water is recommended, but the better plan is to burn the old stock and start afresh with healthy plants.

WORMS IN LAWN: *J. L.* Apply to Cooper, Taber and Co., Ltd., 90 and 92, Southwark Street, S.E., for their Chinese Worm Soap, which we know to be very useful for the purpose.

ROCK-GARDENS.

ALPINE and other diminutive plants that live either on high mountain ranges, on dry, arid plains, or under conditions that may be described as calculated to arrest growth, require a highly-specialised treatment when under artificial cultivation, and one that the ordinary garden cannot provide without some special preparation. Partly to meet the cultural requirements of these mountain treasures, and partly to introduce into their surroundings some measure of beautiful rock scenery characteristic of their native home, the formation of a rock garden becomes necessary. Sometimes these rock gardens represent mountain scenery in miniature, but ofttimes the health of the plants alone is considered, and one finds stone pockets skirting a path, each pocket being painfully square, and an exact counterpart of its neighbour. Rarely does one find a rock garden happily placed, cleverly constructed, and filled with plants whose health and position command the admiration of the geologist, botanist, artist, and gardener alike. The many rock gardens that appear trivial, or too obviously artificial, and ofttimes too massive, generally owe their unfitness to one of three adverse conditons—unsuitability of the site for its purpose, faulty construction, or too abrupt an intrusion into the garden landscape. Not every garden has an ideal site for a rock garden, and it is generally an expensive business making one where the natural conditions are not helpful. Again, the necessary materials may be difficult to procure, and as one always finds that a bad substitute never ceases to be such, it is better in such a case to confine one's efforts to the modest series of pockets that can be made of any material and be placed almost anywhere; for then nothing is attempted that cannot be done well.

The rock garden for the small estate may be confined to an informal retaining wall, a series of outcropping boulders set in a grassy slope, or to a broad edging of rock that so frequently serves to define the flower border. Such sites will provide accommodation for many Alpines that cannot be well grown on the level borders, and they are often more easily managed than a well-appointed rock garden. In fact, with a sufficient edging formed of rocks and a necessary retaining wall space one can grow every Alpine that proves amenable to cultivation, and ofttimes succeeds better with difficult plants than is possible in larger types of rock gardens. There is, however, no greater source of pleasure than a well-constructed rock garden that is planned to harmonise with its surroundings, and the structure itself can be made a thing of beauty, at all seasons. Such a rock garden need not be very large nor very costly. The giant masses of stones that are placed in position simply because they look grand and rugged in appearance miss their special aim and object in a rock garden in which it is desired to grow rare plants that cannot be grown in a flower garden. One does not wish to criticise the landscape gardener who uses masses of stone in places where he thinks it desirable to use them, but one ought to consider a rock garden as a home for Alpine plants, for if it fails in this respect it becomes something that is not a garden.

Materials for a Rock-Garden.

Splendid effects may be obtained by the use of a few tons of natural rock, and if they are judiciously disposed, the boulders can be made suggestive of ten times their real bulk. It is essential, however, that the stonework appearing above ground should be natural rock, and that alone, although the other substances that one often finds in a rock garden have their value if wholly covered with soil. The rock garden whose obvious stones embrace granite from Aberdeen or Cornwall, gritstone from the Midlands, ragstone from Kent, limestone from the Mendips, "hards" from the nearest furnace, concrete, monumental and other worked stone, flints, pottery, brick- and brick-ends, etc., can never be more than a heap of rubble covered with plants. Manufactured stone deceives no one, and as it fails in this purpose it should be discarded. Boulders placed regardless of their natural formation and in all manner of positions become eyesores till they are partially or wholly covered, and it is little wonder that a rock garden starting abruptly with a huge pile of sentinel-like boulders and finishing in a similar manner gives one the impression that the garden has not benefited by its presence.

The best material for the formation of artistic rock gardens is weathered limestone; failing this, any stone showing striations along which it can be readily split. Limestone lends itself admirably to the formation of natural-looking strata; it weathers well, is not of an aggressive colouring, and it can be used to face a declivity. A projecting "bluff" with scored and waterworn face is only effective when made of waterworn limestone, and the innumerable cracks, fissures, and hollows its surfaces present, or that can be artificially fashioned upon them, will delight the plantsman, for therein he can grow all those Alpines that prove difficult of management and for whose accommodation rock-gardens are designed. It may be objected that limestone does not suit all plants; that is quite true, but we can, with cultural aid, overcome this dislike. In fact, the legend "objects to limestone," that one often sees affixed to a description of many of the rarer Alpines is in practice of no account. The one all-governing factor in the cultivation of Alpines is the maintenance of a moisture limit, and the provision of ample fissure accommodation helps immeasurably in maintaining this limit. The plant that has been accustomed to fight hard for its existence on the higher Alps, extracting moisture from deep, but narrow cracks, into which a little vegetable débris has been blown or washed, existing, may be, on moisture that filters from a higher plateau, or from the dew of clouds trickling down the faces of the rocky formation, cannot endure the carefully-tilled soil of the plains. It still needs a scanty larder, it still appreciates a warm fissure and the airy elevation, and these requirements the limestone fissure of the rock garden—protected from rain or not as the plant may require—provides in no uncertain way. The plant that can be grown well in a spacious "pocket" filled with soil will grow equally well in the plant border, and a rock garden is not an essential to its welfare.

An Ideal Rock Garden.

A small rock garden can be built on a garden slope in such a way as to represent serried crags jutting from turf, or from a setting of low-growing shrubs. Let us consider such a rockery. A close observation gives the impression of a bold formation in which the lines of stratification are abundantly manifest, the whole rock garden, whilst not aggressively bold, appearing to be a giant "bluff" of limestone rock whose prominent crests have out-cropped from the turf, its uppermost and largest boulder appearing much serried and weatherworn, while its near neighbours, less prominent, but also much weatherworn, are covered with plants wherever the latter can obtain a foothold. Low shrubs surround these lower stones to hide their bases. One studies the masses of stonework and notes how they all describe the same angle earthward, their faces prominently exposed to all weathers—are much seamed, and but few plants, such as Sempervivums, can find sustenance upon them. Beneath these and around them are rocks in strata that have broken off short, barely projecting from the bank or slope.

Plants and their Positions.

Every fissure is filled with such plants as Androsaces, Onosma taurica, wall Campanulas, and plants whose roots prefer to ramify in the innermost cracks of the rocks, to the best soil the garden affords. Behind these large bluffs, smaller knolls project from the surface for some distance in the background; they are of the same formation, but time has not yet succeeded in wearing away much of the soil that covers the rock. On the right and on the left hand are terraced ledges representing a vertical rift in the formation; these terraced ledges, whereon many things are growing, agree in their stratification with the larger boulders, but they show

greater signs of wear from the action of the weather. Still further to the right and to the left are recesses, one showing a sheer escarpment, with moisture oozing from the cracks, and Ramondias, Haberlea, Shortia, and some Ferns luxuriating therein. Another recess is partially draped with Aubrietia, Gypsophila, and its kindred in habit. At one's feet are flattened outcrops of rock, and among the surrounding debris are colonies of Draba, Erica, Lychnis alpina, with Alpine Poppies established in the vertical rift of the main blocks, that are but partially visible through the soil. Behind are more bluffs, some literally "gone to pieces," and only held in position by trails of Polygonum vaccinifolium, Cotoneaster rupestris, and Rhododendrons of creeping habit. An examination of such bluffs reveals similar veined and weather-worn fronts as those we just left, but they are not so steep, for at the feet of these are large flattened heaps of stones, a few long boulders still lie at the same angle as when they fell from the face of the escarpment, scores of Alpine plants find a home among the rocky debris and on the blocks of stone they hold together. Viewed a few hundred yards away, the first thing such a rock garden suggests is the admirable manner in which it fits into the landscape. Beyond the rockery is a grassy plateau with trees in the background; the rocky outcrop appears to hold up that grassy eminence, with a natural but dissevered terrace of rock facing the observer, its largest boulders agreeing with its smallest in their poise, and the escarpment from which they spring appears to be all but covered with plants, and where the stone work is conspicuous, the seams representing the rocky strata impress one that it is a natural rocky formation. The covering of Ericaceæ and other trailing and low-growing shrubs tone the outcrop of rock so that one scarcely sees its artificiality, and one readily concedes there is not too much rock nor too little, but just the requisite break in the landscape. A view obtained 100 yards to the right or to the left gives one different pictures. Here is a giant bluff of rock starting in a small way (literally) all round the central masses, every projecting boulder showing the same angle of stratification and "going to earth" at the same angle. Its massiveness is implied rather than real, for one has to study the site for a time to discern that the boulders are merely smaller stones pieced together in the roughest possible manner. The joints and fissures filled with plants are not so markedly bad a representation of how plants grow in Alpine regions under similar conditions. Vertical rifts, erosions, abrasions and other details of rocky formation are there in just that quantity and form one finds in any limestone rock scenery of nature's own fashioning. Such, then, is a brief description of the outcrop rockery from the landscape gardener's point of view. A small rockery in a dell or elsewhere that is not in harmony with the surrounding landscape impresses one with its utter unfitness. The rock gardens one sees nowadays are too intensive in their conception, too little consideration is given to their surroundings, and the plants to be grown in them or on them receive no cultural help from the designer. It is an easy matter to make a rock-garden picturesque in itself, but it is less easy to blend it with garden scenery so that all appears picturesque. The plantsman must welcome the outcrop rock garden for the advantages it gives him over other types of rock-gardens in the matter of plant accommodation, advantages that cannot be too diligently studied by those who grow the rarer Alpines. The exposed places will provide accommodation of the right kind for all the encrusted Saxifragas and Sempervivums; the sunny cracks will suit Acantholimon, Arenaria caespitosa, Cyananthus lobatus, and plants of kindred root formation; the ledges covered with débris will suit Campanulas of the pulla, pusilla, Raineri, Hosti and garganica sections, and hundreds of other Alpines whose roots and stems both ramble in shale. The escarpments, faced with stratified rock, will prove ideal sites for such treasures as Eritrichium nanum, Anemone vernalis, Androsaces of kinds, Wahlenbergia Pumilio, and other plants that dislike a wet leafage. The escarpments, being virtually wall-gardens of a rugged description, will have fissure accommodation of the best types, and their supporting stones could be laid so that moisture will be carried back to the soil behind the stones or made to percolate from the back forward. Thus Eritrichium and Androsaces could be placed in a horizontal fissure, the uppermost stone sheltering their leaves, the lowermost stone receding and inclining into the soil bank upward to convey moisture percolating from the soil for their maintenance. Similarly, and by a reverse process, Acantholimons, and most Campanulas would enjoy a projecting ledge and find the rainfall thus collected and carried to their roots in a downward direction ample for their purpose.

A flat rockery, with stones laid around it and upon it, gives one no advantage in the matter of a water supply. An outcrop rockery admits of half its stones forming conduits, and the other half drains, that will serve the planter's purpose admirably. *G. B. Mallett.*

(To be continued.)

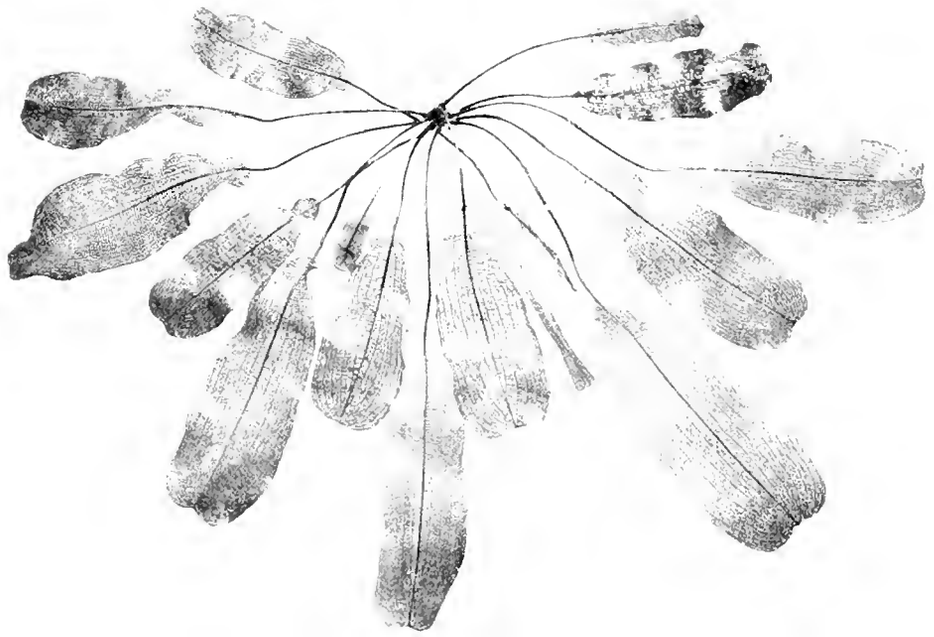

FIG. 108. APONOGETON (OUVIRANDRA) HENKELIANUM HORT.

FOREIGN CORRESPONDENCE.

APONOGETON (OUVIRANDRA) HENKELIANUM HORT.

THIS new lattice-leaf plant was imported from Madagascar in the latter part of 1904, and in the resting state shows a remarkable difference from Aponogeton fenestrale. The rhizome is bigger and the growing point is covered with a few very small scales only, and up to the present time it has shown no signs of a creeping habit, its growths remaining upright. The first leaves were something similar to those of A. fenestrale, although of a paler green colour.

Growth was slow at first, but during the summer it was more rapid, and the leaves commenced to show a great difference from all other known species and varieties in having most irregularly arranged secundary veins, as is shown in fig. 108, which is from a photograph taken in February, 1906. The leaves are not of such long duration as are those of A. fenestrale, the resting time of the plant being more pronounced, when most of the foliage dies, only, however, for growth to commence vigorously after a short rest.

One plant was given to a well-known cultivator of difficult plants, Mr. H. Baum, Curator of the Botanic Garden, Rostock, and in those gardens it reached, during February, 1906, the most remarkable size of 120 cm. in diameter.

The largest leaf was 34 cm. in length and 11 cm. in breadth, the leaf-stalk being 30 cm. long. The photographs, from which figs. 108 and 109 were prepared, were taken at the Rostock Botanic Garden.

It is to be hoped that the plant may flower so that its proper specific determination may be made. The leaves most nearly resemble those of A. fenestrale and its better growing form A. major, having only veins and no intermediate tissue between them. To recapitulate, the differences are found in its much longer rhizome, which has no tendency to a creeping habit; in its more pronounced resting stage, when it loses most of its leaves; the more transient nature of the leaves, especially in higher temperatures; and last, but not least, in the still more divided net-work of its leaf veining.

The growing temperature of the plant illustrated has been 24° to 27° Celsius (say 70° to 80°), the resting temperature 17° to 20° Celsius (64° to 68°). As there are but few of the plants imported it is still a rarity. Lovers of these most interesting lattice-leaf plants should have in their collection the major form of A. fenestrale, which is a most vigorous growing plant, doing well in almost any temperature and any house. It is a shade loving plant, and one of the finest subjects for an aquarium, doing well in any department with a north aspect.

I am preparing a small booklet in English on Aquariums, Aquarium Plants, and Fishes, and shall be glad to receive addresses of any persons interested in these matters. *F. Haakl, Darmstadt.*

ORCHID NOTES AND GLEANINGS.

MILTONIA COGNIAUXLE.

A very pretty form of this natural hybrid between M. Regnelli and M. spectabilis is flowering in the collection of De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables). In this case the M. spectabilis Moreliana, which has purple-tinted flowers, must have been one of the parents. The flowers, which are shaped like those of M. Regnelli, are broader than that species in all their parts, the broadly-ovate and flat labellum being of a claret-purple colour, with a yellow crest. The sepals and petals are creamy-white, tinged with purple on their basal halves, and with pale purple blotches on the outer portions. The genus Miltonia is very prolific in natural hybrids, and of these Mr. Crawshay has a very interesting collection, including M. Crawshayana (Regnelli citrina × Clowesii) and M. Binoti Crawshayana.

VANDA SANDERIANA.

The collection of J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), contains the finest specimen of this noble Orchid yet seen, and it was awarded the Royal Horticultural Society's Gold Medal on October 13, 1896, when it was carrying 127 flowers, the largest inflorescence having 10 blooms. The plant was maintained in good health at Glebelands, but it did not make satisfactory growth, and Mr. Fowler attributed this to a lack of moisture in its surroundings. To more nearly approximate its environment to that of its native habitat, where it is generally found overhanging water or in marshy ground, the plant was divided, and the back of the staging in the corner of the warm house in which it is grown had an open brick-work screen arranged by placing rows of bricks, without mortar, so as to leave openings between the ends of each brick, to allow the freer circulation of air and warmth around the plant. A leaden pipe with holes in it was run over the top of the screen, or loosely built wall, and the pipe was fitted with a stop-cock to allow of water being turned on occasionally until the wall, which is higher than the tops of the plants, becomes thoroughly saturated. Since this provision for increased moisture has been provided the plants have grown more vigorously, and the foliage has become much darker in colour, and it is hoped that the secret of growing this fine species to perfection has been found.

The four and a half inch openly built brick walls, or screen, which can always be removed when necessary, is much used at Glebelands to check or regulate the circulation of heat and moisture, and their use often greatly improves the health of the plants. *J. O'B.*

THE WHEAT CROP OF 1906.

According to the results obtained from the renowned Wheat field at the Rothamsted Experimental Station, which has this year grown its 62nd crop of Wheat in succession on the same land, either without manure, with farmyard manure, or with various combinations of artificial manures, the yield is in all cases above the average, both as to quantity and quality of grain, but with a slight deficiency of straw.

The weight per bushel of dressed grain is higher than in any other year of the experiments, the nearest approach to it being in the sixth year, 1849, when 64½lb. per bushel were in some cases obtained.

The year of highest yields of produce was 1863, when several of the plots receiving artificial manures gave more than 50 bushels of Wheat per acre.

To the plot of land, half an acre in extent, which has grown Wheat without any manure every year since 1843, and for four years previously, no manure has been applied, [?] the present crop is the 67th without manure. The produce this year is 15¾ bushels per acre of 63lb. weight, and 10¾ cwt. of straw. The yield of grain without manure is 2¼ bushels over average, but rather under the average in amount of straw.

The plot which has received 14 tons of farmyard manure every year produced 43¾ bushels of Wheat of 64¼lb. weight, and 38⅛ cwt. of straw per acre. The quantity of Wheat is 8⅞ bushels above average, and the straw is 5⅜ cwt. in excess of the usual amount.

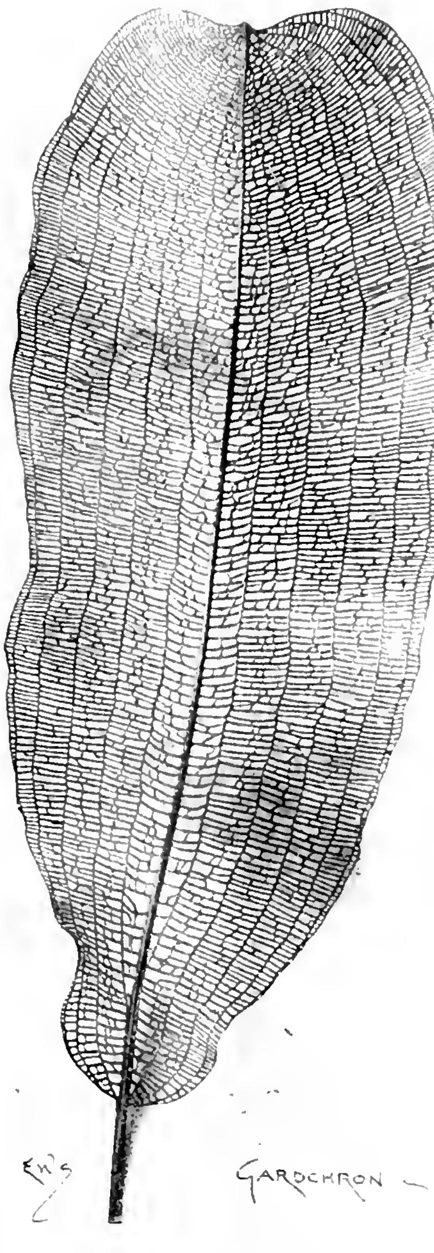

Fig. 109.—LEAF OF APONOGETON (OUVIRANDRA) HENKELIANUM HORT.

(See p. — see page 270.)

The produce of Wheat from the three plots of 6, 7, and 8 increases with each addition of ammonia salts; the grain increases from 27¾ bushels with 200lb. ammonia salts per acre to 37¾ bushels with 400lb., and to 47¼ bushels with 600lb. ammonia. Plots 6 and 7 are from 4 to 5 bushels per acre over average, while plot 8, with the largest quantity of ammonia, is 10 bushels of Wheat in excess. This is doubtless owing to the fact that the crop stood up well until the time of harvest, and so had the full benefit of the brilliant sunshine experienced.

The plots which receive nitrate of soda show that this manure is a more effective source of nitrogenous food for Wheat on the stiff loamy soil of Rothamsted than is sulphate of ammonia.

The weight per bushel of grain is in all cases from 1 to 5lb. above the average weight, and as the weight of grain is generally an indication of quality, the present season's crop of Wheat should "cut" some excellent flour for millers, and should need less foreign Wheat for mixing. *J. Willis, Harpenden.*

THE ROSARY.

ROSES WITH LONG STEMS.

The fashion now common among florists to desire roses that have long stalks has come to us from America. Such varieties are Richmond, Liberty, and General MacArthur. Liberty is of good colour, and, under good conditions of cultivation, it forms moderately long stems. General MacArthur possesses a brilliant red colour, but the plant cannot be recommended for wholesale culture, owing to its compact growth. The growth of the variety Richmond is not better than that of Liberty. American cultivators acknowledge that the above varieties only produce long stems when under special kinds of culture. The varieties named are classed as red-flowered Tea Hybrids.

ROSES FOR COLD DISTRICTS.

Roses which flower freely and early may be selected from the following list, viz., the light-coloured sport from La France, Grace Darling; the light pink Blanche Lafitte, a very early and abundant bloomer (by suitable pruning it bears as many as fifty flowers on a shoot); William Wood, the yellowish-pink G. Nabonnand, Jules Margottin, Mad. C. Testout, John Hopper, Chas. Margottin, Louise Odier, Gruss an Teplitz, Hermosa, Cheshunt Hybrid, Triomphe de l'Exposition, and Oscar Cordel. *F. M.*

ROSE GRUSS AN TEPLITZ.

I am forwarding a few trusses of this hybrid Tea Rose for your inspection, as few Roses can compare with it for an autumn display. It is a vigorous grower, and must be given plenty of space to develop its robust shoots, for although most Rose growers say it should be pruned lightly, ours are cut back fairly hard each spring in a similar manner to the hybrid perpetuals, but this depends upon the way it is grown. In our case three beds are devoted to this variety, and the plants are grown as dwarfs. As the growth extends in early summer they are pegged down to within a foot of the soil, and from these main branches a number of robust shoots spring up, and later, during August, September and October, carry immense clusters of bright crimson flowers. Planted against a low, south wall, in a very warm situation, it has not been a success, but for covering pergolas or pillars it should certainly prove a most valuable subject, especially if Roses are required during the autumn months. In such positions it would not be prudent to prune hard, but basal growths should be encouraged by cutting one or two main stems hard back each year, as by far the finest show is thus obtained. The flowers are very fragrant, and among the sweetest of their class. *J. Payne, Elton, October 3.*

[The growths received were as fully clothed with strong, freely-branched inflorescences of fragrant flowers as could be wished for in June. Ed.]

The Gardeners Royal Benevolent Institution. We are informed by the Secretary of this Institution that the Rev. W. Wilks, M.A., vicar of Shirley, Croydon, and secretary of the Royal Horticultural Society, has kindly forwarded a cheque to the Gardeners' Royal Benevolent Institution for £8 12s. 6d., being the Harvest Thanksgiving offertory at Shirley Church.

LEONARDSLEE.

(Concluded from page 251.)

THE RHODODENDRONS.

Leaving the alpine garden very reluctantly, our path lay through a kind of wood, known as the American and Japanese garden, in which there are now fewer big trees than formerly, and the undergrowth consists of choice Rhododendrons and other flowering and ornamental shrubs. The ground forms one great slope, which in places is again undulating, and the effect in the month of June is most brilliant; the masses of colour being overwhelming. Not only so, but many of the Rhododendrons are of interesting species and hybrids, for fresh planting is done every year, something rare and interesting being substituted for varieties that are more common. Although so extensive, every portion of the garden is under very close observation, and Sir Edmund is constantly engaged in planning prospective improvements. This is a fact that the visitor realises again and again as he wanders through these beautiful grounds. The following species, hybrids and varieties, have been specially good this season, and the notes respecting each have been sent us by Sir Edmund's gardener, Mr. W. A. Cook. R. glaucum (Himalaya), of light rose colour and dwarf habit, in flower from May 25 to June 25. R. ferru-[illegible] very pretty Alpine [illegible] ty, forming round bush, cov[illegible] with small leaves; the flowers are [illegible] funnel-shaped, in light shade of r[illegible]; full flower [illegible] 15; the white variety is also [illegible] R. hirsutum is very similar [illegible] from a distance, but it is covered with small hairs, both on the flowers and foliage; there is also a white variety: both make excellent "dot" plants in the rock garden. R. ciliatum is liable to get damaged by April frosts; the flowers are white with rose blush; the plant flowers with great freedom, and makes a compact bush from 2 to 3 feet in height; it forces well, and the flowers are then quite white. R. racemosum is another smaller [illegible] species, and suitable for the rock garden, where it flourishes well; the colour is a light shade of pink, and it flowers at the end of April and in May. R. punctatum, a very dwarf, evergreen species, that produces rose-coloured flowers, about the size of a shilling, in June. R. Rosy Belle, a dwarf growing plant that flowers in April, and is very effective, but it is liable to be cut by frost. R. Ascot Brilliant flowers towards the end of May, and the blooms are very rich in colouring. R. Shilsoni flowers early in February and March, and is a hybrid from R. Thomsoni and R. barbatum; the flowers are of most brilliant colour and produced in large trusses very freely. This hybrid flowered outside in February, but some tiffany was put over it on cold nights, and also to prevent the birds from picking the flowers. R. Thomsoni (Sikkim) flowered outside in April; the flowers are scarlet and when seen with the sun shining on a good batch the sight is dazzling; the plants require good culture. R. Luscombe Hybrid has red flowers, and is very handsome. R. yunnanense flowers in May, and is of smaller stature. The flowers are white with red spots, and measure about 1½ inches across. R. cinnabarinum (orange scarlet) is one of the most interesting Himalayan species. The flowers are produced in clusters, and resemble in shape a Lapageria flower; the petals are very thick. Plants here are 7 feet in height and 7 feet through, and they flower very freely. R. Blandfordianum is similar but lighter in colour, being light red toned to yellow. This is quite as free as cinnabarinum, and makes a fine plant in the American garden, but it requires some amount of shelter in severe winters. R. Fortunei is a very fragrant species, and flowers later than many Himalayan species, hence it is not so often cut by late frost. R. fulgens has blood-red coloured flowers, produced in small, compact trusses in April and May, and is very liable to suffer injury from frost at the time of flowering. R. barbatum (Sikkim) is the earliest to flower (January). The flowers are blood-red and bell-shaped, 1½ to 2 inches across. The plants need a warm corner and a little protection in severe weather. R. arboreum, also a white variety, and R. campanulatum were also good. R. campylocarpum (Himalayan) flowers in April, and is one of the best of the yellow-flowered Rhododendrons.

The latest to flower is R. lepidotum, which has a very small flower; it is a curious but

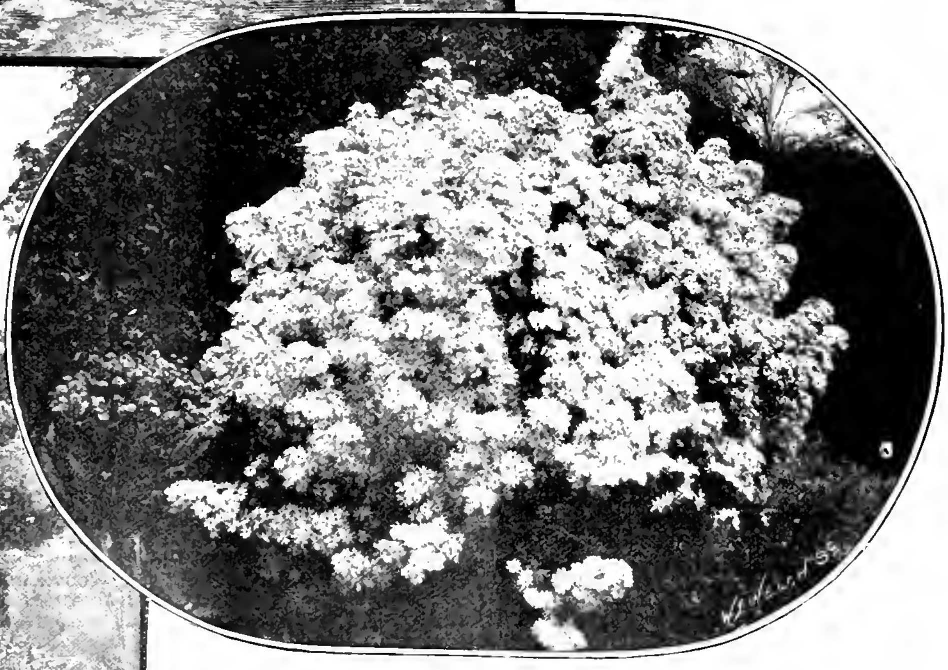

FIG. 110.—LEONARDSLEE.

(1) View of bridge over lake. (2) Saxifraga longifolia blooming in the Alpine Garden. (3) Olearia Gunniana.

interesting plum-coloured flower not more than an inch across. R. punctatum has flowers about three-quarters of an inch across, of light rose colour; R. azaleoides is a very sweet-scented variety.

Amongst the earlier-flowering hybrids are R. kewense (a fine plant 7 feet in height), R. Manglesi, and R. Pink Pearl.

Hybrids and Varieties.

Amongst those which have succeeded best this season are the following:—Marie van Houtte; Sappho (white, with blackish markings); F. B. Hayes (similar to the last); album elegans (white); album grandiflorum (white); Lady C. Walsh (red, edged with pink); concessum (light in centre, margined with rose); Duchess of Connaught; E. S. Rand; Scarlet King; Silvio (purple); Memoir (white); Nasmyth (maroon); Michael Waterer (crimson); Kate Waterer (rosy crimson and yellow); Mrs. C. Leaf (rose); James Marshall Brooks (scarlet); Helen Waterer (scarlet and white); Mrs. John Clutton (white); californicum; Barclayanum (dark crimson); Blandyanum (crimson); Blanche Superbe (white); Caractacus (crimson); fastuosum fl. pl. (light lilac); J. Nasmyth (lilac and maroon); Mrs. Tom Agnew (white, with yellow blotch); J. H. Agnew (pale blush with chocolate spots); Lady Eleanor Catheart (rosy crimson); William Austin; Doncaster (scarlet); fragrans (sweet scented); Fleur de Marie (pink); Othello; Mrs. J. Clution; Old Port (plum-coloured); Auguste van Geert; Prince Camille de Rohan (rosy pink); Mrs. Holford (salmon-crimson); A. Vervaet; Fred Waterer (crimson); Minnie (blush white with orange spots); Butlerianum (light pink); Star of England (pinky-white); J. M. Brooks (scarlet with bronze eye); Stella (pale lilac); Marchioness of Lansdowne (rose-spotted); ochroleucum (pale yellow); gloriosum (bluish white); W. Austen (dark crimson); pictum (white, with lemon spots); Surprise (light rose); Nero (rich purple); H. Sargent (crimson); limbatum (white ground, margined with crimson).

Bamboos.

The collection of Bamboos at Leonardslee is scarcely less remarkable than the number of hardy Palms. Some of the specimens reach to as much as 22 feet in height. Some of the most flourishing and prominent are Bambusa palmata, B. Veitchii, Phyllostachys fastuosa, P. mitis, P. nigra, P. flexuosa, P. Quilioi, and P. viridi-glaucescens, clumps of this last-named species having a diameter equal to 24 feet.

The excellent borders of herbaceous flowering plants provide interest for the visitor, and afford flowers for cutting from early in spring until a short time before Christmas.

Collection of Ericas.

In December Erica carnea and its white variety begins to open its flowers, and in January the plants are a veritable sheet of colour at a height of from 4 inches to 9 inches. E. codonodes (Lusitanica) commences to flower early in January, and continues to flower until May, one of the most beautiful of all, flowering on plants from 2 feet to 10 feet in height. Next in succession is E. arborea (the almond-scented Erica), and from a good-sized plant one can smell the perfume for some considerable distance. This variety is sometimes confused with E. codonodes. E. mediterranea follows E. arborea, and is a more bushy variety, but, like E. arborea, grows 6 feet to 10 feet in height. After the end of May E. cinerea (Scotch Heather) commences to bloom, and flowers right away through July and August. There is also a white variety, which is very prolific in flowering and is much sought after for bouquet-making. These are generally from 1 foot to 2 feet in height, varying a little according to the soil in which they are growing. E. ciliaris (Dorset Heath) succeeds very well in Sussex; it has long slender stems, on which are borne long racemes of purple flowers, and on these are the largest individual flowers of any of our Heaths. The branches are covered with fine hairs. This Heath flowers from July until the end of September. E. Tetralix (cross-leaved Heather), a native species of dwarf growing habit with terminal clusters of pretty pink flowers, has much darker foliage than many. There are several varieties, including alba and rubra. The species grows from 1 foot to 2 feet in height, and flowers from July onward to September. E. vagans (Cornish Heath) is useful when planted in good soil and in a suitable situation. Its long racemes of pink flowers are suitable for cutting. This variety requires much pruning after the flowering stage.

Dabeocia polifolia (St. Dabeoc's Heath), more commonly known as Menziesia polifolia, grows from 1½ feet to 2 feet in height, and has bell-shaped flowers on terminal spikes, sometimes white and often purple and occasionally both. E. vulgaris loves the sand hill-sides, and when in flower is wonderfully pretty. E. v. Alportii is one of the best varieties, being dark pink in colour and very showy. E. v. Foxii is a suitable plant for the rockery, rarely exceeding 3 inches in height. The prettiest plant of all is E. v. var. flore Pleno, its little double flowers being thickly clustered and a bright rosy pink. E. cinerea rigida is a dwarf-growing, dark purple-coloured variety of the Scotch Heather. E. vulgaris Searlei alba is valuable as a late bloomer. E. stricta is an erect growing variety. We had almost forgotten Erica × Veitchii, which flowers in April. It is a handsome plant and grows in an upright direction.

A Show of Sarracenias.

Proceeding over a rustic bridge, we crossed the water already alluded to, and noticed Gunnera manicata and many other handsome water-loving bog plants, but the most interesting sight on this side was that of the American Pitcher plants. There were colonies naturalised down by the water side in large groups, carefully protected from the water fowls, rodents, &c. Can the reader imagine a group of Sarracenia plants ornamented with at least 220 of the richly-purple, curiously-formed flowers? The sight is certainly a rare one, and one not likely to be forgotten. Though the structure of the flower is, of course, quite different, the appearance of them in a mass, as we saw them at Leonardslee, is similar to that of a group of Meconopsis integrifolia, but the colour is more like that of M. punicea. Sarracenia flava and other species were also present, and Darlingtonias; but Sarracenia purpurea was the most effective. From this point a capital view is to be obtained of the house and terrace garden, and some trouble has been taken to make it as attractive as possible.

Coming towards the kitchen garden, we were attracted by a south wall, against which Sir Edmund has planted a selection of the less hardy plants, most of which are already succeeding well. We append the names of some of these:—Bignonia grandiflora, Buddleia Colvilei, Ceanothus Fendleri, C. Gloire de Versailles, C. Veitchianus, Camphora officinalis, Citrus australis, Ephedra altissima, Crinodendron Hookeri, Cinnamomum Loureiroi, Edgeworthia Gardneri, Embothrium rupicola, Lomatia tragophylla, Mandevilla suaveolens in flower and fruit, Grevillea sulphurea, Lagerstroemia indica, Leptospermum grandiflorum, Metrosideros floribunda, Myrtus communis, Olea fragrans, Pueraria japonica, Passiflora, Quillaja saponaria, Rosa sinica Anemone, R. sinica, Solanum crispum in flower, S. jasminoides in flower, Freesia refracta alba and Edwardsia grandiflora.

Our notes have run to a greater length than we intended, so that we shall have to refer only in the briefest terms to the vegetable and fruit gardens. The vegetable garden, being five acres in extent, is one of considerable interest at midsummer as we saw it, and the crops were then very promising indeed. Hardy fruit trees are exceedingly numerous, those of Apples and Pears amount to 500, and these represent as many as 120 varieties. Indoor fruits and tender decorative and flowering plants, also Chrysanthemums, 2,000 Carnations in 100 varieties, Strawberries for forcing, and the other general features of a private garden are successfully cultivated at Leonardslee, reflecting credit on our Calendar writer, Mr. W. A. Cook, but the out-of-doors gardening, particularly the Alpine garden and the shrubberies, are the paramount features.

FRUIT NOTES.

Apples at Sandringham.

The Apple crop in the Eastern Counties is a heavy one this year, and one is not surprised to find an abundance of fruit on the trees in these gardens. There are points in connection with the culture of the trees at Sandringham that are worthy of imitation. For instance, where can larger crops and finer fruit be found of that old favourite Ribston Pippin? The trees are horizontally trained, and are grown against a west wall. The crops are enormous, and the fruit exceptionally fine. Much is made of cordon trained trees in the open; a row on either side of the centre path in the kitchen garden, at the back of the flower border, cannot be short of 300 yards in length. The trees are planted rather thickly together, and they have a distinct lean to the north. Very heavy were the crops and fine the fruit of such sorts as Bismarck, Lane's Prince Albert, Gascoyne's Scarlet Seedling, Schoolmaster (this always does well here), Cox's Orange Pippin, Warner's King, Cox's Pomona, Allington Pippin, Hoary Morning, and Peasgood's Nonsuch. The last-named was very fine; one cordon tree, with stem 6 feet long, carried 22 very large fruits. Trees trained in bush form are largely grown. The branches are trained well apart, which enables the trees to receive an abundance of light and air in their centres. The plants become fully matured, and they furnish large crops of handsome fruit in most seasons. Of the many varieties grown I noted the following as being especially satisfactory: Sandringham was, as is customary here, heavily laden with large, handsome fruits. Originally this variety was found in a game-keeper's garden at Wolferton. Tower of Glamis, Bramley's Seedling, Mere de Menage, Bismarck, Gloria Mundi, Warner's King, Golden Spire, and Chelmsford Wonder, amongst kitchen sorts, were all good. Of dessert varieties Cox's Orange Pippin, Worcester Pearmain, Junes Grieve, Wealthy, Gravenstein, Ribston Pippin, Christmas Pearmain, Writer Ribston, Blenheim Pippin, and King of Pippins were laden with handsome fruits. *E. M.*

Apple Miller's Seedling.

I read with much pleasure and interest (p. 259) the account of, as is stated, the comparatively unknown Apple Miller's Seedling. My late father, James Miller, raised the original tree from a "pip" about the year 1848, at the Speen Nurseries, near Newbury, Berkshire, at which place I was born in 1852. I have grafted thousands of stocks with cuttings from the original tree, and they sold well in the neighbourhood, also in Hampshire.

My father was the second son of William Miller, who established the Speen Nurseries in the year 1820. William Miller died in 1873, and left the nurseries to his son William, my late uncle of Andover and Charlton Houses, who gave them to his son William, who died in 1904, and left them to his son William the fourth, who is now in possession, and he will, in all probability, hand them over to his son William the fifth. The cooking Apple were sent to Highclere Castle before 1866, and I

believe the variety was also supplied to Col. Lloyd Lindsay, at Lockinge, before that date. In 1866 my father left Newbury and bought a nursery business at Lymington, Hants, where he died in 1874. In 1872 he re-named the Apple the Shah, intending to "boom" it under that name, but failing health prevented him from doing so.

I suspect there are some Apple trees in the neighbourhood of Southampton and the Isle of Wight under that name. If so, they are identical with Miller's Seedling. We planted some for Mr. Tennyson, afterwards Lord Tennyson, at Fairfield. It thrives well in the south and west of England, but I rarely meet it here. I have grown it myself, but have none at present. I am not now in the nursery trade, but I may add that good trees can be obtained from the Newbury Nursery, Andover, and Charlton, Hants, or Broad Lane, Lymington, Hants. *Charles H. Miller, Elmhurst, Worcester.*

APPLES AT COPPED HALL.

Just over the border of Middlesex, in the county of Herts, on a very elevated position, is the country mansion and grounds of Copped Hall, the seat of Sir S. B. Boulton, J.P., Bart. Apples are an everyday requirement at this establishment, and Mr. W. M. Wright, who has held the position of head gardener for 17 years, has practically renovated the orchards. Varieties such as Stirling Castle, Lane's Prince Albert, Bramley's Seedling, Mere de Ménage, and Ecklinville Seedling being some of the best of his planting.

The fruit room at Copped Hall is a very simple affair, being merely a lean-to structure 25 feet long by 13 feet 6 inches wide. It is well shelved, and practically the whole of the front can be opened. On entering I noticed the floor of this fruit room was covered with a layer of clean hay, and on my inquiring if there was not a danger of the scent from the hay affecting the Apples, I was informed it had never been known to do so, "but that the cool floor, with the hay, favoured the keeping of the fruits, owing to the atmosphere being less dry." Cox's Orange Pippin appeared somewhat small, and the birds and the wasps had been very busy among them. Blenheim Pippin is largely used for dessert purposes, as there is an abundance of other varieties for culinary purposes. The crop is large, and the fruits are of full size, but a little wanting in colour. King of the Pippins is a very free supply, and the fruits are both clean and of good colour. Ribston Pippin, a good crop, was gathered on the day of my visit. Cellini Pippin, a soft, juicy fruit, but in much request at Copped Hall, is used at the present time for the table. The trees have furnished a heavy crop, but the fruits are much smaller than is usual. Adam's Pearmain, another of the late-keeping dessert Apples, has also furnished a good crop. Fearn's Pippin had been gathered, and was being boxed, some four or five layers in each box, as this variety keeps better when stored in this manner, for it is liable to shrivel if spread out in the ordinary manner. Golden Noble has cropped well, and the small fruits are used for table purposes. This is a very heavy Apple.

Among the culinary varieties Ecklinville has done well, and is now ready for use. Bramley's Seedling proves a very good cropper, and is one of the latest-keeping Apples. Lane's Prince Albert has furnished a very large supply of good fruits. Stirling Castle, a very prolific cropper, is now in season. Bismarck, a heavy, handsomely-coloured fruit, is another favourite in these gardens. Warner's King supplies a fine show, and the fruits are of a good size. Mere de Ménage, though good here in other respects, does not put on a high colour. Emperor Alexander is found a sure-cropping variety. Lodgington Seedling, or Stone's, is a large, handsome fruit. Betty Geeson, a large, first-quality Apple, with a very open eye, also succeeds [illegible]. Hanwell Souring is pretty, [illegible] fruits were small. Striped Beefing, a late-keeping Apple, is a fine crop. Royal Russet is a variety not often seen, but it does well here. Other varieties are grown, but my list comprises the best of the free-bearing Apples that can be depended upon every year. The subsoil of these gardens is a stiff clay. *Stephen Castle.*

GROS COLMAR GRAPE.

As showing the effect of local conditions upon the culture of the above-named Grape, I am forwarding you a portion of a bunch of its fruit. The vine that produced it is growing in the centre of an ordinary hip-roofed or three-quarter-span vinery, with its longest side facing south. Some years ago we trained the leading shoot horizontally directly under the ridge for some 20 feet, which is now furnished with fruit spurs on either side. The continuous ventilator, which is about 2 feet 6 inches in width, on the southern slope, opens directly on to the vine in question. The rod generally carries from 15 to 16 bunches of fruit, averaging, say, 1½lb. each. Every year when fully ripe, they are equal to the sample sent to you, both as to size of berry, colour and flavour. To my taste the latter is equally good as compared with, say, Black Hamburgh, at this time of the year. We have Gros Colmar growing in the ordinary way in other houses, but it never finishes its fruit in the same way as the one in question. This year the crop of fruit is more than the average, hence slight deficiency in colour. *H. J. Clayton, Grimston, Tadcaster.* [The berries were of unusual size and colour, and the flavour delicious, which is very unusual in this variety. Ed.]

The Week's Work.

PLANTS UNDER GLASS.

By B. Cromwell, Gardener to T. Sutton Timmis, Esq., Cleveley, Allerton, Liverpool.

Souvenir de la Malmaison Carnations.—In order to have good plants for next season's flowering much depends on their care and management during the next few months. They should be given a place as near to the roof glass as is possible and consistent with safety from extreme cold; above all, avoid overcrowding the plants on the stages. Should the weather continue mild, lose no opportunity to ventilate the structures freely, both at the top and the sides during the day, and allow a free circulation of air at night time from the wall ventilators. Damp is far more injurious to these plants than actual cold, and is conducive of the dreaded disease rust. As a preventive against this fungus the plants should be sprayed on the under surfaces of their leaves with "carvita" at least once a fortnight, using the same a little under the strength given in the directions. A little warmth may be circulated in the pipes to dispel excessive moisture, but avoid extremes of temperature, which should range from 40 degrees to 45 degrees during the winter months. Water should be afforded only when the plant requires it, and then give a thorough soaking.

The Fernery.—Growth in Ferns will soon become inactive, and by decreasing the atmospheric temperature the plants will be brought to a complete state of rest, which will promote greater vigour in the plants when the season of growth again commences. A temperature of 55 degrees to 60 degrees will suit most varieties of stove Ferns during the winter months. If thrips have been troublesome, the present time affords a good opportunity to take strong measures to eradicate these pests by fumigating the structure two or three evenings in succession with the XL All vaporiser. The matured leaves of Adiantums and other varieties are not so readily injured as are the young fronds when they are unfolding. Previous to fumigating, the plants should have many of the old disfigured fronds removed, as by this means many of the stronger insects which would probably survive fumigation will be destroyed. A. Farleyense and also the Gold and silver-coloured Gymnogrammas should be wintered in a temperature of 62 to 65 degrees, for they are liable to suffer from damp when grown in a low temperature.

General work.—Have all materials used for protecting pits and frames ready, so that in case of a sudden frost they can be easily applied. New Archangel mats should not be used until the ends have been trimmed and tied; this will afford employment under cover on wet days.

Chrysanthemums.—Now that the plants are housed, and before they develop their blooms, a gentle fumigation should be given. Greenfly, if present, readily establishes itself in the florets. Bush-trained plants should be disbudded, leaving only three or five good-formed buds on each growth.

FRUITS UNDER GLASS.

By T. W. Birkinshaw, Gardener to Lt.-Col. Sir Chas. Hamilton, Bart., Hatley Park, Bedfordshire.

Strawberries in pots.—The weather during the past month has been favourable for the growth of Strawberries, and also for the ripening of their crowns, which is important, especially in the case of plants intended for early forcing. Remove all runners from the plants and any weeds from the pots, and turn the latter round to give a check to any roots that may have grown through the bottom into the ash-bed. All small and weakly side-crowns should be removed, especially from the earliest batch of plants. Stand the pots well apart until they are provided with protection for the winter, to permit a good circulation of air between them.

Vines.—Vines which have been inarched should have the portion of the grafted variety below the union permanently removed when the foliage has fallen.

Late Melons.—Fruits that are not yet ripened on late plants should be given every encouragement possible to finish, by closing the house very early in the daytime, and by damping the walls and the paths, for this will be of greater value at this time of the year than syringing the foliage. Give the plants root-waterings sufficient only to prevent them from flagging. These later fruits are usually small, but they are most useful for furnishing an extra dish for the dessert table.

Muscat Grapes.—The bunches should be frequently examined, and all decayed berries should be removed, or they will soon cause further decay. Leaves should be picked up as they fall. Examine the border, and do not allow it to become dry; give sufficient water to prevent shrivelling of the berries, and afford a good soaking after the Grapes have all been cut.

Pot vines intended to produce the earliest crop of Grapes should now be pruned, and, if the rods bleed when cut, apply a little styptic over the wounds. Thoroughly cleanse the rods with a little soft soap and water, and keep them at rest in the coolest place possible, which will also have the effect of making them grow more readily when they are placed in the forcing house. Even if the vines are kept outside, it will be all the better for them later on, so long as the roots do not become saturated by heavy rains, but this can be obviated by placing a few slates over each pot.

Tomatos.—Plants that are in bearing will be benefited by keeping the foliage thinned out, to allow plenty of light to reach the plants. Ensure fertilisation by artificial pollination, and keep the atmosphere of the house in which they are grown rather dry and warm. Fruits on plants that are still growing in frames should be hastened on by keeping the atmosphere of the frames a little closer and warmer. Plants in pots for winter use should be kept growing steadily, and when sufficient fruits have formed on a plant a little artificial manure may be given. Outdoor Tomatos have done well this season.

THE FLOWER GARDEN.

By Hugh A. Pettigrew, Gardener to the Earl of Plymouth, St. Fagan's Castle, Glamorganshire.

The Renovation of the Rosary.—Having in last week's notes offered some suggestions on the formation of new rosaries, it may not be inappropriate this week to offer a little advice on the successful maintenance of existent rosaries—or beds of Roses. It must be obvious to everyone who has had experience of Rose culture, that, given the best of conditions as regards site and soil, the plants after four or five years in the same ground commence to deteriorate, notwithstanding they are afforded liberal "top dress-

ings" and applications of manure water. The reason of this is not far to seek. Roses, like other plants subjected to high cultivation, require a change of soil. In very many instances they are made to grow for years in the same ground, and too often this is accompanied by applications of heavy moisture-holding mulchings of manure during the autumn and winter months, which cause the soil to become cold and sour, and prove detrimental to root action. The inevitable result of such procedure is that the plants gradually become sickly and poor.

Need to lift and replant.—In a rosary that has been permanently planted for some years the best thing to do is to lift all the Rose plants now, and after cutting away rank-growing roots, to plant them again carefully, though it may be closely together, in some good soil in a sheltered part of the kitchen garden, where they can remain until the spring. In the meantime the beds in the rosary can be thoroughly trenched and supplied liberally with farmyard manure, for manure in the soil is of far more benefit to the roots than when on the surface, excluding as it does sunshine and the atmosphere. By the spring the soil in the beds having been thrown up to become pulverised during the winter time will have consolidated and be in the best of condition for planting. The Rose plants in the kitchen garden will have made some useful fibrous roots, and be ready for making a fresh start in their old quarters. When planting in the spring, some fibrous loam should be supplied to the roots to induce quick root-action. For Rose beds which have not been so long made and planted, and in which the plants are not yet showing signs of the need of lifting and change of soil, it will be sufficient to give the surface a dressing of lime, or, better still, a dressing of basic slag. The latter would supply the purpose of lime in making the manure already in the soil available for assimilation by the roots, and at the same time provide a phosphatic manure which is always beneficial to flower-producing plants. To ensure an effect next season, it is important to bear in mind that basic slag must be applied early in the winter, because its action is slow.

Very old beds should be cleared out.—In rosaries where the beds have been an old institution, and the soil has become partially poor, the best remedy would be to remove all the old soil, and entirely replace with fresh loam; a proceeding which certainly entails much labour and expense, but which never fails to repay by the re-invigoration of the plants in the years that follow.

If it is necessary to follow the time-honoured custom of mulching Roses in the winter, as a protection against hard frost, then let it be done with some light, sweet material, but not on any account with the ordinary heavy and wet muck so often used.

THE KITCHEN GARDEN.

By J. Gibson, Gardener to His Grace the Duke of Portland, Welbeck Abbey, Notts.

Leeks.—The earliest plantation for the main crop will have made good growth by this time, the stems being well above the surface of the soil. Draw the earth up to these to increase the blanched portion. Late exhibition Leeks will not now require further blanching. Take care that any paper collars that are used are kept on a level with the soil, otherwise a partially blanched stem will be the result, and this is all against full points. No more feeding or water will be needed after this date, as the rainfall after October is usually sufficient to meet their requirements. Any plants showing signs of "bolting" to seed should be pulled up and sent to the kitchen.

Peas.—Where the practice still exists of sowing Peas in the autumn, a sowing should be made towards the end of the present month on a warm, sheltered border, where the subsoil is moderately light. It is only in gardens that are favourably situated that a sowing should be made at this season, and generally the practice is not to be recommended. When one considers the risks of failure of such seeds, together with the fact that plants raised indoors in the early months of the year will yield a crop almost, if not quite, as early as autumn-sown seeds, and occasion far less trouble than those, there is little wonder that the method is fast dying out. The varieties William the First and Ringleader are round-seeded, and are likely to succeed the best of those sown in autumn. In no case should the more tender Marrowfat varieties be selected, as they will not stand so well the excessive moisture and sudden changes in the state of the weather.

Turnips.—As fast as the autumn crop becomes fit, the roots should be stored together in a pit in readiness for use. It is a mistake to leave these fully-grown roots in the ground, as they are liable to become rotten and woolly in such conditions. The hardier sorts, however, are exceptions, and suffer little harm, such as Golden Ball and Chirk Castle. Where garden Swedes are grown, these may be left in the ground for a little longer. It is surprising how seldom gardeners grow these roots, and yet few vegetables are more appreciated as a change in winter. There is a vast difference between the quality of the ordinary field varieties and the selected garden strains, the latter having much the finer flesh, and they are not so "gritty."

Red Cabbages.—Seedling plants intended to stand the winter out of doors for next year's supply should be pricked off closely together on a border, but this practice is not to be recommended, because, as with Peas, it is possible to obtain from an early sowing under glass a crop quite as early, and one that is freer from risk of failure. The present year's crop, now at its best, should be made use of for pickling before the "heads" burst, which they may do at any time after this month is past.

THE HARDY FRUIT GARDEN.

By W. A. Cook, Gardener to Sir Edmund G. Loder, Bart., Leonardslee, Sussex.

Fruit gathering and storing.—If Apples and Pears are gathered and selected with care the work in the fruit-room later will be considerably reduced. All varieties stored should have a neat label attached to them. At the present time several varieties of Pears are ready for use, and if not consumed will deteriorate rapidly. Pears should be kept in a cool room till just before they are wanted, when they should be taken to slightly warmer quarters. A Pear is nicer when eaten with the chill off. The varieties Beurré Hardy, Comte de Lamy, Louise Bonne of Jersey, Gansel's Bergamotte, Beurré Superfin, Conseiller de la Cour, Emile d'Heyst, Triomphe de Vienne, etc., all ripen during October, but they can be retarded somewhat by keeping them in a very cool place. Really good dessert Apples are not plentiful during October, but there are several comparatively little-known sorts that are of good quality. Among these is St. Edmund's Pippin, an Apple of very agreeable flavour, and with skin covered with a greenish-brown russet and patches of yellow. The flesh is yellow, very juicy, tender, and has a rich aromatic flavour. Wealthy is a very handsome Apple, being coloured dark red on the side next the sun. It is also juicy and rich-flavoured. The tree is a prodigious cropper. Cornish Aromatic is a beautiful, juicy and highly aromatic Apple, an old and valued variety. American Mother is also in season during October, and this is another very fine dessert variety, being rich, juicy, and aromatic. Rival seems destined to become a popular dessert fruit, and ripens in the present month. All these varieties succeed well grown as bush and pyramid-trained trees.

Peach and Nectarine trees.—As soon as the late varieties are cleared of their fruits cut out any of the fruiting wood of the current year that is not required. This will help to strengthen the growths that are left, and will allow the sun's rays to enter the trees. It is not too late to water trees on a south wall. If the trees are dry, or partially dry, give a thorough watering, such as will penetrate to all the roots; at the same time give the foliage a good cleansing with clear water. Out-of-door Peaches are not of much value after this date, as the cool, long nights destroy the flavour. The remaining fruits outside should be brought into a warm house. The earlier trees should have a birch broom passed over them lightly to dislodge any loose foliage, so that the sun's rays can shine on every portion of the trees.

The Loganberry.—If not pruned already, the fruiting branches of this bramble should be cut away, similar to that of the Raspberry, and the new growths be strung up. Wilson Junior is a very good variety of Blackberry. It produces long, handsome berries, and if the soil suits it, does remarkably well and fruits heavily. The common Blackberry, when liberally treated, will also yield a good return in the matter of fruits. The Cumberland blackcap or Rubus leucodermis has small and pretty fruits that look well in the shrubbery, and white stems, from which it has received the name of the White-washed berry. The plant has no economical value.

General work.—Trench ground intended for new fruit quarters, mixing plenty of lime-rubble with the soil. Remove all runners from newly-planted Strawberries, and keep the soil about them clean and free from weeds. Continue to lift and root-prune all trees that require these operations. Bush trees may be planted now, and with better results than when practised later.

THE ORCHID HOUSES.

By W. H. White, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Cypripediums. — Plants of Cypripedium Spicerianum, C. Charlesworthii, C. Leeanum, C. Fitzus, C. Arthurianum, C. Actæus, C. radiosum, C. insigne, and its numerous varieties, and other species occupying a comparatively cool position in the intermediate house will now be fast sending up their flower spikes, which will require to be carefully guided through the leaves, or some of them may become displaced by the foliage and grow distorted. Care should be taken when inserting the sticks not to injure the growths, especially where they are crowded, or the roots more than is avoidable. The flower stems should be tied loosely to the sticks, so that the spikes as they lengthen shall not be restricted. Strong, well-rooted plants of these Cypripediums that are producing their inflorescences should be well supplied with water at their roots, and they will be greatly benefited by an occasional application of weak cow manure water until the flowers open. Well damp the spaces between the pots at least twice a day.

Calogyne cristata and its varieties should be encouraged to finish the development of strong-flowering pseudo-bulbs. Elevate the plants well to the light, and afford them an abundance of water till the flower-spikes appear, after which the amount of moisture given should be gradually reduced.

Zygopetalums.—The genera Bollea, Pescatorea, Huntleya, Warscewiczella, &c., are now included under Zygopetalum. These plants are now growing freely, and should be watered copiously overhead two or three times weekly. They must never be allowed to become really dry, and the atmosphere around them should be kept at saturation point. Notwithstanding all this dampness, a small species of red-spider often times attacks the under surfaces of the foliage, especially if the plants are subjected to high temperatures provided by artificial means, therefore, a periodical use of the sponge is necessary. These plants do not appreciate a high temperature for long periods together; a mean temperature of about 60 degrees is better suited to them. This year, in addition to the ordinary shading, we painted the glass immediately above these plants with a mixture of flour and water, under which shading they made considerable improvement. If, during winter, the night temperature of the house is likely to fall much below 60 degrees, the plants should be removed to a suitable position in the East Indian house, but it must be one in which the direct rays of the sun cannot reach them.

Cattleyas.—The present is a critical season for some of these Orchids that are finishing their growth, including C. Trianiæ, C. Mendelii, C. Mossiæ, C. labiata, C. Dowiana, C. D. aurea, &c. It may happen in damp weather, especially in low-lying districts and in houses that are insufficiently ventilated, that the sheaths enclosing the new pseudo-bulbs become almost transparent, and sometimes of a dark colour; particularly is this the case with C. labiata. When this is observed the involucres should be at once slit open, or decay may ensue in the pseudo-bulbs. Should a plant become thus affected through excess of moisture at the root it will, of course, be constitutionally impaired, and should immediately be placed in a drier position, and as near to the roof glass as is possible. To prevent such decay occurring in the sheaths and pseudo-bulbs, [illegible]

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* EDITOR, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Oct. 20	German Gardeners' Soc meets.
TUESDAY,	Oct. 23	Royal Hort. Soc. Com. meet. Exec. Council of British Gardeners' Assoc. meets 4 p.m.
WEDNESDAY,	Oct. 24	Royal Hort. Soc. of Ireland's Great Fruit & Chrys. Show in Ball's Bridge, Dublin (2 days).
THURSDAY,	Oct. 25	Manchester & N. of England Orchid Soc. meets.
SATURDAY,	Oct. 27	Dutch Gardeners' Soc. meets.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty three Years at Chiswick—48·4°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, October* 17 (6 P.M.): Max. 62°, Min 53°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October* 18 (10 A.M.): Bar., 29·8, Temp., 60°. *Weather*—Fine.

PROVINCES.—*Wednesday, October* 17 (6 P.M.): Max. 58° Southampton; Min. 41 North Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY TO FRIDAY
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30

MONDAY AND TUESDAY—
Indoor and Outdoor Nursery Stock, Statuary, &c., at 489, King's Road, Chelsea, by order of Mr. J. H. Stone, by Protheroe & Morris, at 12.

MONDAY—
Nursery Stock at The Nurseries, Bellingham, by order of Messrs. J. Laing & Sons, by Protheroe & Morris, at 12.
Sale of Bulbs, Plants, &c., at Stevens' Rooms.

TUESDAY
Clearance Sale of Fruit Trees at Farley and Elms Farms, Cheshunt, by order of Messrs. T. & G. Oyler, by Protheroe & Morris, at 12.

WEDNESDAY—
Clearance Sale of Nursery Stock at The Field House Nursery, West End, Esher, by order of Messrs. Thirtle Bros., by Protheroe and Morris at 12.
Palms, Plants, Azaleas, &c., at 67 & 68, Cheapside E.C., by Protheroe & Morris, at 5.
Sale of Bulbs, Roses, Plants, &c., at Stevens' Rooms.

THURSDAY AND FRIDAY—
750,000 Conifers and other stock at Hodamby's Nurseries, Groombridge, near Tunbridge Wells, by Protheroe & Morris, at 11.30

Our Herbaria.

Professor F. W. Oliver's address to the Botanical Section of the British Association at York, some portions of which have been published in our columns, has not been allowed to pass unchallenged. The first portion contained a most interesting summary of what is known and of what is inferred of the history and gradual development of the seed. Read in connection with Dr. Scott's memoir on seed-structures in plants which had till now been considered as of Fern-like affinity, it serves to give a clear account of what is now passing in the minds of those whose studies are devoted to these recondite subjects. The second half of the address had reference to the rise and progress of the "new school" of botanists, and to the future destiny and use of herbaria. In the September number of the *Journal of Botany*, Mr. James Britten repudiates the views as to the function of our great herbaria held by the professor. It is quite true that the study of botany has undergone a very great change during the last half century, and equally true that the change has been highly beneficial in extending the bounds of knowledge and in directing attention to departments previously neglected. But whilst this is incontrovertible there is something to be said on the other side. The laboratory pupil, if for distinction sake we may so call him, quits his table much better equipped in certain limited departments than his predecessor did, but whether he is likely to prove a better all-round botanist, using that word in its most comprehensive sense, has yet to be shown. Professor Oliver, in his address, speaks depreciatingly of our two great herbaria, because they are not associated with any particular teaching institution. But, surely, like great libraries, they are at the disposal of all, and if the "schools" do not make use of them, so much the worse for the schools. A herbarium fulfils the purpose of a vast book of reference, and if the "student" does not make use of the resources at his disposal, it is he who is the loser. Doubtless there is something to be said in favour of the association of a teaching staff with our museums. Such collections, for instance, are not half as much appreciated as they might be, for want of a teaching staff in addition to the conservators. The example of our hospitals is sufficient to show how much their efficiency and their progressive development are secured by association with a teaching body; so if the botanists of the modern school were made practically acquainted with the work done in the herbaria, they would soon cease to regard those collections in the light of "scrap-heaps."

The preparation of an important monograph of any group, with all the research that it entails, all the careful comparison, weighing of evidence from all sources, and judgment that it necessitates, is surely better calculated to make a man a "botanist" than any amount of specialised laboratory work, however important it may be. For the compilation of such a monograph a garden is most desirable, but its resources are not available at all seasons, so that the herbarium becomes essential.

Again, the practical applications of botany are assuming such large proportions that there is no fear of our herbaria languishing from disuse, as the professor seems to fear, for it is to the herbaria that we must turn for the identification of useful plants of all descriptions; it is to them that we must look for information as to the localities in which they grow, and the climatal conditions under which they flourish.

The facts are so obvious that we need not do more than mention the services which the herbaria render to horticulture. In fact, as gardeners, we cannot dispense with either the botanist of the old school or the student of the new. It is as important for us to know the life history of a Dandelion, as revealed in the laboratory, as it is to know the conformation and all that depends upon it of the Welwitschia, to adopt the illustration used by the professor. Both may seem remote from the practical, everyday work of the ordinary gardener, but as regards the extension of that knowledge on which ultimately all good practice must depend, it is certain that we cannot afford to neglect any increase of knowledge.

In spite of what the professor enunciated, we should not have thought that any "defence" of our great herbaria was necessary—certainly it is not required by those who are in the habit of consulting them, but if the "schools" require information on this head, it may be well to subjoin what Mr. Britten has to say on the functions and uses of a herbarium.

"A public herbarium fulfils a variety of purposes with which the 'schools' have, and can have, nothing to do. At the National Herbarium, for example, the botanical history of the last two or three hundred years can be traced; the types of Linnean species, of the early American collectors, and the great Sloane Herbarium are therein preserved; and so far from showing any signs of becoming 'obsolete,' they are constantly consulted by botanists from all parts of the world, both by personal visits and by correspondence. Apart from these, the student of the British flora, the amateur botanist, the horticulturist, the elementary teacher, and the intelligent inquirer find the herbarium a convenient centre for prosecuting their studies, and for obtaining information which they could not readily obtain elsewhere. If Professor Oliver's ideal were realised, botany would become the sole possession of the schools; and not only the foreign systematist, but the general public, the private student, the amateur, and the monographer would be excluded from consideration. The National Herbarium and that at Kew are supported by public funds; it is, therefore, manifestly but common justice that the public rather than the schools should have the prior claim to their services."

GILIA CORONOPIFOLIA.—The illustration on page 277 of the present issue will serve to draw attention to a plant that has long been cultivated in gardens, but is not so well known at the present day as its merits justify. A description of the flowers as shown by Messrs. G. & A. CLARK, LTD., Dover at a meeting of the Royal Horticultural Society on August 28, was published on page 169 of our issue for September 1, and the growing plants are referred to in an article on this nursery on page 280 of our present issue. Messrs. CLARK inform us that the plant is a biennial, the seed of which, if sown in May, will produce flowers in the July of the following year. The plants grow to a height of 3½ to 4 feet under the best conditions, and produce flowering spikes about 2 feet in length.

ROYAL HORTICULTURAL SOCIETY.—The Society's annual general examination in the principles and practice of horticulture will be held on Wednesday, April 10, 1907. The examination will be held simultaneously in as many different centres in Great Britain and Ireland as circumstances may demand. The Society is willing to hold an examination wherever a magistrate, clergyman, schoolmaster, or other responsible person accustomed to examinations will consent to supervise one on the Society's behalf. A copy of the syllabus may be obtained by sending a stamped and directed envelope to the Society's offices. Intending candidates should send in their names not later than March 16. A scholarship of £25 a year for two years is offered by the Society in connection with this examination. Copies of the questions set at the examinations 1893-1905 may be obtained from the Society's offices, Vincent Square, Westminster, S.W., price 1s. 9d., or 10s. per dozen. H. School Teachers' Examination.—The Society will hold an examination in cottage and allotment gardening on Wednesday, April 24, 1907. This examination is intended for, and will be confined to, elementary and technical school teachers. It has been undertaken in view of the increasing demand in country districts that the schoolmaster should be competent to teach the elements of cottage gardening. The Society's certificate will be issued after the examination to all who shall, in the judgment of the Council, have shown sufficient acquaintance with a knowledge of the subject to

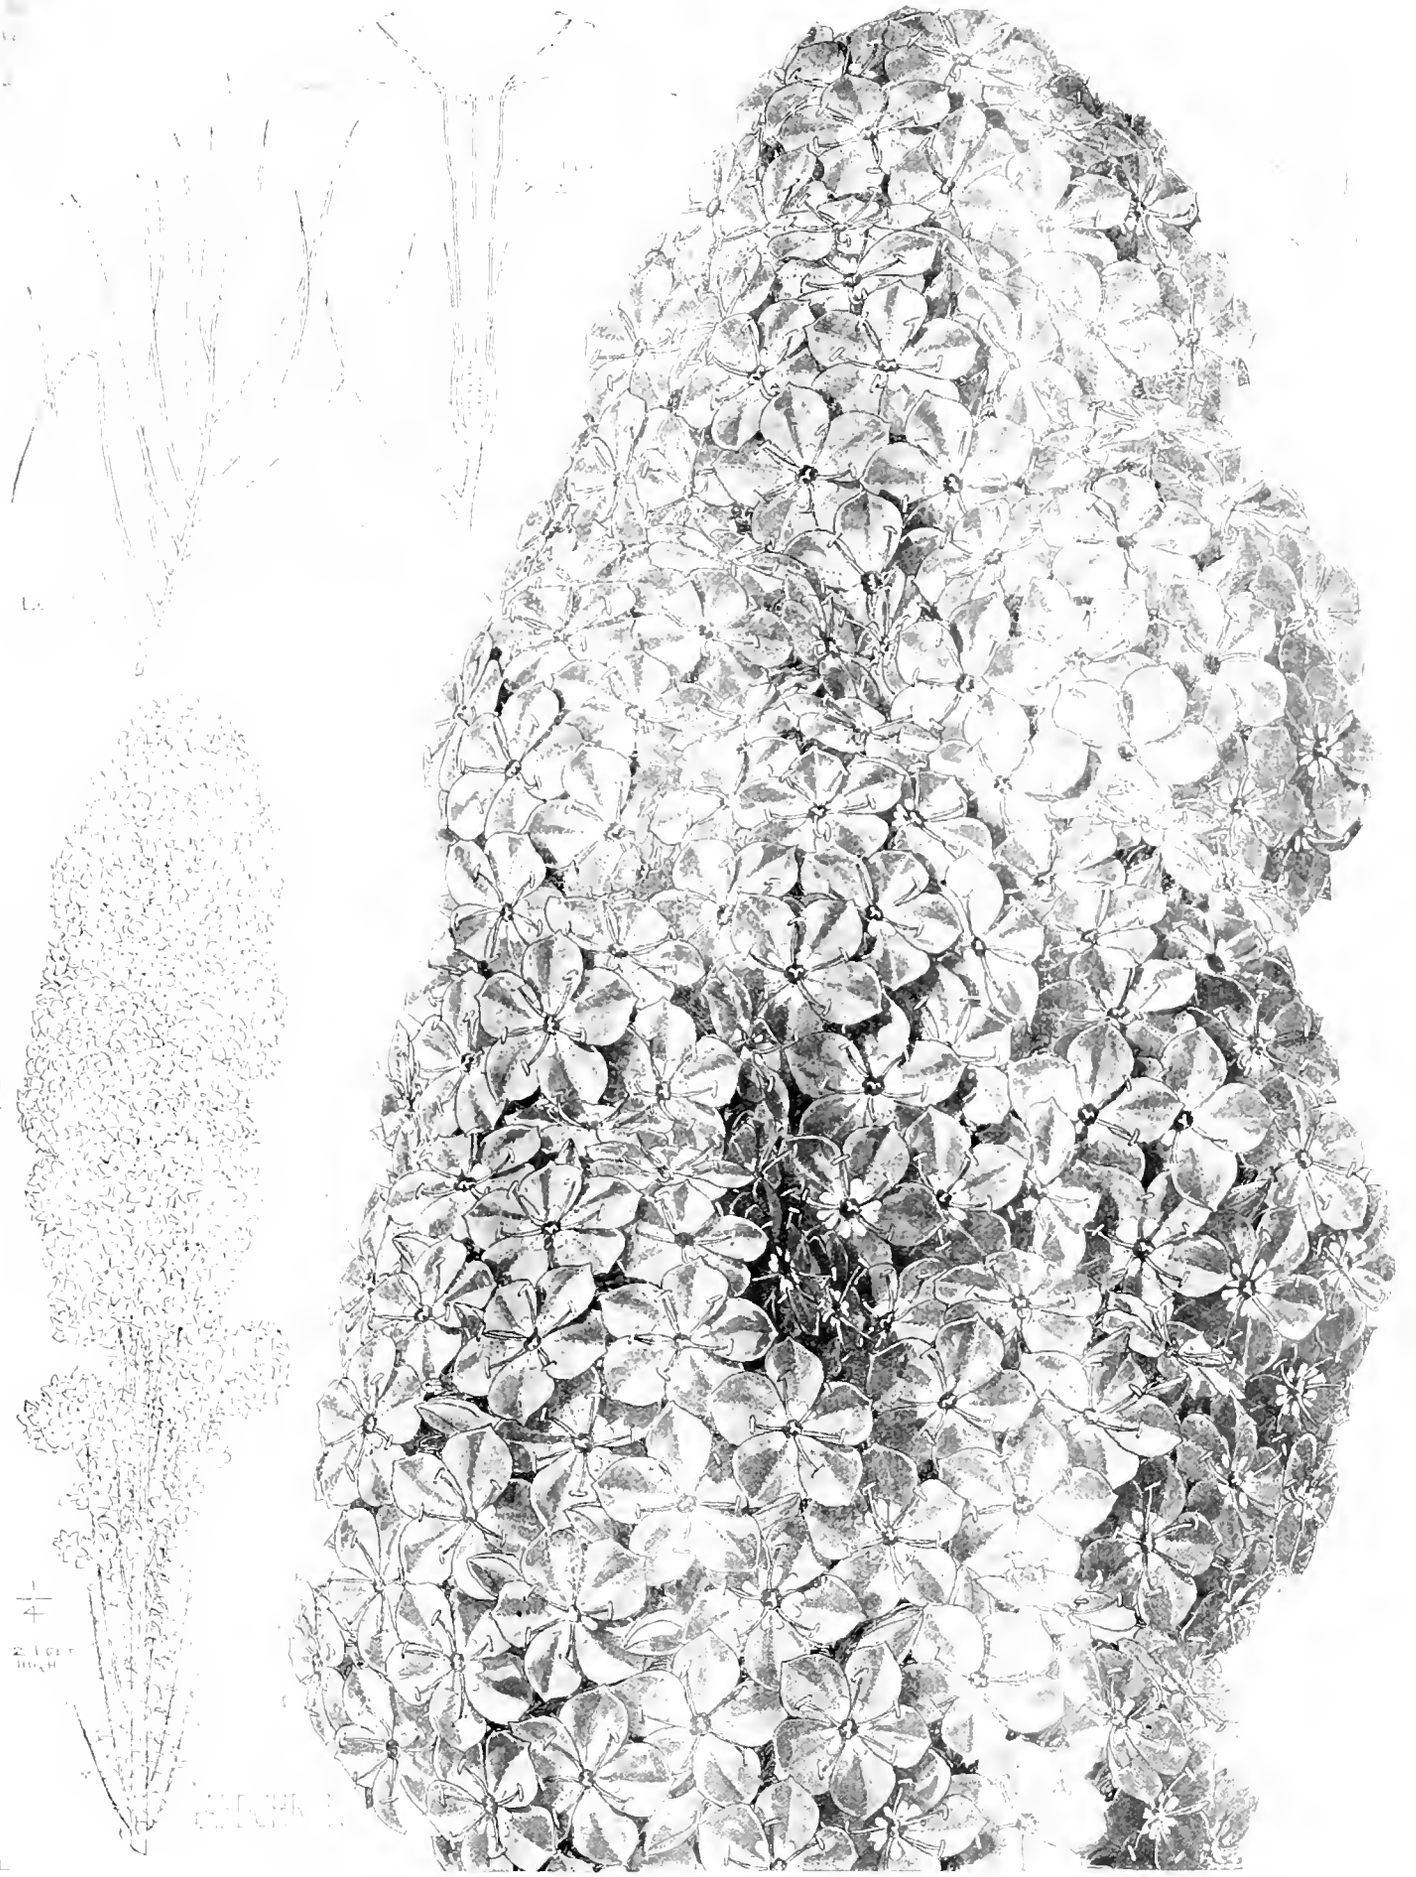

FIG. 111.—GILIA CORONOPIFOLIA, A HALF HARDY BIENNIAL WITH SCARLET FLOWERS.

(From a specimen received from Messrs. G. & A. Clark, Dover. Slightly enlarged.)

warrant their teaching it to their scholars. Teachers and assistants desiring to sit for the examination should apply at once for a copy of the syllabus to the Royal Horticultural Society, Vincent Square, Westminster. A stamp should be sent to cover postage. The general conduct of this examination will be on similar lines to that of the more general examination. III. Public Parks Examination.—This examination is specially intended for gardeners employed in public parks and gardens belonging to county councils, city corporations, and similar bodies, and will be held on Monday, January 14, 1907, in the Royal Horticultural Society's Hall, Vincent Square, Westminster, S.W. The examination, which will commence at 10 a.m., will be partly written, partly viva voce, and will occupy three hours for the written portion, and about 20 minutes each candidate viva voce. A syllabus, with entry form attached, can be obtained on application to the Secretary, R.H.S., Vincent Square, Westminster, to whom intending candidates should send in their names not later than Saturday, December 29, 1906, but before if possible.

——— —The next meeting of the Committees will be held on Tuesday, October 23, in the Society's Hall, Vincent Square, Westminster. A lecture on "Horticultural Education" will be given by Mr. F. J. BAKER, at three o'clock.

THE SCOTS PINE SHEDDING ITS LEAVES PREMATURELY. We have received the following letter from our most highly valued correspondent, Sir JOSEPH HOOKER:—"During September last the Scotch Pines around my house shed their young leaves in profusion, covering the paths under them with a carpet of the tenderest green. Very few, if any, old leaves fell with them. The Pines are self-sown, growing on a slope, in sandy, gravelly soil, with a little peat, together 1 to 2 feet deep, over a hard pan. The oldest trees average 80 years. I should be glad to know if this phenomenon has been observed elsewhere, as it was due, no doubt, to previous drought." *Jos. D. Hooker, The Camp, near Sunningdale, October 12, 1906.*

FLOWERS IN SEASON.—We have received flowers of a large number of beautiful varieties of garden Pentstemons from the well known hardy plant nursery of Mr. JOHN FORBES, Hawick. The great improvement effected in this flower in recent years is remarkable, and it is now quite one of the best subjects for the flower garden in summer-time. Such a selection as Mr. FORBES sends us affords a very wide range of colours, but the scarlet flowers and those of shades approaching to that colour are the most attractive, and these, planted in groups in the borders or in beds by themselves, such as we recently saw them in the old flower garden at Golder's Hill, form quite a beautiful feature. The varieties John Lamont, George Home, and Lady Arthur are all of this colour, their principal difference being in the amount of white found in the throat.

ROTHAMSTED.—A very useful guide to the experimental plots at the Rothamsted Experimental Station, showing the nature and method of the several experiments and the general results, is published at the cost of one shilling by Mr. JOHN MURRAY, Albemarle Street. This summary should be in the hands of all cultivators who can turn the lessons it teaches to good account.

MR. RICHARD LOWE. In recognition of his many services rendered to Horticulture, a fund is being raised in the neighbourhood of Wolverhampton to assist Mr. RICHARD LOWE in his old age. Mr. LOWE has been in business for sixty years, and has devoted much of his time in disinterested efforts to promote horticulture and the welfare of his fellows. An influential local committee has been formed, and Mr. W. JOHNSON, manager of the Metropolitan Bank, Wolverhampton, has consented to act as treasurer, to whom donations may be sent, or to Mr. TOM B. DOBBS, 32, Queen Square, Wolverhampton.

THE SURVEYORS' INSTITUTION.—The first ordinary general meeting of the session 1906-1907 will be held on Monday, November 12, 1906, at 12, Great George Street, Westminster, when the president, Mr. GEORGE LANGRIDGE, will deliver an opening address. The chair will be taken at 8 o'clock.

WELBECK ABBEY GLASSHOUSES.—The Duke of PORTLAND is having a considerable section of the glasshouses at Welbeck renewed and modernised. The new work includes: span corridor, 280 feet by 16 feet; three span plant houses, each 43 feet by 20 feet; six span houses, each 37 feet by 12 feet; span Carnation house 60 feet by 12 feet; also a lean-to range comprising three Fig houses and two vineries, 300 feet by 15 feet. The work of erecting the new houses has been entrusted to Messrs. MESSENGER & Co., Ltd., the well-known horticultural builders, of Loughborough and London. Last year Messrs. MCKENZIE & MOORE built a very large fruit range in these gardens.

THE KRUPP WEDDING.—It is interesting to note that Messrs. CHARLESWORTH & Co., Heaton, Bradford, supplied the whole of the Orchid flowers for the decorations at Hugel a. d. Ruhr. Over 100 sprays of Odontoglossums, 1,000 Laelio-Cattleyas, 500 Cattleya Labiatas, and hundreds of spikes of such things as Oncidiums, Vandas, Phalænopsis, Cymbidiums, &c., &c., were supplied. This is the second large order this firm has received from Germany, the previous one being for the silver wedding of the Emperor WILLIAM a few months ago.

THE GOELDI MUSEUM, BRAZIL. We note the publication of the *Boletim* of the Goeldi Museum, Para, Brazil, which includes the following articles: Materials for the Flora of the Amazon, by Dr. J. HUBER, and Synopsis of Species of the genus Hevea, by Dr. J. HUBER. The papers are in Portuguese, but the "Flora" includes descriptions in Latin of the species enumerated.

POTATO. A "Potato Demonstration" was held on Saturday, September 29, under the auspices of the Edinburgh College of Agriculture, special facilities having been afforded by Mr. SCARLETT. Among the salient results is the disappointing behaviour of Eldorado, the price of which, a few years back, was £160 per lb.! Respecting this, we take the following extract from the *North British Agriculturist*. "In addition to the College exhibits at the 'Show,' the Messrs. SCARLETT exhibited a fine selection. One of their exhibits was interesting by way of showing the results of 'express culture,' of which the potato-growing public heard so much a couple of years ago when Eldorado were selling at £160 per lb. This particular exhibit showed a 'root' of Eldorado grown from 'seed' which had been produced in a natural way by ordinary culture, while alongside it was another Eldorado 'root' produced from 'seed' grown from tubers which had been grown from 'shoots,' by the system of 'express culture.' The result was that the 'root' produced from tubers that had been grown in a natural way showed a very fair yield, whereas the 'root' grown from the tubers that had been produced by 'express culture' consisted of only eight tubers of about the size of marbles. Dr. WILSON showed eight new hybrid varieties of his own raising. Four of these were raised in 1902, and four in 1905, so that four of these hybrids had stood the test of four years' cultivation. One of these was named Rector, a ruddy-skinned maincrop of medium size and excellent quality. It was guaranteed as having stood the test of four years' field culture without even showing a trace of disease. Another named Prior was an oval white second early, which was guaranteed a fine cropper of excellent quality. A third was Kate Kennedy, which was a lineal descendant of British Queen, and the fourth was Bejeant, a fine-looking net-skinned yellow-fleshed kidney, a good cropper, and of the best quality. The four seedlings were the second year from the berry. One of them was the first year's seedling which produced 6 lbs. of tubers last year—within ten months of being raised from the berry. Another of the four was a very attractive rough-skinned pinkish round. The four were specimens selected from over 230 seedlings."

THE POTATO CROP IN IRELAND.—We are sorry to find our bright Irish contemporary, *Irish Gardening*, confirms the reports that have reached us as to the exceptionally bad prospects of the Potato crop in the sister isle. In certain of the western districts the crop is "practically wiped out of existence." Early and repeated sprayings are insisted on as preventives.

ENGLISH GARDENERS IN AMERICA.—We are constantly struck, in perusing the American journals, by the number of nurserymen of British extraction who have made their home in the United States. Of course, this is not very surprising in itself, but what is remarkable is that, with the exception of a comparatively few who have what we may term a cosmopolitan reputation, we hear so little in the old country of what the gardeners of British extraction are doing in their new home, which after all is not like a foreign country, but is only an offset from the old stock, language, literature, religion being the same. We take the following interesting details from the *Weekly Florists' Review*:—"JOHN H. SMALL, senr., the pioneer floral decorator of Washington, D.C., was born at Watford, England, in 1826. He inherited horticultural tastes from both his father's and mother's parents. His paternal grandfather was the owner of a nursery at Colnbrook, England, and leased for 10 years Cliveden, the present home of W. W. ASTOR, on part of which he conducted a nursery, in connection with his business at Colnbrook. Mr. SMALL's maternal grandfather was a Welsh gardener, an authority in his day. Mr. SMALL received his training both with his grandfather and at Frogmore, Windsor. While at Frogmore he saw much of the early married life of QUEEN VICTORIA and the early childhood of the present KING OF ENGLAND. He has also vivid recollections of the Duke of WELLINGTON, hero of Waterloo, as he rode to and from Windsor. Many years ago, antedating the Civil War, Lord LYONS was British Minister at Washington. He was a lavish entertainer, and had imported wax flowers and fruits from Paris for table-decorations. Mr. SMALL persuaded him to give up the waxwork for natural flowers, which he furnished at a financial loss to himself for the time being, but in thus turning the tide of fashion to natural flowers he conferred a great boon on American horticulture."

THE MAINTAINING OF MOISTURE IN ORCHID HOUSES. In an article descriptive of the new Botanical Garden at Dahlem, mention is made in *Die Gartenwelt* for September 22, of the method of affording atmospheric moisture in the Orchid houses recently erected there. As is usual in most span-roofed houses the central stage is arranged in tiers of steps or shelves, and at the sides the usual flat benches. The whole of the staging and benches have an extra platform of wood beneath them, on which are placed porous bricks, pierced with holes, which, by being saturated with water, are capable of maintaining the air of the house in a desirable state of moisture for a considerable length of time. With the same intent, the paths are laid with hard bricks, having channels between them for holding water, that run lengthwise of the paths; a more economical method than wooden gangways.

Flower Gardening at Battersea. The Battersea Borough Council, with a view to encouraging the cultivation of flowers and plants by the tenants of their houses and tenements (351 in number) on the Latchmere and Town Hall Estates, recently held the third competition, with the co-operation of the Battersea and Wandsworth Amateur Chrysanthemum and Horticultural Society, for the best kept outdoor and indoor flower, &c., gardens. The competitors were divided into two classes, as the tenants on the upper floors are provided with gardens away from the houses, whilst the gardens for the ground floor tenants are immediately adjacent to their houses. The number of competitors totalled 34. The presentation of the prizes, &c., by the Mayoress (Mrs. W. Rines) is to be made the occasion of a public meeting, to be held in the small hall at the Latchmere Road Baths (Burns Road entrance), on Friday, October 26, 1906, at 8 p.m.

An Effectual Cure.—We take the following from the *Florists' Exchange*: "A farmer who was much troubled during the nutting season by trespassers in a wood bordering the roadside, ascertained from a botanical friend the scientific name of the hazel, and caused the following notice to be put up in the wood:

Trespassers Take Warning!
All Persons entering this wood do so at their own risk, for the
Corylus Avellana
abounds here in company with more or less poisonous snakes!

The wood is now shunned by everybody, and the farmer is so pleased with the success of his ruse that he thinks of seeing his botanical friend again to find out the Latin name of the common, edible field mushroom." There is another side to this matter. It is quite possible that some persons might be attracted by the intimation, even if couched in botanical language, that "nuts" were to be had in the wood. We remember a similar case where this announcement was made "Scolopendriums and Polypodiums set here." The effect in this case was to induce certain plant lovers to transgress the law of trespass in the hope of finding Ferns, but, alas, they only existed on the notice board, and there only in name.

How to Buy a Business.—By A. W. Bromley. (London: T. Fisher Unwin, Adelphi Terrace).—This is described as being a guide to the purchase of retail and other businesses, professional practices, etc., and it has a supplementary chapter on partnerships. It should prove handy for reference to all who require the advice given in it. This, briefly speaking, is to make as good a bargain on all occasions as is possible, and all that the writer says bears out the maxim that "the buyer has need of a hundred eyes, the seller has need of but one." The author certainly gives timely warning in exposing the tricks to which those who have a business and stock to sell sometimes resort. No reference to any particular class of trade is made, as the same rules are applicable when purchasing any property.

A Botanical Museum.—In the great hall of the Natural History Museum at South Kensington something is done to illustrate the relations of morphology and physiology, and if this plan were more fully developed, taking for illustration Kerner's *Natural History of Plants* as a nucleus, there is little doubt that the study of scientific botany would be materially promoted. Illustrations bearing on Mendelism and de Vries' views on mutation would be useful to those desirous of acquainting themselves with the current of modern botanical thought and observations. A series of specimens illustrative of the "improvement" of garden flowers would be of great interest. Take, for instance, the tuberous Begonias, of which the original species should be shown in effigy, if not in the form of dried specimens, together with the latest developments which are so different from the original type that a new genus has even been proposed for them. Dahlias, Fuchsias, Chrysanthemums, Gladioli, and numerous other genera might be treated in like manner, and would assuredly be of great value to the students of evolution. At present they are looked on as decorative objects only, and as of no value for scientific purposes, but it is obvious on consideration that they might be made to serve a much higher and more permanent purpose.

Specific Names.—At the Botanical Congress held in Vienna last year the following "recommendation" was made that all specific names should be written with a small initial letter, except those derived from the names of men or women (whether used as substantives or as adjectives), or those which represent the names of old genera (substantives or adjectives), thus: Ficus indica, Brassica Napus (Napus being a name of an old genus), Phyteuma Halleri, Malva Tournefortiana. In this way the confusion engendered by the recent practice of spelling words derived from the names of persons in two ways, according as they are used as substantives or as adjectives, is abolished, and all personal names, whether substantives or adjectives should be spelt with a capital letter, thus: Rosa Hookeri or Rosa Hookeriana. It is generally understood that the substantive form implies that the person whose name is connected with a species has been connected with its discovery, its description, or in some other way; whilst the adjective form *anus*, or, in the feminine, *ana*, is purely complimentary.

Lectures on Agricultural Biology at Royal College of Science, Ireland. Mr. D. Houston will give a course of lectures in the Royal College of Science, St. Stephen's Green, under the auspices of the Dublin Seed and Nursery Employees' Association. The subjects are as follow: October 11: I. The Micro-organisms of Soils, and their influence upon fertility. October 18: II. Parasitic Fungi in relation to the Health of Plants. October 25: III. Sexual Reproduction in Plants; "Laws" of Heredity. November 1: IV. The Natural History of Conteræ. November 8: V. Liliaceous Plants as representing the great group of Monocotyledonous Vegetation (or Amaryllidaceous Plants). November 15: VI. Rosaceous Plants as representing Dicotyledons. November 22: VII. Geographical Distribution of Plants.

Commercial Research in the Tropics.—The Institute of Commercial Research in the Tropics, connected with the Liverpool University, has lately published its third quarterly journal. It contains the following articles:—"Agricultural Products of the Ivory Coast," by E. Castaing; "Gold Coast Department of Agriculture," by Viscount Mountmorres; "Botanic Gardens at Konakry, French Guinea," by Viscount Mountmorres and Leo Farmar; "Notes on the Gold Coast," by Francis Crowther; "Analysis of Mollendo Biscuit Rubber," by D. Spence; "Absorbent Value of Ramie Fibre," by Dr. Eric Drabble and F. A. Upsher-Smith; and "Possibilities of Ramie," by D. Edwards-Radclyffe. The Institute is doing good work collecting and publishing information concerning the industries of the tropics and in original research and investigations connected with them.

Influence of the Scion upon the Stock.—M. Van Heede reports, in a recent number of *Le Jardin*, that he has received from M. Lindemuth, Berlin, through Messrs. Haage & Schmidt, an exceedingly interesting novelty showing the influence of the graft of Abutilon Thompsoni on the stock of Kitaibelia vitifolia. By grafting the Abutilon on the Kitaibelia the shoots produced below the graft became prettily variegated. The large leaves of the Kitaibelia are freely marked with touches of bright red, which are very conspicuous even from a distance. Kitaibelia vitifolia is a native of the South of Europe, and is a hardy shrub, especially in Central and Southern France. The new production bears the inappropriate name of Kitaibelia Lindemuthii ×.

Parks and Squares of the United States.—The first Bulletin of the American Association of Park Superintendents is before us, and is of interest in helping us to compare the public spaces in U.S.A. with those of Great Britain. In our country, outside the cities, almost every private house has its own garden, large or small, our public parks being intended chiefly for the enjoyment of those who, in crowded districts, have no other outlet. The American open spaces, on the other hand, are for the benefit of all classes, since small, separate gardens are the exception rather than the rule. Hence there is the more need for skilful gardening that shall appeal to cultivated tastes and maybe prove instructive as well as merely ornamental, while in our country the aim is generally to secure a pleasant playground for town children and some bright floral effects and shady nooks for their elders.

Publications Received. *The School Garden*, by J. J. Hemsley. Published by Blackie & Son, Ltd. Price 1s.—*The Estate Magazine*, October. The contents include an article upon the estates of the Earl of Selkirk, notes upon Hops and Hop picking, upon fruit and railway rates, the storage of Apples, &c.—*The Book Lover*, October.—*The Garden City*, October. This includes a portrait of Mr. George Cadbury, whose name is familiar in connection with Bournville. The following leaflets have reached us from the Board of Agriculture and Fisheries. No. 108, *Hints on the Formation of Permanent Pastures*; No. 175, *The Use of Inorganic Substances as Manures*; No. 174, *Tree Roots* (Armillaria mellea).—From the Transvaal Department of Agriculture. Division of Publications, Bulletin No. 1, *Burr weed or Boete Bosch* (Xanthium spinosum), by William Macdonald; Bulletin No. 3, *The Food of Plants*, by Herbert Ingle. Also from the Division of Botany, leaflet No. 4, *The Cocklebur* (Xanthium strumarium).—From the Ontario Department of Agriculture, *The Common Fungus and Insect Pests of Growing Vegetable Crops*, by Wm. Lochhead and J. D. Jarvis.—From the United States Department of Agriculture, Farmers' Bulletin No. 254, *Cucumbers*, by L. C. Corbett. A useful pamphlet dealing with growing Cucumbers for early market in the open and in cold frames, Cucumbers for pickling, and Cucumbers forced under glass.—From the Bureau of Entomology, *Requirements to be complied with by nurserymen and others who make interstate shipments of nursery stock* by A. F. Burgess.

LAW NOTE.

PREVENTION OF CORRUPTION ACT, 1906.

The following is the full text of the Act for the better Prevention of Corruption passed on August 4, 1906, and which will come into operation on January 1, 1907.—

"Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

1. (1) If any agent corruptly accepts or obtains, or agrees to accept or attempts to obtain, from any person, for himself or for any other person, any gift or consideration as an inducement or reward for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act in relation to his principal's affairs or business, or for showing or forbearing to show favour or disfavour to any person in relation to his principal's affairs or business; or

If any person corruptly gives or agrees to give or offers any gift or consideration to

to any agent as an inducement or reward for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act in relation to his principal's affairs or business, or for showing or forbearing to show favour or disfavour to any person in relation to his principal's affairs or business; or

If any person knowingly gives to any agent, or if any agent knowingly uses with intent to deceive his principal, any receipt, account, or other document in respect of which the principal is interested, and which contains any statement which is false or erroneous or defective in any material particular, and which to his knowledge is intended to mislead the principal, he shall be guilty of a misdemeanour, and shall be liable on conviction or indictment to imprisonment, with or without hard labour, for a term not exceeding two years, or to a fine not exceeding five hundred pounds, or to both such imprisonment and such fine, or on summary conviction to imprisonment, with or without hard labour, for a term not exceeding four months, or to a fine not exceeding fifty pounds, or to both such imprisonment and such fine.

(2) For the purposes of this Act the expression "consideration" includes valuable consideration of any kind; the expression "agent" includes any person employed by or acting for another; and the expression "principal" includes an employer.

(3) A person serving under the Crown or under any corporation or any municipal, borough, county, or district council, or any board of guardians, is an agent within the meaning of this Act.

2.—(1) A prosecution for an offence under this Act shall not be instituted without the consent, in England of the Attorney-General or Solicitor-General, and in Ireland of the Attorney-General or Solicitor-General for Ireland.

(2) The Vexatious Indictments Act, 1859, as amended by any subsequent enactment, shall apply to offences under this Act as if they were included among the offences mentioned in section one of that Act.

(3) Every information for any offence under this Act shall be upon oath.

(4) The expenses of any prosecution on indictment under this Act shall be defrayed as in cases of indictment for felony.

(5) A court of quarter sessions shall not have jurisdiction to inquire of, hear, and determine prosecutions on indictments for offences under this Act.

(6) Any person aggrieved by a summary conviction under this Act may appeal to a court of quarter sessions.

3. This Act shall extend to Scotland, subject to the following modifications:—

(1) Section two shall not extend to Scotland.

(2) In Scotland all offences which are punishable under this Act on summary conviction shall be prosecuted before the sheriff in manner provided by the Summary Jurisdiction (Scotland) Acts.

4. (1) This Act may be cited as the Prevention of Corruption Act, 1906.

(2) This Act shall come into operation on the first day of January nineteen hundred and seven."

A STRIPED GOOSEBERRY.

SOME years ago I found a single striped berry on a bush of Warrington's Red Gooseberry, all the others were pure Warrington red although I annually have about six or seven hundred of Gooseberries annually, I never saw another striped berry amongst them. I had the seed of the above mentioned berry sown. Several of the seedling bushes have produced striped fruit. I enclose some of the berries (see fig. 112), which of these are the most novel and pretty, the flavour is also good.—*W. G. Holmes.*

[We have also an illustration of a striped currant (red), striped red and white (fig. 113).]

NURSERY NOTES.

MESSRS. G. & A. CLARK, LTD.

ON the slope of the hill dominated by the imposing Castle of Dover is situated the nursery, or one of the nurseries, of Messrs. G. & A. Clark. Before seeking an entrance, it is as well to look westward over the narrow valley in which, as contradistinguished from the seafront, the town of Dover threads its way for some few miles. Hills upon hills, with bold outlines and noble sweeps, attract the attention of the visitor, and bring to remembrance the lower Welsh hills. On his way up from

FIG. 112.—"HELEN HOLMES," STRIPED GOOSEBERRIES.

the main street through an apparently endless maze of mean streets, not to say slums, the curious visitor may possibly pass the disused burial ground, where Churchill, a now-forgotten poet, lies. With this inscription:—

1764
Here lie the remains of the celebrated
C. CHURCHILL.
Life to the last enjoyed,
Here Churchill lies
Candidate.

For strictly personal reasons this tomb has a particular interest for the writer, as, many years ago, two of his forbears visited the spot the one, a nurseryman, planted a Bay tree, which died within the last few years; whilst

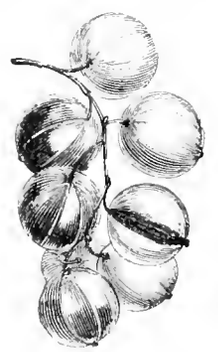

FIG. 113.—STRIPED CURRANT.

the other, a well-known poet in his days, composed and published a sonnet in honour of Churchill.

Churchill is forgotten, those who honoured his memory are in their graves, the Bay tree is dead, and nothing remains but the headstone. It is right, however, to add that the stone is in good condition; indeed, it looks as if the original memorial had, within recent years, been replaced by a newer one.

Close by is a public-house, which has a curious sign, "The Cause is Altered," which suggests the enquiries what cause? why altered? But no response was forthcoming from the natives to whom the question was put.

These details have, however, nothing to do with Messrs. Clark's nursery. We must put an instant check on our discursiveness.

Speaking generally, a seaside town is not addicted to horticulture. The ever-changeful sea, the lovely atmospheric effects, the *va et vient* of a frequented harbour, divert the attention from gardens and flower-beds.

And yet something might be accomplished on the sea-front of Dover were the attempt made, as some seaside resorts that we know of have their shrubberies and plantations, which add to the attractiveness of the promenades, and by no means detract from the beauty and variety of the seascape. The subject of seaside planting has often been discussed in these columns, but those who are not disposed to rout out back volumes of the *Chronicle* may form an excellent idea of what is likely to succeed by the seaside by paying a visit to the nursery above mentioned. The great demand, however, here, as elsewhere nowadays, is for "cut flowers" and plants for the decoration of apartments, and so we find house after house filled with the commoner Ferns and Palms, Lorraine Begonias, Carnations, Tuberoses, Chrysanthemums in promising condition, Pelargoniums, Asparagus, Primula obconica, and a host of similar plants, not forgetting Aristolochia elegans, introduced by the late Mr. W. Bull, which has a special interest as having been first described and figured in these columns. We did not expect to see it grown for "cut flowers," but, nevertheless, it is, we are told, appreciated for that purpose, and a vaseful in the shop window in the town afforded corroboration of the statement.

Between one range and another was a border of Belladonna Lilies, dazzlingly beautiful and striking in appearance. The plants were sheltered on both sides, and doubtless the border derived some additional heat from the pipes in the houses.

The outdoor department is very extensive, occupying several acres on the slope of the hill from the bottom nearly to the top, broken up by shelter hedges of Beech and Hornbeam. The soil is mostly pure chalk, and the effect of a dry summer on such a slope and such a soil might have been expected to be visible. At the end of September, in glowing weather, when our visit was made, no such ill effects were perceptible. It was too late in the year to see the place in perfection, but the Dahlias were noteworthy, and untouched as yet by frost. The Twentieth Century, though nearly over (the flowers so-called, not the century!), was still noteworthy for delicacy of tint and elegance of form. Anemone japonica in many varieties still lent colour to the garden, but pre-eminent in this respect were the perennial Asters, of which Riverslea and Bessarabicus may specially be mentioned, Sedum spectabile Sunflowers, Rudbeckias, the scarlet-flowered Gilia coronopifolia, and other perennials were here in profusion, and showing a depth and intensity of colour rarely seen away from the sea. In addition to a good stock of rock-plants, climbers, and shrubs suitable for seaside planting, we were surprised to see a fine bush of Abutilon vitifolium, which, we were told, proves quite hardy here, and flowers profusely. We get specimens of this each year from Ireland and the south-western counties, but we have not previously seen it in Kent. Noteworthy also are edgings of the dwarf Veronica buxifolia, excellently suited for the purpose. The little shrubs are lifted and replanted about once in three years.

We have no intention of writing a catalogue, but, having seen the exhibits made this summer at the R.H.S. by this firm, a visit to their nursery furnished an easy explanation of their success.

TRADE NOTICE.

MESSRS. W. BAYLOR, HARTLAND & SONS.—We are informed that this firm has determined to dispose of their city establishment in Cork, and to carry on business exclusively at Ard-Carra, Ballintemple, in order to be able to give undivided attention to the nursery business, particularly the culture of bulbs.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

Tomato Carter's "Sunrise" (see fig. 114). —This Tomato is said to have proved the finest ever tested under the Royal Horticultural Society's trials. When exhibited in full bearing on July 4 of last year it gained the high honour of a First Class Certificate. Its healthy and robust constitution, evenness of size, and its suitability as a dessert fruit render it a desirable variety; in fact Carter's Sunrise is one of the best Tomatos ever brought out for both in-door or out-door culture. The house in which the plants shown in fig. 114 are growing is a light, well ventilated, span-roofed structure, and forms one of a range of three set apart for Tomato culture in the gardens at King's Walden Bury, Hitchin, the residence of Mr. S. Fenwick Harrison. The plants were set out in a bed 6 inches deep and 15 inches wide, resting on a layer of ashes, a plan I find to produce a marked improvement in the culture of Tomatos. The compost used consisted of 20 parts of loam, 3 of old Mushroom bed manure, 1 of burnt earth, and 1 of lime rubble. The house has been planted again since the photograph was taken, and the first fruits of the new crop are now setting. *A. J. Hartless, King's Walden Bury Gardens.*

——— I am interested in the correspondence in the *Gardeners' Chronicle* on Peach culture out-of-doors. A few remarks from Cheshire may, perhaps, be of interest, as most of the other correspondents appear to live much south of here. In these gardens a wall 56 yards long and about 10 feet high is furnished with Peach trees from which, as a rule, we obtain fairly good crops of fruit. The border in which the trees are planted is raised 2 feet above the level of the surrounding garden, and is 12 feet in width. The soil possesses a natural drainage. I have not seen any appearance of blister on the trees, but on another wall, which is 34 yards long, we have a little of the disease more or less every year, but not sufficient to cripple the trees. These are planted on the same level as the garden, on a 4 feet border, and are therefore in much colder and damper soil than those on the longer wall, and to this cold and damp I attribute the spread of the blister. Both walls face due south, the only protection the trees receive is a double net over them when the flowers are about half open, but this is taken off if the weather permits when the Peaches are about the size of Peas. As we have the same varieties on both walls it is a proof that raised borders are an advantage. Nectarines do not succeed with us, and the culture here out of doors has been discontinued. A great secret, in my opinion, in the successful cultivation of Peaches is to train the young shoots well apart, say from 6 inches to 8 inches, and to afford plenty of water at the roots at all seasons of the year when the trees are active. The syringe should also be liberally applied. With regard to the question of flavour, out-of-door Peaches are preferred here to those cultivated inside. *Jas. Thompson, Delamere House Gardens, Cheshire.*

Polygonum Baldschuanicum as a Wall Climber. From what I saw of this Polygonum growing at the foot of the south side of Mr. Frank Barclay's house in Cromer, I consider this to be quite a desirable wall-climber, especially where quick growth is desirable. The naturally drooping habit of its long shoots, clothed with its pinky-white blossoms in the autumn, is very effective. *E. M.*

Strawberry Prospects for 1907. —It is rather doubtful if good crops of this fruit will be seen next year in many parts. Our plants, on account of the long drought, have made scarcely any new growth, and no doubt there are many other growers who can tell the same tale. However, the rain on the 2nd inst. did much good, and if we get mild weather for a month it will give the plants a chance of making the necessary growth. *H. J. Long.*

Rough Plate as Glazing for Garden Frames. As a means of avoiding the labour of affording shade to plants in frames and pits during hot weather and the loss from breakage, rough plate glass is too rarely put to its obvious uses in gardens in this country, excepting in Ferneries and Orchid Houses. It may be said that it is not free from breakages during hard frost, when iron sash-bars instead of wooden ones are employed. In lean-to and span-roofed houses, in some Continental nurseries and private gardens, the roof is glazed with rough plate in sheets reaching from the wall plate to the apex, in place of the 12 to 15 panes of the ordinary, weak polished glass; and frame and pit lights are filled with one sheet only. It is a pity that we possess but little accurate knowledge of the advantages and the reverse of the use of rough plate glass in this country. *F. M.*

Fig. 114. TOMATO "SUNRISE."

Outdoor Peaches. —I am sending a photograph of a Peach tree in the open, planted against a wall 14 feet in height, with a south aspect. It has been in its present position nine years, and has a spread of branches measuring 38 feet. The variety is Violette Hative, and it has regularly produced heavy crops of fruit. The tree is simply protected in springtime with a double layer of fish netting. It has this season carried eighteen dozen handsome fruits, some of which were successfully exhibited. Several other trees of different varieties are growing on the same wall, but all these suffer more or less from leaf blister and mildew, and I am of opinion that if hardy, vigorous varieties were selected for outdoor culture the trees would be much less troubled with blister, &c. *J. Lockie, senr., Piddington Hall Gardens, Huntingdon.* [The photograph, which we do not reproduce, showed a well-trained, heavily fruited tree.—Ed.]

Horse Chestnut in Flower. —In this village is now to be seen a Horse Chestnut tree (Æsculus Hippocastanum) in full flower, precisely as it should be in the spring. Owing to the great heat and drought, the old foliage has fallen, and the new buds have burst, covering the tree with foliage of a light green colour, and flowers, which are as though the tree had been subjected to hard forcing. The tree is always a centre of attraction owing to the fact that the village smithy is beneath its shade. The recent heavy rains and mild autumn weather are doubtless the direct cause, following the drought and heat of summer. *H. Ralph..., Buring, Kent.*

The Proposed Champion Vegetable Class. In fairness to myself and other exhibitors I should like to reply to the remarks of ... in the issue for October 6, and will do so as briefly as possible. In the first place, he refers to my bewailing the fact that the Shrewsbury Society does not provide more liberally for us poor vegetable exhibitors. If ... will carefully study the Shrewsbury schedule, he will notice that very much better prizes are offered by the seedsmen for "...

than the society offers in their open and principal class for "no fewer than twelve kinds." In my opinion, this latter class should be the principal vegetable class in the show, and I have no doubt this is also the view of other exhibitors. Anyhow, that is the only important alteration I would wish made. At the same time, I cannot see why the successful competitor in this one class should be termed champion. In reference to Chiswick and Edinburgh, *Nous verrons* apparently runs away from the argument, and asks: "What chance had the small grower at either?" Though my sympathies are, and always have been, with the small growers, the larger exhibitors are not to blame, but rather the societies who frame the schedules. In the case of a society of such importance as Shrewsbury, it is highly desirable that the best produce in the country should be brought into competition, and this can only be assured by offering substantial prizes of sufficient value to meet the large expenses incurred by those living at a considerable distance. I have not the slightest doubt but that the public would be equally interested in a smaller class for a collection from growers with a limited area, but let me remind *Nous verrons* that it is not always the man who has every facility and ten or more acres of kitchen garden who succeeds; neither is it, as he infers, always a question of money. As far back as June, 1883, substantial prizes were offered at South Kensington for a collection of vegetables, and most of the best-known exhibitors of that day competed. In a very keen competition I was awarded the first prize, and also the first prize for a collection of six varieties of Lettuce (see *Gardeners' Chronicle*, June 30 of that year). Again, in the autumn of the same year, I was awarded the first prize for a collection of twelve varieties at the same place. I mention these facts simply in support of my case, and not with any desire of self-aggrandisement. I was then in a small place in Surrey, and one in which very little money was spent on the gardens. The kitchen garden was small, and I had to supply a very large household with vegetables. I am questioned by *Nous verrons* as to my decision in which two classes I intended to compete. I most certainly never kept it a secret, neither did I go the round of exhibitors and advertise it. But, even supposing I had done so, it would be no concern of *Nous verrons*. As to the question of wrong naming, it is surely not fair to ask me to answer for other exhibitors, but, because I do not, this does not prove that I admit it. No doubt *Nous verrons* has some proof of this, he may have been an exhibitor himself. I know there is a great similarity in many varieties, but I also know at the same time that these kinds are really distinct. Take the case of the four varieties of Cauliflowers and Broccoli. Veitch's Autumn Giant Cauliflower, Sutton's Early Giant Cauliflower, Sutton's Mammoth Cauliflower, and Sutton's Michaelmas White Broccoli. These when staged at their best are very much alike, nevertheless each one is thoroughly distinct and has its own distinct value to all cultivators of vegetables. I have seen cases, even in Chrysanthemums, especially among the Incurved flowers, where Tweedledum and Tweedledee are very closely related, and others have thought so, too.—*Edgar Burt.*

—In your issue of October 6, *Nous verrons* states "no one will deny that it is all a question of money and space in the production of choice vegetables." This certainty has nothing to do with the issue at stake. I venture to state that if *Nous verrons* were a thoroughly practical gardener, such a statement could not possibly emanate from him, for he must know that there are also many large gardens, the vegetables from which would not compare with those of smaller growers. It is certain that if *Nous verrons* had a large garden to deal with he would soon find that something other than money and space were required to produce vegetables of the highest quality. I may say that, in respect to another question that has been raised, as I have for some time past obtained all my vegetable seeds from one firm I could not enter in the class belonging to another firm.—*James C. S. R.*

We have already stated that "*Nous verrons*" is a thoroughly practical gardener, whose opinion is worthy of attention, even from those who [illegible] in his conclusions.—[Ed.]

A POTATO TRIAL. A trial of six well-known varieties of Potatos, Up-to-Date, Duchess of Cornwall, The Factor, Dalmeny Beauty, British Queen, and Northern Star, conducted under the Surrey County Education Committee, expressly to show the results of climate or other conditions in producing seed-tubers best fitted for reproductive purposes, was planted at Farnham under exceedingly dry conditions on a small area of land in April last. The crop was lifted on the 12th inst. In this instance, tubers specially selected and of every size and carefully sprouted and planted alike in rows 2½ feet apart gave in bulk the following weights:—Irish sets 237lb., Scotch 225lb., Midland 150lb., and from Surrey seed 65lb. It is thus seen that the produce of the Irish or Scotch seed tubers was nearly four times greater than was that of Surrey seed, and fully 50 per cent better than Midland seed. In four cases the Irish seed gave the best results, and in two cases the Scotch seed. Thus are the results of Messrs. Sutton's trials (see page 260 of last issue) well sustained. *A. D.*

A TORQUAY GARDEN.—Since the publication in the *Chronicle* in 1903 of some notes on my garden many additions of great interest have been made to it. We have a fine collection of Trachycarpus, one raised from seed grown here. A lovely Phoenix canariensis has now been growing out of doors for the last 16 years. It was given to me as a pot plant when about two years old by Mr. Veitch, of Exeter. There is also a grand Latania borbonica which, when given me, was nearly dead. It had been grown in a greenhouse but was transferred to the open air and, thanks to the care of my gardener, is now thriving. Among other plants doing well are Corypha australis, Cocos australis, Chamærops humilis, and a lovely Tree-Fern (Dicksonia?) planted out four years ago. This has thrown out full-sized fronds and is now an object of much beauty, with a full complement of fronds of a lovely green colour. It stands gracefully between two noble Palms, and is sheltered from almost every wind that blows.—*R. Hamilton Ramsay, Torquay.*

CALCEOLARIA AMPLEXICAULIS. At the present time (October 5) this plant is one of the showiest subjects in a ribbon border in these gardens. Owing to special treatment they have succeeded better than usual this season, and the delicate pale yellow flowers, in heads attaining a height of 2 to 3 feet, have a pleasing, as well as a very natural effect. The plants are placed some 20 inches apart in the row, and each, just now, is carrying a dozen or more inflorescences which require careful staking to show them to the best advantage. Cuttings for next season's plants should be inserted in September in a sandy compost, and placed in a little heat. They have usually been potted in early spring, in 2½-inch pots, but last season, instead of using this size pots, they were grown in 6-inch pots with most satisfactory results.—*M. McN.*

SOCIETIES.

ROYAL BOTANIC.

OCTOBER 17. The autumn show of this Society opened in wet weather, and the attendance was poor. The exhibits were not numerous.

The Society staged an interesting collection of economic plants, Monstera deliciosa, in fruit, Sansevieria grandis, also in fruit, many spice plants, &c. The conservatory was gay with Aster Amellus, arranged with Yellow Pompon Chrysanthemums, while the corridor was decorated with Chrysanthemums and Celosias, which made a bright display.

Miss ADAMSON (gr. Mr. G. Kelf), Regent's Park, put up a fine group of Codiæums (Crotons), the plants being remarkably well coloured; the varieties were Flamingo, Williamsi, rubrimunum, Youngi, Mortfontainense, and other useful sorts. A display of fruits from the same exhibitor included well-finished Alicante Grapes; Melons, Regent's Park, Best of All, and Earl's Favourite; Apples, King of the Pippins (beautifully coloured), Charles Ross, Peasgood's Nonsuch, and others; Pears, Conference, Beurré Diel, &c. (Large Gold Medal.)

Messrs. J. S. WARE, LTD., Feltham, staged a fine exhibit of Dahlias, perennial Asters, &c. Among the Dahlias, Mrs. W. Marshall, H. Shoesmith, Amos Perry, Harbour Light, and Daisy Easton were all good. Pæony-flowered Dahlias were also shown. Among the Asters, the varieties cassubicus, Mrs. F. W. Raynor, lævis, Melpomene, and Framfieldi were conspicuous. (Large Gold Medal.)

Mr. ERIC F. SUCH, Maidenhead, filled a table nearly 100 feet in length with Chrysanthemums cut from the open ground, Michaelmas Daisies, and coloured foliage. Notable varieties of Chrysanthemums were Miss B. Miller, Nellie Blake, Horace Martin, Murillo, and Cranford White. Asters were shown in the best market varieties. Foliage of Quercus coccinea was very bright. (Gold Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, W.C., put up an extensive exhibit of flowers. Asters were a great feature, and of these we may mention Ryecroft Pink, cordifolius, Ideal, turbinellus alba, and Amellus Framfieldi. Kniphofias were shown well. Cimicifuga simplex is a beautiful autumn flower with slender spikes of feathery white flowers. Nerine flexuosa alba is a pure white variety, with flowers on rather long stems. (Gold Medal.)

PROPOSED FEDERATION OF HORTICULTURAL MUTUAL IMPROVEMENT SOCIETIES.

OCTOBER 16.—In accordance with announcements made in these pages, a meeting was held on Tuesday last in the Royal Horticultural Hall, Westminster, for the purpose of bringing about a federation of the Mutual Improvement Associations.

The meeting was called at the instance of the Croydon Society—one of the youngest and most flourishing of these bodies, and Mr. Reid, its President, occupied the chair, Mr. H. Boshier, the Croydon secretary, acting as secretary pro tem. There were upwards of fifty gentlemen present, but it became apparent that many of these were not members of any society that it is proposed to federate. Mr. H. Boshier read a short statement, setting forth some of the advantages it was thought might be obtained by federation, such as the aid that might be afforded by richer societies to poorer ones, the helping through the London Executive Committee to establish debating societies in new districts, making arrangements for cheap analysis of soils (already done by the Royal Horticultural Society for the benefit of its members), the obtaining of railway facilities for societies visiting distant localities, the arranging for paid lecturers on terms to be decided by the Executive Council, and the holding of an annual conference of members, and monthly meetings of the Executive.

Mr. Alex. Dean expressed sympathy with the movement, stating that it was extremely difficult for many of the smaller societies to get suitable lecturers. He moved the following resolution: "That this meeting of delegates of Gardeners' Mutual Improvement Societies considers the time has arrived to form a federation of these societies throughout the British Isles, and appoints a provisional committee to draw up a scheme of federation, which scheme shall be submitted to a general meeting of Gardeners' Mutual Improvement Societies at a later date for approval."

The motion having been seconded by a member of the Salisbury Association, a member of the East Anglian Horticultural Club said he thought the adoption of the resolution would have the effect of giving help to the weaker societies. For themselves, the East Anglian Club, with its 600 members, was strong enough to be able to pay the travelling expenses of lecturers from a distance, and consequently was not in need of help. He thought that it would be impossible for delegates from Norwich to attend meetings in London.

Mr. John Weathers, secretary of the British Gardeners' Association, protested against the use of the word "Gardeners" in the resolution. It was unfair to professional gardeners, and very misleading to the general public to describe as gardeners' associations, societies that included mechanics, schoolmasters, professional men of various kinds, and labourers. If the membership was largely made up of amateurs, how could they be properly described as gardeners' associations?

A delegate explained that his particular association was known as a "horticultural" society for that very reason, and others appeared to think this would be the more correct term to apply to the federation. In this connection, it may be pointed out that one of the members subsequently elected to the provisional committee was a delegate from the Battersea and Wandsworth Amateur Chrysanthemum Society, which is almost or entirely composed of members who are not professional gardeners. The Chairman explained that if the provisional committee were appointed the question of title would be among the first subjects for consideration.

Mr. Lyne (Chislehurst) strongly supported the resolution, and said that his society was composed of all in the district who had a love for gardening, and who desired to be members.

Another delegate asked what would be the affiliation fee. It would have to be made as low as possible, or the federation could not succeed. Mr. E. Beckett and Mr. J. Gregory also supported the resolution, the former gentleman explaining that he is not a member of any association interested in the federation.

Mr. W. P. Bound (Reigate Society) declared that the holding of an annual conference would be better than the establishing of a central organisation, and the holding of meetings in London once a month. His society was largely supported by the gentlemen in the Reigate district who would not continue to do this if they knew that part of the money they subscribed would pass out of the district. The Reigate Society had been made a flourishing society by hard work, and he did not think it would be disposed to send funds to localities where less effort had been made, and, therefore, less success achieved.

Mr. Lyne said he did not favour the practice of seeking funds from employers. The societies should be self-maintaining.

Mr. George Gordon supported the resolution, specially referring to the matters of lectures and lantern slides as subjects in which the proposed federation could help individual societies in out-of-the-way districts.

Mr. Mills (Croydon Society) and a delegate from Newport (Monmouthshire) supported the resolution.

The Chairman then put the question, when 24 hands were held up in its favour, and none voted to the contrary. The Chairman therefore, putting the question as a substantive motion, pleaded for a vote that would be more representative, as it scarcely included half of the number present, but on the second count there were only 23 hands uplifted.

A delegate from Tunbridge Wells then said that his society was already affiliated with the Royal Horticultural Society, and the British Gardeners' Association, and was therefore anxious to know what further advantages could be gained from federation. Another delegate asked who would pay the expenses of delegates who attended the meetings of the executive. The Chairman explained that these were matters that could only be settled after a provisional committee had been formed, and proceeded to accept nominations for a committee to consist of fifteen members. This matter proved to be one of some difficulty, the Bath Society and several others at a long distance from London refusing to entertain the idea of election on account of the expense it would entail. Eventually the following gentlemen accepted election:—Messrs. J. Lyne, Chislehurst; J. Gregory, Croydon; M. E. Mills, Croydon; H. Boshier, Croydon; Price, Beckenham; Alderman, Wimbledon; Blencowe, Kingston; Leach, Dulwich; May, Kenley; Field, East Anglian Horticultural Club; Patterson, Bickley; Jay, St. Barnabas, Sutton; Forth, Battersea and Clapham; and Pearman, Caterham; the Sevenoaks Society were to be asked to depute a member.

Votes of thanks concluded the meeting.

SCHEDULES RECEIVED.

West of England Chrysanthemum Society's exhibition, to be held in the Plymouth Guildhall and Square on Tuesday and Wednesday, November 6, 7, 1906. Hon. Sec., Mr. Charles Wilson, 4, North Hill, Plymouth.

Devizes Chrysanthemum Society's show, to be held in the Corn Exchange, Devizes, on Tuesday, November 13. Hon. Sec., Mr. A. J. Randell, Exchange Place, Devizes.

MARKETS.

COVENT GARDEN, October 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

Cut Flowers, &c.: Average Wholesale Prices.

Remarks.—Ripe Bananas are a short supply, consequently the value of them has risen considerably. Home-grown fruit is generally plentiful, but trade is bad. *J. H. B., Covent Garden, Wednesday, October 17, 1906.*

Potatos.

Bedfords, 60s. to 65s.; Blacklands, 50s. to 55s.; Kents, 70s. Trade is very dull, although large supplies are arriving. Many of the tubers are badly diseased. *John Bath, 32 & 34, Wellington Street, Covent Garden.*

COVENT GARDEN FLOWER MARKET.

One still hears complaints about bad trade and low prices, but I believe this is because supplies of everything are over abundant. Ericas have been making very good returns, but prices are sure to drop a little. Mr. Sweet has E. gracilis in the ordinary type, and its white and the pink varieties. Good plants of E. caffra are to be had, and E. hyemalis is coming fairly well flowered. Of these last-named, well plants are realising about 8s. 6d. each. Mr. E. R. ... also has E. hyemalis, and its white variety. Messrs. Lyons & Sons and Messrs. B. Mallar are also sending in good Ericas. Good plants of Chrysanthemums were never seen in such large quantities; the principal varieties are La Pactole, Market White, Mrs. Wingfield (pink), Ryecroft Glory in nice dwarf plants, Nellie Brown (bronze), Geschir's Crimson, Carrie, and Soleil d'Octobre. Marguerites are very good, but with an abundance of good white Chrysanthemums they are not wanted. I still notice some fairly good Cinerarias, Asters and Zonal Pelargoniums. Bouvardias from ...

growers are well flowered. Plants of Spiræa japonica from Mr. Iceton are good. Solanums are over-plentiful and trade in them is dull. Physalis Franchetti on Mr. Seabrook's stands are very good. All hardy plants are now abundant, also climbers, &c. Ferns are well supplied, and several growers of these plants, whose stands have been recently empty, have them again.

CUT FLOWERS.

Chrysanthemums take the lead among flowers. At closing time this morning (Wednesday), large quantities of all grades were left on hand. Among varieties noted, Sunshine, from Messrs. Cragg, Harrison, & Cragg, is one of the best yellow kinds. Soleil d'Octobre is good from all growers. Miss B. Miller is still plentiful and of very good quality. Murillo, from Mr. J. Low, is of a fine pink shade, and Mrs. Scott, from the same firm, is one of the best "whites," but there are other good whites, among which is Miss Fulton. Some fine blooms of the bronze Norman Davis were noted on Mr. Ingamells' stands, also a few very fine blooms of Algernon Davis, the early blooms of this latter variety are of a deep golden yellow shade, and have little of the bronze tint seen in the blooms last season when it was awarded a Certificate of Merit. Bunches of blooms from the open ground come in to the market from some growers in large wagon loads. I was informed that one grower sent in about 30 wagon loads last week, and on Saturday last some were cleared at from 2s. to 4s. per gross of bunches. Roses are still plentiful, but best quality blooms are realising higher prices. Carnations are over-plentiful, and many were unsold at closing time this morning. Lilium longiflorum is again plentiful, and consequently lower in price. L. lancifolium is also plentiful. Pancratiums have only a moderate demand. Eucharis is well supplied, but Stephanotis is a little short. Violets are now abundant. The Parmas are now seen, but they are not of the best quality, "blues" are much better now. Of Michaelmas Daisies some of the small-flowered white varieties sell fairly well; those of the novæ-angliæ type are pretty in the day time, but they close at night, which is a disadvantage. Gaillardias, Dahlias, and other flowers from the open are abundant. Sweet Peas are again seen; they were making about 2s. per dozen bunches. Orchid flowers in various sorts are plentiful, but the demand is not great. *A. H., Covent Garden, Wednesday, October 17, 1906.*

Obituary.

GOTTLIEB EISENBARTH.—The death of this Royal Bavarian Court gardener took place recently at Bamberg, at the age of 85 years. At the beginning of the sixties he was in charge of the Royal Gardens at Schonthal, near Aschaffenburg, and in 1871 he was transferred to Bayreuth, and was given a pension in 1889. During his spare time he was greatly occupied with botanical studies.

E. G. REID, formerly a nurseryman in this country, died at Vienna on September 23 last, at the age of 15 years. In 1888 he introduced to Germany the first large-flowered Chrysanthemums, and helped greatly at a later period in creating an interest in the cultivation of these plants. With the introduction of the cultivation of show blooms, and the best varieties of Chrysanthemums, likewise show and other varieties of the Dahlia and Zonal Pelargoniums the name of Reid is closely connected.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Another warm week. With the exception of two cold nights, on one of which the exposed thermometer showed three degrees of frost, the weather has continued warm for the time of year. The ground also remains warm, the temperature at 2 feet deep being two degrees, and at 1 foot deep three degrees warmer than is seasonable. Rain fell on four days during the week, but to the total depth of only about a quarter of an inch. Since the month began 3¼ inches of rain have fallen, which is nearly half an inch more than the average rainfall for the whole month. During the week about a gallon of rain-water has come through the bare soil percolation gauge, but none through that on which short grass is growing. The sun shone, on an average, for 3½ hours a day, or for half an hour a day longer than is usual at this season. Light airs alone prevailed during the week, the direction being mostly some point between south and west. The mean amount of moisture in the air at three p.m. was five per cent. less than a seasonable quantity for that hour. *E. M., Berkhampsted, October 17th, 1906.*

ENQUIRIES AND REPLIES.

HOT WATER PIPES.—If the substance *M. P.* enquired for on p. 267 for covering hot-water pipes is asbestos, it may be obtained from Leroy and Co., Gray Street, Commercial Road, London, E. *Wells and Sagar, South Kensington.*

SANDSTONE FOR ROCKERY.—Where can I obtain a good-quality sandstone for making a rockery? Preferably, of course, I should like to get it from the nearest place to this neighbourhood. *C. D'A. L., Harpenden, Herts.*

PEACH BUDS.—Having had charge of two Peach-houses for over two years I found that each spring the wood buds commenced to drop from the base of each shoot, leaving only one or two buds at the points. The fruit buds remained intact. The trees carried good crops, and the borders were in first-class condition. What was the cause of the wood buds falling? *S. T. D.*

ANSWERS TO CORRESPONDENTS.

ANTIRRHINUM. *P.* In the specimens you are good enough to send, the flowers are replaced by leaf-buds. There are also traces of fasciation. These are the result of a disturbance in the processes of growth and nutrition, but what has upset the balance we cannot tell.

APPLE SEEDLING: *L. H.* The variety has little or no merit, and would not find favour with fruit growers.

BEGONIA MITE: *W. G. B.* Dip the plants in a weak solution of tobacco water.

CELERY DISEASED: *W. S.* See answer to *A. W.* in our last issue.

COPPER BEECH TREE: *S. A. A.* The insects that you find in the decaying portion of the stem of your Copper Beech are specimens of a well-known beetle and its grubs. It has not, as far as we are aware, any English name. Its scientific name is Sinodendron cylindricum; it is very nearly allied to the well-known "Stag beetle." We believe that it is only found in decaying wood, and not in healthy trees, and that it is not responsible for the condition of your tree, though, to a certain extent, it may have contributed to the rapidity of the decay. Cut away all the diseased part so as to expose the sound wood, which may be well dressed with tar.

CORRECTION. We are informed by Messrs. Lovell Reeve & Co., Ltd., that Hooker's *Handbook of the New Zealand Flora* is not out of print as stated by our reviewer on p. 258, but may still be obtained from the publishers.

FUNGUS ON LAWN. *F. L.* Very difficult to extirpate. Is the lawn sufficiently drained? Try a dressing of wood ashes.

FERNS AFFECTED WITH MITES: *A. H.* The fronds are swarming with a species of acarus or mite belonging, apparently, to the Tyroglyphidæ, but what the exact nature of the injury to the fronds is like, or whether they have been injured at all by the mites, is impossible to say, as the examples were all dried up. Sponge the fronds with Gishurst soap. You might also try the effect of dipping the plants in water at a temperature of 100° Fahr. This method has proved very effective in destroying "Spring tails" (Podura) infecting various species of Ferns.

GRAPES: *E. N.* The bunches are badly shanked and they are also infested with mealy bug. The shanking is probably due to some defect in the border, which should be overhauled during the coming resting season. The mealy bug is best removed from the berries with a brush and methylated spirit.—*Vandor.* The failure is due to some detail in cultivation, probably in connection with the treatment of the roots. There is no fungus present.

HALF-INCH BOXES: *G. G. L.* These are obtainable from any garden sundriesman, or your local nurseryman would procure them for you if desired.

NAMES OF PLANTS: *F. H. R.* Eupatorium Weinmannianum.—*C. E. A.* 1, Spiræa callosa; 2, Chrysanthemum lacustre; 3, Sedum spectabile; 4, Begonia not recognised; 5, Lygodium scandens.—*A Constant Reader.* What you send is not the common Walnut, nor is it Juglans nigra nor either of the Hickories. It is probably Juglans cinerea, but the material is not adequate for determination.—*T. S., Newry.* Oxycoccus erythrocarpus, syn. Vaccinium erythrocarpon.—*Squire.* 6 and 7, Aster vimineus vars.; 8, Aster pyrenaeus; 9, Aster patulus; 10, Vernonia novaeboracensis.—*W. H. D.* 1, Helianthus giganteus; 2, H. laetiflorus.—*J. E. T.* Vitis heterophylla var. humulifolia.—*W. G. B.* Urceolina pendula, syn. aurea, a Peruvian Amaryllid.—*V. A.* 1, Pteris tremula; 2, Ada aurantiaca; 3, Sophronitis cernua; 4, Oncidium pubes; 5, Adiantum assimile; 6, Adiantum tinctum.—*G. H.* Cattleya Bowringiana and Cypripedium carnusianum.—*C. B.* Hedychium Gardnerianum, a warm-conservatory or temperate-house plant.—*E. H.* Cyrtanthus Mackenii, a Cape bulb requiring warm greenhouse treatment.—*R. P. A.* 1, Zephyranthes carinata; 2, Selaginella Wildenovii; 3, Adiantum cuneatum; 4, Adiantum caudatum.—*R. A.* Vitis humulifolia.—*C. B.* 1, Larix leptolepis; 2, Taxodium distichum; 3, Juniperus virginiana.—*Trehane.* Brunsvigia multiflora. Cultivate the plant similarly to the deciduous Hæmanthus in a cool, well-ventilated greenhouse. Until the plant sends up leaves, the roots will require but little water, but afterwards a more liberal supply will be needed. When growth is completed the leaves will turn yellow, and after that stage no water need be afforded the roots until the flower spike appears or growth commences again.—*C. C.* Ailanthus glandulosus.—*J. S.* Adiantum Weigandii.

PEACHES: *C. G. L.* Find out where the ants have their nests, and if it be in the ground pour boiling water over them.

POTATO IN IRON RING: *J. S. U.* Thanks for the specimen, we have received others growing in an iron match box, and one through the neck of a glass bottle.

RETARDING BULBS: *Frost.* You would probably find it too expensive to build a chamber merely for your own requirements. Probably you could obtain some information on the subject from Messrs. Thomas Rochford & Sons, Turnford Hall Nurseries, near Broxbourne, who have had a large chamber in use for some years past.

RICHARDIA: *W. B., Cheshunt.* The failure is caused by Botrytis, the fungus causing Pæonies to droop and die. A dredging of lime on the soil will prevent the fungus passing from the ground up the stem. Diseased plants should be burned.

STRAWBERRY, ST. ANTOINE DE PADOUE: *Strawberry.* This so called perpetual fruiting variety is generally considered to be better than St. Joseph. Under the same cultivation, St. Antoine de Padoue has usually greater size in the berries. The best fruits we have seen from varieties of this type were from Mr. W. Peters, Givon's Gardens, Leatherhead, and were referred to in our issue for September 22 last, p. 216. You cannot do better than adopt the method of cultivation then recommended by Mr. Peters.

VINES: *J. M.* Your Grapes are affected with spot. You have probably kept the vines too moist when the bunches were ripening.

WALNUT TREE: *E. C. C. D.* The Walnut begins to fruit when 10 years old from the seed. London gives it as from 10 to 12 years.

WATER POLLUTED WITH PETROL: *H. S. M.* It will depend entirely on the proportion of petrol which has been admitted to the water. If the proportion is considerable, harm will doubtless result to the plants. Can you not empty the tank and refill it?

WEED ON CLAYEY SOIL: *G. W. W.* The plant is Polygonum Hydropiper, a common weed in most parts. It is an annual, and you should cut it before it seeds.

WINDOW BOXES: *Select.* These should have a depth of from 9 inches to 1 foot, and be provided with supports to raise the base of the box 1 inch above the sill. The boxes must be well furnished with material for drainage. Place some rough material over the drainage to prevent the finer particles of soil from filling the interstices. A suitable compost for window boxes is good turfy loam with a small amount of well-rotted farmyard manure, and a sprinkling of sand to keep the compost porous. You omitted to state what sort of plants you intend to cultivate in the boxes.

Exhibition of British-Grown Fruits.

October 16 and 17.—The 13th annual show of British-grown fruits under the auspices of the Royal Horticultural Society was held on these dates, in the Horticultural Hall, at Vincent Square, Westminster. The show was about equal in extent to that of last year, but was not quite so large as in 1904, when some of the exhibits had to be accommodated in rooms upstairs and down, as well as in the hall itself. There is necessarily great similarity in these yearly shows, but could they not be arranged differently each year? A show of fruit cannot hope to vie with one of flowers from a spectacular point of view, but much could be done to relieve the monotony of flat dishes repeated on almost all the tables. The only attempt at a display was seen in the nurserymen's classes, and the effects were poor. Apples were the outstanding feature of the display, and some good Pears were seen, but of Plums there were few, and in many instances they bore evidences of their having been kept back for the show. The present date is also late for Peaches and Nectarines, and only Morello Cherries are available. Grapes were but mediocre, and although most of the berries were perfectly finished and the bunches of good form, they were small and not of the quality that was seen at the provincial shows earlier in the season. The southern, especially Kentish growers, were very successful in the various classes, but it was interesting to note that some excellent fruits were staged from Ireland, while those from Scotland were not lacking in colour. The show was strictly confined to competitive classes. The arrangements were in excellent order, thanks to the capable management of the secretaries, Mr. S. T. Wright, Mr. Reader, and the other members of the society's staff. In the afternoon of the first day a paper was given by Dr. Josiah Oldfield on the "Food Values of Fruit."

On the first day there was a very large attendance of gardeners, but the general public was not so well represented, nor can it be expected that it should be, unless the displays can be made more attractive than the exhibits in fruiterers' shops and the market halls.

DIVISION I.

Fruits Grown Under Glass or Otherwise.

(Open to Gardeners and Amateurs Only.)

Collection of nine dishes.—There were only two exhibits in this class this year, and the 1st prize was awarded to the Earl of Harrington, Elvaston, Derby (gr. Mr. J. H. Goodacre). The Grapes were superior in this exhibit, especially the variety Muscat of Alexandria, the berries being of exquisite colour and finish. The other variety, Gros Maroc, was large in berry and of deep colour, but the bunches were of somewhat small size. His other "dishes" were Coe's Golden Drop Plum, Golden Sea Eagle Peaches, Doyenne du Comice and Triomphe de Vienne Pears, Cox's Orange Pippin and Ribston Pippin Apples, and Countess Melon. The 2nd prize exhibit, from Sir C. Swinfen-Eady, Oatlands Lodge, Weybridge (gr. Mr. Jas. Lock), was also of very fine quality, being very little inferior to that from the Earl of Harrington. The Marguerite Marillat and Pitmaston Duchess Pears, also Humboldt Nectarines and Princess of Wales Peach, were very fine. The fruits of Cox's Orange Pippin Apple were highly coloured, and a fruit of Countess Melon was of good appearance. A fruit of Cayenne Pineapple was somewhat small, and had too much top growth, and the Muscat Grapes lacked colour, though Black Alicante was better in point of colour than size of berry.

Six dishes.—There were five exhibits in this class, the 1st being from the Earl of Londesborough, Market Weighton, Yorks (gr. Mr. J. C. McPherson). His Grapes were of fair quality, but not remarkable for weight of bunch. Allington Pippin Apples were almost perfect specimens, and Cox's Orange Pippins were of very large size (one fruit particularly so) and of good colour. The other dishes were Marie Louise Pear and a seedling Melon. 2nd, J. W. Fleming, Esq., Chilworth Manor, Romsey, Hants (gr. Mr. W. Mitchell); Mrs. Pince Grapes and Muscat of Alexandria were both of good size and quality. 3rd, W. Cooper, Esq., Whittlebury, Towcester (gr. Mr. G. J. Squibbs).

Grapes.

Collection of six varieties.—There was only one exhibit in the class for six varieties, two bunches of each variety, but the fruit shown by J. W. Fleming, Esq., Chilworth Manor, Romsey, Hants (gr. Mr. W. Mitchell), was of very commendable quality, though not remarkable for extra weight of the bunches. Black Hamburgh was shown as medium-sized bunches, with rather small berries, but perfectly coloured; Muscat of Alexandria was perfect in colour and finish, the skins of the berries being remarkably free from blemish, but again they were quite ordinary in point of size; Gros Maroc was of satisfactory size and perfect colour; Black Alicante was well "finished," but the bunches were less good in shape than they should have been, and we have seen larger berries; Mrs. Pince was represented by two rather long bunches, with large berries, coloured very satisfactorily for this somewhat difficult variety; and, lastly, Madresfield Court, though well coloured, was sadly lacking in weight, also in the size of the individual berries.

Four varieties.—These varieties had to be selected from Madresfield Court, Mrs. Pince, Muscat Hamburgh, Muscat of Alexandria or Canon Hall (not both), Mrs. Pearson, and Dr. Hogg. The 1st prize was awarded to an exhibit from C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, London, S.E., who showed Mrs. Pince, Muscat of Alexandria, Madresfield Court, and Mrs. Pearson. There was no competition.

In the following classes two bunches were required of each variety mentioned.—

Black Hamburgh.—In this class, J. W. Fleming, Esq., easily beat the Earl of Harrington in points of size and colour.

Mrs. Pince.—There were six exhibits of the variety Mrs. Pince, and two capital bunches were found for the 1st prize in an exhibit from J. W. Fleming, Esq., which was much superior to the 2nd prize bunches from Col. G. B. Archer-Houblon, Gt. Hallingbury Place, Bishop's Stortford (gr. Mr. Harrison).

Black Alicante.—There were seven exhibits of this popular Grape, and the two bunches shown by W. G. Raphael, Esq., Castle Hill, Englefield Green (gr. Mr. H. H. Brown), were not only superior to any other that was shown, but they were good representatives of the variety; if there was any deficiency, it was in the size of the berries. The 2nd prize was awarded to Earl Stanhope, Chevening Park, Sevenoaks (gr. Mr. C. Sutton), who had admirably-shaped bunches, though lacking the shoulders so characteristic of this variety, and excellent colour; 3rd, C. Bayer, Esq., Tewkesbury Lodge, Forest Hill (gr. Mr. W. Taylor).

Madresfield Court.—Of three exhibits, the best was from J. W. Fleming, Esq., and he was followed by C. Bayer, Esq., and the Earl of Harrington. The exhibits lacked weight more than any other quality.

Any other Black Grape.—There were as many as twelve exhibits in this class, and the varieties shown included Gros Maroc, Lady Downes, Muscat Hamburgh, Gros Guillaume, Gros Colmar, and Appley Towers. The 1st prize was awarded to two magnificent bunches of Gros Colmar exhibited by the Earl of Londesborough, Market Weighton, Yorks (gr. Mr. J. C. McPherson). The individual berries in this exhibit were quite as large as small plums, and the "finish" was perfect. The same variety, from the Studley Horticultural College, Warwickshire (warden, Miss M. C. Faithfull), was awarded the 2nd prize; but the 3rd prize went to two large bunches of Gros Guillaume shown by the Earl of Stanhope, Chevening Park, Kent.

Muscat of Alexandria.—Out of five exhibits, the pair of bunches from the Earl of Harrington was the best. The bunches were shapely, and the berries highly coloured and clean-shinned, but the weight was only moderate; 2nd, H. J. King, Esq., Eastwell Park, Ashford, Kent (gr. Mr. J. G. Weston); and 3rd, Major Hibbert, Ashby St. Ledgers, Rugby (gr. Mr. W. Camm).

Any other White Grape.—The variety selected for receiving the 1st prize was that known as Mrs. Pearson, and it was shown by Sir C. Swinfen-Eady. The same variety obtained the 2nd prize for Mr. A. Benson, Upper Gatton, Merstham (gr. Mr. W. Mancy). Two bunches of the large-bunched variety Trebbiano were shown by W. Maynard, Esq., The Holt, Fedbury (gr. Mr. W. E. Hyde). The weights of the bunches were given as 14lb. 10½oz. and 10lb. 1oz.

Collection of Hardy Fruits.

This class is one that is always included in Division I., and it calls for 30 dishes, distinct, grown entirely in the open, not more than 12 varieties of Apples or eight varieties of Pears being allowed. There were three exhibits, and the first prize was awarded to Sir Marcus Samuel, Mote Park, Maidstone (gr. Mr. W. H. Bacon). The superiority of the exhibit consisted in the greater weight of the Apples and Pears; Allington Pippin and Gascoyne's Scarlet Seedling were among the best. There were also good fruits of Peaches, Plums, Nuts, and other fruits. Major Powell Cotton, Quex Park, Birchington, Kent, had a varied collection of fruits that was little inferior to the one already referred to. The 3rd prize was obtained by Sir Weetman Pearson, Bart., Paddockhurst, Crawley (gr. Mr. A. B. Wadds). The Apples and Pears lacked size, but otherwise the collection was most varied, there being Mulberries, White Bullaces, Blackberries, Crabs, Sloes, Cobnuts, Plums, Raspberries, Morello Cherries, and "Strawberry" Grapes.

DIVISION II.

For Orchard House Fruit and Trees.

(Open to Nurserymen Only.)

Twenty-four feet run of six feet tabling.—In this class, in which there were but two competitors, the exhibits were arranged on tabling of 24 feet by 6 feet in each case; the trees at the back and the gathered fruit in the front. A gold medal was awarded to Messrs. G. Bunyard & Co., Ltd., Royal Nurseries, Maidstone. Their trees measured from 6 to 8 feet in height, and were sparsely trained in most cases. The finest fruits on the trees were, in the case of Apples, Gascoyne's Scarlet, Cox's Orange Pippin, Allington Pippin, and Lord Hindlip. The finest Pears were Doyenne du Comice, Glou Morceau, and Beurré Alexander Lucas.

Of figs there were Negro Largo, Brunswick, Nebian D'Agen, Black Douro; not in every case in a ripe condition. The Apples and Pears were shown in baskets, and were among the finest for size and colouring, clearness of rind and development, being everything that could be desired.

We may mention among Apples of the culinary class King of Tomkins' County, an American variety, that has become much appreciated here; The Queen, Byford Wonder, a very large British fruit of a greenish-yellow tint; Peasgood's Nonsuch, very large and high in colour; Gascoyne's Scarlet Seedling, Emperor Alexander, exceedingly large and highly coloured; Belle de Bois, a large green fruit; Twenty-Ounce, a handsome, yellowish fruit, streaked crimson; Allington Pippin, a very handsome variety of not over-large size, yellow in colour when exposed to the sun; Roundway Magnum Bonum, a prettily striped fruit; Wealthy and The Queen.

Dessert varieties were few and included Cox's Orange Pippin, very fine in size and the colour higher for this variety. Plum the President

... shown in fine condition. It is a dark purple oval fruit. Pears were unusually fine, and consisted of Beurré Bosc, Nouvelle Fulvie, Marie Louise d'Uccle, extra large, Doyenné du Comice, much above the usual size; Président Osmanville, a long, showy green fruit; Conference, Pitmaston Duchess in very superior condition, Beurré Alexander Lucas, Beurré Diel, Durondeau, Conseiller de la Cour, Marie Benoist, some of them 2lb. in weight, and Duchesse d'Angoulême. Of culinary varieties we noted Catillac and Uvedale's St. Germain, both of very large size. Messrs. RIVERS & SONS, Sawbridgeworth, Herts, who showed trees in greater numbers than the exhibitor above mentioned, and these more heavily cropped and of larger size, were also awarded a gold medal of equal value. These remarks apply to Pears and Apples alike. The Pears included Beurré Fouqueray, Doyenné du Comice, Conference, Beurré d'Anjou, Pitmaston Duchess, Conseiller de la Cour, Durondeau, Marie Louise, St. Edmund, Magnate, several of them shown in duplicate. The varieties of Pears shown in baskets, and likewise Plums were very attractive. We may mention of Plums, Princess, a variety raised in Messrs. RIVERS' nursery; Reine le Clerc de Laval, Durondeau, Beurré Diel, some of which were very fine fruits. St. Luke, a ponderous fruit of a russet tint and globular shape; Le Lectier, Magnate, and Beurré Hardy. Of Apples, there were nice examples of Cox's Orange Pippin, King of the Pippins, Gloria Mundi, Gascoyne's Scarlet Seedling, rather pale in colour for orchard house fruits; Crimson Quoining, Pomona, Thomas Rivers, Emperor Alexander, Peasgood's Nonsuch, and Mother. The Plums shown were Primate, President, Monarch, Grand Duke, Rivers' Orange, and Golden Transparent. These varieties of Plums add considerably to the length of the season of Plums.

FRUIT GROWN ENTIRELY OUT OF DOORS.

Twenty-four feet run of six-feet tabling.—1st, Messrs. G. BUNYARD & CO., LTD., Maidstone, with a splendid collection set out in plates, having standards beneath them of various heights. The space occupied was 24 feet by 6 feet. Some dishes of Pears were also shown. For lack of space, it must suffice if we select the finest, i.e., the largest and best-developed varieties, viz., Royal Jubilee, The Queen, Mrs. Barron, Lady Sudeley, Lane's Prince Albert, Winter Ribston Pippin, Cox's Pomona, Mabbott's Pearmain, Stirling Castle, Bedfordshire Foundling, James Grieve, Warner's King, Wealthy, Preston Hall, Sandringham, Lord Derby, Gascoyne's Seedling, Belle de Boskoop, St. Edmund, Chelmsford Wonder, Baumann's Red Winter Reinette, Reinette Superfin, Melon Apple, Bietigheimer, Easter Orange, Swedish Reinette, Court Pendu Plat, Ashmead's Kernel, Improved, Bow Hill, and Queen Caroline, &c. The Pears, Beurré Diel, Princess, Fondante de Thirriot, and Marie Benoist were fine examples. The 2nd prize was awarded to Messrs. H. CANNELL & SON, Swanley and Eynsford, with very superior fruit arranged pyramidally in flat baskets. Very fine were Peasgood's Nonsuch, Gascoyne's Scarlet Seedling, Gravenstein, Summer Quoining, Grenadier, Belle de Pontoise, Colonel Vaughan (syn. Kentish Pippin), Emperor Alexander, Warner's King, Bramley's Seedling, Golden Russet, Hollandbury, The Queen, Dutch Mignonne, Schoolmaster, Pott's Seedling, Atalanta, Cox's Pomona, Allington Pippin, Graham's Royal Jubilee, Chelmsford Wonder, Bull's Golden Reinette, Small's Prince Arthur, Melon Apple, Beauty of Kent, King of the Pippins, and many more. 3rd, J. CHEAL & SONS, Crawley, with varieties of high tints, if not over large. The place of honour was appropriately given to the high-coloured Sussex Apple Nanny, a good dessert fruit, good till the end of the year. Other notable varieties were Allington Pippin, Col. Vaughan, Ross's Nonpareil, Paroquet, Buxted Favourite, High Cannons, Egremont Russet, Forge, Jubilee, Charles Ross, and The Queen.

Fruit arranged on tabling, twelve feet.—The KING'S ACRE NURSERIES CO., Hereford, showed a grand lot of fruit shown in round baskets, the highly-coloured varieties being very conspicuous. There were large fruits observed of Lady Henniker, Pott's Seedling, Jas. Grieve, Bismarck, British Queen, Beauty of Kent, Prince Albert, Lord Derby, Allington Pippin, Peasgood's Nonsuch, Tyler's Kernel, Loddington, Newton Wonder, Stirling Castle, Bramley's Seedling, King's Acre, Bountiful, Sandringham, C. Ross, Sanspareil, Egremont Russet. The Pears consisted of Conference, Huyshe's Victoria, Doyenné du Comice, Beurré Hardy, Marie Louise, Baron de Mello, Nouveau Poiteau, Pitmaston Duchess. (Silver-Gilt Knightian Medal.) Mr. J. BASHAM, Fair Oak Nurseries, Bassaleg, Newport, Mon., with a fine collection, in which Pears vied in number with Apples. In the size of the fruits, there was nothing to wish for, although in colour we have seen them excelled in other years. The Queen, Newton Wonder, Allington Ribston, Peasgood's Nonsuch, Tamplin (a bright-looking local variety), Graham's Royal Russet, New Hawthornden, Mère de Ménage, Ecklinville Seedling, Baumann's Reinette, and Lady Henniker were among the better kinds of Apples. Pears were fair examples of mostly well-known varieties as Triomphe de Vienne, Beurré Hardy, Durondeau, Hacon's Incomparable (very good fruit this, the only exhibit), Marie Benoist, Doyenné du Comice (excellent), Chaumontelle, Beurré Rouge, Marguerite Marillat (the finest of the sort in the show), Emile d'Heyst, Beurré Fouqueray, Gansel's Bergamotte, Président, and Osmanville. (Silver-Gilt Knightian Medal.) 3rd, Messrs. PAUL & SON, The Old Nurseries, Cheshunt, with a collection of Apples and a few Pears, shown in shallow baskets, the centre row being displayed in vase-like baskets having over them a bow covered with sprays of red and white fruited Raspberries. There were many splendid dishes, of which mention may be made of Peasgood's Nonsuch, Annie Elizabeth, Golden Noble, Gold Medal, Stone's, Cox's Orange Pippin, Warner's King, Emperor Alexander, Bismarck, Cellini, and Mabbott's Pearmain. (Silver-Gilt Banksian Medal.)

DIVISION III.

OPEN TO MARKET GROWERS ONLY.

Twelve feet run of six feet tabling.—In this class the 1st prize fell to Mr. G. H. DEAN, Whitehall, Sittingbourne, for a good assortment of Apples and Pears. Fine examples of Apples were observed in Peasgood's Nonsuch, The Queen, Lord Derby, Bismarck, Golden Noble, Worcester Pearmain, Lane's Prince Albert, Bramley's Seedling, Royal Jubilee, Lady Henniker, Allington Pippin, Gascoyne's Scarlet, Cox's Orange Pippin, Cox's Pomona, Rival, and Ribston. The Pears of fine form and size were Beurré Fouqueray, Roi Charles de Printemps (a massive fruit), Conference, Beurré Bachelier, Marguerite Marillat, Duchesse d'Angoulême, Pitmaston Duchess, and Beurré Superfin. 2nd, Mr. W. POUPART, Marsh Farm, Twickenham. The fruit in this exhibit was displayed rather lavishly in boxes and baskets, and consisted of very finely developed and highly coloured examples of Apples, and of duller coloured Pears. The largest Apples were Mabbott's Pearmain, Allington Pippin, Wealthy, Lord Derby, Wellington, King of the Pippins, Mannington, Peasgood's Nonsuch, Lane's Prince Albert, Bismarck, Striped Beefing, Cox's Orange, Alfriston, Mère de Ménage, Jubilee, Warner's King, Barnack Beauty, Alexander, Hormead's Pearmain, Chas. Ross, Bramley's Seedling. The Pears shown notable for clean skins and fine development were Durondeau, Emile d'Heyst, Comice, Beurré Bachelier, Conference, Beurré Sterckmanns, and Beurré Bosc. 3rd, HEREFORD CO-OPERATIVE FRUIT GRADING SOCIETY (manager, W. H. Press), Eign Street, Hereford. The exhibits in this case were shown in a carefully graded manner in boxes holding three to four layers according to size, with wood-wool or soft paper as packing material. Of the varieties shown, we may name Cox's Orange Pippin, King of the Pippins, Worcester Pearmain, Annie Elizabeth, Ribston Pippin, Devon Reds, Blenheim Orange Pippin, Wellington, &c. Small platefuls of other good varieties were shown. The fruits in the boxes were packed for sale to travel long distances without loss or damage.

Apples, twelve dishes distinct—six cooking, six dessert.—Those who exhibited in Classes 17 and 18 were not admissible.—1st, R. M. COURTAULD, Esq., Knight's Farm, Colne Engaine, Earl's Colne, Essex, with an exhibit consisting of kitchen and dessert Apples, viz., Gascoyne's Scarlet, Lord Derby, Bismarck, Newton Wonder, Peasgood's Nonsuch, Allington Pippin, Lane's Prince Albert; and dessert fruits, well-grown and without blemish of Cox's Orange Pippin, Calville Rouge Precoce, Christmas Pearmain and Mannington Pearmain.

DIVISION IV.

FRUITS GROWN ENTIRELY IN THE OPEN AIR.

(OPEN TO GARDENERS AND AMATEURS ONLY.)

Twenty-four dishes of Apples in distinct varieties, sixteen culinary, eight dessert.—Six exhibits were staged, the best being shown by Lt.-Col. BORTON, Cheveney, Hunton, Kent (gr. Mr. J. Whittle). Colour, size, and quality were all good in this collection. The front row was occupied by dessert varieties—Christmas Pearmain (remarkably fine), Mother, Cox's Orange Pippin, Allington Pippin, &c., and at the back were splendid examples of The Queen, Gascoyne's Scarlet, Lane's Prince Albert, Peasgood's Nonsuch, Mère de Ménage (magnificent fruits), and others. 2nd, R. H. B. MARSHAM, Esq., East Sutton Park, near Maidstone, Kent (gr. Mr. Wm. Lewis), with equally choice fruits, but a trifle smaller; Wealthy, Blenheim Pippin, and Gascoyne's Scarlet Seedling were especially good. 3rd, Mr. HENRY WHITELEY, Marlborough Road, Saint Marychurch, Torquay.

Eighteen dishes of Apples, distinct, including twelve culinary and six dessert varieties.—Three more entries than in the preceding class were seen, the nine exhibits forming a very fine display. The premier place was taken by J. G. WILLIAMS, Esq., Pendley Manor, Tring (gr. Mr. F. G. Gerrish), with fruit of remarkable ... SIR MARCUS SAMUEL, Bart., Mote Park, Maidstone (gr. Mr. W. H. Bacon), followed, and O. E. GOLDSMITH, Esq., Summerhill, Tonbridge, Kent (gr. Mr. C. Earl), was awarded the 3rd prize. Mr. WILLIAMS' best dishes were (dessert) Wealthy, Allington Pippin, Blenheim Pippin, and James Grieve, and (culinary) Peasgood's Nonsuch, Bramley's Seedling, and Mère de Ménage. Christmas Pearmain, Sandringham, and Warner's King were finely shown by Sir MARCUS SAMUEL.

Twelve dishes of Apples, distinct varieties, eight culinary, four dessert kinds.—Four exhibits only were seen in this smaller class, the premier collection being shown by C. R. ADEANE, Esq., Babraham, Cambridge (gr. Mr. R. Alderman). A magnificent dish of Tyler's Kernel was seen in this display, which also contained good examples of Bramley's Seedling, Prince Albert, and Hoary Morning. 2nd, Rt. Hon. WALTER LONG, M.P., Rood Ashton, Trowbridge (gr. Mr. W. Strugnell), with highly-coloured fruits.

Culinary Apples.—The best six dishes of cooking Apples among eight competitors were shown by Lt.-Col. BORTON, Cheveney, Hunton, Kent (gr. Mr. J. Whittle), who showed very large examples of Peasgood's Nonsuch, Belle Dubois, Warner's King, Mère de Ménage, Emperor Alexander, and Lord Derby. 2nd, Hon. JOHN BOSCAWEN, Perranwell, Cornwall.

Dessert Apples.—The best half dozen dishes of dessert Apples came from Lt.-Col. BORTON, and Sir MARCUS SAMUEL, Bart., won the 2nd prize. The premier exhibit contained highly-refined examples of Christmas Pearmain, King of the Pippins, Cox's Orange Pippin, Wealthy, &c.

Eighteen varieties of dessert Pears.—Kentish-grown fruits shown by Sir MARCUS SAMUEL, Bart., eclipsed all others, being larger and of remarkable finish. Beurré Hardy, Marie Louise d'Uccle, Directeur Hardy, Doyenné Boussouch, Emile d'Heyst, Beurré Superfin, and Beurré Bosc were, perhaps, the best examples. 2nd, Mr. W. A. Cook (gr. to Sir E. G. LODER, Bart., Leonardslee, Horsham), the writer of our weekly calendar on hardy fruits. 3rd, Major POWELL-COTTON, Quex Park, Birchington.

Twelve dishes of dessert Pears, distinct.—The Rt. Hon. W. H. LONG, M.P. (gr. Mr. W. Strugnell), had the best fruits among four exhibitors, being followed by Mr. A. BASILE, Woburn Park Gardens, Weybridge. 3rd, Lt.-Col. BORTON, Cheveney, Hunton, Kent (gr. Mr. J. Whittle).

Nine dishes of dessert Pears, distinct.—The only exhibit in this class was shown by F. A. BEVAN, Esq., Trent Park, New Barnet (gr. Mr. H. Parr), and he was awarded the 1st prize.

Six dishes of dessert Pears.—Five good displays were seen in this smaller class, the best being those shown by Mr. A. BENSON, Upper

Yatton, Mersham (gr. Mr. W. Mancy), who had very large examples of Pitmaston Duchess, and high-class examples of Marie Louise, Durondeau, Louise Bonne of Jersey, &c. 2nd, F. E. Croft, Esq., Stanstead Abbotts, Ware (gr. Mr. G. Longhurst).

Stewing Pears.—Sir Marcus Samuel, Bart., secured the 1st prize for the largest fruits, having the varieties, Vicar of Winkfield, General Todleben, and Catillac. 2nd, Major Powell-Cotton, Quex Park, Birchington, Kent. 3rd, Mr. Edward Phillips, 78, East Street, Sittingbourne.

Peaches, Nectarines, and Plums.

Peaches grown out of doors.—Although the season is comparatively late for Peaches grown in the open, the half-dozen dishes staged in a class for a dish of one variety of these fruits showed that good Peaches can be, and are, grown in the open. The dish of Sea Eagle shown by C. R. Adeane, Esq., Babraham, Cambridge (gr. Mr. R. Alderman), was very fine, and almost as good was the dish of Lady Palmerston shown by Lord Hillingdon, Uxbridge (gr. Mr. A. R. Allan).

Nectarines.—Two exhibits only were staged in a class for a dish of these fruits, those shown by Sir C. Swinfen-Eady, Oatlands Lodge, Weybridge (gr. Mr. Jas. Lock), and C. R. Adeane, Esq., Cambridge (gr. Mr. R. Alderman), taking 1st and 2nd prizes respectively, the varieties being Humboldt and Victoria.

Plums.—A class was provided for three dishes of these fruits grown under glass; the response was poor, two competitors only staging. The best was adjudged to be that shown by the Earl of Harrington, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre). His varieties were Transparent Gage, Guthrie's Gage, and Coe's Golden Drop. 2nd, Major Powell-Cotton.

A class was also provided for a similar number of dishes of Plums grown in the open. Major Hibbert, Ashby St. Ledgers, Rugby (gr. Mr. W. Camm), was 1st with three excellent dishes of Monarch, Coe's Golden Drop, and Pond's Seedling. 2nd, J. B. Fortescue, Esq., Dropmore, Maidenhead (gr. Mr. C. Page), with Reine Claude de Bavay, Coe's Golden Drop, and Brahey's Green Gage.

The best dish of Coe's Golden Drop was shown by Mr. Fortescue, and the best dish of any other variety of dessert Plums than Coe's Golden Drop was shown by C. H. Berners, Esq., Woolverstone Park, Ipswich (gr. Mr. W. Messenger), who had a very fine dish of Reine Claude de Bavay.

The best dish of cooking Plums was displayed by Mr. J. Vert, Audley End Gardens, Saffron Walden, who had superb examples of Monarch. 2nd, Major Hibbert, with Magnum Bonum.

Cherries and Grapes from the Open.

The class for Morello Cherries was represented by seven dishes, all generally good, for the late season, but those shown by J. G. Williams, Esq., Pendley Manor, Tring (gr. Mr. F. G. Gerrish), were a trifle the largest and plumpest, and thus gained the 1st prize.

A basket of Grapes from the open.—The present has been a favourable season for Grapes in the open, and the 1st prize basket of Chasselas de Fontainebleau was a remarkable exhibit. The berries were well ripened and finished, and almost as large as when grown indoors. It was shown by E. Ascherson, Esq., Pett Place, Charing, Kent (gr. Mr. J. Pitts), who also showed a basket of Grapes (not for competition) from the open of most remarkable size and quality. The 2nd prize was awarded M. Devenish, Esq., Addington Park, Surrey (gr. Mr. J. R. Smith), for a basket of Gamay Noir.

DIVISION V.

Special District County Classes.

Open to Gardeners and Amateurs Only.

These classes, from which trade growers were debarred, were open to growers in specially-named counties, or groups of counties, having as nearly as could be arranged equal climatic and other conditions. A class was, in each case, provided for six dishes of Apples, in distinct varieties, of which four were to be culinary and two dessert kinds, and for six dessert varieties of Pears.

Open Only to Kent Growers.

This important fruit-growing county was awarded a class to itself. Four exhibits of Apples were staged and two of Pears. The best of the former were shown by Mr. E. Chopping, Milton, near Sittingbourne, who had large and highly-coloured fruits, including Cox's Orange Pippin, Allington Pippin, Bismarck, Lord Derby, Peasgood's Nonsuch, &c. 2nd, H. G. Kleinwort, Esq., Merton Park, near Maidstone (gr. Mr. B. J. Mercer), who showed a superb dish of Annie Elizabeth.

The best Pears were shown by C. G. B. Marsham, Esq., Beechy Lees, Sevenoaks (gr. Mr. R. Edwards). They were not over large, but they had splendid finish, Durondeau, Doyenné du Comice, and Beurré Bachelier being the pick. 2nd, Mr. Edward Phillips, 78, East Street, Sittingbourne, who showed Louise Bonne of Jersey almost covered with red colour.

Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall.

These seven southern counties were represented by seven exhibits of Apples, and only four of Pears. The Apples were generally very fine produce; large, shapely, and well coloured. The best, but not the largest, were shown by B. H. Hill, Esq., Newcombes, Crediton (gr. Mr. G. Lock). Cox's Orange Pippin had a very intense colour, and Bramley's Seedling, Mere de Ménage, and Peasgood's Nonsuch were equally good. 2nd, F. J. B. Wingfield-Digby, Esq., Sherborne Castle, Dorset (gr. Mr. T. Turton), whose fruits included a magnificent dish of Mere de Ménage, the total weight of the six fruits being 7lb. 14oz.; the colour was very pronounced.

Mr. Wingfield-Digby reversed positions with Mr. Hill in the class for Pears, showing Durondeau, Doyenné du Comice, Beurré Superfin, Beurré Alexander Lucas, &c.

Wilts., Gloucester, Oxford, Bucks., Berks., Beds., Herts, and Middlesex.

Rather better competition was seen among these counties, there being nine displays of Apples and six of Pears. J. B. Fortescue, Esq., Dropmore, Maidenhead (gr. Mr. C. Page), showed the best Pears, and Lord Hillingdon, Uxbridge (gr. Mr. A. R. Allan), was placed 2nd, but they reversed these positions in the class for Apples. Mr. Fortescue showed a beautiful half-dozen dishes of Pears, Duchesse d'Angoulême, Beurré Hardy, and Durondeau being almost perfect fruits. The best Apples in the premier exhibit were Cox's Orange Pippin (a splendid dish), Bramley's Seedling, and Peasgood's Nonsuch, the latter being of very large size. The fruit from these counties, taken collectively, was of a high standard of merit.

Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland.

These six counties sent seven exhibits of Apples and the same number of Pears. The premier exhibit of Apples, shown by Hon. W. Lowther, Campsea Ashe, Wickham Market (gr. Mr. A. Andrews), contained one of the best dishes of Peasgood's Nonsuch in the show; Worcester Pearmain was remarkably fine, as was also Gloria Mundi; in fact, the exhibit generally was of a very high quality. The adjoining exhibit, shown by Major Petre, Westwick House, Norwich (gr. Mr. G. D. Davison), was awarded the 2nd prize.

Major Petre easily led in the class for Pears, his examples of Durondeau, Doyenné du Comice, and The Conference were not to be equalled in the section. C. H. Berners, Esq., Woolverstone Park, Ipswich (gr. Mr. W. Messenger), was a very creditable 2nd.

Lincoln, Northampton, Warwick, Leicester, Notts., Derby, Staffs., Shropshire, and Cheshire.

The response was not large from these Midland Counties, and only four exhibits of Apples and two of Pears were seen. Mr John Lee, Higher Bebington, Cheshire, staged the best Apples, and J. Bibby, Esq., Hardwicke Grange, near Shrewsbury (gr. Mr. John Tavlor), the best Pears.

Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke.

Five exhibitors contested in the class for Apples, and the same number in that for Pears. Very large examples of these latter fruits won premier position for G. H. Hadfield, Esq., Moraston House, Ross, Hereford (gr. Mr. J. Rick), W. Maynard, Esq., Holt, Ledbury (gr. Mr. W. E. Hyde), securing the 2nd place for fine fruits of choice varieties. His dish of Pitmaston Duchess was noteworthy. Very high colour obtained in the Apples; some examples of Peasgood's Nonsuch were deep red.

Mr. P. M. Whiting, Credenhill, Hereford, who won the 1st prize, showed a magnificent dish of Allington Pippin. 2nd, Mr. J. Paget Norbury, The Norrest, near Malvern.

Welsh Counties Other than those in the Preceding Class.

This proved a very weak class, Sir George Menrick, Bart., Bodorgan, Isle of Anglesey (gr. Mr. W. Pilgrim), had the best in each section among two competitors in each case.

Six Northern Counties of England and the Isle of Man.

This was another poorly-contested class. John Brennand, Esq., Baldersby Park, Thirsk (gr. Mr. J. E. Hathaway), had the best Apples and the best Pears; his examples of Charles Ross Apple were very fine, as were those of King of the Pippins shown by the Earl of Latham, Ormskirk (gr. Mr. B. Ashton), in the 2nd prize exhibit.

Scotland.

Very few entries were staged, there being only one of Pears and four of Apples. The fruit generally compared unfavourably with that from more southern gardens, but the dessert Apples showed no lack of colour, the examples of Cox's Orange Pippin in the 1st prize exhibit of Mr. James Duff, Threave Gardens, Castle Douglas, had a redder tinge than many from Kent.

Ireland.

The only exhibit of any importance from Ireland was the collection of Apples shown by Clement R. Broad, Esq., Aghern, Conna, co. Cork, Ireland. Grand fruits of Allington Pippin and Charles Ross averaged quite half-a-pound each, and they had splendid finish. Bramley's Seedling was also a fine dish.

W. M. Kavanagh, Esq., Borris, co. Cork, showed the only exhibit of Pears, and the quality was but mediocre.

Single Dish Classes.

Apples.

Dessert varieties.—The best dish of *Adams' Pearmain* among fifteen was shown by B. H. Hill, Esq., Newcombes, Crediton (gr. Mr. G. Lock). *Allington Pippin:* Very large fruits, shown by Major Petre, Westwick House, Norwich (gr. Mr. G. D. Davison), won among nineteen. *American Mother:* Highly-coloured fruits shown by D. J. B. Wingfield-Digby, Esq., secured the 1st prize. *Blenheim Pippin:* This old favourite variety was shown by thirty-two growers; some were quite green, others bright red. The best were small, but exquisitely finished fruits shown by H. G. Kleinwort, Esq., Wierton Park, near Maidstone (gr. Mr. B. J. Mercer). *Claygate Pearmain:* The best of six dishes was that shown by G. H. Hadfield, Esq., Moraston House, Ross (gr. Mr. J. Rick). *Cox's Orange Pippin:* Thirty-three dishes of this variety were seen, Jeremiah Colman, Esq., Gatton Park, Reigate (gr. Mr. W. Bound), taking the 1st prize with large, highly-coloured fruits. *Duke of Devonshire:* The best dish of this variety was shown by Hon. John Boscawen, Perranwell, Cornwall. *Egremont Russet:* Mr. John Lee, Higher Bebington, Cheshire, won with the largest specimens among ten exhibits. *The Houblon:* G. H. Dean, Esq., J.P., Whitehall, Sittingbourne, had the best dish of two. *Lord Grizzle:* The best dish of this variety was shown by Mr. R. M. Whiting, Credenhill, Hereford. *King of the Pippins:* Jeremiah Colman, Esq., showed the best dish among twenty-six. *King of Tompkins County:* By far the best dish was that staged by John Brennand, Esq., Thirsk (gr. Mr. J. E. Hathaway). *Lord Hindlip:* Mr. E. W. Cadbick, Caradoc, Ross, Hereford, was awarded the 1st prize. *Margil:* Fifteen dishes were staged, the differences seen being remarkable, Lord Hillingdon, Uxbridge (gr. Mr. A. R. Allan), was awarded the 1st prize. *Mère de Ménage:* B. H. Hill, Esq., Crediton, had the best dish among

two. *Scarlet Nonpareil:* The largest fruits were shown by the Dowager Lady HILLINGDON, Wilderness, Sevenoaks, Kent (gr. Mr. J. Shelton), and these were awarded the 1st prize.

Culinary varieties.—Alfriston: The best dish was shown by Mr. H. H. WILLIAMS, Pencalenick, Truro. *Anna Elizabeta:* A very excellent dish shown by WINGFIELD-DIGBY, Esq., Dorset, took premier honours. *Beauty of Kent:* B. H. HILL, Esq., Crediton, had the best dish of this variety. *Bismarck:* Mr. H. H. WILLIAMS, Truro, won among a dozen exhibitors. *Blenheim Pippin:* Twenty-eight exhibits were seen, size and colour securing for H. G. KLEINWORT, Esq., Wierton House, near Maidstone (gr. Mr. B. J. Mercer), the 1st prize. *Bramley's Seedling:* A beautiful class; Mr. B. H. HILL, Crediton, won out of fourteen entrants. *Dumelow's Seedling:* JEREMIAH COLMAN, Esq., Surrey, was awarded the 1st prize for this variety having fine fruits. *Emperor Alexander:* The best were shown by B. H. HILL, Esq., Crediton. *Gascoyne's Scarlet:* Mr. HILL was again 1st. *Golden Noble:* Mr. H. H. WILLIAMS, Pencalenick, Truro, won with deeply-coloured fruits. *Grenadier:* Mr. JOHN LEE, Cheshire, had the best dish among four. *Hormead Peasgood:* The 1st prize was easily secured by G. H. HADFIELD, Esq., Moraston House, Ross, Hereford (gr. Mr. J. Rick). *Lane's Prince Albert:* This beautiful variety was well shown by twenty-one growers, the 1st prize going to F. J. B. WINGFIELD-DIGBY, Esq. *Lord Derby:* Mr. JOHN LEE, Cheshire, won for large fruits. *Mere de Ménage:* The last-named exhibitor also staged the best of this variety. *Newton Wonder:* Two classes were provided for this variety, one open to northern and the other to southern growers. G. J. GRIBBLE, Esq., Henbow Grange, Biggleswade (gr. Mr. A. Carlisle), won in the former, and Mr. WINGFIELD-DIGBY in the latter section. *Peasgood's Nonsuch:* CHAS. O. WALTER, Esq., Ickleton House, Wantage, Berks, with a magnificent dish of fruits, secured the 1st prize. *Potts' Seedling:* 1st, F. J. B. WINGFIELD-DIGBY, Esq. *Stirling Castle:* 1st, Mr. R. WHITING, Hereford. *Tower of Glamis:* The best of nine dishes was shown by Rt. Hon. Earl of STANHOPE, Chevening Park, Sevenoaks (gr. Mr. C. Sutton). *Warner's King:* Mr. E. W. CADDICK, Ross, Hereford, showed the best dish among a dozen. Mr. WINGFIELD-DIGBY showed the best dish of any other variety than those named, selecting Hollandbury for this purpose.

DESSERT PEARS

Beurré Alexander Lucas: 1st, F. J. B. WINGFIELD-DIGBY, Esq. *Beurré Hardy:* Mrs. St. V. AMES, Westbury-on-Trym (gr. Mr. W. H. Bannister), had the best dish among thirteen. *Beurré Superfin:* 1st prize was secured by Mr. WINGFIELD-DIGBY, with very fine mellow-looking fruits. *Charles Ernest:* 1st, LORD POLTIMORE, Poltimore Park, Exeter (gr. Mr. T. H. Sladey). *Comte de Lamy:* J. T. CHARLESWORTH, Esq., Nutfield, Surrey (gr. Mr. T. W. Herbert) won with large fruits. *Doyenné du Comice:* Of fifteen dishes, the best was that shown by Mr. WINGFIELD-DIGBY. *Durondeau:* A very handsome class, in which F. E. CROFT, Esq., Stumstead Abbotts, Ware (gr. Mr. G. Longhurst), was easily 1st. *Emile d'Heyst:* The premier dish was shown by Col. Hon. C. HARBORD, Gunton Park, Norwich (gr. Mr. W. Allan). *Glou Morceau:* 1st, Major PETRE, Norwich. *Jacques de Malines:* The best examples were shown by the Earl of PEMBROKE, Wilton House, Salisbury (gr. Mr. T. Challis). *Le Lecteur:* The smallest but best finished fruits shown by J. B. FORTESCUE, Esq., Dropmore, Maidenhead (gr. Mr. C. Page), were awarded the 1st prize. *Louise Bonne of Jersey:* 1st, Col. SANDFORD, Chipley Park, Wellington, Somerset (gr. Mr. S. Kidley), among 14 entrants. *Marie Louise:* 1st, Col. Hon. C. HARBORD. *Nouvelle Fulvie:* 1st, Mr. WINGFIELD-DIGBY. *Pitmaston Duchess:* Thirteen dishes were staged; the largest and finest were shown by A. P. BRANDT, Esq., Castle Hall, Bletchingley, Surrey (gr. Mr. J. W. Park), and these were given the 1st prize. *Président Drouard:* 1st, Col. H. C. HARBORD. *Thompson's:* 1st, Mr. WINGFIELD-DIGBY, among three. *Winter Nelis:* A well-contested class, ten dishes being staged, the best of Major PETRE, Norwich.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 9.—*Present:* Dr. M. T. Masters, F.R.S. (in the chair); Rev. Prof. Henslow; Messrs. G. Massee, E. M. Holmes, F. J. Baker, R. A. Rolfe, J. T. Bennett-Poe, C. H. Hooper, G. S. Saunders, and F. J. Chittenden (hon. sec.).

The Late Prof. Marshall Ward.—The following letter from Mrs. WARD to the Chairman was read, and ordered to be inscribed on the minutes.—"Will you kindly convey to the members of the Scientific Committee of the Royal Horticultural Society the gratitude of myself and my children for their kind sympathy and appreciation. Such an honour truly reflects the esteem in which my dear husband was held by his colleagues, and we greatly prize the expression of it from your society. Permit me also to convey our thanks to you personally as chairman."

Blisters on Pear Leaves.—Mr. G. S. SAUNDERS reported that the blisters on the Pear leaves from Ulverston, shown at the last meeting, were the work of the caterpillars of a small moth, one of the Tineinæ, which burrows between the skins of the leaves, feeding on the parenchyma of the leaf. The insect pupates in the soil. Removing the surface soil to the depth of 2 inches and burning or burying it deeply would probably prevent the tree from being attacked again next year. If the tree is infested next season, the affected leaves should be picked off as soon as the attack is noticed; spraying would not be of any use.

Imperfectly-formed Acorns.—Mr. SAUNDERS showed some Acorns in which the growth had evidently been arrested at an early stage. They were from Quercus rubra. No member present knew whether the species produced perfect fruit in this country, but it was thought that the arrest of growth was due to uncongenial climatal conditions.

Intoxication of Bees.—Mr. SAUNDERS also showed some bees, received from a correspondent, which had become stupefied while searching for nectar in the flowers of Kniphofia. They had been unable to make their way out of the tube of the flower and so had perished. Other bees and wasps had obtained the nectar through holes at the base of the floral tube, and had likewise become stupefied, and had fallen to the ground, but, gradually recovering, ultimately quite revived. Mr. MAYSEE said he had frequently noticed the same thing at Kew, and had also seen the wasps eat their way out of the tube after being imprisoned, but had never observed bees doing this.

Æcidium on Abies.—Mr. SAUNDERS showed leaves of Abies Pinsapo having numerous æcidia of the fungus formerly known as Æcidium pseudo-columnare, the white pseudo-peridia of which occur in two rows on the under surface of the affected leaves, which are somewhat paler than the healthy ones, and stand like little cups one-eighth of an inch in depth. The teleuto spore stage is known as Melampsora Caryophyllacearum.

Bulbils on Horseradish.—Rev. Prof. HENSLOW showed an inflorescence of Horseradish with abortive flowers, and upon which were numerous bulbils replacing the flowers.

Cleistogamous Flowers.—He also showed runners of Viola which had during the summer produced cleistogamous flowers only, but which were now bearing normal flowers, thus bearing out the observation he had before made that the production of cleistogamous flowers was largely due to climatal conditions. (Origin "Floral Structures," p. 262.)

"Grit" in Apples and Pears.—Adverting to this subject, which formed the text of a communication at the last meeting, Prof. HENSLOW said: "The theoretical origin of grit I would attribute to the breaking down of the 'stone' of such a fruit as that of Crataegus. In the formation of an 'inferior' ovary by the fusion with the ovary of a receptacular tube (calyx tube), the *inner* epidermis of the tube (as in Prunus), and the *outer* one of the ovary, are totally arrested; so that the central parenchymatous tissues of both are fused into one common layer, the 'pseudocarp.' In forming the fruit of the Pear or Apple there is no true epidermis *inside* the ovary cells; but the core consists of *two* fibrous layers continuent with the external parenchyma. If there be a stone as in haws, this is usually described (as is also a cartilaginous core) as the endocarp. As, however, there is now no true mesocarp, and the stone is only lined with a thin fibrous layer, I would regard this latter as the homologue of the core of a Pear from which the stone is gone. As this is produced by the formative tissue of the pseudocarp (which is continuous from the core to the epidermis), it might be either carpellary or axial; as 'grit' it may be found anywhere.

"Another suggestion in support of the theory arises from affinities. The tribe Pomeæ has nine genera; five have stone fruits, three have berries; one, Pyrus, has 'a cartilaginous, very rarely a crustaceous or bony endocarp'—(Bentham and Hooker). Hence the stone-fruit genera form the majority and probably the ancestral condition; but the stone, or sclerenchymatous cellular tissue, being more or less arrested, has given rise to the baccate instead of a drupaceous fruit, and to a cartilaginous core. If we turn to the tribe Potericæ, of the ten genera included in it at least four have an 'indurated' receptacular tube; while that of Margyricarpus is described as 'coriaceous or nucumentaceous'; and of Bencomia it is said 'the achenes are "closely invested" (arcte concreta) by the globose calyx tube into a drupe with a somewhat bony stone (putamine subosseo).' If, now the tube of the Plum should ever become concrescent with the ovary, we should know that the stone was of a carpellary nature. But, if the tube were similarly fused in Bencomia, we should be wrong if it were equally referred to the ovary."

Beetles in Beech.—Dr. MASTERS exhibited a piece of copper Beech wood much bored by beetles, together with specimens of the beetles, upon which Mr. SAUNDERS will report at the next meeting (see page 284).

Potato perforated by Twitch.—Dr. MASTERS also showed a good example of this peculiarity, which is frequently met with. Some discussion took place as to whether the perforation was due to the dissolving action of an enzyme from the tip of the Twitch rhizome or merely to mechanical pressure of the growing shoot of the grass.

Galls on Salix alba.—Mr. CHITTENDEN showed a branch of the white Willow, in which all the buds had become aborted, and produced masses of small leaves, probably through the attacks of a mite.

Fasciation.—He also showed a specimen of Daphne Laureola very much fasciated, and having very small leaves, so that the whole had much the appearance of a green Cockscomb.

Apples and Pears Diseased.—Apples and Pears attacked by Fusicladium were sent from Chigwell. The Apple had very numerous spots just below the skin, but the cracks and roughnesses usually associated with Fusicladium were not apparent.

GARDENERS' DEBATING SOCIETIES.

BECKENHAM HORTICULTURAL.—An enjoyable evening was spent by the members and friends of this association at the Church House, Beckenham, on October 12, when Mr. M. E. Mills gave a lecture, entitled "Coombe House Gardens." The lecturer gave many beautiful lantern views, taken both in the gardens and in the glass-houses, especially beautiful being the spring and rock gardens.

HOYLAKE, WEST KIRBY, CHESHIRE, AND DISTRICT HORTICULTURAL.—The first of a series of lectures in connection with this society was delivered before a largely attended meeting in the Tynwald Hall, on Thursday evening, the 4th inst., by Mr. R. Horne, of Dawpool, the subject being "The Supplying of Cut Flowers." The chair was occupied by H. J. Falk, Esq., M.A. Mr. Horne described the best and most suitable subjects or species of flowers for personal, domestic, and ecclesiastical decorations. Mr. Horne dealt fully with each subject, describing the origin, dates of importation, the Greek, Latin, and English names of each plant, giving the different times of their flowering, the growing and resting seasons, the application of manures, &c. He also showed how and when to cut the flowers to last the longest time in water. He concluded his lecture with an interesting description of Clematis indivisa lobata. *A. P.*

EGHAM AND DISTRICT GARDENERS'.—The first meeting of the winter session of this society was held on Wednesday, October 3, Mr. A. Sturt in the chair. A large number of members were present to hear Dr. Russell, D.Sc., from Wye College, give a lecture on manures. The lecturer commenced by explaining the meaning of the word manure, and then proceeded to describe the methods of applying manures to the soil from the earliest times to the present day. The manurial substances dealt with were nitrogen, potash, phosphates, sulphates, and lime. The lecturer explained how and where these manures were obtained, how they are assimilated by the plants, and the best kinds for the different soils. The lecturer pointed to the great value of applying lime to soils in which this element is deficient. This lecture is the first of a course of three on manures given under the auspices of the Surrey Education Committee. *F. J. W.*

CHEQUERS COURT, BUCKS.

CHEQUERS PARK, the residence of T. M. Clutterbuck, Esq., is charmingly situated in the centre of Buckinghamshire, some three miles from the small but ancient town—once a parliamentary borough—of Wendover, and about five miles from the county town of Aylesbury. The park consists of about one thousand acres, and comprises hills that attain almost to the dignity of mountains, with sheltered valleys and romantic walks. At the entrance to the park at Great Kimble stands a picturesque lodge covered with creepers and Roses, the ornamental brickwork and twisted chimneys testifying to its antiquity. The drive as it rises from the lower ground to the summit of the hill, in a slight undulation in which the mansion is situated, follows a circuitous route to avoid the steepest gradients, and glimpses of magnificent but constantly varying scenery are obtained. At one moment the lower, richly-wooded slopes, then the severer outlines of the hills, with small trees stunted and gnarled by the fierce easterly winds that in spring and winter oft-times rush through the defiles. Chequers Court is a fine Elizabethan red-brick structure, the colour of the bricks being toned to that delightful neutral tint that age only can produce. It was once surrounded by a moat—a portion of which remains—for were not the inhabitants of the Chiltern Hundreds notorious for their outlawry? and the place needed protection. A prison chamber is still in existence, where, no doubt, evil-doers were consigned whilst awaiting their removal to the county jail. The house also possesses great historical interest as being frequently the residence of the Great Protector, whose fifth daughter married, as her second husband, Sir J. Russell, whose descendants are still the owners of the estate. From whatever aspect viewed, the mansion presents an interesting appearance, though the portion facing south is the most imposing in appearance. The family escutcheon adorns the wall, the striking motto, "Justum tenax," being engraved in letters of stone. Covering the lower parts of the wall are creepers and plants entirely in harmony with the architectural features—good specimens of Wistaria, Honeysuckle, Jasmine, Provence Roses, Rosa devoniensis, the pretty Rêve d'Or Rose, with others. Facing to the south is the lawn, the grass comprising which is in that splendid condition often met with on old English estates. The severity of the lawn is relieved by groups of pillar Roses of the usual climbing varieties, while a portion of the greensward is broken up to form a garden that is laid out in the Italian style. A fountain and basin are also to be found in the centre of the greensward, in which are some choice Nymphæas and other aquatic plants. I must not forget to mention that here are the remains of a gigantic Elm associated with the name of King Stephen. The trunk is but a few feet high, though a slight bronze still testifies to its vitality. The larger branches fell some two hundred years since, and from a portion of these a splendid cabinet was made. A document states that at the time the limbs fell the trunk of the tree was 27 feet in circumference. Near the tree is a good specimen of Liriodendron tulipiferum, which at the time of my visit was in full flower, as was also the herbaceous border on the north of the mansion. Against a background of Lilacs was a long line of noble Delphiniums, and in front Iceland Poppies, Japanese Iris, Tritomas, Pampas Grass, Lilium candidum, Hollyhocks, Helianthemums, and a good selection of Sweet Williams (Pink Beauty being especially noticeable). Antirrhinums, Francoas, Eryngium amethystinum, Spiræa astilboides, Lychnis chalcedonica, and many other subjects. In the vicinity are fine specimens of ancient Yews, in age no doubt contemporaneous with, or even older than, the mansion, also some splendid specimens of Crataegus. The trunk of one specimen of Crataegus orientalis measured 4 feet 4 inches in circumference 3 feet from the ground, and the tree was 25 feet high; while another of Crataegus punctata measured no less than 5 feet 6 inches round trunk, and the branches covered an area of 32 feet. Unfortunately, the branches broke in spite of supports, though healthy-looking growth is springing from the base.

Before describing the garden and the park, I will briefly indicate the treasures the Court contains. The state apartments are spacious with groined ceilings, carvings, and galleries, the light being admitted through stained glass windows exhibiting armorial bearings and other heraldic designs, on the walls being the family portraits, some by eminent painters: ecclesiastics and warriors, fair Lolies and gallant gentlemen, the two most important being those of Oliver Cromwell—one when he was in his prime, the other when a child. On the walls, too, are placed flags and banners, many of which have a national as well as a local interest. The cabinets, armour, clocks, fireplaces, doorways, &c., would delight a connoisseur.

The locality appears to be suitable for the cultivation of the Rose. I noted in the rosary good specimens of the varieties Marquise Litta, Viscountess Folkestone, Mdme. Victor Verdier, Frau Karl Druschki, Papa Gontier, Senateur Vaisse, Caroline Testout, Mdme. Abel Chatenay, Gloire Lyonnaise, Mrs. John Laing, Bessie Brown, Killarney, and many others.

The rockery is picturesque, and must be a beautiful object nearly the whole year. In the spring, flowers Narcissi, Primulas, &c., while later are to be found splendid specimens of Osmunda regalis, many indigenous Ferns, a good selection of Sedums and Campanulas, Hypericums, Bambusas, while Tropæolums, and the old Dundee Rambler Rose roam at will.

In the vineries the Grapes looked healthy and were bearing good crops, the varieties principally grown are Black Alicante, Black Hamburg, and Muscat of Alexandria. Melons looked well, and were of good size and well netted, the variety affording the largest quantity of fruit being Hero of Lockinge. Cucumber plants in frames were well fruited, Sutton's Matchless being remarkably prolific.

The greenhouse contained a magnificent display of Begonias, Streptocarpus, Achimenes, Liliums, Stephanotis, Plumbago capensis, Fuchsias, Zonal Pelargoniums, and many other subjects. There was also a small but choice collection of Cœlogynes, Dendrobiums, and other Orchids. The plants appeared very healthy. In the fernery were good specimens of Adiantum and other exotic Ferns, Dracænas, Palms, Asparagus Sprengeri and A. decumbens, Hoya, &c.

On proceeding to the fruit and kitchen gardens I was shown a handsome Box hedge 4 feet through. On the walls enclosing the gardens hung fair crops of Early Rivers, Princess of Wales and Royal George Peaches, also a good crop of White Heart, May Duke, and Morello Cherries. Pears were also doing very well, the varieties Doyenné du Comice, Williams' Bon Chrétien, and Louise Bonne of Jersey appearing best. The Apple trees have also a considerable quantity of fruit, though the trees suffered from the inclement spring. Of bush fruit, Currants, both red and black, were bearing a remarkable crop, the variety Magnum Bonum especially; also Raspberries, while there was a good prospect of an abundance of Cob nuts. Strawberries (Waterloo, Royal Sovereign, and President) had borne excellent crops. Gooseberries had not done well.

The vegetables also appeared in the best condition. In the vegetable garden stood an old-world picturesque retreat yclept the Shepherd's Lodge, reminiscent of a time when poets sang of the delights of country life, and ladies and gentlemen masqueraded as "gentle" shepherds and shepherdesses. Here, too, was a number of the best varieties of Chrysanthemum in pots, full of promise of beauty for the autumn and early winter.

To the lover of trees the park affords endless pleasure. As is to be expected in Buckinghamshire, the Beeches are of great height, the trunks and principal branches being of massive size, and covering an unusual amount of space. Limes, too, grow in profusion, and, being in full bloom at the time of my visit, the atmosphere was laden with their perfume. An avenue of fine specimens of Limes was indeed a feature of the landscape. There was also a handsome avenue of Walnut trees. The timber on the estate consists principally, in addition to the above, of Elms, Oak, Pines, Weeping Beech, Sycamore, Laburnum, Lilac, Spanish Chestnut, Copper Beech, Cedars, Hollies in variety, &c., Planes; Hazels, Dogwood, Brambles, Honeysuckle, Syringas, &c., formed the undergrowth.

Wild Strawberries were growing, and are to be gathered in their season by the million, while in spring-time Primroses, sheets of Bluebells and Anemones cover the ground. A great feature is the size to which the Box trees attain. These average from 10 to 14 feet in height, with a girth of some 15 inches. In the hollows and damper portions of the woods an admirer of Mosses could gather an interesting collection. The park is a sanctuary for birds, while squirrels, rabbits and foxes also abound.

The unrivalled views both from the valleys and summits of the hills form a unique feature of the estate; indeed, it would be difficult to conceive fairer scenes in this beautiful island of ours. Standing on Baccombe Hill (on which the beacon fires were of yore kindled to apprise the immediate countryside of the occurrence of significant events, or to form a link in the transmission of news of national importance), the summit golden with Stonecrop, Sedum acre, and fragrant with Wild Thyme; on the right Coombe Hill, between 900 and 1,000 feet above the sea-level, on the summit of which is erected the monument, in view of half a county, to the men of Bucks who jeopardised and lost their lives in the late Boer war; to the left, hill succeeding hill, on one of which is Whitecate Cross, formed by the exposure of the chalk substratum, the significance of which is lost in the mists of antiquity. The hill on which we stood for half its height is clothed with magnificent English forest trees rising out of an underwood of Box, while beyond stretches the Vale of Aylesbury, thirty miles in breadth, the old county town indicated but by a mist while the church tower appears as a shadow. In front for some distance the fields are marked by hedgerows like a map, then all is merged, and the eyes wander on till they rest on the hills forming the western boundary of the Vale, and still others are to be discerned in the misty beyond, yet with no obstruction between Baccombe Hill and the western side.

The gardens are under the care of Mr. E. F. Thorne, who must be congratulated on the appearance of every department. *R. T. Hesketh.*

ORCHID NOTES AND GLEANINGS.

CYMBIDIUM ERYTHROSTYLUM (ROLFE).

THE illustration at fig. 115 represents a flower of this beautiful Cymbidium, which was imported from Annam by Messrs. Sander & Sons, through their collector Micholitz, and which flowered for the first time in cultivation in the Royal Botanic Gardens, Glasnevin, Dublin, last year.

At the meeting of the Orchid Committee of the Royal Horticultural Society, on October 9 last, a First Class Certificate was awarded to the plant, a noble specimen of which, with two spikes of five flowers each, one of six and one of seven flowers, was shown by J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), and a smaller plant of it by J. Bradshaw, Esq., The Grange, Southgate (gr. Mr. Whitelegge).

Cymbidium erythrostylum is a valued acquisition, its slender arching leaves constituting it a graceful plant, even when not in bloom, and its flowers, in point of beauty, rank with the best of the genus. The blooms are white, with a slight pink tint, and a few obscure pink spots at the base of the petals. The lip is yellowish, with red-purple lines, and the column crimson.

FIG. 115.—CYMBIDIUM ERYTHROSTYLUM.

LÆLIO-CATTLEYA EXONIENSIS.

A FINE specimen of this well-known hybrid is now in bloom in Sir Trevor Lawrence's collection at Burford. The plant is part of the original specimen which first flowered with Messrs. James Veitch & Sons in 1866, being purchased from them ten years later. The plant at Burford has 52 pseudo-bulbs, each of which is carrying a fine healthy leaf. There are nine leading growths, four of which are now flowering, three have recently bloomed, and the remaining two have flower-spikes just pushing through. It is interesting to note that notwithstanding the numerous fine hybrids which have been raised of late years, L. c. exoniensis × is still one of the most beautiful of its class. In one of the warmest houses at Burford a side stage is filled with about 80 plants of the bright cinnabar-scarlet flowered Habenaria pusilla (militaris). Every plant has produced a flower-spike, a large proportion of them, especially the dwarfer varieties, having exceptionally large heads of bloom. Arranged with them are several plants of the flesh-coloured H. carnea, the pure white H. Susannæ, and the curious but interesting H. longibracteata, which altogether make a very charming display. These Habenarias are well worthy of attention as amateur's Orchids, and it is surprising they are not more extensively cultivated. *W. H. W.*

COLONIAL NOTE.

CEYLON BOTANICAL GARDENS.

FROM the official report for 1905 we learn that great improvements were made at Peradeniya in 1905, chiefly by the opening up of the land east of the fernery to extend the flower garden. This work has been projected for years, but, owing to the presence on the land of unique specimens, has not been previously possible of accomplishment. The east drive has been closed from the fernery to the Royal Palm avenue, and a driving road opened in its place down the Palmyra avenue. The land east of the fernery up to the Bat drive has been partly laid out with walks and flower beds. It is intended to still further extend the flower garden here in 1906.

The branch garden at Badulla was closed in February, and that at Anuradhapura will be closed early in January, 1906, the movable plants being transferred to Maha-iluppalama, where it is intended to open a botanic garden on a small scale on some of the land between the Experiment Station and the superintendent's house. This is at present covered with jungle, and it is intended to cut paths through this and label all the important trees in it to serve as a guide to the "dry" flora of Ceylon, and to plant the forest trees and plants on a clearing in it. These two branch gardens, which were opened by the late Dr. Trimen, have, unfortunately, in no way fulfilled their purpose. The department will now be much more concentrated, and all the stations will be under control of Europeans actually residing upon them, excepting only Henaratgoda and Jaffna and Nuwara Eliya, all of which will be under pretty constant supervision.

HARDY FLOWERS.

ARCTOTIS GRANDIS.

THIS comparatively new annual has done remarkably well this season, the dry weather appearing to suit its requirements, for it has produced quite a wealth of blossom since the end of June. The individual flowers are about the size of a florin, and they are pure white, with a lilac disc. The plant branches freely, and the flowers can be cut with a goodly length of stem, thus enhancing its value for decorative purposes. Towards evening the flowers close, which is not in its favour. I intend using it as dot plants for a large bed next year, where, with an undergrowth of Henry Jacoby Pelargonium or intermixed with the scarlet Lobelia Queen Victoria, it will show to much advantage. Visitors to these gardens inform me that it seeds freely, and the self-sown seedlings come up in numbers the following season. It has not done so here, however, although this autumn I have gathered a quantity of ripe seed, which should be sown by the middle of March, and be placed in a temperature of 60° if plants are required that will flower early in the following summer. Do not apply too much moisture to the seed pans until the seedlings are well through the soil, for the seeds are very woolly, and much of it would damp off. *J. Mayne, Bicton.*

CONNAUGHT PARK, DOVER.

Many visitors to the ancient Cinque Port, we expect, never penetrate to this delightful spot. Access to it is not altogether easy for the stranger however familiar it may be to the resident. Moreover, the "parade" and the piers and other seaside amenities have greater attractions for the multitude destined to live in great cities than have inland resorts; nevertheless, those who scale the steep slopes on which this park is placed will be amply rewarded for their pains. In the first place there is the noble castle, which dominates everything in Dover. On the opposite side of the valley in which the town is ensconced are the imposing "heights," strongly fortified, and then, stretching away inland, are range after range of swelling downs, together with isolated hills, so bold as to call up visions of Mid Wales rather than of East Kent. Commanding this noble prospect is Connaught Park. It occupies, as we have said, the somewhat precipitous slopes to the west of the castle, and is arranged in a series of artificial terraces at different levels, but all connected one to another. Entering at the highest level, the visitor sees before him a straight walk some three-quarters of a mile long. From this terrace the views over the surrounding country are imposing. The terrace itself is sheltered from the bleak winds by a thick belt of Austrian Pines, which are doing well. At their base runs for the whole length of the terrace a herbaceous border—an ambitious effort. The dry season and the drier soil—little but bare chalk—are not altogether favourable to the growth of herbaceous perennials, which do not grow with the vigour which they manifest on a richer, moister soil. Nevertheless, even on the last day of September there was a satisfactory show of flower, among which the numerous varieties of Nicotiana Sanderæ were very noticeable. Every shade of colour from white to deep purple was to be seen, and, in particular, one plant with flowers of the richest, brightest crimson. Sunflowers, Chrysanthemums, Antirrhinums, Riverslea Asters, Plumbago Larpentæ served to make the border still gay.

On a lower level are croquet lawns and space for games, as well as a separate quarter set apart for children's use. Unfortunately, the children seem to prefer to get in the way of their elders, and in their gambols to make havoc of the flower-beds and shrubberies. For the general welfare of the visitors and of the plants it would be well to keep the little darlings to their own playground, where they might shriek their loudest and exercise their limbs to the fullest extent, without injury to plants or annoyance to their elders. At a still lower level are well-kept lawns, with a small piece of water; ribbon beds of Pelargoniums, Begonias, Lobelias were past their best, but one long belt of single Petunias, covering a sloping surface, must be mentioned as being quite one of the most beautiful and effective things of the kind that the writer has ever seen. The individual plants and flowers were not large, but, in the mass, they were most effective, and of all shades of colour from white to crimson and purple. There was some correspondence in the *Times* lately as to the relative merits of the wild and cultivated forms of garden-plants. We think that the severest botanist would acknowledge the surpassing beauty of these Petunias, and those of us who know what the wild form is like must acknowledge with thankfulness the gardener's art and its suitability to the surroundings.

We do not know the gardener's name, but we may cordially congratulate him on the successful manner in which he deals with a garden, the management of which must, from the nature of the environment, offer no little difficulty. We may suggest that more labels are desirable, and that efforts should be made to introduce a larger variety of shrubs known to flourish by the sea. Experiments could be made in this direction at little or no extra cost, and they would furnish a grateful variation to the too plentiful Euonymus.

Dover has another small recreation ground tucked away behind the Town Hall, and also not easy of access. It is simply a square enclosure with a bowling green and borders of herbaceous plants. A small and very dirty stream—it used to be pellucid once—traverses the garden, and by its sides a small rockery has been formed for "Alpines" and similar plants, some of which are labelled. *The Rambler.*

Fig. 116.—The fountain-lawn in the Connaught Park, Dover.

NATURAL VARIATIONS OF GERBERA JAMESONI.

It will probably surprise many, as it certainly surprised me, to learn that Gerbera Jamesoni, the Barberton Daisy, in its natural habitat, occurs not only with red flowers, but also with white, pink, amber, and yellow blossoms. It is wild in the De Kaap Valley, where it was first found by Mr. Jameson, of Natal, who sent it to Mr. Tillett, of Norwich, with whom it flowered in 1887, and it was shortly afterwards figured in the *Botanical Magazine*. Mr. A. E. Graham-Lawrance, of Barberton, who called at Kew a short time ago, assured me that he had collected wild forms of G. Jamesoni with flowers of white, pink, yellow, and other colours. The yellow-flowered variety known as "Sir Michael" was, I understand, introduced from the Transvaal to the Cambridge Botanic Garden, and, by crossing it with the red form, Mr. Lynch obtained his seedlings of various shades of colour. The significance of Mr. Graham-Lawrance's information, here given, is that nature has produced a number of wild, coloured forms similar to those originated at Cambridge. There are so few species in nature with flowers showing much colour variation that this case of the many-coloured Barberton Daisy is interesting. The Barberton Daisy is found wild only in De Kaap Valley, at the headland of which lies Barberton. It has a rhizomatous rootstock, whipcord-like roots, pinnately-lobed, dark, green leaves, and flowerstalks which spring direct from the rhizome. The blooms are bright red, and attain a size of 5½ inches in diameter. The plant is a greedy feeder, thriving well in a loamy soil mixed with sand and rotten stable manure. Here it sprouts with the first spring rains, and blooms almost without intermission till the end of summer, dying down in autumn. Sometimes, in places free from frost, plants will start growing again in the winter, if watered. In addition to the red-flowered one, there are wild forms with yellow, white, white suffused with rose, salmon, terra-cotta, maroon, buff, and peach-coloured flowers. These have all been gathered in the creeks here, and are, no doubt, natural hybrids or crosses. They are like G. Jamesoni in habit and foliage. There are two other species of Gerbera here, one with serrated leaves and pink or yellow flowers, the other with oblong elliptical leaves and ivory white flowers with blackish discs, like little Marigolds. I have myself raised a new variety from seeds, which I have named King Sol. It is of the Jamesoni type, the scape is 22 inches high, the flower 4½ inches across, quite round, erect, coloured rich terra-cotta red, shaded amber. *W. W.*

APRICOTS.

THE cultivator is often called upon to explain the reason why whole shoots and branches die back—and in some cases the trees also—simultaneously and without warning. It is difficult to give a satisfactory reason, for a variety of causes will bring the dreaded evil about. Undoubtedly the chief cause is that at some stage of the tree's growth it has received injury to the shoot which fails either by being twisted in the nursery, from a blow of the hammer when nailing the tree, or from a too tight tie which has cut into the branch and set up gumming. Excessive use of the knife will also cause the mischief, as will also excess of manure, for soil which is too rich in organic manure is prone to cause this evil. Even when all the above evils are avoided, the branches often die, and this must then be attributed to some constitutional cause. The cottager appears to be the man who can claim the greatest success with the Apricot, and his trees are often planted in the ordinary soil of his garden, without any special preparation, against the warmest side of his house. His trees receive no attention, except that the shoots are nailed to the wall, and the superfluous growth removed, which under the circumstances is very little. Planting in the right medium and with efficient drainage and porosity of the soil, are the foundation of success in Apricot culture. Under all circumstances a free mixture of mortar rubble, old plaster, broken tiles, bricks, or oyster shells should be incorporated with the soil; no manure of any description is necessary; in fact, it is fatal to the welfare of young trees, and only when the trees have exhausted all the available food supply in the soil, so that their growth becomes stunted, or when they are maturing a heavy crop of fruits, should manure of any kind be given, and then it should consist of diluted manure water, followed by a heavy mulching of stable litter. Lime is essential to all stone fruits, and where there is a deficiency of this element in the soil, it should be applied during the winter and spring months.

PRUNING.

Pruning is a matter needing careful consideration and much practical skill, for the less the knife is brought into use, the less will be the chances of the tree gumming.

Apricots, in common with most trees bearing stone fruits, are not benefited by much cutting, especially after the foliage has fallen. What little pruning will be required should be performed through the summer, finally finishing during the month of September. The fruit-buds are principally formed on spurs, and the formation of the latter must be induced by the cultivator's skill. In the spring, when the trees commence to grow, disbudding is necessary, for to leave all the growths that form would cause a congested state of growth. Strong shoots that were laid in for extension purposes or for filling blank spaces on the wall will make a large number of lateral growths; any of these that are not required should be rubbed off with the finger and thumb before they get too large, leaving a space of from 4 to 6 inches between those that are left. Shoots not required for extension purposes should be pinched back to four leaves; they will break into growth again, but the secondary growths must be similarly pinched back to two or three eyes, repeating the operation if necessary. After the fruit is gathered, and before the leaves develop their autumn tints, these summer growths must be shortened with a sharp knife to two or three eyes of the first made growth. These spurs will form fruit-buds, from which strong flowers and fruits will be produced the following season. If any of the shoots are required for covering blank spaces on the wall, they should be laid in as growth progresses so as to become thoroughly hardened. When the fruit commences to colour, or even before, these strong growths must be shortened, thereby giving the fruit the extra sap. The proper length to shorten these growths depends on circumstances, but two-thirds may be regarded as usual, for if too great a length is left, the base of the shoots will remain barren of fruit-spurs, and these will not form subsequently.

STOCKS.

The stocks on which the Apricot is grafted are usually the Mussel and the Mussel Plum. I have, however, seen them worked upon the Myrabolan Plum with not altogether satisfactory results, and because the hard, woody nature of this stock does not allow of a free union between the scion and the stock; consequently in a few years' time, the tree either becomes stunted in growth or dies.

VARIETIES.

The varieties of Apricots have increased in number considerably of late years; several of them have evidently emanated from Moorpark as seedlings. Some sorts are not to be recommended, for they are rather shy croppers. Possibly one of the best which has come under my notice among many kinds grown is Luizet. This produces very large, round fruits, of first-class quality. The tree is a vigorous grower and a good cropper. One of the most attractive and at the same time free-bearing kinds is Oullin's Early Peach. The fruits are of first-class flavour and are singularly attractive by reason of their bright red cheek. St Ambroise is a very large fruited kind, larger even than Grosse Pêche and quite equal in flavour. Moorpark by some growers is considered still the best flavoured Apricot, but the tree is certainly not so hardy as Hemskerk or Kaisha; this latter kind is a very free cropper. Powell's Late has, similar to Early Peach, fruits of a very high colour. The tree is a very prolific bearer, and the foliage is strong and healthy and of a dark green colour. This variety bears its fruits in clusters, and in these gardens proves to be a good hardy variety. I have grown other kinds, but I cannot name any that are better than those I have mentioned. *W. H. Clarke, Aston Rowant, Oxon.*

DIOON EDULE.

THERE are fine examples of this handsome Cycad in the Palm house at Kew, both sexes being represented. That illustrated at fig. 117 is a female plant, which bore a fine cone two years ago. The spread of the leaves is fully 10 feet across, the stem being about 3 feet in height and the cone 1 foot in length. It is probable that this and the other largest plant at Kew are two of the original introductions by Messrs. Loddiges of Hackney, who imported stems of this Dioon from Mexico about 60 years ago, when the genus was first described by Dr. Lindley. It was introduced from Mexico by a Mrs. Lavater, who presented to the Royal Horticultural Society a living stem and cone which were recognised by Lindley as being quite distinct from the other genera of Cycadeæ then known. The male plant differs from the female only in having a narrower cone and differently formed scales.

There is only one other species of Dioon known, named D. spinulosum, also a native of Mexico, but it was not described until 1883, when it was introduced into Kew. There is now a splendid specimen of it in the Palm-house which formed the subject of a supplementary illustration in the *Gardeners' Chronicle*, June 17th, 1893, under the name of D. pectinatum. This is a handsomer plant than D. edule. Where space can be afforded for them the Dioons are worth cultivation, as they are noble of aspect and very good-natured under ordinary treatment.

TREES AND SHRUBS.

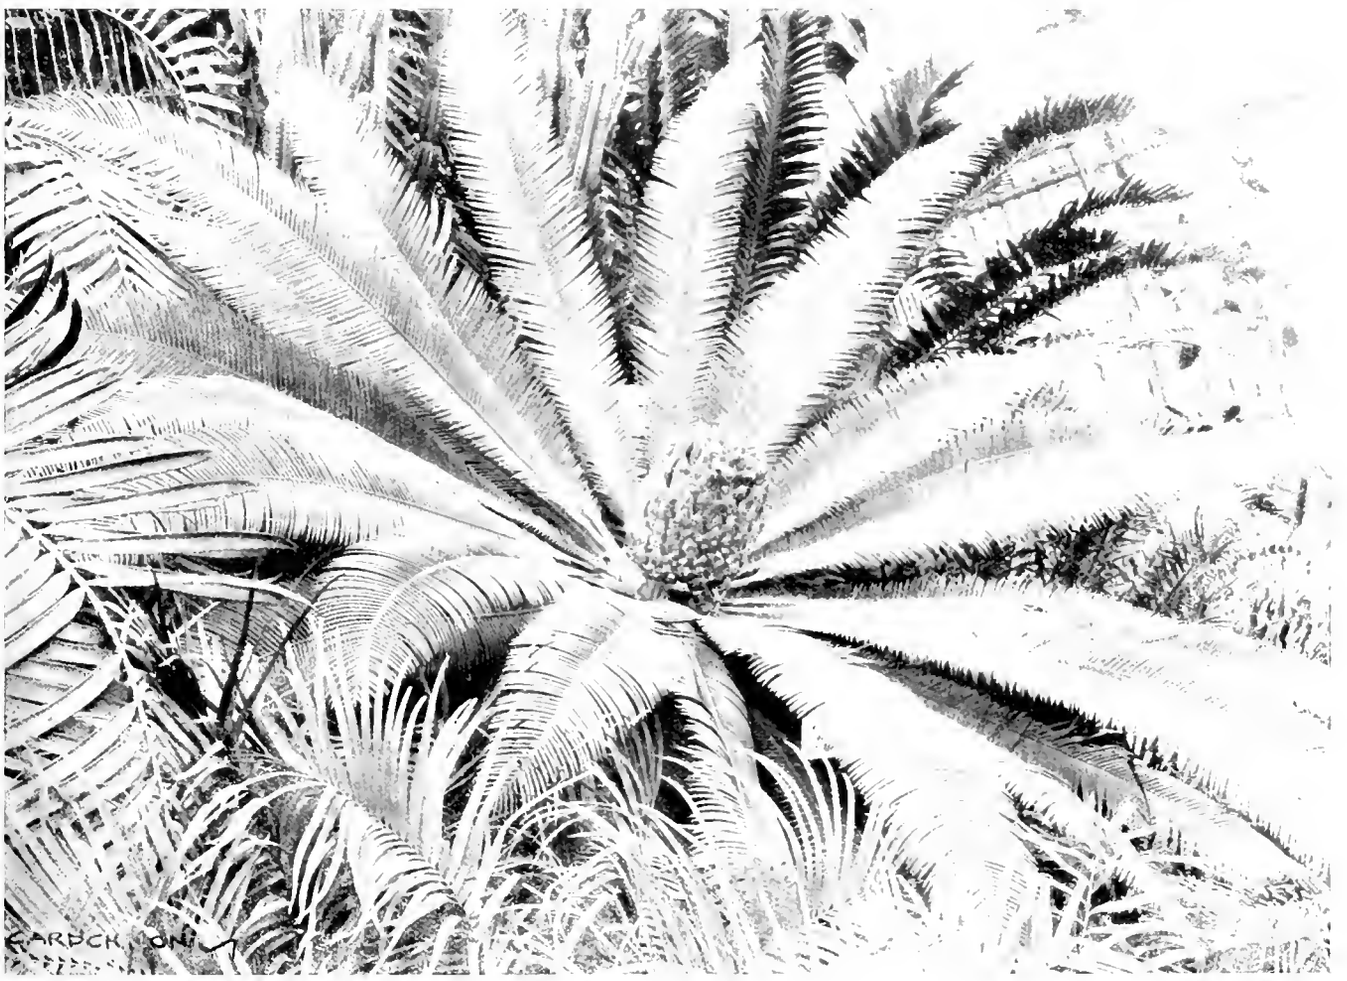
PLANTING HOLLIES.

GREAT care is necessary to ensure the safe transplantation of Hollies. The best time to move them is early in October, or in April or May, but October is the best season, except on heavy lands, when spring-planting is usually the most successful. It is, however, useless to attempt to transplant Hollies that have been growing in one place for a number of years, without the aid of a proper transplanting machine. This necessitates a considerable expense, and requires a certain amount of skill to handle. It is not always possible to have a machine to do the work, so use must be made of the simpler and, under certain conditions, equally effective contrivances to be found in most gardens. The preparation of the plants for removal must be taken in hand one year, or even two years, before they are shifted, and if the work is well done, they can then be moved with safety.

This should take place from the middle of September to the middle of October, when the ground is warm and has become fairly moist from the autumn rains, or, if not practicable then, the middle of April is nearly as good a time. A trench should first be dug round the plant at a distance of from 2 feet to 3 feet from

the stem, according to the size of the plant, and should be taken out to a depth of about 2½ feet, or as far as the roots go down. The side of the trench nearest the plant should be cut down perfectly straight, cutting off all roots cleanly, but taking care not to break the ball of soil. When the bottom is reached the soil can be worked out a little way beneath the tree to cut any perpendicular roots that may be found, but care must be exercised in doing this, or the ball of soil will be weakened and perhaps broken. When this has been done, the trench should be filled in and made firm, the upper half being filled with fresh soil mixed with some well-rotted manure. This will cause the plant to make a large number of fibrous roots near the surface. The plant should afterwards be secured by stakes or ties to prevent it being moved by wind. This is particularly necessary, or the jar will break the soil above. The earth should first be worked out from each side sufficiently to allow of a couple of stout planks being passed under it, and when these are in place to take the weight of the plant the central part can be cleared. The plant can then be lifted bodily on to a low trolley, or carried by hand to its future place. If very heavy, rollers could be put under the planks, and the plant may be drawn to where it is required. It is a good plan to tie a piece of canvas or some matting tightly round the ball before moving it, and care must be taken to lift the plant from below, and not to use the stem for this purpose.

When planting, at least a foot space should be left clear round the plant, so that it will have fresh, good soil to grow in for a year or two. The roots should also be spread out separately, and some fine soil worked amongst them. No manure



[Photo by E. J. Wallis

Fig. 117. Dioon edule at Kew. (For text see page 288.)

as the cutting back of the roots will have weakened the hold of the plant on the ground and rendered it liable to be blown about.

The plant should stand for one year afterwards at least, or two years in the case of large specimens, before being finally moved. To do this operation a trench should be dug outside the former one, and the soil worked out from amongst the roots with a fork. This should not be carried too far back towards the stem, or the ball of soil will be broken, and it is imperatively necessary to keep this intact. The use of the fork is to preserve the younger feeding roots, and at the same time to get rid of some of the soil that would otherwise make the plant very heavy to move. Care will be necessary in working the ground out from under the plant, as there will probably be thick roots found that were not cut off in the previous operation. These should be cut with a sharp knife, or a small saw if they are large, but chopping must be avoided.

need be used, but a good top-dressing will be beneficial in keeping the ground cool and moist.

J. C. B.

TREES AND SHRUBS FOR COLOUR EFFECT.

By a judicious selection of these plants fine effects may be produced both in the pleasure grounds and in the outlying parts of the garden proper. A great deal of the success depends upon the arrangement of the various subjects, but as no hard and fast rule can be laid down, the artist must adapt his plans to circumstances and must be guided by the undulation of the ground or exceptional topographical circumstances. In planting, the great secret to success is to make the whole appear as natural as is possible, and if the designer is fortunate enough to have to deal with undulating ground he has the means of making the landscape appear more beautiful and natural. Quercus rubra var. *aurea* is a variety which should be freely planted in choice shrubberies and near woodland walks. Prunus Pissardi furnishes bright patches of colour to the landscape: indeed, it is one of the most effective trees in this respect. Æsculus Hippocastanum aureum, Robinia aurea pendula, and Acer Negundo californicum aureum, all of which possess foliage of a golden hue, are very picturesque and beautiful subjects, and should be dotted about the grounds. Fagus sylvatica purpurea and Betula alba pendula are two of the most ornamental among trees, and when either is planted as a specimen on the lawn it is sure to excite admiration. I know of no more graceful tree than the weeping Beech Fagus pendula, of which there is a very fine symmetrical specimen at Aldenham, and near it is a tree of Tilia petiolaris; both are much admired.

Acer palmatum sanguineum, A. Negundo variegatum, and A. purpureum are all showy varieties of Maple. Taxus pyramidalis variegatus is a shrub that is much appreciated, both for its bright golden colour and its compact habit of growth. The Hollies are very picturesque plants, whether given a prominent place in the shrubbery or as a single specimen on the grass. Ilex aquifolium, I. argentea marginata, I. ferox argentea, I. aurea-marginata, and I. aurea regina are some of the more beautiful varieties of Hollies. Aucuba japonica and many of its varieties form useful additions to our shrubberies. Corylus avellana purpurea and Cornus alba when planted together in beds produce a very pleasing effect. Prunus Pissardi and Cornus alba are also suitable for this mode of planting. Sambucus racemosa, Rosa rubrifolia, the purple-leaved form of Berberis vulgaris, B. Thunbergi, B. Aquifolium, and Spiræa Douglasi are useful kinds for massing in beds or for growing as single specimens in the shrubbery. For autumn and winter effect

nothing is more pleasing than masses of Cornus sanguinea and Salix aurea; these are best seen when planted near ornamental water. The two last-named plants and Spiræa Douglasi should be pruned down to the ground in April, and they will make new growths from 3 to 4 feet in length during the following summer. Their coloured stems will be beautiful objects throughout the autumn and winter. *James Gardner, Aldenham House Gardens.*

FORESTRY.

LARIX LEPTOLEPIS.

IT is generally admitted that the Japanese Larch has succeeded remarkably well in this country since it was introduced, and if it continues to make the same satisfactory progress as it has already made it will be a great acquisition to persons interested in forestry.

It grows very rapidly, and compares most favourably with the native Larch when grown under the same conditons, and this is a most valuable qualification. A short time since I inspected a considerable number of young plantations on a large property in England, where I had an opportunity of seeing the two kinds growing side by side. Both kinds had done well, but the difference in their annual growth was remarkable; that of the native species averaged from 18 to 24 inches, and the Japanese from 3 to 4 feet. In 10 years the whole of the native Larches in these plantations will be completely overshadowed by their more vigorous growing neighbours. The Japanese species is also superior to the native Larch in other respects. A striking proof of this was recently brought to my notice by a friend, who

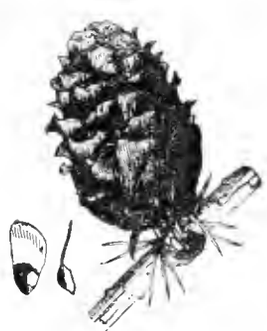


FIG. 118.—CONE OF LARIX LEPTOLEPIS.

has been inspecting the plantations on a high-lying property in North Wales, where the Japanese Larch has been planted in conjunction with Larix europæa, native Larch, and other Conifers.

The plantations referred to are situated from 800 to 1,000 feet above the sea level, at about 10 or 12 miles distance from the sea as the crow flies, and the trees are more or less exposed to the winds blowing from that quarter.

Recently the winds from seaward have been very severe, with the result that the native Larches look as if they have been scorched by fire, and doubts exist as to whether they will recover. The Japanese Larches do not show the slightest traces of having gone through the same ordeal, and are as green and fresh looking as if they were growing in a sheltered nursery bed. The forester in charge of these plantations has had a wide and extended experience, and he attributes the condition of the native Larches to the salt-laden winds blowing from the sea and to these alone. The Japanese Larch in this instance has shown a quality, with which, so far as I know, it has hitherto not been credited. *P. R.*

FRUIT NOTES.

EARLY DESSERT APPLES.

THE note by Mr. Molyneux (p. 299) is interesting. There certainly is a dearth of good-quality dessert Apples during September. He mentions Worcester Pearmain, but I do not consider this a variety of first-class flavour, although it is a sweet, brisk-eating Apple, and one easily assimilated; it has, in addition, a pleasing colour for market, but it lacks the quality and aromatic flavour of our best dessert kinds. I was rather surprised to find this Apple classed in a well-known nursery firm's catalogue under the heading of "Kitchen Apples." I have always regarded it as a purely dessert variety, and of moderate size only. No mention is made by Mr. Molyneux of Kerry Pippin, which, although of small size, is of excellent quality. Devonshire Quarrenden is about equal in flavour to Worcester Pearmain when at its best. By planting King of the Pippins in a favourable position it is possible to have its fruits in condition for the table by the end of September. Half the Apples catalogued as September varieties have only their colour to recommend them, and the newer kinds ripening at this period are not really first-class, although I do not know what the resuscitated Miller's Seedling may prove to be. A good Apple for a slightly later date is Cornish Aromatic: grown as a standard it bears freely, while its quality is first-rate. Some 14 years ago I obtained an Award of Merit at the R.H.S. for an Apple called Kane's Seedling, but afterwards parted with the stock. Although, perhaps, not essentially a dessert Apple, it possessed a pleasant musky perfume, and flavour agreeable to most palates. The tree possessed a good constitution and cropped well, and I should be glad to hear of it again. The general public are very critical in their opinion as to what constitutes a good Apple, and I have known people to prefer Worcester Pearmain to Cox's Orange Pippin, regarding the latter as too firm and solid in eating (!). Wasps have proved very destructive to early Apples this season, and many fruits have been gathered prematurely in order to save the crop. Given another mild winter, we may expect a visitation of these pests next year even more numerous than this. Can no one save us from this scourge? I have done my part individually, but without any appreciable diminution of their numbers. *Geo. Dyke.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Odontoglossum citrosmum and the various species of Chysis and their hybrids that are still growing may be placed in a warmer atmosphere to complete their new pseudo-bulbs, after which they should be suspended in a light position in the Cattleya house.

Aerides crispum, A. Lindleyanum, Vanda concolor, V. flava, and such plants as grow well during summer in the intermediate house should now be removed to a shady position in the Cattleya house for the winter.

In the intermediate house the varieties of Miltonia spectabilis, M. Moreliana, M. Lamarckiana, M. Bluntii, M. Binotii, M. Veitchii, &c., make a very pleasing show at this season, and last a considerable time in bloom. After the flowers fade the plants require a short season of rest. A cool, dry position in the same house will suit them, and until growth recommences very little water is needed to keep them fresh and plump. Lælia autumnalis and L. albida that have been growing in the cool house are now producing their flower spikes, and may be placed with the L. anceps in the Mexican house. L. Gouldiana, being in full growth and pushing up flower spikes, should be elevated close to the roof glass in the same house. Afford these Lælias copious waterings until the flowers open. L. anceps and its varieties are also throwing up flower spikes, and the compost should be kept moderately moist until the blooms are developed, but afterwards a very small amount of water is needed to keep the pseudo-bulbs plump until such time as growth commences. L. rubescens (acuminata) grows freely when suspended on the lighter side of the warm house. The flower spikes are now showing in the partially-matured growths.

Epidendrum fragrans and E. ibaguense are well worth growing on account of the sweet and pleasant perfume of the flowers, which at certain times pervades the whole house. These and E. radiatum, E. sceptrum, E. xanthinum, E. fulgens, E. floribundum, E. ellipticum, and E. cinnabarinum are in bloom. Such Epidendrums will grow well in an atmosphere of intermediate temperature, and they require to be kept moderately moist at the roots at all times.

Ventilation.—The cool house should be abundantly ventilated, especially through the lower ventilators, when the temperature of the external air is above 45 degrees. The Cattleya, Mexican, and intermediate houses also must still be well ventilated whenever the out-of-doors thermometer registers 50 degrees or more. The East Indian house may be opened moderately at the top for several hours in the middle of warm days.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

Liliums.—The early potted bulbs of L. Harrisii that are growing, should be afforded an atmospheric temperature of 55° to 60° by day, and 50° to 55° by night. It will be noticed that green-fly usually attacks the young growths, and should be kept in check by very light and frequent fumigations, or by dusting the leaves and stems with tobacco powder. Apply water very carefully to the roots until the growths have considerably advanced, after which a more liberal supply will be necessary. Many failures in the cultivation of Liliums are due to overwatering the plants in the early stages of growth and before they have made many roots. Avoid the use of strong, stimulating manures, and especially those which contain a large percentage of ammonia, which is very injurious and often causes premature decay in stem and bulb alike. L. speciosum and L. auratum commence to make new roots quite early in the autumn; and when it is seen that the potting materials have become exhausted, the bulbs should be taken out of the pots and shaken clear of the soil, after which they should be re-potted into clean pots and sufficiently provided with good drainage. Use a potting compost of good turfy loam three-fourths, leaf soil and peat in equal proportion making one-fourth, and a liberal addition of sand and charcoal siftings. Any manure that is used should be in a thoroughly decomposed condition. After re-potting the bulbs place them in a cold frame on a well drained coal-ash bottom, or plunge the pots to their rims in coal-ashes and cover the bulbs with two to three inches of cocoanut fibre. Protect them from heavy rains.

Berried Plants.—Rivina humilis is attractive, but if grown in a confined atmosphere will not set its berries freely, nor will the brilliant berries be preserved from falling off when the plants are treated to the drier atmosphere of the dwelling rooms. The first point to be observed is to keep the plants, when growing, close up to the glass, and to afford free ventilation. Apply liquid manure freely to the roots and on no account allow the soil to become dry, or the plants will become even more liable to an attack of red spider. If grown in small pots this plant may be used with much effect for the decoration of the dinner table. Ardisia crenulata and A. crenulata alba are much neglected plants, but when grown as small standards a foot or more high, and treated properly they will set an abundance of red and white berries which have great decorative value. The plants should be occasionally syringed with a weak solution of the XL. sponging wash, which will cause the berries to assume a bright, glossy appearance.

General remarks.—Afford a little Standen's manure or other good fertilizer to Poinsettias, Bouvardias, and other plants which have their roots in a confined space, and are just commencing to flower. Careful attention should now be given to the temperature of the water supplied to plants, which should exceed that of the atmosphere of the house by 5°. Cold rains and showers of hail reduce very considerably the temperature of the water in the tanks at this season of the year.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Pine-Apples.—Plants now ripening their fruits should be placed in a house by themselves, where the atmosphere can be kept dry and warm. But later plants, although bearing fruits, may be kept moist and in a buoyant atmosphere, which will assist the fruits to swell, maintaining for them an atmospheric temperature of

70 degrees at night with a rise of 15 degrees during the day. Whenever the weather is at all favourable, a little air may be admitted to the structure. If this is only possible for an hour or two in the day it will be of advantage to the plants.

Succession Plants must not be in the least excited by heat. The atmospheric temperature for these at night may be 60 degrees, or even lower than that on very cold nights. Keep the bottom heat at 70 degrees, taking care that it does not fluctuate, or the plants may fruit prematurely. The application of water to the plants is a most important item at this time of year. Each plant should be carefully examined before water is given it, always allowing the soil to be rather on the dry side than otherwise.

The suckers should be exposed to all the light possible, and plenty of room should be allowed between the plants. It is not a good practice to apply much heat at the present time, for as the days shorten this would tend to weaken the plants. If a little air be admitted at the top of the pit on fine days its effect will be to improve the health of the plants. They will not require much water, but should not be allowed to get too dry.

Late Grapes.—If these have been given the advantage of a little fire-heat, they will now be thoroughly ripe, and this is advantageous, for Grapes will not keep satisfactorily unless they have ripened perfectly. Ventilate the Vinery freely. Artificial heat need only be used to prevent the atmospheric temperature from falling below 50 degrees. If the houses are not proof against "drip," it is very difficult to keep Grapes good during November, and, providing a fruit-room is available, they had better be cut when thoroughly ripe, and the stems inserted in bottles filled with water. If the Grapes can be thus cut early in the season, it will be of advantage to the vines, because the roots can then be afforded stimulants, and, in addition, the work of cleaning the houses and vine-rods can be carried out earlier than they could be otherwise. Inside and outside borders may also be kept in more natural conditions when the Grapes have all been gathered.

THE HARDY FRUIT GARDEN.

By W. A. Cook, Gardener to Sir Edmund G. Loder, Bart., Leonardslee, Sussex.

Autumn work.—Proceed with the root pruning of fruit trees as recommended on p. 243. The soil, owing to the recent rains, is now in splendid condition for working, and it still contains much warmth. Therefore, the sooner this work is accomplished the better will be the result. Burn all rubbish and scatter the ashes on the ground. Push forward with the gathering of all fruits. Most varieties of Apples will now be ready for storing. Late varieties of Pears must be left till they will part readily from the spur. Glou Morceau may be allowed to hang until well into November. Ne Plus Meuris, Josephine de Malines, Olivier des Serres and Bergamotte d'Esperen are all late varieties, and unless these are well ripened before gathering they will not be of good flavour.

Medlars and Quinces.—Medlars are not, as a general rule, ready for gathering before November, but one has to be guided, to a great extent, by the weather. These fruits should be harvested on a dry day, and be laid thinly upon stages. Place the "eye" of the fruits downward, so that the stalks can be readily noticed, as decay always commences at the region of the stalk. Quinces will soon be ready for gathering, and these fruits must also be handled carefully. They are much sought after for making jelly and marmalade.

Late Plums should be all gathered by this date. Coe's Golden Drop can be kept for a considerable time after it is gathered. The fruits should be placed in a dry room, and each should be laid separate. By means of small, new seed trays a lot of these fruits can be stored in a small space. Place a little wood-wool in the bottom of the box, and over this material place a sheet of tissue paper.

Apples, &c.—Orders for fruit trees should be posted as speedily as possible, for early planting is much to be preferred to later, and, generally, autumn planted trees grow much better than those that are shifted in springtime. A good selection of the various fruits should be aimed at, and those that are most valuable either for dessert or for culinary purposes. By a careful selection of varieties Apples can be had nearly all the year round. Varieties furnishing fruits in August are Domino, Lord Grosvenor, and Lord Suffield, and these will carry on the supply till the end of September. To these, for later supplies, may be added Golden Noble, Peasgood's Nonsuch, Loddington Pippin, Warner's King, Blenheim Pippin, Gascoyne's Scarlet Seedling, Lane's Prince Albert, Mère de Ménage, Royal Jubilee, Newton Wonder, Dumelow's Seedling (Wellington), Bismarck, Schoolmaster, Northern Greening, Norfolk Beefin, Barnack Beauty, and King Edward VII. Many more varieties could be added. I have enumerated only the pick of the best cooking varieties fruiting over an extended season. The variety Lord Derby generally crops well and regularly. Dumelow's Seedling or Wellington is also a pretty sure cropper, and is of good quality.

Dessert Apples should not be too large. The following varieties are among the best:—Irish Peach, Beauty of Bath, Lady Sudeley, Devonshire Quarrenden, Wealthy, Margil, St. Edmund's Pippin, Allington Pippin, Kerry Pippin, American Mother, Ribston Pippin, Cox's Orange Pippin, Blenheim Pippin (small, well-finished fruits), Cornish Aromatic, Brownlee's Russet, Sturmer Pippin, and Court Pendu Plat. This last-named is an old Apple, but a good one when the fruits are well developed. I have purposely omitted a lot of market favourites, and some of the more handsome varieties are really only fit for exhibition purposes. Those who require showy varieties in addition to the above should add Baumann's Red Winter Reinette, Barnack Beauty (a perfect picture as a pyramid to-day—October 18), Calville Rouge Precoce, Gascoyne's Scarlet Seedling, Worcester Pearmain, Fearn's Pippin, King of the Pippins, and Red Astrachan. [See also the Apple census published in the *Gardeners' Chronicle* for October 29 and November 5, 1904.—Ed.]

Pyramid-trained trees are very useful, decorative, and extremely prolific in bearing, and if these are frequently root pruned they can be kept to a suitable size for many years. Horizontally-trained trees always look well in a kitchen or fruit garden, and they do not take up much room. They should be trained to neat stakes or Bamboo rods. Iron wire not infrequently causes canker and gumming.

THE KITCHEN GARDEN.

By J. Gibson, Gardener to His Grace the Duke of Portland, Welbeck Abbey, Notts.

Forcing Seakale.—The time has now arrived when the earliest batch may be put in the forcing pit. If the plants have been lifted and exposed to the air for several days this will have partly rested them, and they will therefore force more easily. Very often the earliest plants are not a success through being too immature, and instead of them making growth, they rot off at the base of the crowns. A brisk bottom-heat, accompanied with a little top ventilation is necessary until growth has started, afterwards less air need be admitted, and the plants should be kept in perfect darkness in order that they may become blanched. It is a mistake to think that any kind of soil is good enough in which to force this crop, for observation will soon prove that young roots are rapidly made, and unless good fresh soil is applied the first growth is never so fine—nor the aftergrowth prolonged. After the crowns have been planted a few days water them well, and do not let them suffer from want of moisture afterwards. A bed of leaves made up in a Mushroom-house affords a very suitable means of providing bottom-heat at this season, and if a box sufficiently large to meet the requirements is placed over it, this will contain the heat and moisture better than if it were left exposed, and the growth of the plants will be more abundant and of better quality.

Chicory.—This vegetable may be forced in the same manner as Seakale. It is essential, however, to provide a little ventilation to prevent the young leaves from rotting, which they are very liable to do from excessive moisture. It is best to force Chicory in small weekly batches. The growth is very rapid and unlike Seakale or Rhubarb, the plants grow away freely even when lifted quite green from the open, and with its green foliage still on. It is best to remove this before placing the plants in the hotbed.

Asparagus.—This crop will respond more readily to the influence of heat than Seakale, and no fear need be entertained of getting a quick return. Many force Asparagus in darkness, but I much prefer to do so in a warm house, where it is exposed to light. Instead of making any attempt to blanch the produce as in the French system, I try to get it as green as possible, the heat and moisture doing its part towards ensuring tenderness and good quality. When thus grown it can be eaten almost wholly and no waste is incurred. A hot-bed prepared in a deep frame answers the purpose equally well for forcing, and is even better for use during the spring months.

Weeds.—A final clearing up for the season should be made in the kitchen garden. There is always more or less rubbish, in the shape of leaves, weeds, Asparagus tops, &c., to clear at this season, and these should either be burned, which is best, or wheeled on to a piece of ground which is to be trenched and turned under the bottom spit. Decayed Cauliflower stumps may also be given a resting place on these quarters.

Celeriac.—Lift the crop as soon as possible and store the roots in a fairly dry place, in readiness for immediate use. Frost is detrimental to these roots, which, if left in the ground too long, would probably be spoiled.

Horseradish.—I strongly advise the lifting of this crop annually, and this may be accomplished much in the same manner as Seakale—by saving all the best pieces for use in the kitchen, and the smaller thongs for planting in the spring. The roots can be stored in a covering of leaves out-of-doors, where they will retain their freshness and keep in good condition. This system is much preferable to making a plantation that will last indefinitely, as larger and straighter roots may be thus obtained.

THE FLOWER GARDEN.

By Herbert A. Pettigrew, Gardener to the Earl of Plymouth, St. Fagan's Castle, Glamorganshire.

Roses in the "cut-flower garden."—Wherever an abundance of cut-flowers is required for the furnishing of vases, &c., a portion of the garden should be devoted exclusively for the purpose of their raising. Roses are almost indispensable subjects as cut-flowers, consequently they will be very much in evidence in such a garden. When forming new plantations of Roses, the ground should be thoroughly trenched and heavily manured, and if the situation is at all exposed to winds protection should be afforded by planting some quick-growing hedge, such as one of Privet. The selection of varieties should be very limited, and should be restricted to a few definite colours of the best kinds of Roses adapted for supplying cut blooms. The present fashion in indoor and table decoration with cut-flowers is to eschew a medley of shades, and to employ only one, or at most two colours. Therefore, what is required from the cut-flower garden is a large number of flowers of varieties of certain shades, and not a large variety of mixed colours. In planting, the varieties of certain colours should be kept together to facilitate cutting.

Roses for dry banks.—Many gardens, especially terrace gardens, are often spoilt by a repetition of uninteresting steep grass banks, which are rarely maintained in good order because of the difficulty of mowing the grass, which in the heat of summer is often browned by exposure to the sun. Such banks as these might be made very beautiful by covering them with Wichuraiana Hybrid Roses. These Roses develop luxuriant growths, which are crowned with a profusion of flowers, and the plants readily adapt themselves to such dry, hot situations. Not only are they beautiful while in flower, but their pendulous habit of growth, in combination with their attractive foliage, gives a delightful effect during the rest of the year. The following list contains a good selection: Dorothy Perkins, Jersey Beauty, Gardiner, Alberic Barbier, Paul Transon, Rene Andre, Pink Roamer, Wichuraiana rubra, and the type Wichuraiana alba. When planting, large pockets should be made in the banks, and these should be filled with manure and fresh loam.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, etc., but he cannot be responsible for loss or injury.*

Newspapers. *Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS.

SATURDAY,	Oct. 27	Dutch Gard. Soc. meet.
MONDAY,	Oct. 29	Nat. Chrys. Soc. Com. meets at Essex Hall, 3 p.m. British Gard. Assoc. meet at Bournemouth.
WEDNESDAY,	Oct. 31	Kent County Chrys. Soc. Annual Exh. at Blackheath (2 days).
THURSDAY	Nov. 1	Brixton, Streatham & Clapham Hort. Sh. Sydenham Fl. Sh. Linnean Soc. meet.
FRIDAY	Nov. 2	Windsor & Eton Chrys. Sh.
SATURDAY	Nov. 3	Soc. Franç. d'Hort. de Londres meet. German Gard. Soc. meet. Roy. Hort. Soc. Comm. meet. Ulster Hort. Soc. Chrys. Sh. (2 days). Nat. Amateur Gard. Assoc. meet. Brighton Chrys. Sh. (2 days).
TUESDAY	Nov. 6	Croydon Chrys. Sh. (2 days). West of England Chrys. Sh. at Plymouth (2 days). Bournemouth & Dist. Chrys. Exh. (2 days). Southampton Roy. Hort. Soc. Sh. (2 days). Evesham Chrys. Sh. FRIDAY	Nov. 16	Bolton Hort. & Chrys. Sh. (2 days). Newport & Dist. Chrys. Sh.
SATURDAY	Nov. 17	German Gard. Soc. meet.
MONDAY,	Nov. 19	Nat. Chrys. Soc. Com. meet. Roy. Hort. Soc. Comm. meet.
TUESDAY	Nov. 20	British Gard. Assoc. Exec. Council meet.
WEDNESDAY	Nov. 21	Darlington Fl. Sh.
THURSDAY,	Nov. 22	Manchester & North of England Orchid Soc. meet.
FRIDAY,	Nov. 23	Aberdeen Chrys. Sh. (2 days).
SATURDAY	Nov. 24	Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—48·4°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, October* 24 (6 P.M.): Max. 61°; Min. 53°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October* 25 (10 A.M.) Bar., 30·4; Temp., 53°; Weather—Fine.

PROVINCES.—*Wednesday, October* 24 (6 P.M.): Max. 57° Cornwall; Min. 46° North Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY
Sale of Roses, Plants, Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY to FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Greenhouses, Piping, Boilers, &c., at Ashburnham Park Nurseries, 480, King's Road, Chelsea, by Protheroe & Morris, at 12.

TUESDAY—
Well-grown Nursery Stock at The Nurseries, Richmond Road, Twickenham, by order of Mr. H. E. Fordham, by Protheroe & Morris, at 1.30.

WEDNESDAY—
Sale of Surplus Nursery Stock at Station Nurseries, Horsham, by order of Mr. Riley Scott, by Protheroe & Morris, at 12.
Azaleas, Palms, Roses, &c., by Protheroe & Morris, at 5.
1,278 cases Japanese Lilliums and other Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 3.

THURSDAY—
Annual Sale of Nursery Stock at Shortlands Nursery, Shortlands, by order of Mr. J. B. Bryant, by Protheroe & Morris, at 11.

FRIDAY—
Orchids, by Protheroe & Morris, at 12.15.

A Question for Nurserymen.

In so far as the proposal to amend a Bill, now before Parliament, is treated as a party question we, of course, can have nothing to say concerning it in these pages. But as it affects much wider interests than those of a mere "party" nature, and as many of our readers, whatever their political proclivities may be, are vitally interested in the matter, we are glad of the opportunity of laying before them the opinions of Mr. Morgan Veitch, a gentleman who has for a long period paid special attention to the subject:—

"Several Acts of Parliament have been passed for the special benefit of those who are tenants of what are technically called Agricultural Holdings. The benefits conferred by these Acts, commonly called The Agricultural Holdings Acts (and which include The Market Gardeners' Compensation Act, 1895), are as numerous as they are important, and include, for instance, such items as (a) a full year's notice to quit, instead of half a year's notice, in the case of a yearly tenant; (b) compensation to a tenant on the expiration of his tenancy for improvements made by him in respect of 27 different matters, including erection, alteration, or enlargement of buildings, drainage and irrigation works, protection of young fruit trees, planting orchards or fruit bushes, manuring land by certain methods, etc.; (c) right to remove various fixtures; (d) landlord's right to distrain limited to one year's rent instead of six years; (e) arbitration in case of dispute between landlord and tenant, with assistance from the Board of Agriculture if necessary.

The question it is now proposed to consider is how far, if at all, nurserymen, seedsmen and florists are entitled to share in those benefits. It will probably come as a surprise to most of those engaged in the nursery or seed trade to find that there is any doubt on the subject, yet when the matter comes to be looked into it will be seen that it is a very serious question whether nurserymen (to take them first) come within the purview of the Acts at all. "Market gardeners" are expressly included in the Acts, but not a word is said in any of them about nursery grounds or nurserymen, and, therefore, unless the term "market-garden" is considered to be wide enough to include nurseries and nursery grounds, it is perfectly clear that nurserymen as such are not entitled to the benefits conferred by these Statutes.

Did the Legislature intend to draw a distinction between a nurseryman and a market-gardener, and, if so, wherein does the distinction lie? That some distinction is *popularly* recognised as existing between the two trades must surely be conceded, although it is by no means easy to say precisely where the line between them should be drawn. In the trade the distinction is well recognised. Many nurserymen do not describe or recognise themselves as market-gardeners, neither do market-gardeners hold themselves out as nurserymen. The definition of a "market-gardener" given in most dictionaries is "one who grows fruit and vegetables for the market" (nothing being said about flowers or plants), and this no doubt exactly corresponds with the meaning ordinarily attached to the words in popular speech. If, however, this definition is to be accepted as a full legal definition of the term as used in the Agricultural Holdings Acts, it will certainly exclude at least a very large proportion of those who call themselves "nurserymen." The latter term seems in strictness to be confined to those whose business it is to grow trees, shrubs, and other plants from the seed or from cuttings for the purpose of transplanting, and who thus may be said to "nurse" plants in their infancy, but in popular language it appears to be understood to include both seedsmen and those who cultivate flowers for the purpose of sale, and slightly different considerations would apply to each of these classes. It is, however, clear that a man carrying on business as a nurseryman in the narrower sense of one who grows from the seed or from cuttings for the purpose of transplanting would not be included under the definition of a market-gardener given above. The same remark applies to those who grow flowers for the purpose of sale, whether wholesale or retail. The case of the seedsman is perhaps not quite so clear, for in its very widest sense seeds have been defined as *fruit*. (See the definitions of "fruit" in the "Century" and "Murray's" Dictionaries.) [This definition will make a botanist stare, for he, of course, considers the seed to be contained within the fruit and perfectly distinct from it.] It might, therefore, possibly be argued that a seedsman answers to the description of one "who grows fruit or vegetables for the market." On the other hand it may be fairly argued that this would be to place an undue strain on the words of the definition, since the words "fruit and vegetables," as there used, are obviously intended to be confined to fruit and vegetables intended for food.

These considerations are sufficient by themselves to raise some doubt as to whether it was the intention of the Legislature to extend the benefits of the Acts to any of the three classes now under discussion, and this doubt is considerably strengthened when we find that in other Acts of Parliament which confer special privileges on "market-gardeners" the Legislature has taken the express precaution to insert additional words extending their benefits to nurserymen. An instance of this is supplied by the Public Health Act, 1875, which provides that in an urban district the occupiers of any land used "as market-gardens or *nursery grounds*" shall be assessed for rates levied under that Act in the proportion of one-fourth part only of the net annual value of the lands. Another example is to be found in the Agricultural Rates Act, 1896, which exempted the occupiers of agricultural land from one-half of the rates payable in respect of buildings and expressly extended this privilege to (amongst others) occupiers of "market-gardens *and* nursery grounds." The express mention of nursery grounds, in addition to market-gardens, in these two enactments would seem to justify the inference that Parliament recognised that a distinction existed between the two classes, and considered that the latter term was not wide enough to include the former; otherwise, why did not Parliament rely merely on the term "market-garden" in these Acts in the same way as it did in the case of the Market-Gardeners' Compensation Act, 1895, and the other Agricultural Holdings Acts?

Again, if the Legislature intended "market-gardens" to include "nursery grounds," how does it happen that the Agricultural Holdings Act, 1900, which confers benefits on agriculturists, refers only to market-gardens, whereas, when it comes to imposing liabilities, the Workmen's Compensation Act, *passed in the same year*, is very careful to provide that for the purposes of that Act "Agriculture" shall include "horticulture" as well as the growth of fruit and vegetables? In further support of the contention that the term "market-gardener" was meant to be confined to those who grow fruit and vegetables intended for food, one may point to the fact that The Market-Gardeners' Compensation Act, 1895 (which is one of the series of Acts included under the general heading of the Agricultural Holdings Acts), while it expressly authorises market-gardeners to remove *fruit* trees which have not been permanently set out, makes no mention of any other class of trees, bushes or shrubs such as nurserymen are in the habit of growing. In like manner, the same Act expressly provides for compensation to be paid in respect of the planting of fruit and vegetables, but not in respect of any other class of crops.

On the other hand, it might be contended that it is difficult to see what reasonable grounds could exist for drawing a distinction between growers of fruit and vegetables and growers of other kinds of garden-produce, and for extending to one class the benefits of the Agricultural Holdings Acts whilst excluding all others.

One of the main objects of the Acts was to mitigate the hardship entailed upon farmers in consequence of the refusal of the Common Law to extend to them the privilege, which it extended to those whom it recognised as "Traders," of removing fixtures erected for the purposes of their business. If the law had recognised the nurseryman as a trader, but not the market-gardener, one could have understood the latter being included in the Agricultural Holdings Acts and the former excluded. But this does not appear to have been the case. The *Common* (or unwritten) Law does not seem to have drawn any such distinction between these two branches of the gardener's calling, and whatever doubts existed at one time as to the precise rights of the trade in respect of the removal of fixtures applied at Common Law to market-gardeners and nurserymen alike. There would, therefore, seem to have been no valid reason for extending the Acts to the one class and not to the other.

It seems more reasonable to suppose that nurserymen find themselves in their present inferior position simply through supineness and want of proper organisation on their part, until recent years, with the result that their interests have inadvertently been overlooked. If one could ignore the significance of the fact that in other Acts of Parliament the Legislature has thought it necessary to insert express words extending to nurserymen the benefits which it was granting to market-gardeners, and could concentrate attention solely on the apparent absence of any valid reason for drawing a distinction between the two classes, it might be possible to argue with some force that the definition of a "*market-gardener*" given in the dictionaries must not be regarded as exclusive as well as inclusive, but that the word, as used in the Acts, must be taken to have been intended to embrace all who cultivate *gardens (using the word in its widest sense) as a regular trade or business as distinct from those who cultivate them for pleasure only*. If this were the correct view, it might follow that the Acts would include both nurserymen and seedsmen, in addition to those who confine themselves to the growing of fruit and vegetables for market.

But there is even room for the controversy as to the meaning of the simple word "*garden*," though, if taken in its popular sense, it should be wide enough to include the holdings of the majority, at any rate, of seedsmen and nurserymen. In connection with this point, it will be well to mention a case under the Allotments Act in which judicial approval was given to the definition of a garden as "a piece of ground enclosed and cultivated for herbs or fruits for food, or laid out for pleasure." This definition would certainly not be wide enough to include the gardens or grounds of the majority of those who call themselves nurserymen or seedsmen, and, indeed, it was expressly held in the very case just alluded to that the grounds of a seedsman did not fall within the term "garden" as used in the particular Act then under consideration. The above quoted definition, however, is much narrower that some of those given elsewhere (e.g., in Murray's and other standard dictionaries), and the case referred to is no authority for applying the narrower construction to the word "garden" when used in other Acts of Parliament, there being special reasons for using the word in its narrower sense in the Allotments Act. Indeed, it would even be possible to extract from the judgments in that case arguments in favour of applying the wider meaning to the word when used in the Agricultural Holdings Acts, but on closer examination the judgments do not throw much real light on the question now under discussion, and cannot be regarded as supporting either the one view or the other.

Enough has now been said to show that the question whether the benefits of the Agricultural Holdings Acts are extended to nurserymen and seedsmen is one which is surrounded by very considerable difficulties, and where so much doubt exists one naturally hesitates to prophesy how the Courts would deal with the matter should it come before them judicially. However, after much hesitation, the writer has reluctantly formed the opinion (now expressed with all due diffidence) that if this question ever comes before the Court to be decided, it is, on the whole, more probable that the decision will be in favour of the view that the term "market-gardener" is confined to those who "grow fruit and vegetables for the market," and that in consequence the majority of seedsmen and florists are excluded from the benefits of the Acts. In any case, it will be seen how grave are the difficulties with which a nurseryman would be confronted should he seek to convince the Court that he is, in effect, a market-gardener within the meaning of the Acts. The arguments against such a contention are at least quite sufficient to induce a wealthy opponent to take the action from Court to Court until the nurseryman found himself confronted with the heavy responsibility of deciding, on the one hand, whether he should abandon the case and pay the costs on both sides (assuming compromise to be impracticable), or, on the other hand, undertake the serious financial risk of making a final fight in the House of Lords. It is certainly curious to note how prolific in appeals to Higher Courts cases concerning the nursery and market-garden trades have been, and it is equally remarkable to find how frequently the judges have held varying opinions among themselves in such cases, and thus after "reserving judgment" for the purpose of considering at leisure the points involved. There is an old legal maxim to the effect that it is desirable for the State to save litigation, and every businessman will agree that prevention is better than cure, and that to have one's legal position definitely secured by statutory authority is distinctly preferable to the problematical chance of winning (or losing) a law suit.

The remedy is simple. Parliament has merely to declare (by means of a clause added to a Bill now before it) that in the Acts passed for the benefit of market-gardeners *the term "Market-Garden" shall be deemed to include also "a Holding or that part of a Holding which is cultivated wholly or mainly for the purpose of the trade or business of a nurseryman or seedsman."* The benefits involved are clearly of such importance as to call very urgently for the slight legislation which is necessary to assure such benefits to nurserymen and seedsmen beyond the possibility of doubt or argument.

As soon as the necessary arrangements are completed, full particulars will be given of a movement undertaken with a view to invoking the early assistance of Parliament.

Finally, it may be of interest to know that, having regard to the vital importance of the subject, the opinion of counsel (Mr. R. E. Moore) has been taken, and such opinion entirely supports the views above expressed. *H. Morgan Veitch.*"

Our Supplementary Illustration represents one of two large plants of Impatiens Oliveri, which have been a great feature in No. 4 greenhouse at Kew during the past two years. The plants are about 9 feet in height, and the same in diameter. They were rooted from cuttings inserted in February, 1904, so that they are about two years and eight months old, and, except for the first two months after planting, they have been in flower during the whole of this time. Professor D. Oliver described the plant under the name of I. Thomsoni in the *Journal of the Linnean Society* for 1906, when dealing with the plants collected by the late Mr. Joseph Thomson on the mountains of Eastern Equatorial Africa. As a Himalayan species had previously been described as I. Thomsoni (see *Journal of the Linnean Society* for 1860 and *Botanical Magazine*, t. 7795), this name had to be dropped, and that of I. Oliveri was substituted, under which latter name it is figured in the *Botanical Magazine*, t. 7960. Only dried specimens appear to have been brought home by Mr. Thomson, and it was left to Sir John Kirk to introduce the plant to cultivation. This gentleman found it growing between 300 and 400 miles inland, by the side of the Uganda Railway, at an elevation of 6,000 to 8,000 feet, the bushes averaging 4 feet in height. He collected seeds, and presented them to Kew, in which institution the plant first flowered in July, 1903. Like most of the Balsams, it is easy of propagation and culture. There is an abundance of seed-pods present on the Kew plants, and seedlings in number have germinated beneath and around the plants, wherever they could obtain root-hold. In a wild state, the flowers are said to come white and to measure 1½ inches across. Under cultivation, however, they show a pale lilac shade, with almost a rosy tint in bright weather, and measure 2½ inches in diameter. In colour and general appearance the flowers very much resemble those of Miltonia vexillaris. The lip of the flower is narrowed into a curved spur 1½ to 2 inches in length. Some persons have found fault with the plant, because the flowers are not particularly showy; but how many other plants are there which will flower for two years continuously? The plant branches freely from its base, and thrives in a cool house. During summer it can be used as a bedding plant, the chief requirement being to have well-grown plants at the start. Another purpose for which it is especially suited is for use as specimen plants in tubs on the terrace, or in sheltered sunny positions around the mansion.

Linnean Society.—The session will open on Thursday, November 1, 1906, at 8 p.m., when the following papers will be read:—1, Sir Dietrich Brandis, K.C.I.E., F.R.S., F.L.S., "The Structure of Bamboo Leaves"; 2, Dr J. G. de Man, "On a Collection of Crustacea Decapoda and Stomatopoda, chiefly from the Inland Sea of Japan, with descriptions of new species"; 3, Prof. A. J. Ewart, D.Sc., F.L.S., "On *Hedwigia ciliatosa*, Hook. f., with remarks on its systematic position." Exhibitions:—1, The President, "Young plaice hatched and reared in captivity"; 2, Mr George Talbot, "Abnormal specimens of *Epeira fasciata*, Cl[erck]."

THE BOARD OF AGRICULTURE AND FISHERIES.—The President has appointed Professor THOMAS HUDSON MIDDLETON, M.A., M.Sc., to be an Assistant Secretary to the Board in the place of Dr. W SOMERVILLE, resigned.

VIKING CLUB.—The Viking Club, a society for northern research, is proposing to issue a quarterly journal of "Miscellany and Records." The object is to bring together materials for the history of Orkney and Shetland from all available sources. This should appeal to all interested in the neighbourhood, and its Norse and other histories and legends. All desiring to co-operate in the scheme should apply to the hon. treasurer, Mr. A. JOHNSON, 59, Oakley Street, Chelsea. We hope the natural history including the details relating to the cultivation of hardy plants, fruits, and crops generally in these northern islands will receive attention.

SOUTH EASTERN AGRICULTURAL COLLEGE.—We are informed that the annual meeting of the governors was held at the Charing Cross Hotel on Monday, October 22, the Right Hon. Lord ASHCOMBE presiding. The principal (Mr. M. J. R. DUNSTAN) reported that the autumn term commenced on October 1 with 113 students (the largest number yet recorded) in residence. Amongst the appointments on the staff were Mr. S. S. PARKINSON as lecturer in Botany, Mr C. A EALAND as lecturer in geology, and Mr J. MORISON as farm superintendent.

FLOWERS IN SEASON.—From Mr. SMITH'S interesting nursery at Newry come flowers of Escallonia pterocladon, an evergreen species which blooms throughout the summer and autumn. Its dark green, shining leaves render it attractive at all times. The white flowers are disposed in long clusters at the ends of the shoots. Mr. SMITH also sends a spike of a hybrid Verbascum flowering profusely for the second time this season, the new flowering shoots emerging from the old stem between the remains of the old flowers. Such renewals of growth are to be expected after such a season as we have had.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—There will be a meeting of the association at Winchester House, Old Broad Street, E.C., on November 6, at 7 p.m., when Mr. T. W. SANDERS, F.L.S., will deliver a lecture on "Beautiful Gardens," illustrated with limelight views.

BRITISH GARDENERS' ASSOCIATION.—A meeting will be held at Bournemouth on Monday next, October 29, when Mr. E. F. HAWES will attend as a delegate from the Executive Council. Other meetings will shortly be held at Richmond (Surrey) and at Bath. The Executive Council invite further applications from districts desirous of holding similar meetings.

THE EUROPEAN GOOSEBERRY-MILDEW ATTACKING THE RED CURRANT.—Mr. E. S. SALMON sends us the following communication. "Mr. C. J. ALEXANDER, a student of Wye college, directed my attention a few days ago to a white mildew on the leaves of some Red Currant bushes in the college fruit plantations. Conspicuous white patches of mildew occurred on the upper surface of the leaf, and on these, as well as scattered over the under surface, the minute blackish fruit-conceptacles (perithecia) of the fungus were being formed. On microscopical examination the fungus proved to be the European Gooseberry-mildew (Microsphæra Grossulariæ [Wallr.] Lev). From each conceptacle a number of minute processes or appendages radiate, while inside the conceptacle is a number of little sacs, or asci, each containing four or six winter spores (oospores). Each appendage is branched at its apex in a repeatedly dichotomous manner, characteristic of the species. Creeping over the surface of the leaf, and bearing the fruit-conceptacles (perithecia), is the mycelium or spawn of the fungus, composed of a number of very fine white threads or hyphæ, which are branched and interwoven. Each hypha sends at frequent intervals a sucker or haustorium into an epidermal cell of the leaf, by means of which the fungus obtains its nourishment, but the whole of the fungus is otherwise external to the tissues of the plant on which it is feeding. Hitherto this mildew has been recorded in Europe only on the Gooseberry, and it seems curious, considering how frequently Red Currants and Gooseberries are grown together, that the former plant has remained unattacked—or has never been recorded as being attacked—until this season. In the present instance the Red Currant trees attacked (of which there were some dozens) are young trees of the Raby Castle variety, and stand close to Gooseberry bushes attacked by the same fungus. The European Gooseberry-mildew, when it attacks Gooseberry bushes severely, may cause a premature shedding of the leaves; this can, however, be prevented by spraying with a fungicide, viz., potassium sulphide ('liver of sulphur'), 1 oz. to two or three gallons of water. The same fungicide should be used if the mildew becomes troublesome to Red Currants. It may be noted that this season, both in Ireland and in Denmark, the Red Currant has been attacked—for the first time in Europe—by the American Gooseberry-mildew (Sphærotheca mors-uvæ [Schwein.] Berk.). I should be very glad if anyone meeting with a mildew on the Red Currant would kindly forward me a specimen, with particulars of the outbreak, to the address given below.—E. S. SALMON, F.L.S., South-Eastern Agricultural College, Wye, Kent."

UNIVERSITY OF LONDON.—Mr. FRANCIS DARWIN, M.A., M.B., F.R.S., is delivering a course of six lectures on "The Physiology of Movement in Plants," at the Chelsea Physic Garden, at 4.30 p.m. The first lecture was delivered on October 19 on "The principle of association: stimulus in relation to adaptation," and the rest are as follow:—Lecture II. (October 26), "Some questions regarding physiological nomenclature and method." Lecture III. (November 2), "The modern methods of analysing gravitational stimulus and reaction." Lecture IV. (November 9), "The localisation of the perceptive region in heliotropic and geotropic organs." Lecture V. (November 16), "The mechanism of perception in heliotropic and geotropic organs." Lecture VI. (November 23), "On diageotropic and diaheliotropic organs."

THE "CORRUPTION" BILL.—We hear that there is a feeling among some members of the horticultural trade that a discount of 5 per cent., payable to the gardener, should be treated as a recognised legitimate custom, and not be deemed "corrupt." Of course, if the master who pays the bill is aware of the practice, and raises no objection, the odious word corruption would have no place. The master in this case knows that it is he who in some way or another pays the tax, though why he should be called on to do so is not apparent. A much better plan would be for the master to pay a fair price for his purchases, give higher wages and not expose his servant to the temptation of receiving "unearned increment." We believe the solution of this matter rests with the traders themselves. If they would co-operate and agree to take no unfair advantage of their neighbour we should not hear so much of discounts, bribes, commissions, or "grafts." To say that a gratuity, by whatever name it be called, is of necessity "corrupt," and to enact that it shall cease forthwith is to use vain words. We cannot in every case define where "corruption" comes in. In most instances we must leave that to the consciences of the persons concerned; all we can do is to quicken the conscience both of giver and receiver—especially of the giver, and to plead for such a rate of remuneration as shall render the offer or the receipt of secret discounts, commission, presents, or whatever they may be called, an offence against morality.

RUBBER.—About 50,000 acres in Ceylon are now planted with rubber trees (Hevea). A like area is devoted to the culture in the Malay States. Such is the demand for rubber that our tropical Colonies are vieing with each other as to which shall be foremost in cultivating these valuable trees. At the same time the collection of native rubber from various plants in the Congo and other tropical countries goes on apace. So many are the uses to which rubber is now put that there is no present risk of increasing the profitable supply beyond the demand.

NITROGEN IN RAINFALL.—When we read of the tropical downpours and the luxuriant vegetation which ensues, we have no reason to bemoan our deficiency in nitrogen, for, according to Dr. MILLER, in the *Journal of Agriculture Science*, the amount of nitrogen in the rainfall at Rothamsted may not only be proportionately, but even absolutely, greater at the Hertfordshire station than in British Guiana. A heavy rainfall therefore does not always coincide with a large proportion of nitrogen.

BOTANICAL TRAVELLERS.—We learn that Prof. BOULGER is about to visit the Hevea rubber forests of Peru, in order to report on the commercial prospects of certain districts in the Amazon basin. Mr. E. H. WILSON is also about to proceed once more to China with a view to collect and introduce new plants. Mr. WILSON, on this occasion, goes out under the auspices of Prof. SARGENT. The most cordial good wishes of all interested in horticulture and economic botany will attend the travellers.

SLUGS.—A writer quoted in the *Journal de la Société Nationale d'Horticulture de France* speaks in the highest terms of the use of sulphate of iron as a means of destroying slugs. The quantity used was 300 kilos (660lb.) to the hectare (2½ acres approx.). The remedy is simple, not costly and "sovereign."

ECONOMIC ENTOMOLOGY.—President GARMAN'S address to the Association of Economic Entomologists is published by the United States Department of Agriculture. It has so much in common with the subject of general education, scientific method, and practical cultural work, that we may commend it to the attention of all our readers interested in such matters. The crowded state of our columns forbids us from making extracts, but we may recommend those concerned in teaching science to procure the "Proceedings" from the United States Department of Agriculture at Washington.

Publications Received.—*Proceedings of the Agri-Horticultural Society of Madras.* April to June 1906. This contains a description and illustration of a curious instance of syncarpy in a Pineapple, six fruits having grown together into a mass weighing about 12 lbs.—*Reports on the Botanic Station, &c., Dominica*, 1905-6. Mr. W. R. Buttenshaw reports a large increase in the number of plants distributed and useful work with economic plants carried on by Mr. J. Jones.—*A Selection of Flowering Climbers.* By J. F. Bailey, Director of the Botanic Gardens, Brisbane. This little pamphlet should prove very handy for reference. It consists of a paper read before the Horticultural Society of Queensland last August.—*Annual Report of the Queensland Acclimatisation Society*, for year ended 31st March, 1906. Some important new property has been acquired by the society, and the overseer, Mr. Jas. Mitchell, furnishes a very satisfactory report.—From the West Virginia University Agricultural Experiment Station, Morgantown.—*The Ripe Rot or Mummy Disease of Guavas.* By John L. Sheldon. An illustrated report of a fungoid disease that corresponds to the "anthracnoses" of a number of fruits and vegetables.—U. S. Department of Agriculture. Bureau of Plant Industry, Bulletin No. 92. *Date Varieties and Date Culture in Tunis*, by Thomas H. Kearney.—Farmers' Bulletin, No. 257. *Soil Fertility*, by Milton Whitney.

THE PAMPAS GRASS.

The clump of Pampas Grass Cortaderia (Gynerium) argentea, shown at fig. 119, is growing in the nursery of Mr. William Goff, Littlehampton, who obligingly forwarded us the photograph. Mr. Goff states that the plant is six years old, and is carrying 135 plumes. The Pampas Grass is quite hardy in the South of England, and is seen to its best advantage on a lawn, or by the side of a lake or stream. April is the best month for its planting, and it is easily propagated by division of its roots. The plant is a native of Monte Video, and it will succeed in any rich soil, especially if planted on a warm situation facing south. In colder situations it can be grown with a certain degree of success, providing it receives the protection of a garden mat in winter.

TRADE MEMORANDA.

MESSRS. JAMES VEITCH & SONS, LTD.

We are requested to state that the illness of Mr. James H. Veitch necessitates his relinquishing active work. Mr. Harry J. Veitch, who was for many years at the head of the firm and who withdrew some years since, has in consequence returned and resumed the position of managing director.

BANKRUPTCY STATISTICS RELATING TO GARDENERS.

In a comparative table attached to the report of the Inspector-General in Bankruptcy, we find that during the five years from 1901 to 1905 the number of failures among gardeners, florists, and nurserymen, with the aggregate amount of liabilities was as follows: In 1901 there were 37 failures, including receiving orders and deeds of arrangement, with liabilities amounting in the aggregate to £34,882; in 1902 there were 40 failures with liabilities amounting to £63,273; in 1903 there were 49 failures with liabilities amounting to £33,603; in 1904 there were 49 failures with liabilities amounting to £29,104; and in 1905 there were 31 failures with liabilities amounting to £27,065.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

Apple James Grieve.—On p. 249 Mr. E. Molyneux appears rather dubious about planting this Apple as a dessert variety for market purposes. I send herewith four specimens of Apple James Grieve pulled 10 days ago, also two fruits of King of the Pippins pulled three days ago from standard trees growing alongside each other, planted in the spring of 1901. I have also several trees planted against a south wall, the fruits from which are a fortnight earlier. I have no hesitation in recommending James Grieve as a good Apple for market purposes, owing to its setting freely and cropping heavily. The difference between the size of the fruits sent is remarkable, but size is not the only recommendation, for colour, shape, and keeping qualities, as well as flavour, are all in favour of James Grieve. *James N. Scarlett, Edinburgh, October 8.* [The variety James Grieve is a first-class Apple in every respect, and well suited to northern gardens. The examples of King of the Pippins, as sent by our correspondent, were inferior, and quite out of character, as we know them in the south; in fact, we have doubts as to their being correctly named.—Ed.]

Apple Judging at the Fruit Show.—Kindly permit me to supply an omission in your otherwise excellent report of the recent fruit show, no mention being made of that most interesting class in the dessert Apple section "any other variety." As this class was by itself on a separate table, the most vigilant reporter might be excused from overlooking it. There were many dishes, and though not all distinct, there were many varieties. All the best were tasted by the judges, and a remarkable result so far as relates to the reputation of that veteran and esteemed raiser, Charles Ross, followed. As last year, his namesake, Charles Ross, medium-sized fruits shown by himself, was put first. A handsome variety of his raising also, named Rival, came second. Mabbott's Pearmain was third, and then another of Mr. Ross's seedlings, Paroquet, was fourth. That is, I think, quite another version of what is known as the "hat trick." Certainly it has, I believe, never occurred to any one raiser before. For the sake of consistency, I am glad to learn that the restriction as to size, viz., the passage through a 3-inch ring, imposed upon Blenheim Pippin in the dessert class, is not to be repeated. I am glad so far, not that I do not think the smaller size amply large enough for dessert purposes, but because it was absurd to note this restriction in one case, then a little farther on to find Allington Pippins placed first in their class, although 4 inches in diameter. Even in the Blenheim class one fruit in the 2nd prize dish measured 3¼ inches across. But this want of consistency as to what is the proper or desirable size in dessert fruits ran through all the classes and the judging. Is it not possible to obtain even from diverse sets of judges something like unanimity as to what should be regarded as essential dessert size? I greatly fear modelling fruits in wax is not yet a perfect art. Could the Council but determine on what is the ideal size and shape for dessert purposes of any one variety, have the selected samples modelled in wax, and place them at the disposal of the judges dealing with the varieties as a model, we should then secure some consistent judging. At present there is no consistency. How greatly the judges wished, in dealing with classes in which, being universally grown varieties, the entries were numerous, that the Council would have entrusted them with a few extra prizes. Merely two prizes in a class with from 30 to 40 entries are inadequate—there should be six at least. May I suggest to judges of single dish classes in future always to collect to the front the few very best "dishes," so as to have them for comparison side by side. That practice will help them to a right decision; it helps the Press, and also the public. In one class, which I want to specially indicate, the most perfect dish was overlooked simply because this precaution was not taken. One other circumstance I should like to comment upon is in relation to the prominence given to red or partly red fruits in the classes for cooking Apples over size and, generally, form, and keeping excellence. What merit has colour in cooking Apples? Even if having a more attractive appearance could that

Fig. 119.—Cortaderia argentea growing in the nursery of Mr. Wm. Goff, Littlehampton.

probably does weigh with many—is a fine sample, possibly a very perfect sample, lacking colour, to take an inferior position to a less fine sample having colour? That is a rather important point, and calls for some authoritative opinion. In all possible cases judging on precisely similar lines throughout is most desirable. *D.*

Impatiens Holstii (as a bedding plant).—I have grown this plant in pots, and also out-of-doors, and I have come to the conclusion that it will make a first-rate bedding subject. Its bright scarlet-coloured flowers, set in a suitable groundwork of some other plants, will furnish a pleasing change. It is of dwarf habit and of sturdy growth, and remains in flower for a very considerable time. Plants raised from seeds sown in heat, early in March, and grown like Petunias, will furnish good material by the end of May. If many plants are desired, several packets of seeds must be obtained. *A. J. Long, Wyfold.*

An Apple Census.—I agree with Mr. A. Dean that a census of bush-tree Apples would be interesting, but upon what lines it should be carried out he does not fully describe. Shall the lists be made with a view to giving the best selection for profit or for home consumption? Upon this depends the way in which the lists should be compiled. For market supply, appearance, rich colour, with freedom in cropping and fair size, are the important points a variety should possess. Flavour is purely a secondary consideration, or hardly that. I submitted highly-coloured fruits of Mère de Ménage recently to a large fruiterer who was in search of dessert Apples. He tasted them and pronounced them not bad! He said many persons do not like sweet Apples, and that hard, crisp fruits are required as well as the soft, sweet ones, especially as some have to be sent to the Cape. Again, locality, soil, and various other considerations have to be taken into consideration. In some gardens where the soil is sandy loam, Ecklinville is quite one of the best of early culinary Apples, but for market it is quite useless. In cold, heavy soils the fruit has a strong tendency to "spot," and in this garden it is utterly worthless. At one time we had 250 trees, now we have two only. Lord Suffield affords another example of variation. Here it almost refuses to grow, but in some gardens it is the best Apple. Golden Spire, although an excellent Apple for small gardens on account of its form of growth, is not large enough for the market. Therefore any list would be the subject of criticism. Miller's Seedling would not be named in many lists, because it is not widely known. Cockle Pippin, Lord Burghley, and Sturmer Pippin are all of moderate quality. Lord Burghley is exceptionally poor in flavour, and what has Sturmer Pippin to recommend it beyond its keeping quality? King of Tompkins County is a distinctly high-flavoured sort in March. Waltham Abbey Seedling, although a good Apple, is much too shy in bearing. Norfolk Beauty will eventually take a high position among cooking Apples in large and small gardens, as it bears freely on small or large trees. It will eventually oust Warner's King from favour, except under peculiar circumstances of exhibition. Good dessert Apples are very scarce at several periods from August to April. *E. Molyneux, Hampshire.*

Codiaeums (Crotons) at Brent Hill Nursery, Hanwell.—I am enclosing four photographs of these plants that were grown from cuttings inserted in January and potted, when rooted, into large 60's, after standing out of the propagating pit for a few days. When they were nicely rooted through these pots, they were given a shift into 32's. As a potting medium I use the following mixture: equal parts loam and peat, one shovelful of silver sand, and one 48 pot of Clay's Fertiliser to each barrowload of the compost. The soil is well rammed when potting. The plants are allowed plenty of room and are stood on inverted pots. They are syringed overhead three times a day in hot weather, and whenever possible the hose is used once a day, for it keeps the plants free from red spider. A little shading is provided while the plants are actively growing, but this is removed by the middle of August. The temperature of the house in which they are grown ranges from 70° to 90°. *R. Ferguson.* [The photographs, which we do not reproduce, showed some good specimens of these decorative foliage plants.—Ed.]

Federation of Horticultural Mutual Improvement Associations.—If these societies are composed entirely of professional gardeners by all means let them federate, assisting each other as far as possible, and educating all their members (especially the younger ones) up to a higher standard of efficiency. But is it not a fact that many of these societies are largely composed of amateurs? I have been informed that such is the case with some of them at any rate, and if this is true they have fallen from their first estate. I was a member for several years of the Maidstone Association, which was, I believe, the first of such societies, or certainly one of the first. This was confined to professional gardeners, and rightly so (I refer to the period 1870-1880), and it certainly was the means of assisting many gardeners to obtain information regarding their profession. But if amateurs and all persons are admitted I would ask professional gardeners to consider the harm they are likely to do to their brother gardeners by encouraging these societies. We are overcrowded now with men, many of whom are not worthy of the name of gardener, and who ought to be debarred from using it. Wages are constantly falling in regard to head positions, one reason of which is the large number of candidates who apply for vacancies. What may we expect will be the state of affairs in another ten years' time, if everyone is to be indiscrimmately taken in hand, and lectured on the general qualifications of the professional gardener? Does any other profession act in this suicidal manner? If so, I have never heard of it. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

Rough Plate Glass for Gardens (see p. 281).—Having some years since had considerable experience with a similar material, I would not advise anyone to use it in this country. In order to cultivate plants and fruits to perfection we require the greatest amount of light we can get on dull days, and always from October 1 to March 31. What is done on the Continent is another matter. A large portion of that "Continent" is nearer to the equator than we are, and the conditions therefore cannot be compared to ours in the matter of light. *W. H. Divers, Belvoir Castle Gardens.*

A Big Fungus.—I have found, in Lythe Hill Park, a very large specimen of the Sparassis crispa, measuring 18 inches long, 9 inches deep, 9 inches wide, and weighing 5½ lbs. I have given the specimen to Dr. J. Hutchinson for his collection, and am told that it is the finest specimen he has seen. *J. Thorne, The Gardens, Lythe Hill, Haslemere.*

Cratægus Pyracantha Lelandii.—My large bush of this variety of Cratægus is just now in grand profusion of berry. Birds are very fond of these berries, and are already taking them from plants growing on the upper side of my grounds; but down by the railway, where noisy trains are frequently passing, the berries so far have been left alone. A lady has asked me whether I could tell her which of the two plants, namely, the common C. pyracantha or the variety Lelandii, birds were most fond of. She evidently was of opinion that the species was more immune than its variety. Perhaps some correspondents will kindly give us their opinions. The lady was going to select for planting the variety which is the more immune. Where expense is no great object, some kind of a wattle cage might be constructed with a net thrown over, this would preserve the berries from the ravages of the birds for a considerable time longer. The netted enclosure should be made high enough and wide enough to allow of people to enter and walk all round the clump. When at Batsford in July last Mr. Garrett showed me a large bed of C. pyracantha Lelandii that had been planted high up on the charming Hillside Wild Garden. When these have grown for a few more years they will form not the least attractive feature in that garden, so unique in its construction and planting. *W. Miller, Berkswell, Oct. 8.*

Sports and Species. A perusal of the interesting leading article on "Sports" which appeared in your issue of September 29 induces me to add my support to Prof. De Vries' "Theory of Mutation" on the strength of the evidence adduced by the Ferns which have formed my special study for about thirty years. It is now a good many years since I first maintained that the sports in this tribe of plants in very many cases fulfilled all the conditions of species proper, inasmuch as they, as a rule, were capable of reproducing their special type truly and constantly from their spores, so that all that was necessary for them to become recognised species by botanists was that they should hold their own in the struggle for existence, and be able to spread and multiply. As a rule, however, though found as established plants, often obviously of considerable age, they are usually either solitary specimens, or but few in number, and growing within a limited area. This fact is the more remarkable as under cultivation these spores generally germinate freely, and, as I have said, reproduce the type truly, the exceptions being merely individual plants representing greater or less variation from the parental type, but in my own experience never thoroughly reverting to the normal or presumably grand-parental type. As individuals the age and robust growth of many "finds" demonstrates at any rate their capacity to hold their own among their normal associates and presumable progenitors, and since their spores must be shed and scattered by millions every season, the reason of their general isolation becomes a puzzle not easy to solve. Exceptions, however, occur which point to the possibility of a "sport" or mutational form, assuming the one missing qualification of a true species, viz., the power of spreading. Thus the late Col. A. M. Jones, a most reliable authority, has recorded that a truncate form of Scolopendrium vulgare (S. v. peraferens) was plentiful in a wood near Portishead, and an even more marked instance occurred with one of my own "finds" of Asplenium Adiantum nigrum, of which some hundreds of a curious caudate form cover a stone dyke on Dartmoor so densely as entirely to oust the normal type which prevails at both extremities of the dyke, the centre of which is monopolised for some yards from top to bottom by the spread of the "sport" in question (A. a. nigrum var. caudifolium). The fronds of this form are short and decumbent, lying much flatter on the wall-surface than those of the normal type, and this appears to give them an advantage, probably by smothering the normal seedlings and encouraging the abnormal ones, whose young prostrate fronds would naturally be less handicapped than upright ones. However this may be, the fact remains that in such a "sport" we have all the essentials of a species proper, and had it been discovered unassociated with the normal type, no botanist would have hesitated to give it a distinctive specific name, since it differs quite as much from the normal as many species do from each other. Considering the great number of Fern sports of the constant class which have been found under wild conditions, and the published records of the most reliable character which exist, we are somewhat struck by the absence of more than a brief allusion to them in Prof. De Vries' book, especially as they in themselves afford a mass of evidence tending to support his theory, and, at the same time, controverting to some extent the prevailing idea of the extreme rarity of such mutational forms. It is well within the mark to claim that at least two thousand such are on record, and it must be borne in mind that these are independent of a large number of variants which the connoisseur and finder did not consider worthy of a place in his collection, or even of record, on account of defective symmetry, but which, nevertheless, are botanically and morphologically as interesting as the others, involving as they do a sudden change of structure of a permanent character. Considering, then, the number of such "sports" and their diversity, it would be strange indeed if, in the æons of time during which plant evolution has gone on, that none of these sudden mutations should assert themselves as species proper. In some cases, indeed, the difference between recognised species is such that a small mutation would suffice. Our three Polystichum species are so closely akin that if a bi-pinnate P. Lonchitis (Holly Fern) were found, it could not be discriminated from P. aculeatum, and, in point of fact, on more than one occasion the latter has most mysteriously appeared in presumed pure sowings of P. Lonchitis sports. I myself found a P. aculeatum high up on Ben Lawers among the Holly Ferns there, and strongly suspected it to be a bi-pinnate form of the latter species. Our native Lastreas (Nephrodium) to some extent belong to a similar category. L. dilatata, for instance, has been split up into several species

—uliginosa, spinulosa, and cristata (why so named no one knows, as it bears no trace of cresting), which very moderate mutations would cover; and L. filix mas, as Mr. G. B. Wollaston demonstrated, presents three distinct forms, viz., the accepted L. f. mas, L. pseudo mas, and L. propinqua, all three of which are prevalent in numerous habitats, are easily distinguished from each other and yet well within the scope of a mutation. Instances of this kind might be multiplied, but even these few suffice to confirm in the writer's mind the view that new species not only may, but are very likely to arise by sudden rather than gradational steps, thus solving the difficult question of the required missing links. We cannot get away from the fact that Nature can proceed by "leaps," and, given such "leaps," it would be strange indeed if they did not occasionally produce like results as the gradational steps of mere individual variation, upon which alone so far the evolutionist has relied. *Chas. P. Druery, V.M.H., F.L.S.*

SOCIETIES.

ROYAL HORTICULTURAL.

October 23.—Although the meeting on Tuesday last was held so soon after the fruit exhibition, there was a large display of Orchids, flowering shrubs, Dahlias, Chrysanthemums, fruits, vegetables, and other things.

The Floral Committee recommended 11 Awards of Merit to novelties, and some of the groups before the Committee were extensive and interesting.

Orchids were numerous, and there were 11 groups of these plants shown. A large number of interesting novelties were submitted to the Committee, and three First-Class Certificates, two Awards of Merit, and one Botanical Certificate were awarded.

The Fruit & Vegetable Committee recommended two Awards of Merit to Potatos, and one to a variety of Broccoli.

In the afternoon a paper on "Horticultural Education" was delivered by Mr. F. J. Baker.

Floral Committee.

Present: W. Marshall, Esq. (chairman), and Messrs. J. T. Bennett-Poë, George Paul, H. B. May, John Green, Chas. E. Shea, C. T. Druery, T. W. Turner, Jas. Walker, Geo. Nicholson, R. W. Wallace, Jas. Douglas, Chas. Jeffries, Geo Gordon, Chas. Dixon, Chas. E. Pearson, H. J. Jones, W. Cuthbertson, W. P. Thomson, E. H. Jenkins, W. J. James, Chas. Blick, Jno. Jennings, R. Hooper Pearson, Jas. Hudson, J. W. Barr, J. F. McLeod, and W. Howe.

Messrs. James Veitch & Sons, King's Road, Chelsea, showed 25 varieties of Nepenthes. As notable as the completeness of the collection, was the remarkable vigour seen in the plants, each of which was in splendid condition. One large plant of N. Morganæ was carrying about 50 pitchers. The comparatively new variety Sir W. T. Thiselton-Dyer is among the biggest and handsomest of all, and this was shown splendidly. N. Mastersiana × and N. sanguinea are both of shades of red, with no spotting, but the pitchers of N. Tiveyi × owe their chief beauty to the dark red spots present. Some of the cups hang down far below the lamina of the leaf as N. formosa. The pitchers of N. Balfouriana × are very large, while in N. excellens × they are short, but broad, and have very large wings. N. ampullaria vittata produces clusters of tiny pitchers at the base of the plant. Messrs. Veitch also exhibited winter-flowering Begonias, Streptocarpus hybrids, and a group of large flowering Japanese Chrysanthemums. (Silver-Gilt Flora Medal.)

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, staged a semi-circular group of Codiæums (Crotons) in the best decorative species and varieties. On an adjacent table Mr. May also displayed some excellent plants of the Begonia Gloire de Lorraine type, and small plants of Veronica Andersoni, with flowers of red, purple, white, and other shades. (Silver Banksian Medal.)

Messrs. J. Hill & Son, Barrowfield Nurseries, Lower Edmonton, showed over 100 varieties of choice Ferns. The exhibit occupied the whole of one side of a long table. It was very rich in varieties, with tinted and coloured fronds, and of these the more handsome were Adiantum Farleyense, A. macrophyllum albo-striatum, Pteris tricolor, and Lomaria Hermminieri. A group of Platyceriums occupied the centre of the display. A good specimen of the Killarney Fern Trichomanes radicans was noticed. (Silver-Gilt Banksian Medal.)

Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, showed a group of Chrysanthemums of exceptional merit. The flowers were displayed in a very artistic manner. Both at the back and upon the floor was a covering of green material, which was in excellent taste, and added to the effectiveness of the display. Large specimen blooms of Japanese varieties pleasingly staged in tall tripod stands, with graceful grasses and palms interspersed, and at the back tall Bamboos, and rows of large Chrysanthemum flowers in vases at the foreground, completed a very handsome exhibit. Nothing but praise can be accorded the two epergnes of the white Mrs. A. T. Miller. We have space only to mention a few of the other varieties shown, which were of the same high-class culture. Among these we may select Mrs. W. Knox, Mrs. A. H. Lee, Mrs. Codrington (yellow), and Moneymaker (white). (Silver-Gilt Flora Medal.)

Messrs. W. Wells & Co., Merstham, Surrey, showed a very large and beautifully-arranged group of Chrysanthemums. At the back were three large "bays," having a groundwork of the border varieties, and taller plants of the choicest Japanese varieties; the centre and taller "bay" terminated in a raised group, and on either side were smaller groups all arranged in a setting of small flowering kinds and many of the early-flowering single type. The golden Mrs. A. Thompson, a new decorative flower of last season's introduction, was seen to great advantage in this exhibit. (Silver Flora Medal.)

Messrs. H. Cannell & Sons, Swanley, Kent, displayed a very large assortment of Zonal Pelargoniums, a dozen or more varieties of violets, some good Dahlias among which were some of the pretty Anemone flowered type, and Chrysanthemums. October White and Cannell's Yellow are two pleasing varieties of the large single Chrysanthemum; they both have very long ray florets. (Silver-Gilt Banksian Medal.)

Messrs. J. Peed & Sons, West Norwood, London, filled one corner of the Hall with an exhibit of Chrysanthemums, bordered and interspersed with showy Caladiums. (Bronze Flora Medal.)

Mr. W. Godfrey, Exmouth, Devon, staged a selection of Chrysanthemums, including most of the best Japanese varieties now in season, such as Mrs. A. T. Miller, Lady Northcote (a rather flat, white flower of the incurved type), Miss D. Oliver (pale heliotrope), Jessie Godfrey (yellow), Walter Jinks, &c.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, staged a miscellaneous group of greenhouse plants, among which we noticed some well-grown Ficus, Gerberas, nicely flowering, Cassia corymbosa, Tibouchina macrantha, &c. On an adjoining table the same firm displayed Carnations of the winter-flowering type.

Mr. S. Mortimer, Rowledge, Farnham, Surrey, showed some splendid Carnations of such varieties as Flamingo, Floriana, Harlowarden, Enchantress, Lady Bountiful, &c. Some epergnes containing cactus Dahlias made the exhibit additionally attractive. (Silver Banksian Medal.)

Messrs. W. Cuthbush & Son, Highgate Nurseries, London, N., displayed vases of Carnations of popular varieties and several seedlings of merit.

Messrs. Wm. Paul & Son, Waltham Cross, Herts, staged a group of pot Roses. Some of the blooms were very good, considering the lateness of the season, the best being Bridesmaid, Pharisaer, and the beautiful crimson Richmond.

Messrs. G. Stark & Son, Great Ryburgh, Norfolk, showed a variegated-leaved Nasturtium, named Ryburgh Perfection, and vases of Sweet Pea Enchantress, gathered from the open.

Messrs. Cragg, Harrison, & Cragg, Merivale Nurseries, Heston, showed small Cactaceous plants; some were in very tiny pots in miniature greenhouses.

Mr. L. R. Russell, Richmond Nurseries, Richmond, Surrey, exhibited small plants of Aucuba vera that were well furnished with the pretty scarlet berries.

Messrs. Richard Smith & Co., Worcester, showed an interesting collection of dwarf Conifers and miniature ornamental trees and shrubs—Hollies, Ivies, Aucubas, Eleagnus, &c. (Bronze Banksian Medal.)

Lord Aldenham, Aldenham House, Elstree (gr. Mr. E. Beckett), put up a very extensive collection of tinted foliage, sprays of berries, and other ornamental objects from the open. Most of the foliage was in its autumn colouring, and beautiful indeed were the various species of Rhus, such as R. copallina, with handsome compound leaves, R. glabra laciniata, and R. toxicodendron; Maples such as Acer platanoides and A. saccharinum; Cornus alba (very fine), Liquidamber styraciflua, Quercus alba, Ribes americana, &c. The red berries of Sambucus Thunbergiana, Osmanthus ilicifolius in flower, Hippophae (the Sea Buckthorn, weighed down with its scarlet berries), Arbutus Unedo in flower and fruit, the silky achenes of Clematis paniculata and many others equally attractive. These made up a group both interesting and beautiful. (Silver-Gilt Flora Medal.)

Messrs. Barr & Sons, King Street, Covent Garden, London, showed seasonable hardy flowers.

Mr. Frank Brazier, Caterham Hardy Plant Nursery, Caterham, Surrey, showed a very large number of hardy flowers and border Chrysanthemums. (Silver Banksian Medal.)

Hobbies, Ltd., Dereham, Norfolk, showed Pæony-flowered Dahlias in a very artistic manner. Hobbies also displayed a number of the choicer varieties of Cactus Dahlias. (Silver Banksian Medal.)

Awards of Merit.

Begonia elatior ×.—This is one of the semi-tuberous race of winter-flowering Begonias raised from crossing B. socotrana with varieties of the tuberous-rooted section of the genus. In this case the flowers are semi-double, and of rich, rosy-carmine colour. Shown by Messrs. Jas. Veitch & Sons.

Carnation Robert Craig.—A sweet-scented winter-flowering variety, flowers crimson, with much-fringed petals. Shown by Messrs. Hugh Low & Co., Messrs. W. Cuthbush & Sons, and Mr. A. F. Dutton.

C. White Perfection.—A first-class, white, winter-flowering variety, with fringed petals, robust in growth, very erect flowering. Shown by Messrs. Hugh Low & Co. and Mr. A. F. Dutton.

C. St. Louis.—This winter-flowering variety conforms more to the florists' type than does Robert Craig. The flowers, as shown, are less full of petals, but these are of much better form and quality, and are barely toothed in place of the almost ragged fringing seen in the variety mentioned. In colour the flowers of St. Louis are velvety-crimson, and the habit of the plant appears very satisfactory. Shown by Messrs. W. Cuthbush & Sons.

Chrysanthemum Mormon Davi.—A Japanese variety, the flowers being of good size and considerable depth. The shade of yellow is deeper than in the variety Mrs. R. Hooper Pearson, which in other respects it much resembles. Shown by Mr. Norman Davis and Mr. W. J. Godfrey.

C. Dora Godfrey.—A single variety, with buff-yellow flowers, very free in flowering, and of valuable decorative qualities, but, judged as a "single," the flowers contain too many florets. Shown by Mr. W. J. Godfrey.

C. Mrs. A. T. Miller.—This large, white, Japanese variety, with large, globe-like, white flowers, somewhat resembling those of Alice Byron, is already in commerce, and is familiar to many of our readers. Shown by Mr. H. J. Jones and Mr. W. J. Godfrey.

C. Mrs. Norman Davis.—This variety is also a white Japanese, but of a very different type. The flowers are of the largest size, but the florets are narrow, somewhat twisted, and the bloom is very full in the centre. There is just a suspicion of lemon colour. Shown by Mr. Norman Davis.

Nerine flexuosa alba.—This white variety of N. flexuosa is not new, but, being pure white, it is a valuable variety. The flowers so shown were a little over 2 feet high. Shown by Messrs. Baker & Sons.

Nephrolepis cordata tesselata.—A variety of the type in which some of the individual pinnæ have become pinnate, reproducing, as it were, the conduct as seen in the main stem, and giving to the plant a tesselated appearance. Shown by Mr. S. Crickett, South Tottenham.

Vitis armata Veitchi.—This is a highly ornamental vine from the province of Hupeh, Central China. The stems and petioles are thickly beset with prickles. The leaves generally measure about 9½ inches by 7½ inches, and in autumn are rich red or purplish in colour. A full description and illustrations may be found in Mr. James H. Veitch's paper published in the *Journal of the Royal Horticultural Society*, Vol. xxviii. Shown by Messrs. James Veitch & Sons.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, De B. Crawshay, H. Little, J. Colman, R. G. Thwaites, W. Boxall, W. H. White, W. H. Young, G. F. Moore, A. A. McBean, W. Cobb, J. Wilson Potter, H. G. Alexander, H. A. Tracy, N. C. Cookson, W. A. Bilney, F. M. Ogilvie, and F. Peeters (visitor).

Major G. L. Holford, C.I.E, C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander), for the fourth time this year staged a very large cleverly-arranged group replete with fine varieties, and for the fourth time secured the Society's Gold Medal. In the centre, with their graceful sprays of yellow flowers, were fine examples of Oncidium varicosum. These were surrounded by fine forms of Cattleya labiata, including a specimen of the pure white variety with three flowers. Other sections were formed of finely-flowered Dendrobium Phalænopsis, a remarkable set of varieties of Cypripedium insigne, one example of C. i. Sanderæ having fourteen flowers, and another of the Harefield Hall variety with seven large blooms; a pretty arrangement of Vanda Kimballiana; a fine show of varieties of Cattleya "Lord Rothschild," with very richly coloured flowers, the disc of the lip in the best form being a rich shade of reddish orange; a clump of Cattleya Mantini; a selection of Vanda cærulea, and a large number of very handsome Cypripediums, the best of which were C. Charlesianum palmatum, C. Draco (Euryades × insigne magnificum), C. Chapmani superbum, a very large flower; C. Fairieanum, Westonbirt variety; fine varieties of C. Leeanum, C. Maudiæ, C. Niobe, Westonbirt variety, C. triumphans magnificum. A batch of Lælio-Cattleya luminosa and others of its class gave fine colour; C. aurea, C. Hardyana, and other showy hybrids were also present, and the whole was excellently well arranged.

Sir Trevor Lawrence, Bart., Burford (gr. Mr. W. H. White), was awarded a Silver Flora Medal for an interesting group, containing about two dozen plants of the bright carmine-scarlet Habenaria militaris, the finely-grown plants of which were well furnished with prettily marked leaves, each bearing from one to three spikes. The plants, which are reputedly very difficult to keep in good condition, were perfect in every respect. A Cultural Commendation was voted to Mr. W. H. White, the grower. The other part of the group was made up of several white forms of Lælia pumila, L. p. delicatissima being a good white flower with a slight blush tint, and Miltonias.

Sir Frederick Wigan, Bart., Clare Lawn, East Sheen (gr. Mr. W. H. Young), received a Silver Flora Medal for a neat group of rare varieties. Among the forms of Cattleya labiata was the fine white C. l. Cooksoniæ, which has a violet-purple lip with a broad white margin, and another pretty form with flowers of a uniform light rose tint. A very large form of Cattleya Portia had flowers resembling C. labiata in shape; Odontoglossum crispum Sir Frederick has good white flowers with many light-brown blotches, and others noted were the nearly white Lælia Perrini leucophæa, Sophro-Cattleya Chamberlainiana, Sophro-Lælia Veitchii, Brassia Lawrenceana longissima, Saccolabium calceolare, the handsome Cypripedium Marjorie (Leeanum × insigne Sylhetense), and other Cypripediums.

Jeremiah Colman, Esq., Gatton Park, Reigate (gr. Mr. W. P. Bound), was awarded a Silver-Gilt Flora Medal for a very fine group, in which the white and coloured forms of Lælia pumila were well represented. L. pumila, Gatton Park variety, seems to be a very free grower, and produces its white flowers with peculiar slatey-blue front to the lip satisfactorily. L. p. superba and magnifica are two very large forms of the typical rose-tinted form, and other representatives of the species were good. In the group were a number of the pretty Cattleya Browniæ, raised at Gatton Park; a good selection of Cattleya labiata, Cattleya Bowringiana, C. Mantini, and Cypripediums, Odontoglossums, &c.

H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), secured a Silver Flora Medal for an effective group, in the centre of which was the very beautiful Cattleya Octave Doin var. Herbert Goodson, which secured a First-Class Certificate and a First Diploma (see Awards). The group contained a good number of hybrid Cypripediums, including the massive C. H. S. Goodson, C. Fairrieanum, C. Maudiæ, C. Insigne Sanderæ, and other yellow varieties; C. i. Harefield Hall, Miltonia spectabilis Moreliana, and other Miltonias; a good selection of Cattleya labiata, various hybrids, &c.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. Smith), staged a group of Cypripediums, &c., which included a very fine form of C. Chas. Rickman, good C. insigne, including the yellow forms Ernesti and Miss Corbett; and a few interesting species, including Pleurothallis cardium, P. velaticaulis, P. scapha, &c. (Silver Banksian Medal.)

Messrs. Charlesworth & Co., Heaton, Bradford, had a very handsome group, principally of showy hybrids, which secured for them the well-deserved award of a Silver-Gilt Flora Medal. Among the showiest were forms of Lælio-Cattleya luminosa, L.-C. Issy, and other Lælio-Cattleyas. With them were several Brasso-Cattleyas, with large, rose-tinted flowers; richly-coloured Cattleya Mantini, the beautiful C. Octave Doin, C. Vulcani, C. F. W. Wigan, and other hybrids. There was also a good selection of Cattleya labiata, Miltonia vexillaris Leopoldi, and other Miltonias; Odontoglossum nebulosum, O. Hallio-crispum, &c.

Messrs. Jas. Cypher & Sons, Cheltenham, secured a Silver Flora Medal for an extensive and effectively-arranged group, at one end of which was a batch of Cypripedium Fairrieanum with many flowers. The centre was of graceful sprays of Dendrobium Phalænopsis, in front of which was a fine form of D. formosum giganteum with dark orange disc to the lip. Other noteworthy batches were made up of Vanda cærulea, Cattleya labiata in fine varieties, the true C. Mantini nobilior; a selection of a pretty Lælio-Cattleya with white flowers, with a showy purple front to the lip; a number of fine Cypripediums, including the richly-coloured C. triumphans, Westonbirt variety, C. Chas. Rickman, C. Lathamianum giganteum, C. insigne varieties; some good Cattleya aurea, including C. aurea chrysotoxa, &c.

Messrs. Hugh Low & Co. staged a group in which were forms of Cattleya labiata, including the fine white-petalled C. l. G. G. Whitelegge; C. Mantini, Warscewiczella velata, Odontoglossum grande, Miltonia Binoti, &c. (Silver Banksian Medal.)

J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), sent Cypripedium Troilus, a massive yellowish flower, with white upper half to the dorsal sepal.

The Marquis de Wavrin, Somerghem, Belgium (gr. Mr. de Geest), sent two forms of Cattleya Robert de Wavrin (Schroderæ × Schilleriana), rose-tinted with purplish-rose markings on the lip; and Cattleya Wildemani (velutina × Trianæ alba), with white sepals and petals, and rose-veined lip.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent Miltonia spectabilis Moreliana nigrescens, and Rosefieldiensis, both of fine dark colour; Odontoglossum Urania (crispum × cristatellum), with cream-white flowers blotched with purple-brown; and O. crispum Angel, a very fine and broad-petalled white form, with clusters of brown spots on the segments.

R. G. Thwaites, Esq., Streatham (gr. Mr. Black), showed Cattleya Robert de Wavrin (Schroderæ × Schilleriana), with rose-coloured flowers in form nearest to C. Schilleriana; several good Cattleya Iris; Lælio-Cattleya × Ophir, and Brasso-Cattleya Mrs. J. Leemann inversa (see Awards).

Messrs. Heath & Son, Cheltenham, staged a small group of hybrid Cypripediums, Dendrobium Statterianum, Lælio-Cattleya Bletchleyensis, &c.

Messrs. Edgar & Co., Montrose, South Woodford, staged a small group.

J. Forster Alcock, Esq., Northchurch, sent Cypripedium Bingleyense, and its finer variety superbum.

Messrs. Lager & Hurrell, Summit, New Jersey, U.S.A., showed Cattleya Ballantineana.

Mr. J. E. Sadler, Beedon, Newbury, Berks, showed Cypripedium Germaine Opoix var., Gaston Bultil, a large flower of good form.

M. A. A. Peeters, Brussels, sent Cattleya Mantini fastuosa, a large and brightly-coloured flower, C. labiata Peetersii (see Awards), and the superb white-petalled C. Hardyana alba.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), sent Brasso-Epidendrum Stamfordianum (E. Parkinsonianum × B. glauca), with singular greenish-white flowers.

AWARDS.

First Class Certificate.

Cypripedium Muriel Hollington (niveum × insigne), from Sir Frederick Wigan, Bart., Clare Lawn, East Sheen (gr. Mr. W. H. Young). The typical variety to which an Award of Merit was given November 11, 1890. Flowers white, wax-like, with some light-purple markings on the lower halves of the segments.

Cattleya Octave Doin var. Herbert Goodson (Mendeli × Dowiana aurea), from H. S. Goodson, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day). One of the most beautiful of hybrid Cattleyas. Sepals and broad crimped petals white, delicately mottled with lavender colour. Lip broad and finely crimped, crimson-purple in front, disc orange with reddish lines at the base.

Cattleya labiata, Peeters' variety, from M. A. A. Peeters, Brussels. A very remarkable variety with almost uniformly coloured rich rose-purple flowers, which show some white variegation on the sepals and petals. The original plant was shown by M. Peeters, November 27, 1894, when it received an Award of Merit. The bizarre colour has been attributed to disease in the plant, but the fine cultivation of M. Peeters has conferred healthy vigour on the specimen shown, and consequently finer colour, but with fewer white markings.

Awards of Merit.

Brasso-Cattleya Mrs J. Leemann inversa (B. Digbyana × C. Dowiana aurea), from R. G. Thwaites, Esq. (gr. Mr. Black). The first Brasso-Cattleya, with B. Digbyana as a seed-parent to be shown. The plant seems harder in substance than the Cattleya seed-parent progeny, and the flowers firmer in texture. Sepals and petals sulphur yellow, disc of lip bright yellow, the fringed front prettily marked with rosy lilac, the base bearing dark reddish-purple lines.

Dendrobium Phalænopsis Phyllis Moore, from G. F. Moore, Esq., Chardwar, Bourton-on-the Water (gr. Mr. Page). A very finely formed white flower with a faint pink disc to the lip.

Botanical Certificate.

Pleurothallis velaticaulis, from R. I. Measures, Esq. (gr. Mr. Smith). A free-flowering species growing a foot in height. Flowers in erect spikes pale green.

Diploma Awards.

Cattleya Dowiana.—*1st Diploma:* Cattleya Dowiana aurea Westfield Beauty, from Francis Wellesley, Esq. (gr. Mr. Hopkins). A charming variety with pale yellow sepals and petals, the latter being prettily decorated with rose at the margins. Lip, claret-purple veined with gold to within half an inch of the front.

C. Dowiana hybrids.—*1st Diploma:* Cattleya Octave Doin var. Herbert Goodson, from H. S. Goodson, Esq. (gr. Mr. Day). *2nd Diploma:* Cattleya Mantini superba, from Jeremiah Colman, Esq. (gr. Mr. W. P. Bound).

Lælia pumila.—*1st Diploma:* Lælia pumila superba, from Jeremiah Colman, Esq. *2nd Diploma:* Lælia pumila, Gatton Park variety, from Jeremiah Colman, Esq.

Fruit and Vegetable Committee.

Present: Jos. Cheal, Esq. (in the chair), and Messrs. S. Mortimer, A. Dean, Geo. Keif, H. Parr, R. Lye, Ed. Beckett, Horace J. Wright,

H. Markham, J. Davis, Jno. Lyne, P. D. Tuckett, J. McIndoe, C. G. A. Nix, and C. Foster.

W. Roupell, Esq., Harvey Lodge, Roupell Park, West Norwood, showed eight varieties of Grapes, almost all of the Frontignan section, grown in unheated structures. The flavour of most of the varieties was very good, being rich, sugary and aromatic. The best in this respect was Primavis Muscat (Frontignan), which was of delicious flavour, but which we were informed was very liable to crack in the berry, and is difficult of cultivation. Ascot Frontignan gave the best results, and is the variety recommended for planting. Silver Frontignan, White Frontignan, Auvergne Frontignan, Black Frontignan, Grizzly Frontignan, Diamant Traube, and Purple Constantine, the wine Grape of the Cape, were other varieties shown. (Silver Banksian Medal.)

Major Wm. Bythway, Watborough, Llanelly (gr. Mr. Walter Williams), showed 100 dishes of Apples in seventy varieties. Taken collectively, the fruit was of excellent quality, and dessert and culinary varieties alike were good, useful produce. The examples of Calville Rouge Précôce were especially fine. (Silver-Gilt Knightian Medal.)

Mr. Henry Whiteley, St. Marychurch, Torquay, showed two dozen dishes of dessert and culinary Apples of well-known varieties. Very large fruits of Allington Pippin were noticed. (Silver Banksian Medal.)

University College Reading (Horticultural Department) (gr. Mr Charles Foster), showed thirty varieties of English and French Carrots, fourteen of Beet, and several baskets of Onions and Potatos. The Carrots were ordinary field produce, and showed nothing remarkable in their culture, but they were exhibited to show the comparative value of the various varieties and stocks. The same remarks apply to the Beet. One of the best Carrots was found to be Sutton's Champion Horn, and this variety did well either forced or grown as a market variety. It had very little "core," and sparse foliage. Rouge Demi longue de Chatenay is, as its name implies, of French origin. It is classed as a horn, or half-long Carrot. It has a big body, and is a marvellous cropper. Longue Rouge Sang, the long, blood-red Carrot, has a very dark coloured exterior. Other good varieties were Long Forcing, Early Nantes, and Veitch's Intermediate Matchless Scarlet. Seeds of more than one nurseryman's stock were sown, and they were found to differ greatly, and this was also seen in the stocks of Beet. The best of this latter vegetable were Cheltenham Green Top, Sutton's Perfection, Pragnell's Exhibition, and Market Favourite. Dobbie's New Purple Beet is a very dark-coloured variety, the flesh being almost black. The best of the Onions were Trebons, A1, Veitch's Main Crop, and Carter's Giant Zittau. (Silver Knightian Medal.)

Mr. W. H. Barber, Culham Court, Henley-on-Thames (gr. Mr. W. Turnham), showed about eighty very large Onions of the variety Selected Ailsa Craig. They represented part of a crop of 600 bulbs, which totalled 1,405lb. in weight. One hundred of the largest bulbs weighed 300lb., the two largest totalling 8lb. (Silver Knightian Medal.)

Awards of Merit.

Potatos Brydon's Crampton and Russet Queen were each given an Award of Merit after trial at Wisley, and after passing a culinary test. They were forwarded by Messrs. Kent & Brydon, Darlington, and Mr. Scarlett, Edinburgh, respectively.

Broccoli Michaelmas White.—We were informed this variety is distinct in habit from the ordinary type of autumn Cauliflowers, having growth more resembling a Broccoli. The "heads" were very large, and somewhat irregular in surface. The curd is very white. Mr. E. Beckett (gr. to Lord Aldenham, Aldenham House, Elstree) exhibited quite a quantity of "heads," and was awarded a Silver Banksian Medal.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

October 11.—Committee present: Messrs. E. Ashworth, R. Ashworth, F. Sander, H. Thorp, A. J. Keeling, E. Rogers, A. Warburton, W. Stevens, Dr. Ritchie, J. Cypher, J. C. Cowan, F. Ashton, C. Parker, J. E. Williamson, and P. Weathers (hon. sec.).

Groups of Orchids were exhibited by W. Thompson, Esq., Stone (gr. Mr. Stevens), and Messrs Cypher & Sons, Cheltenham, for which Silver Medals were awarded.

Bronze Medals were awarded to Walter Laverton, Esq., Nantwich (gr. Mr. Smith), Mr. W. B. Upjohn, and Messrs. A. J. Keeling & Sons. Votes of thanks were given to G. W. Jessop, Esq., Messrs. J. W. Moore, Ltd., and Mr. D. McLeod.

G. W. Jessop, Esq., Leeds, was voted an Award of Merit for Ærides Lawrenceanum, and Messrs. J. Cypher & Sons gained a similar award for Burlingtonia candida var. gigantea. W. Thompson, Esq., received Awards of Merit for Cypripedium × Cybele Walton var.; C. × "Nora," a distinct cross between C. tonsum × C. × Harrisianum; and Odontoglossum × Rolfæ var. leopardinum.

Cultural Certificates were awarded to W. Thompson, Esq., for Odontoglossum crispum var. "Belle," and to A. J. Oakshott, Esq., for some fine specimens of Odontoglossum grande.

ROYAL HORTICULTURAL OF IRELAND

October 24, 25.—This exhibition was held in the large central hall of the Royal Dublin Society's premises, and was favoured by fine weather and a good attendance on the opening day. Close on 2,000 entries, chiefly among the Apple classes, well filled the extensive tabling.

In the nurserymen's class for the best general exhibit of hardy fruits on a table 20 feet by 4 feet, Messrs. Hugh Dickson & Co., Belfast, won the society's Gold Medal, and were closely followed by Messrs. Alex. Dickson & Sons, Newtownards. In the "Cup Class" for 12 vases of Japanese Chrysanthemums premier honours were awarded to John Jameson, Esq., who thus wins the trophy right out. Mr. F. W. Moore's substantial prize for the best exhibit of 18 dishes of Apples on a table 20 feet by 4 feet, decorated with plants and foliage (11 entries), was also won by John Jameson, Esq., Mr. Hennerty and the Earl of Bessborough following in the order named. Irish-grown Apples are remarkable for their high colour, and in the various classes for which the Department of Agriculture and Technical Instruction for Ireland, had contributed liberally to the prize list, the older standard varieties were very conspicuous. For Bramley's Seedling there were 57 entries, 46 for Lane's Prince Albert, 50 for Warner's King, and 48 for Blenheim Pippin, whilst in the class for a collection of culinary Apples, twelve dishes distinct, six fruits of each variety, there were 17 competitors for Messrs. Rivers' prize. The class for a collection of six varieties brought forward 32 exhibitors.

At the time of note-taking, judging was still going on (under difficulties, owing to a crush at the tables), but the well-filled hall and its spacious galleries, on which the fruit-packing exhibits were displayed, formed a *fait ensemble* apparently as pleasing to the public as to the responsible executive. *Erin.*

ENQUIRIES AND REPLIES.

Hot-Water Pipes.—The substance *M. P.* enquired for (see pp. 267-284) is probably "lagging" and not asbestos. I used some of it for covering 6-inch main pipes, several years ago, with great advantage. Unfortunately I cannot remember the name of the firm supplying the material, but I was told it was refuse from wool factories, and if *M. P.* applies to a mill where wool is cleansed and woven he will probably be able to get it. *W. H. Divers, Belvoir Castle Gardens.*

Peach Buds.—See *S. T. D.'s* enquiry on p. 284. If the borders are in first-class condition as described, the soil constituting the borders maintained in a uniformly moist condition all the year through, the foliage of the trees kept free from the attacks of red spider and aphis until it falls off in the autumn, and abundance of fresh air admitted to the trees day and night from the time the crop has been taken until the houses are closed for forcing towards the end of the year, such trees should not, and in my opinion would not, cast their wood buds, providing the after-treatment afforded was suitable to the trees. But if a rather high and dry atmospheric temperature was maintained at the time of starting the trees into growth, the wood buds would probably commence to drop in the manner described by *S. T. D.*, the rising of the sap in the shoots in the meantime causing the one or two buds left at the points to push into growth.—*H. W. W.*

ANSWERS TO CORRESPONDENTS.

Apples Diseased: *L. F., Ashby.* The fruit is affected with Apple scab, due to a fungus named Fusicladium dendriticum. The Pear also is affected by a fungus, probably Monilia fructigena. Both these diseases occur most often when the trees are growing in uncongenial conditions.—*A. S.* The markings are caused by a fungus Monilia fructigena. See answer to *T. M.* in our issue for October 13, p. 267.

Arum: *M. E. F.* Your plants are affected with the soft rot. Give the corms a thorough baking in the sun during the summer, and grow the plants in a maximum of light. Change the soil frequently, and burn any of the diseased leaves and corms. See article on this disease by Dr. Cooke in the *Gardeners' Chronicle* for January 7, 1905, p. 9. Such communications should be addressed to the Editor and not the Publisher.

Carnation: *H. E.* The seedling is worthy of retention. The flower, although not of the best form, judged from a florist's standpoint, possesses a pleasing colour. The calyx being non-splitting is another point in its favour. The fragrance you draw attention to is very faint.

Compensation for Crops and Greenhouses; *L. E. K.* 1. Thanks for your kind expressions. The articles to be given in an early issue will remove much of your difficulty, and if we were to give you a short answer here we might only confuse you. The question turns on date of tenancy, date of building, and certain other conditions. 2. You should try to come to an amicable arrangement with your landlord, but failing this you can have the matter settled by arbitration under the Agricultural Holdings Acts. The procedure is somewhat technical, so that you should consult a solicitor. We are, of course, assuming that your tenancy agreement is silent on these matters, and that the land is cultivated as a market garden only. See this week's article, p. 292.

Cotoneaster Simonii: *C. E. A.* The berries are not poisonous.

Daffodils and English Irises: *Select.* The following varieties of each section are among the best Narcissi for furnishing a supply of cut flowers in an ordinary garden. *Yellow Trumpet*: Emperor, Golden Spur, Obvallaris (The Tenby Daffodil); *Bicolor*: E. T. Cook, Madame Plemp, Victoria; *White Trumpet Daffodils*: Albicans, Madame de Graaf, Mrs. Camm; *Incomparabilis*: Beauty, C. J. Backhouse, Gloria Mundi, Lucifer, Princess Mary, Stella Superba; *Leedsii*: Duchess of Westminster, Katherine Spurrell, Mrs. Langtry; *Barri*: Conspicuus, Dorothy E. Wemyss; *Poeticorum*: Ellen Barr, John Bain; *Englehartii*: Sequin; *Poetaus*: Cassandra, Ornatus, Poetarum. The Irises should include Blanche Fleur (white), Clara Butt (white with faint blue markings), Emperor (violet, flaked with dark purple), L'Innocence (white ground marked with lavender), Mont Blanc, Perle des Jardins (china blue), Prince Mauritz (ruby flaked with black), Rosa Bonheur (crimson and white), Simon (pale lavender), and Triumph (rosy-claret with silvery shading).

Flower Beds on Lawn: *Vasca.* The most effective method would be to dig over the lawn and thoroughly prepare the surface for sowing with lawn-grass seeds. But you may not desire to go to this trouble, in which case the soil of the flower beds should be made quite firm so that it will be perfectly level with the surrounding turf, after being covered with specially selected turves. The chief reason for the sites of such beds remaining visible for some years after being turfed down, is that the soil being freshly worked, and liberally manured, the roots of the grasses are provided with a more suitable medium than that in which those of the surrounding turf are growing. In order to redress matters as far as possible, let the lawn be given a top-dressing with well-rotted manure, and an occasional application of chemical nitrogenous manures.

Greenhouse Plants: *H. H.* Greenhouse plants require a maximum amount of light in winter, and as any excess of light can be regulated by

suitable shading in summer time, the best position for the house is one that is fully exposed to the sunshine. Of all situations you mention, we should prefer the warm slope of a hill facing to the south. The following is a list of nurserymen in Rio de Janeiro, Brazil, but we cannot say if they are exporters of bulbs and plants:— Lourenço Hoyer, Rua de General Polydore, No. 10 (Botafogo); Pereira da Fonseca, 10, Rua dos Invalidos; Carlos Trevassos, 74, Rua Jose Bonifacio S. Domingo.

LISSOCHILUS: *J. R. H.* We do not know Lissochilus Krameri. It may be Lissochilus Krebsii that is intended, and if this be so, a warm greenhouse will suit it well. The Lissochilli require an atmospheric temperature consistent with that of the locality from which they were obtained. West African species require a moist stove-house, but the Cape and Natal species such as L. Krebsii are capable of thriving in a warm conservatory or greenhouse.

NAMES OF FLOWERS AND FRUITS: We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *F. G.* 1, Waltham Beauty; 2, Waltham Abbey Seedling; 3, Tower of Glamis; 5, Prince Albert.—*Water Lane.* Both fruits are of the variety Prince Albert.—*F. L.* 1, Sandringham; 2, Domino; 3, Lord Suffield; 4, Small's Admirable; 5, the fruit was decayed; 6, King of the Pippins.—*G. H.* 1, Beurré Diel; 2, Marie Louise d'Uccle; 3, Winter Nelis; 4, Summer Beurré d'Aremberg.—*J. Staghthorn.* The Apple is The Queen.—*G. Parker.* 1, Cox's Orange Pippin; 2 & 4, Newton Wonder; 3 & 6, Prince Albert; 5, Cheshunt Pippin; 7, Royal Snow; 8, Cox's Orange Pippin; 9, Ecklinville; 10, Worcester Pearmain; 11, Bachelor's Glory; 12, Tower of Glamis; 13, not recognised; 14, we think is a local variety; 15, Sturmer Pippin. You have sent more than the proper number at one time. See the notice at the head of this paragraph. A contribution to the Gardeners' Orphan Fund would be taken in compensation for the cost and time incurred in replying to you.—*C. C.* 1, Gooseberry Apple; 2, probably a local variety; 3, Hanwell Souring; 4, Melon; 5, Wyken Pippin; 6, Beauty of Kent.—*F. G., Caterham.* Fruit of Pyrus japonica and Apple Warner's King.—*B. W. G.* 1, Yorkshire Beauty; 2, Pott's Seedling; 3, Wyken Pippin; 4, Malster; 5, Cellini Pippin; 6, White Nonpareil.—*J. T. L.* 1, Mère de Ménage; 2, Queen Caroline; 3, not recognised.—*Pears.* 1, Marie Louise; 2, Beurré Superfin; 3, Beurré de Capiaumont.—*H. Reynolds.* 1, Local variety; 2, Minshull Crab; 3, Beauty of Hants; 4, Greame's Pippin; 5, Norfolk Beefin; 6, Keswick Codlin.—*Fair Field, Swanley.* 1, Waltham Abbey Seedling; 2, Scarlet Pearmain; 3, Hollandbury; 4, Belle du Bois; 5, Crimson Queen; 6, Court Pendu Plat.—*J. P. S.* Summer Pearmain.—*Fenote.* 1, probably a local variety; 2, White Westling.—*H. Kaboder.* 1, Graham; 2, not recognised; 3, Prum River; Lite.—*E. M. F.* Doyenné Boussoch.—*H. W. S., Hatfield.* 1, Baldwin; 2, Golden Reinette; 3, Dumelow's Seedling (Wellington); 4, Prince Albert.—*A. Clark.* The numbers were detached. Send again and use stamp waste if possible.—*A. Houghton.* 1, Wyken Pippin; 2, The Queen; 3, White Whorle; 4, White Nonpareil; 5, not recognised; 6, Worcester Pearmain.—*J. E. Thom.* 1, Cellini Pippin; 2, not recognised; 3, Alfriston; 4, Minshull Crab.—*R. O.* 1, Yorkshire Beauty; 2, Hollandbury; 3, not recognised; 4, Waltham Abbey Seedling; 5, Fearn's Pippin; 6, Duchess' Favourite.—*Godla.* 1, Cellini Pippin; 2, Ross Nonpareil; 3, Cox's Orange Pippin; 4, Ribston Pippin.—*A. C. J.* 1, Gravenstein; 2, The Queen; 3, Old Nonsuch; 4, not recognised; 5, Bess Pool; 6, Lady's Finger.—*W. G. G.* American Mother.—*J. M. Bott.* Pear Thompson.—*W. Yandell.* Apples: 1, King of Tompkin's County; 2, Tower of Glamis; 3, Lord Lennox; 4, Cox's Orange Pippin; 5, Pears Beurré d'Amanlis; 6, Belle de Brissac.—*Hibernia.* 64, Newton Wonder; 72, Cheshunt Pippin; 73, Winter Queening.—*F. E. S.* 1, Baddow Pippin; 2, Dean's Codlin; 3, Sturmer Pippin; 4, Golden Russett; 5, Baldwin; 6, Scarlet-golden Pippin.—*L. F.* Adam's Pearmain.—*J. S. H.* 1, Bramley's Seedling; 2, Blenheim Pippin; 3, Court Pendu Plat; 4, Lady Henniker; 5, Beurré de Capiaumont; 6, Autumn Bergamot.—*F. T.* 1, Cox's Orange Pippin; 2, White Nonpareil; 3, Baumann's Red Winter Reinette.—*J. H. A.* 1, Small's Admirable; 2, Winter Hawthornden; 3, Domino; 4, Warner's King; 5, Lane's Prince Albert; 6, Alfriston.—*H. Reeder.* 1, Gloucester Quoining; 2, Waltham Abbey Seedling; 3, Norfolk Beefing; 4, Castle Major; 5, Wellington; 6, Dunster Bitter Sweet.—*Correspondent.* Apple packed in a small cardboard box with cotton wool, no letter, Wyken Pippin.—*W. T.* Fertility.

NAMES OF PLANTS: *G. M. S.* Tussilago Farfara (Coltsfoot).—*N. D. P., Hibernia.* 1, Sedum rupestre; 2, Thymus Serpyllum, var. lanuginosus; 3, Sedum album; 4, Saxifraga hypnoides; 5, Sedum hispanicum; 6, S. oppositifolium; 7, Dianthus deltoides; 8, Saxifraga Andrewsii; 9, 10 and 11, Too faded to recognise; 12, Lysimachia vulgaris. You have exceeded the proper number.—*W. J.* 1, Aster Novæ Angliæ var.; 2, A. diffusus, var. horizontalis; 3, A. Novi Belgii "Robert Parker"; 4, A. N. B. densus.—*J. H.* 1, Miltonia candida; 2, M. Bluntii; 3, Oncidium cheirophorum; 4, O. crispum; 5, Pteris hastata; 6, Selaginella lævigata.—*F. M. O.* 1, Masdevallia nidifica; 2, M. triaristella; 3, Stelis micrantha; 4, Pleurothallis obovata.—*J. L., Euston.* 1, Polystichum angulare; 2, Polypodium aureum; 3, Cyrtomium caryotideum; 4, Pteris argyræa.—*A. F.* The light form of Cypripedium Harrisianum called Dautheri.—*R. P.* 1, Adiantum formosum; 2, A. assimile; 3, Pteris tremula; 4, Woodwardia radicans; 5, Cystopteris fragilis; 6, Polypodium vulgare.—*W. J. G.* Phytolacca decandra.—*J. H., Ireland.* 1, Leycesteria formosa; 2, Tamarix gallica; 3, Pinus contorta.—*W. F.* Aster ericoides var. Clio.—*W. H. D.* Acacia longissima.—*F. S.* Polygonum orientale.—*W. C. O.* 1, Hordeum jubatum; 2, Eragrostis elegans; 3, Lagurus ovatus.—*H. A. M.* Tsuga Brunoniana.—*F. F.* 1, Astrantia major; 2, not recognised, send when in flower; 3, Clethra arborea; 4, Solanum sp.—*B. L.* Abies grandis; we have no experience of its value as a timber tree here.

ODONTOGLOSSUM CRISPUM: *R. S.* The specimen you have with 10 flowers is unusually fine, but a much larger number is sometimes produced by plants sending up branched inflorescences.

OFFICIAL STATUS, &c., OF PARK SUPERINTENDENTS: *Surrey.* We agree with the principle that a Parks Superintendent should be the head official in his department, and that he should be solely responsible to a committee and not to another paid official. Until recent years most of the public parks throughout this country were under the control of Town Surveyors and Engineers, and managed by them more or less as part and parcel of the public highways department. At the present time, however, in the more progressive cities and towns the public parks and recreation grounds are managed by a Parks Committee and a distinct department, the head of which is a trained gardener. The idea that because an engineer is clever at drawing plans and laying out roads and footpaths, he is the best person to have charge of the public parks, is wrong. Public bodies are fast realizing that parks are horticultural institutions, and that the truest interests of the community are served when the person responsible for their management is a trained horticulturist. The fact of the head official being a trained gardener does not in the least prevent his being a shrewd business man capable of looking after the financial part of the work, or one ever on the alert in looking after the safety, comfort, and enjoyment of the public. All these are essential qualifications for a successful Parks Superintendent. We will answer your questions as fully as is possible in the limited space at our disposal. 1, The duties of a Parks Committee should consist in safeguarding all public interests, in relation to parks, commons, recreation grounds, and street trees, controlling all expenditure in connection with the upkeep of parks and open spaces, or on the purchase and laying out of new ones. The appointment and discharge of all its officials. All acts on the Parks Committee should be subject to the approval of the Council; 2, The question of the personnel of a Parks Committee for the management of your public parks is a somewhat difficult one for us to deal with at such a distance, as this largely depends on local circumstances. The fact that your full council consists of only nine members, leads us to think that it would be advisable to enlist the services of a few outside ratepayers as an advisory committee who should, however, have no power to vote. The most important qualification for membership should be the business one. As long as a member is in close touch with public opinion, and has a thorough grasp of business detail, it matters but little whether he understands purely gardening matters or not—the Superintendent is the paid expert and should be the authority on gardening; 3, The duties of the Superintendent should consist in the carrying out of the instructions of the Parks Committee, preparing yearly or half-yearly estimates for carrying on the works of his department; he should keep all expenditure under his control. As far as ordinary garden routine is concerned, he should be allowed to exercise his discretion, but it would be exceedingly bad policy on his part to undertake alterations, planting, or laying out fresh ground without first getting the sanction of his Committee; 4, In Glasgow, Edinburgh, Liverpool, Manchester, Cardiff, Leeds, and most of the other up-to-date towns, a trained horticulturist is the head of the Parks Department; 5, It is not usually considered to be one of the functions of a Parks Committee to raise subscriptions for the purchase of Parks and Recreation Grounds. This is done in isolated cases, but such purchases are usually made out of money raised by rates; 6, The salaries of Parks Superintendents who are heads of their departments range from about £200 to, we believe in one case, £550 per annum, usually with free house, coal, and light; 7, When it can be managed, the best method of arranging the apportionment of playing areas, is to get all Clubs to send in their match-fixtures, whether cricket, football, hockey, or other such games at the commencement of each season. By doing this the Superintendent has a good idea of the demand which will be made upon the ground, and can make a fair division of the play-pitches among the various clubs for their matches. The details for carrying out this principle can easily be arranged to meet local customs. We know one or two Parks Departments in this country where this method of allocating pitches (for every match and not for the season) is carried out to the satisfaction of players and park officials alike.

PLUM ROOTS: *A. E. T. R.* The roots have no trace of fungoid disease; their failure results from their growing in an unsuitable medium. When root-pruning the trees add some old potting material or other fresh soil, and encourage the roots to grow nearer the surface. Root-pruning will most probably result in the tree bearing fruits.

TOMATO: *W. J. G.* So far as we can determine the small circular marks are caused by the punctures of some insect, perhaps greenfly. But if a fungus is present they will soon spread, and in that case kindly send us further specimens.

TRANSPLANTATION OF HOLLIES: *L.* Read the article on p. 288, which includes all the information you require.

VINE ROOTS: *W. B.* The roots have perished, but there is no fungus present to account for the trouble, and we suspect the mischief has been caused by the unsatisfactory state of the borders. These should be seen to and thoroughly renovated during the approaching resting season. Afford some fresh, sweet loam, and encourage the roots to grow near the surface of the soil. Above all see that the drainage material is put into a satisfactory condition.

VIOLETS DISEASED: *F. J.* See answer to *F. C. L.*, p. 268.

THE AMERICAN GOOSEBERRY-MILDEW IN 1906.

A WARNING TO ENGLISH GOOSEBERRY GROWERS.

I HAVE on several occasions* during the past five years, both in this journal and in the *Journal of the Royal Horticultural Society*, pointed out the danger of the introduction of the American Gooseberry-mildew into England which has been threatening Gooseberry growers in this country. It is quite clear that the danger is now imminent, and that unless immediate and resolute measures are taken, Gooseberry plantations in England will be annually subject to a disease which will prove even more ruinous than "big bud" has proved to Black Currant plantations.

The American Gooseberry-mildew (*Sphaerotheca mors-uvae*) is a native of America, and was unknown in Europe until 1900, when it occurred in three gardens in Ireland, to which country it had been imported on diseased Gooseberry bushes. Since then, it has appeared in several countries on the Continent. At the present time the disease is flourishing in Ireland in hundreds of gardens in no fewer than 14 counties. In many cases the Gooseberry crop has been totally destroyed year after year.

So far England is free, but if the present conditions are allowed to continue, it is practically certain that the appearance of the disease in England is merely a matter of time. I have studied closely the history of the outbreaks of the present disease in Europe, and the preventive legislative measures now in force in other countries, and I have been receiving for the past six years detailed reports from a number of correspondents in Ireland. I am convinced that it is necessary, in order to protect English growers of Gooseberries, that the following measures should be taken:

(1) The temporary prohibition of the uncontrolled importation of Gooseberry bushes from Ireland and all foreign countries.

(2) The extirpation of the disease in Ireland. This can only be effected by the authorities carrying out a systematic inspection of nurseries and private gardens in the affected districts, and ordering the destruction (with partial compensation to the owner) of the worst affected bushes, and the spraying of those only slightly affected.

(3) The distribution through England and Scotland of a leaflet fully describing the disease, and pointing out to all growers the dangerous nature of the disease and the necessity of immediately notifying to the authorities any outbreak in the neighbourhood.

No less thorough measures than these can hope to combat the disease successfully, on account of its epidemic and infectious nature. The Irish Board of Agriculture has now begun to warn growers of the dangerous nature of the disease, and has issued a leaflet describing the disease and recommending fungicides. But until *legislative* measures similar to those now in force against certain infectious diseases of animals are employed against this Gooseberry fungus, the disease will never be stamped out. At the present moment the disease is still existing in Ireland in the very same garden in which it occurred in 1900, and since 1900 not a single year has passed without the disease being reported from fresh counties in Ireland. I have within the last few weeks received communications from correspondents in Ireland which seem to show that diseased plants are being sent out from Irish nurseries to different parts of Ireland. So long as the disease is widely-spread over Ireland, as it is at present, the gravest danger exists of its being brought by chance or in ignorance or carelessness into England. At any time the offer of a cheap lot of Gooseberry bushes from an Irish nursery may induce an English grower to send for them, and by such a purchase the disease may be introduced into England. If once the disease gains a firm foothold in this country, it is not too much to say that it will never be stamped out.

We can best realise what will be the fate of Gooseberry growing in England—where we are wholly unprepared for resisting this pest and where as yet no assistance is given by the Government for the stamping out of epidemic fungus diseases of plants—by taking a glance at the present state of affairs in two countries on the Continent, viz., Germany and Sweden.

In Germany the disease was first noticed in 1904 in a single locality at Labischin, near Bromberg. Dr. Herter, who was specially appointed to investigate the outbreak, now writes to me from the Institute for Plant Diseases at Bromberg, that the disease has appeared during the present year over all the districts along the rivers Menel, Weichsel, Warthe, and Netze, and also along almost the whole of the Baltic coast.

With respect to the outbreak of the disease in Sweden, Prof. Eriksson has recently published in the *Deutsche Landwirtschaftliche Presse* a detailed account of the present state of affairs. This account is of the greatest interest as showing what we may expect to happen in this country should the disease be introduced, and the Government then attempt to combat it. I give below a translation of Prof. Eriksson's article, and I would ask every Gooseberry grower to give it his most careful attention and consideration.

"THE FIGHT AGAINST THE AMERICAN GOOSEBERRY-MILDEW IN SWEDEN.

[illegible]

"In the summer of 1905 the occurrence of the American Gooseberry-mildew was reported for the first time from two localities in the south of Sweden—Karlshamn (Sandvik) and Falsterbo. As a matter of fact, the fungus had been observed in the first locality in 1901, and in the second in 1904 (or 1903), without anyone having paid special attention to it. The diseased plants in both cases had been obtained from a Danish nursery. All the badly-diseased bushes in both the localities were immediately rooted up and burnt, while those bushes only slightly affected were sprayed thoroughly and repeatedly with sulphide of potassium (30 grammes to 1 litre of water).

"Immediately after the first discovery of the disease, the Royal Agricultural Academy had a leaflet distributed through the country, calling the attention of the public to the new pest, and giving the necessary directions for proceeding against it. In order to prevent more diseased Gooseberry bushes being brought into the country, a Royal Prohibition against the importation of Gooseberry bushes and fresh Gooseberries into Sweden was issued on September 27, 1905. At the same time, the Department of Agriculture sent round an official notice to the Agricultural Societies in all parts of Sweden, requesting every grower (in their several districts) who during the last few years had procured and planted Gooseberry bushes to keep these bushes under close observation, and if the disease was discovered, to carry out instantly and with all precision the directions given for its destruction.

"In 1906, at the beginning of June, a new outbreak of the disease was discovered at a residential suburb (Bjerred) near Lund, and by the middle of July numerous cases of the occurrence of the disease were reported from all parts of the kingdom. The disease is now known to occur in a number of places from Dalecarlia in the north to Scania in the south, both in nurseries and in private gardens. For the most part the disease has been brought into the nurseries with Gooseberry bushes obtained from German nurseries; these bushes had been imported in the year 1904 and in the early part of 1905 before the passing of the Prohibition against the importation of Gooseberry bushes.

"II.—*What has been done to combat the pest in* [illegible]

"On July 14, 1906, an appeal was made in the Stockholm newspapers to residents in the

* *Gardeners' Chronicle*, October 28, 1905, and January 27 and February 3, 1906; *Journal Royal Horticultural Society*, vols. xxv., xxvi., xxvii. and xxix.

neighbourhood to examine their Gooseberry bushes very carefully (especially the standards), and, if the disease was discovered, to take immediate and energetic measures against it. In order that the fight against the pest might be carried on vigorously, the Minister of Agriculture, on July 20th, put aside the sum of 1,000 Swedish crowns (£55 4s. 2d.) for this purpose, and at the same time sent to all the newspapers in Sweden a circular with the title 'A call to arms against the American Gooseberry-mildew!' in which the cause and appearance of the disease, its dangerous nature, &c., were briefly described. Further, a printed list of questions, with a request for answers, was sent to all those persons who had reported the occurrence of the disease. During the next few weeks the officials of the Plant Physiological Experimental Station of the Academy of Agriculture paid visits to different parts of the country, in order to examine nurseries as well as numerous private gardens, and to give directions for combating the pest. Finally, it is to be noted that in consequence of these proceedings, many thousands of diseased Gooseberry bushes were rooted up and burnt. Neighbouring bushes which were still healthy were sprayed as prescribed above.

"3.—*How is the fight to be continued?*

"On August 18 the Swedish Pomological Society held a special meeting at Stockholm to discuss this question, when the author laid before a large assembly for discussion the results of his studies and experiences in the following propositions:—

"(1) Where even only a single diseased bush is discovered, this bush, together with all bushes coming from the same place and planted at the same time, must be immediately rooted up and burnt, great care being taken that the persons who carry out this work do not (by means of their clothes, tools, or so forth) unintentionally carry the disease to bushes in other plantations. Should plantations which are but little diseased be very large, then the following *experimental* measures may be carried out: the mildewed shoots must be immediately cut off as soon as they appear, and burnt; later, in the autumn, the bushes must be completely cut down to the ground, and all the parts which are cut off likewise burnt; then the ground must be heavily limed or sprayed, and, finally, in the following spring the new shoots must be kept under close observation.

(2) As spraying with liver of sulphur solution (30 grammes to 10 litres of water), according to results obtained in Sweden during the last few weeks, is not only liable to injure certain kinds of Gooseberries, so that the leaves, or even the fruit, fall off, but may also be insufficient to stop entirely the development of the fungus, growers cannot at present be recommended to use this spray on those bushes or plantations where the disease has already appeared. As an experiment a weaker solution (20 grammes to 10 litres of water) may be used on perfectly healthy bushes to protect them from the disease.

"(3) As in those districts where the culture of standard Gooseberries is a matter of some importance as, e.g., in the neighbourhood of Stockholm the disease appears to have been imported and distributed chiefly with these plants, we advise that such standards should for the present not be planted, especially as it has now been clearly shown that the fungus flourishes on the 'stocks' of the standards, that is, on *Ribes aureum*. All owners of nurseries should therefore be asked not to import wild 'stocks' of this species of *Ribes*.

"(4) As a similar disease has been observed in some cases also on Currants—especially the Red, but also on the Black and even in one place on the Raspberry, careful attention should be paid to these plants also."

"(5) All owners of nurseries in this country must agree not to offer Gooseberry bushes for sale during this autumn and the whole of next year, and all owners of gardens are advised not to plant during that time new Gooseberry bushes coming from other gardens.

"(6) As it concerns the saving of our most important fruit, a united and permanent cooperation for the attainment of this purpose should take place between the State, the local authorities, owners of nurseries, and private growers. All must suffer some loss. In the first place, the State and the local authorities should contribute generously towards giving compensation for monetary loss incurred by the destruction of diseased bushes.

"(7) The fight against the pest must be continued in 1907 with undiminished energy. If the pest were to be allowed to remain unchecked for a few years, it will no longer be possible to control its ravages.

"After some discussion, the Society at this assembly decided to submit to the Swedish Government the following resolutions:—That a Royal Prohibition should be issued forbidding the transplanting of Gooseberry bushes (or parts of them) to other gardens, as well as any sale of them; that this Prohibition should come into force as soon as possible, at the latest by the 10th of September of the present year; and that the necessary means should be provided by the Government for the partial compensation to the grower for loss occasioned by the rooting up and burning of diseased plants, especially in the cases where nurserymen and dealers are concerned."

One cannot help contrasting the activity manifested by Continental countries, as shown in the above case, in combating this new fungus disease of Gooseberries with the inaction of the authorities of this country. Since its appearance in Ireland in 1900, the disease has steadily increased its area each year, until now it is threatening the whole of the eastern half of Ireland. No systematic attempt has been made to eradicate the pest or prevent the appearance of fresh centres of infection. We are now practically waiting until the disease appears in England, although as I wish particularly to point out here, it will in all probability prove too late then to deal successfully with the disease, on account of its epidemic nature.

If the American Gooseberry-mildew is to be kept out of England, immediate and energetic action is required by the Fruit-Growers' Associations of this country. I shall be glad to receive notice of any meetings to be held for the purpose of discussing the matter, or a copy of any resolution on the subject passed by a society. *E. S. Salmon, F.L.S., Hon. F.R.H.S., Mycologist to the South-Eastern Agricultural College, Wye, Kent.*

* Instances of the Mildew attacking Red Currant have occurred this year in Ireland, and also in Denmark. *E. S. S.*

CULTURAL MEMORANDA.

CYCLAMEN.

These plants are most useful subjects for the decoration of the greenhouse and conservatory during winter and early spring. They can be had in flower in about 14 months from the time the seed is sown. The seed should be sown during September or October in clean, well-drained pans, containing a mixture of good loam, leaf-soil, peat and sand, with some finely broken charcoal added. Pass the soil through a ½-inch mesh sieve, fill the pans to within ¾-inch of the top, and well water the soil before sowing the seeds. Place the seeds quite ½-inch apart, and cover them with finely-sifted soil. Another good plan is to dibble in the seeds at a distance of ½-inch apart and about ¼-inch deep, but care must be taken that they are not planted too deeply. Place the pans on a shelf in an atmospheric temperature of 65° to 70°; cover the pans with glass, and place paper over the glass until the seedlings appear, when the paper can be removed, and the glass also as the plants advance into growth. As soon as the seedlings have made two or three leaves, transfer them to small, 60-sized pots, using as a potting medium two parts of good turfy loam, one of leaf-soil and peat, some charcoal and dried cow-manure, and enough coarse sand to keep the soil open.

The plants should be placed again in the same temperature on a shelf as near to the glass as is possible. As soon as the pots are filled with roots, shift the plants into others 3½ inches in diameter, using the same kind of soil as before. The plants can be kept in this temperature until they have become established in their pots, when they can be taken to a frame or pit, in which a temperature of 55° to 60° is maintained. By the second week in June they should be ready for their final potting into pots 5 to 5½ inches in diameter, using the same kind of soil as before, broken more roughly. When the pots are filled with roots the plants should be watered occasionally with weak manure water made from cow manure or from sheep droppings which have been put in a bag and soaked in a tub of water. On warm nights during July and August the lights of the frame may be removed. Attend carefully to their watering and syringe them overhead during the afternoon, for this will help to keep them free from Aphis. These pests can be kept down by occasional fumigations with XL-All insecticide. Towards the end of September some of the most forward plants may be removed to a light position in an atmospheric temperature of 50° to 55° through the winter months. The great secret of success in the culture of these plants is to allow them a moist atmosphere, give them liberal supplies of water and admit a free circulation of air, with suitable shade in summer-time. Endeavour from the first to keep the plants sturdy, vigorous, and as healthy as is possible. *G. W. Smith, Dunsfield.*

NEW OR NOTEWORTHY PLANTS.

XYLOBIUM BRACHYSTACHYUM, Kränzlin n.sp.*

This plant, without flowers, might be considered by anybody as a Stanhopea, the bulbs and leaves and manner of growth being the same in this plant as in that genus. The flowers, however, in their principal features agree with what botanists call Xylobium, a genus comprising all the Maxillarioid Orchids with stalks bearing more than one flower. The genus Xylobium has had a rather heavy struggle for existence, being

Xylobium brachystachyum, *Kränzlin, n.sp.* Bulbi cepiformes fere globosi supra paulum angustati monophylli rhizomate lignoso 1 cm. crasso insidentes laete virides rudimentis coriosis cataphyllorum dense vestiti, 4 cm. alti 3,5 cm. diam. folia singula e petiolo sulcato oblonga acuta trinervia crasse coriacea nitida, petiolus 7-8 cm. longus, lamina 25 cm. longa 9-10 cm. lata; racemi brevissimi pauciflori vix 2 cm. longi, rhachis et ovaria et flores extus sordide purpurei, bracteæ pro planta magnæ cucullatæ 2 cm. longæ vi expansæ 2, 3 cm. latæ flores semiaquantes. Sepalum dorsale late ovato-oblongum obtusum, lateralia bene majora basi valde dilatata cum pede gynostemii mentum obtusum quadalabastris acutum) formantia leviter falcata obtusa; petala basi obliqua gynostemio affixa antice oblonga acutiuscula quarta parte minora quam sepala, omnia flaveola maculis sordide purpureis onusta, labellum simplex obovato-oblongum acutiusculum leviter panduratum subconvexum medio in disco leviter excavatum v. foveatum vix incrassatum lineis callisque omnino destitutum atropurpureum superficie vernixium nitidum; gynostemii pars antica libera vix alla; rostellum magnum cucullinstar foveam stigmaticam obtegens; anthera obtuse apiculata. Flores maximi generis expansi 3 cm. diam. sepalum dorsale 2 cm. longum basi 1, 2 cm. latum, lateralia 2-5 cm. longa basi 1-5 cm. lata, petala ad 8 cm. longa 8 mm. lata, labellum 2 cm. longum antice ca. 7 mm. latum. —*F. Kränzlin.*

Importavit pusit Wilh. Hennen, Hildesheim. E Brasiliæ meridionalis provincia Sta. Catarina.

formerly united with Maxillaria, then re-established as a separate genus. This new member of the genus by no means settles the question, but makes it still more intricate. Besides the unusually short spike, which scarcely reaches the length of the bulb, and the large Stanhopea-like sheathing bracts, the lip of the comparatively large, dirty purplish flower is not like the Maxillaria type, and has still less resemblance to the lip of other Xylobiums. It offers no peculiar character, being a single oblong organ, without any trace of the crests or calli so common in Maxillarias, Lycastes and Bifrenarias. The lip is a little thickened in the middle, with a very shallow impression in its centre, and only in its dark purple colour and the glossy and varnished surface does it differ essentially from the other parts of the flower. Although the plant is not beautiful, it is of botanical interest, as showing the tendency of a Maxillarioid Orchid to pass gradually into the Stanhopea line, whilst there is no trace of affinity to Bifrenaria—a genus considered mostly to be the next to Xylobium.

The plants were imported from Southern Brazil, viâ St. Catarina (or from the province of this name), by Mr. W. Hennis, of Hildesheim, Germany. I could not recognise it in Dr. Alfr. Cogniaux's just finished great work on the Brazilian Orchids, and after a long examination of all materials, literature, and plants accessible to me, I feel quite sure that the plant has not hitherto been described. Besides these negative results of my researches, I gained a positive and rather surprising one, which I mention here because the plant in question has been known in England for many years. It is the so-called Kochiophyton negrense of Schlechter, recently figured under this name in the *Flora Brasil. Orchidaceæ* (III., t. 110), or by its correct previous name, Acacallis cyanea Lindl. The plant was detected by Spruce at Barra de Rio Negro, Brazil (n. 1780 of his collection), and described and analysed in a thoroughly exhaustive way by Dr. Lindley. The sketch of the analysis was afterwards published by Prof. Reichenbach, in *Beitrage zur Orchidenkunde* (Dresden, 1869, p. 13-14, t. IV.) under the name Aganisia cyanea Rchb. f. Then for a rather long time the plant seemed to be forgotten, until in 1885 it flowered for the first time in Europe, and was figured twice in the *Lindenia* (Vol. I., t. 45, and Vol. III., t. 110—Aganisia tricolor, N. E. Brown). Unfortunately the plants were very weak and died soon after flowering. Lastly, the Royal Botanical Museum at Berlin received a small but highly interesting collection of dried plants from the original habitat of the species, and from this material the text and the drawing in the *Flora Brasiliensis Orchidaceæ* (III. t. 119) was made. The two plates in the *Lindenia* give a very good general idea of the plant, and show the spikes as slightly drooping, as indeed they are, but the details for an instructive critical examination are not supplied. The plate 119 in the third volume of *Orchidaceæ of the Flora Brasiliensis* is exaggerated in nearly every respect. The type-specimen in the Berlin herbarium is much more slender and less compact, and not so free flowering as the plate represents. It shows the flower stalks erect as they were placed by the collector, whilst the stalks being thin and the flowers large they should have been drawn in a drooping position. All the other characters, the wings of the column, the crest or calli of the lip, the colour of the flower, as pointed out in the text, are quite the same in the old Acacallis cyanea of Lindley as in the new Kochiophyton negrense of Schlechter. Therefore, I am quite sure that we have the pleasure of renewing an old acquaintance under a new name. *Fr. Kranzlin.*

DISTYLIUM RACEMOSUM.

THIS curious Japanese shrub is a near ally of the Witch Hazels (Hamameldidaceæ). The flowers have a calyx of five or more linear reddish sepals, no corolla, a variable number of stamens with two-celled anthers, a two-celled ovary with a single ovule in each cell, and surmounted by two styles.

Our illustration is taken from a specimen sent us by Mr. Smith from the home of interesting plants at the Newry nurseries. The shrub is not only botanically curious, but it is ornamental as well, and should therefore find a place in the gardens of all plant-lovers. In the north it would require the shelter of a greenhouse.

FIG. 120.—DISTYLIUM RACEMOSUM, FLOWERING BRANCH NATURAL SIZE, SECTION OF FLOWER MAGNIFIED, AND STELLATE HAIR MUCH ENLARGED.

CASTLE ASHBY.

A RECENT visit to these gardens proved to be of much interest. On entering the grounds one is impressed by the fact that the surrounding landscape is in keeping with the grandeur of the mansion. The terraces near to the residence are extensive, and they command some grand views of the beautiful country. The grounds contain many noble Conifers, judiciously planted in connection with some of the more ornamental forest trees. The flower beds are numerous, and they are planted with subjects that not only harmonise with each other, but also with their surroundings. The various strains of flowers are of the best, and the effect they produce is most beautiful. The hardy flower borders are filled with a choice collection of plants, including some of the more recently introduced perennials, in addition to the best of the older varieties. I have seldom seen Hollyhocks in such robust health. Mr. A. R. Searle, the gardener, attributes their success to liberal treatment. The plant-houses are numerous and of imposing architecture, although, perhaps, not the most suited to plant growing. The plant-structures contain a goodly collection of plants, and their roofs are covered with the choicest of greenhouse climbers. The roof of one house was completely covered with the lovely but somewhat uncertain flowering Rose Fortune's Yellow, which, I was informed, succeeds splendidly here. Plants for the embellishment of the mansion, and also for the production of large quantities of cut flowers are largely grown, numerous pits and frames, in addition to the houses, being used for their raising. Chrysanthemums, both for the production of large blooms and as decorative plants, were numerous, the collection containing many up-to-date varieties, all of which gave promise of a wealth of flowers.

In the fruit houses Grapes, Peaches, Nectarines, and Figs were noticed. Melons are also largely grown and in numerous variety. All the fruit showed excellence in culture. In the hardy fruit quarters the Apple crop was but moderate, the late spring frosts having to a great extent destroyed the crop. A large orchard containing pyramid-trained Apple trees has been renovated. Useless varieties have been cut down and re-grafted with kinds suitable to the locality.

The kitchen garden consists of 6 acres of land, completely surrounded by walls. This provides ample space for a large quantity of wall-trained fruit trees. Good crops of Peaches were noticed on these walls, also some young, healthy Peach and Nectarine trees, which the writer was informed were intended for transferring to the Peach-houses as occasion required. Numerous young trees of Pear, Cherry, Plum and Apricot have been planted. Most of the older trees in the gardens were carrying good crops of fruit. Pyramid, bush and espalier-trained Apple trees of the leading varieties are planted parallel with the main walks of the kitchen garden. Bush-trained trees are also largely grown. Strawberries for forcing are layered at once in their fruiting pots, and to judge from their appearance this method is highly satisfactory.

The quarters devoted to vegetables contained good Peas, Onions, Potatoes, Carrots and Beetroot. Peas, notwithstanding the drought, were of high merit. Other vegetables were very good, and gave evidence of good culture and careful attention to detail.

The grounds of Castle Ashby are, by kind permission of the Marquis of Northampton, open to the public, twice weekly, during the summer months. Mr. A. R. Searle has effected many improvements in these gardens during the four years he has been entrusted with their care. *W. Iggulden.*

PLANT NOTES.

LACHENALIA HYACINTHINA.

IN *Meller's Deutsche Gartner Zeitung* for September 15 last appeared a short descriptive note and illustration of this pretty variety. The blooms are small individually, and they are arranged thickly together on the stalk in a horizontal direction like those of a Hyacinth. The colour is white, striped with pale lilac, and the scent is reminiscent of that of the Hyacinth. As a pot-plant it remains in good flower for one month. According to the management of Lachenalias, they may be made to blossom in winter or spring, if the tubers are placed in pots in early or late autumn. It is always advisable to stand them in a cold frame or pit for some time to permit the roots and leaves to develop fully before putting the plants into warmth to hasten the formation of the blossoms. Great care should be taken in applying water during the early stage of development; whilst in the flowering stage water is required in abundance, and as soon as the foliage begins to turn yellow after flowering has ceased, no moisture should be afforded, the pots being turned on their sides when the ripening is completed in the open air.

OXALIS BRAZILIENSIS.

THOSE who possess a greenhouse, cold pit, or garden frame should obtain, at this season, tubers of this beautiful species of this Oxalis, and put them, an inch or two apart, in a moderately light, sandy compost or ordinary garden mould. The drainage should be ample. By potting a few tubers at intervals of a fortnight during autumn and early winter, blossoms may be obtained throughout the spring months. The flowers appear to the number of six or eight on a stalk, and are of a deep shade of carmine. As soon as the tubers have commenced to grow, the pots should be placed in the fullest sunshine. From the time the foliage is mature, the tubers should be kept dry, the pots being turned on their sides in the open air. *A. M.*

PENTAS CARNEA.

THE rage to-day in the horticultural, as in every other walk of life, is for the new and the bizarre, for the untried, no matter how mediocre. The descriptive critique re Pentas carnea, p. 246, is most opportune. Introduced over 60 years ago, it is surprising that this plant, whose cultural requirements are of the simplest, should be so much neglected by the majority of present-day gardeners. Pentas carnea Quartiniana is an improvement on the type, and is the one most usually grown. Cuttings of the young growths inserted in sandy soil, and placed in a little heat, make roots readily at any time; but, if inserted in the spring, good flowering plants for autumn and winter flowering may be obtained. When rooted they should be hardened off and grown on during the summer in cold frames, removing them to the greenhouse before the cold weather arrives. They are not fastidious as to soil, a light, loamy mixture suiting them perfectly. Six-inch pots are large enough for all ordinary purposes, and good, useful plants may be grown in 4-inch pots, provided attention is given to the watering and feeding of the plants. The plant is of a somewhat straggling habit, and should be pinched occasionally. A few light fumigations will keep down fly, which otherwise is apt to be troublesome.

COLEUS THYRSOIDEUS

is useful for associating with the Pentas in any scheme of floral decoration. The thyrsoid racemes of cobalt blue give a combination at once charming and original. May is sufficiently early to commence the propagation of this plant, it being of rapid growth, and if the plants are grown cool, much more sturdy and compact specimens than are usually seen will be the result. The young flowering shoots may be taken for use as cuttings when the spike is showing. Placed in small pots in gentle heat they will root quickly, and come in useful for house decoration for stands and such-like, where, as often as not, pot space is strictly limited. *Fred W. Jeffery, 30, Stevenson Drive, Glasgow.*

ROCK-GARDENS.

(Continued from page 270.)

ONE can so arrange an out-crop rockery that it could only be described as a collection of stones placed in natural-looking strata, to provide deep fissures, seams, rifts, sheltering canopies of stone, exposed ledges of stone, moraines of grit and shale, sunny cracks and clefts, shady cracks and clefts from which moisture oozes, pockets or dips that invite moisture, and pockets that drain moisture away. The fissures, cracks, seams and rifts vary in width from the thickness of a pencil to the thickness of a man's arm, and such fissures and cracks will appear ugly enough directly the rock garden is finished, and the moraines of grit and shale and projecting ledges of stone will appear to be a result of careless workmanship, but when draped with thriving plants they will present a picture far more enjoyable to the eye than that of bolder masses of stone less suitable for the plant.

Generally, one can plant the out-crop rock garden as it is being built, reserving the rarer plants till it has been established several months; by that time the rockery will have been studied, and the sites found that offer the best conditions for plants which are exacting in their requirements. The surroundings of dwarf trees and shrubs can be more tastefully arranged when the actual building has been finished, it being the easier process to throw the rocks into relief by skilful planting, than by building after planting is done. Use Ericas wherever the wind can blow through them; they delight in and have the best effect in elevated positions.

THE MAKING OF PATHS.

Gravel, shingle and other similar materials would be too reminiscent of the formal parterre. A few flat slabs of natural rock will serve as steps for any incline difficult to negotiate without danger or fatigue, and for the rest similar slabs and the debris collected after the rockery is finished, will serve as road-making material for the rockery pathway. Nothing more than a track is desirable, and if it can describe a circuitous course around the principal boulders, it edges, and, for the matter of that, its whole surface in places, covered with Erinus, Thymus, and other free-growing creeping plants, it will serve its purpose well, and as closely resemble the footways of Alpine scenery as the gardener can make it. One can recommend the out-crop rockery for its simplicity and for the cultural advantages it gives. It may cover a few rods, or it may be made to cover an acre with equal fitness. It associates well with a garden landscape if it is implanted in a setting of shrubs and dwarf trees, and it is the only rock-garden one can design that does not need an open expanse of horizon against which its boulders may be seen. Solid and massive boulders are not really necessary for it, but bold out-crops made up of small rocks pieced together and cemented with living plants only, should form its main features. The essential condition is that the slope shall be neither too steep nor too easy, for in the former case the rock garden becomes a wall garden, and in the latter it becomes, what is worse still, a heap of stones. Water, other than a small pool that can be partially hidden, is not a very desirable feature in connection with out-crop rockeries. *G. B. Wallett.*

(To be continued.)

CABBAGE GROWING ON A WALL.

THE example of wall-gardening shown in fig. 121 is perhaps more curious than attractive. The presence of a healthy plant of some species or other, growing upon or in a wall, is common, but we never remember having before seen a perfectly developed Cabbage in such a curious seed bed. It appears to have made the most of its unusual environment, and was not weakly, or consequently in haste to reproduce itself. The photograph was kindly forwarded by Mr. D. R. McKay, Slains Castle Gardens, Port Erroll, Aberdeenshire, who writes: "I enclose you a photograph of a Cabbage growing in an ordinary brick garden wall. The seed must have got in a small crevice between the bricks where the lime had fallen out. It 'hearted' and had a healthy appearance, although it had no other nourishment than that which it extracted from the bricks and dews. I have examined the crevice, and there is nothing in it except some lime rubble."

FIG. 121.—A CABBAGE GROWING ON A WALL.

There are, of course, many interesting examples of species of plants growing on old walls that one would not expect to find in such situations. One instance that occurs to us is that of a specimen of Pinus sylvestris on the side of a wall in the Botanical Gardens, Edgbaston, Birmingham. We do not know the exact age of this plant, but there is evidence forthcoming that it was growing on the wall as long ago as 1845. Its roots commence at a point on the wall 7 feet 6 inches from the ground level. The circumference of the trunk just out of the wall, as measured by Mr. T. Humphreys, is 1 foot 10 inches, and the circumference of the trunk 6 inches from the wall, 10½ inches. The plant has lost the erect habit characteristic of the Scots Pine. For the first 19 inches the trunk is straight, it then assumes a spreading or pendulous habit extending to a distance of 7 feet (more than double its height) over the border. The tree produces cones freely, but these are of small size. There is a smaller plant growing on the same wall, which, it may be added, has an aspect facing to the south.

VEGETABLES.

ONION CULTURE.

A LONDON daily paper recently announced that the growing of Onions in this country in such quantity as to enable us to compete with the Brittany Onion growers and exporters to be impossible. Leaders of such papers too often regard such non-professional dictums as authoritative, yet everyone who is conversant with British Onion culture will agree that we can and do grow under fully profitable conditions the finest, best-keeping, and generally most serviceable Onions to be found in the world. The introduction of the practice of sowing in the autumn varieties of a hard-keeping nature, such as Ailsa Craig, Excelsior, Main Crop, The Globe, A1, and others, in place of the soft-fleeting, if fine-bulbing, Tripolis and Roccas, has done much to open growers' eyes to the folly of adhering to old Onion-growing traditions. Such varieties as those just named are not only quite hardy, but give in the summer very fine bulbs, whether the plants be left where sown or transplanted. If well ripened, and that is easy at that time of the year, they will keep, if needed, till Christmas. Plants so raised also invariably escape maggot troubles, and commonly mildew. But the primary revolution in Onion culture has come from the method originally adopted to produce plants under glass by making sowings in shallow pans in gentle warmth in mid-winter, and by growing the plants on in ample light and air, well hardening them later, and finally planting them out in deeply-worked and well-enriched soil in the spring. Recently when visiting the gardens at Lockinge, I observed several beds of transplanted Onions, each bed being almost exactly a rod in extent, for each contained six rows of plants set at 15 inches apart, and the rows were 54 feet in length. The crop throughout was indeed a splendid one. There might have been altogether 1,000 bulbs. The ground had been trenched deeply, and well manured, and this deep working and liberal manuring were primarily the secret of the success, for whilst in other parts of the garden ordinary crops had felt the drought severely, on this plot the Onions, sending down roots 24 to 30 inches in length, had found ample moisture and food, with the outcome that the crop was generally a superb one. Mr. Fyfe, at my desire, kindly undertook to weigh three beds of equal area when the bulbs were lifted and cleaned, and he has sent me the result as 4 cwt., 3 cwt. 96 lb., and 3 cwt. 8 lb. Had there been an average rainfall, no doubt the weights would have been greater, but, still, here is an average of nearly 4 cwt. per rod, or the enormous crop of 32 tons per acre. Generally, the bulbs averaged 2 lb. each, and were in every case very hard and finely matured. The bulk were of the famous Ailsa Craig variety. But, taking the above as a sanguine estimate, certainly 5 cwt. per rod is a very reasonable one, and that would give 24 tons per acre, and, at £5 per ton, £120 per acre, certainly a marvellous return, but which, after all, only represents 1d. per bulb, a ridiculously low price. Such bulbs as these seen at Lockinge would find ready purchasers in this country at double that price. At present these cannot be purchased in this country, because Onion growers in a large way will not adopt garden methods of culture. These large bulbs are mild and pleasantly flavoured, and baked, stewed, or otherwise cooked, they form delicious diet. What a private gardener can do so well by the rod, large growers might equally well do by the acre. *A. D.*

SWEET CORN.

THIS is a rare vegetable in England, but in America it is grown largely and is there very much appreciated. I have grown something approaching 700 plants this year, so that a few hints on its culture may be of interest. The seeds were sown at intervals of about four weeks in order to provide a succession. The first sowing was made on March 16, another about the middle of April, and another about the third week of May. The seeds were inserted singly in good, light soil in 3-inch pots, and placed in a warm house. When the seedlings were about 6 to 9 inches high, they were moved to a cooler house, in which Tomatos were planted, and here they obtained plenty of light and air and became robust. As soon as the pots were filled with roots, the plants were re-potted into 6-inch pots, in soil such as one would use for Pelargoniums. As the weather became milder they were gradually hardened off, and the seedlings of the first sowing were planted out on May 26, in a warm border. These began to furnish "cobs" on August 1. The next sowing was planted, in the middle of the vegetable garden, on June 7, and "cobs" from these were ready to cut on August 12 and 20, according to the variety. The last sowing was planted about the middle of June, and the first heads were cut on September 10.

I also sowed a dozen rows in the kitchen garden, much in the same manner as Spinach is sown, save that the seed was placed a little deeper. This sowing was made on April 23, and the first head was fit to cut on September 12, and we are cutting from that sowing now (October 2).

The cultural hints can be summed up in a few words. Plant in lines, allowing 18 inches between the plants and 24 inches between the rows, in well-cultivated garden soil, giving manure waterings if required. Do not allow suckers from the bottom to grow, or the size and quality of the corn will suffer; the sooner the suckers are cut off the better the crop, and the more quickly will it be produced. Two or three cobs are sufficient on each plant. Among the sorts grown, I specially recommend Aristocrat for earliest supply, Early Crosby and Early Giant for main crop, and Early Crosby also for late. These are the best kinds among seven sorts tried. *A. H. Pearl, Moor Park Gardens, Tadmore.*

A POTATO "MUTATION."

BEFORE the Potatos are all lifted and stored, and whilst Potato mutations are still in our minds, it may be well to give an illustration of an abnormal condition, which is not very uncommon, and is every whit as remarkable as the alleged sport of Solanum Commersoni, about which so much has been written. Our illustration, fig. 122, was taken from an inflorescence of "Up-to-Date," growing in Messrs. Sutton's grounds at Reading. To the left are shown normal flowers, to the right flowers which are not only much smaller, but yellow in colour.

FIG. 122.—STAMINODY OF THE PETALS IN "UP-TO-DATE" POTATO.

On examination of these flowers, the petals were found to be partly of the nature of anthers, being not only yellow in colour, but producing pollen. Staminody of the petals is a much less common change than the petaloidy of the stamens, such as occurs in so many so-called double flowers; nevertheless, it does occasionally occur and, as we have said, we have not infrequently met with it in Potatos. The reasons for the change are hard to divine, particularly where, as in this case, the normal and the abnormal flowers occur in the same inflores-

FLORISTS' FLOWERS.

OLD AND NEW VARIETIES OF CANNA.

THE gardener has a great scope in regard to his choice of varieties, and among those are the new ones of M. Crozy and other raisers of these beautiful decorative plants for use in beds and borders. The newer ones are much finer, and the blooms larger than in the older varieties, but they are more apt to suffer from heavy rains and wind during the summer months. It is for that reason that many cultivators prefer the older Cannas, notwithstanding the smaller spikes and individual blooms. The following varieties will be found quite satisfactory for group planting. For beds or groups from 5 to 6 yards in diameter choose Rubin, a plant having dark-brownish red leaves and fiery red blossoms that are of great size, and abundant for the centre. It reaches a height of 1¼ yards. Around the central mass plant Königin Charlotte, a variety with light-green leaves and robust growth. The blooms are large, of deep red colour, and broadly bordered with yellow. A bed of this kind has a fine finished appearance, if it be bordered with the fine, cut-leaved Perilla nankinensis foliis atropurpureis laciniatis. Canna Austria is a variety of strong growth and very large leaves, the height of the plant being 4½ feet. The bloom is of a canary yellow colour, with scarlet stripes. Prince Bismarck has large leaves, having a broad reddish margin. The bloom is bright red, and the petals are turned backwards. The height of the plant is from 3 feet to 3½ feet. The following varieties may likewise be recommended, viz., Kaiser William, G. Bornemann, Stadtrath Heidenreich, and Garteninspektor Stapel. Among Cannas having reddish foliage, Pioneer, President Carnot, Amiral Avellan, and Hof-gartendirektor Græbener are among the best. For occupying single small groups on the lawn, owing to their great height and robust growth, are Heinrich Niepa and Ituha. A top dressing of cow-dung three fingers thick, and frequent applications of liquid manure and clear water during hot, dry weather, are good aids to growth. The top dressing is not nice-looking, but in about three weeks it is hidden under the leaves. Extract from an article by F. Hellmuth in the *Deutsche Gartner Zeitung*, October 13 1906.

KEW NOTES.

AUTUMN ROSES.

THE recent rains, coupled with genial weather, have prolonged the season for Roses. In some instances there are now more flowers on the bushes than there were in July. The variety Georges Nabonnand is decidedly better now, its pale, flesh-coloured flowers, shaded with salmon, are charming. Gruss an Teplitz is carrying more blooms than earlier in the year, and this is also the case with Canoens, which is one of the best bedding Roses. In addition to Hybrid Tea and Tea Roses, which usually furnish a late display, some of the Hybrid Perpetuals have also a goodly sprinkling of flowers. The most free-flowering of this last-named section is the beautiful white Frau Karl Druschki. Closely following this is Clio, a pale, flesh-coloured variety, with very thorny stems. The system of pegging down the long shoots in spring, instead of pruning them hard back, appears to encourage the production of autumn Roses, and both these varieties received this treatment. A bed of the variety Mrs. R. Sharman Crawford is gay with a considerable number of flowers. Other varieties of Roses that have now a fair number of flowers are Mrs. John Laing, Countess of Oxford, Baroness Rothschild, and Captain Hayward.

Among the Hybrid Tea Roses, which always produce the best display of flowers, Caroline Testout is easily best, for from three to four months, with scarcely a break, a bed of this variety has been covered with the salmon-pink tinted flowers. Very good also are Mrs. W. J. Grant, bright rose-pink; La France, and its blush sport, Augustine Guinoisseau; Viscountess Folkestone, creamy white, shaded with flesh colour; Killarney, pale rose-pink; and the distinct Mme. Abel Chatenay, of a pleasing shade of salmon-pink colour, especially beautiful when in the bud stage.

The best of the Tea section are Georges Nabonnand, mentioned earlier in the note; Anna Olivier, flesh-coloured; Mme. Lambard, rose, shaded with salmon; Corallina, deep rose, a vigorous grower, an excellent garden Rose, and very pretty as a bud for buttonholes; Hon. Edith Gifford, white, with the centre shaded flesh colour; and Jean Ducher.

During the long period of dry weather this past summer the plants were kept well supplied with water, or they would have fared badly, as the soil at Kew is very sandy and dry. When the blaze of flowers was over towards the end of July, manure water from the stable yard, and also a sprinkling of artificial manure, were given the plants to encourage new growths. *D. D.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Dessert Pears.—Last week I enumerated a few choice varieties of Apples. The following is a list of some of the best dessert Pears:—Beurré Giffard, Clapp's Favourite, Jargonelle, Williams' Bon Chrétien, Marguerite Marillat, Triomphe de Vienne (the two last-named varieties are in season as nearly as possible together in the latter part of September, therefore it will not be necessary to grow both), Beurre Hardy, Comte de Lamy, Emile d'Heyst, Louise Bonne of Jersey, Marie Louise, Charles Ernest, Thompson's, Doyenné du Comice, Glou Morceau, Josephine de Malines, Le Lectier, Nouvelle Fulvie, Winter Nelis, Ne Plus Meuris, Easter Beurré, and Olivier des Serres. To this list may be added for exhibition purposes:—Doyenné Boussoch, Pitmaston Duchess, Marie Benoist, Brockworth Park, Souvenir du Congrès, Duchesse d'Angoulême, Durondeau, Conference, Directeur Hardy, Beurré Alexandre Lucas, Beurre Bachelier, and Beurré Baltet Père. These last-named are all very handsome fruits, but they must be grown well, and be of a good size, in order to have them at their best condition. The varieties enumerated will all succeed as cordon, and many of them as bush and pyramid-trained trees if planted in a sunny situation. Doyenné du Comice should be planted in several situations, so as to obtain a succession of fruits. This Pear will hang for a long time, and the major portion of a crop on a south-east wall in these gardens are still hanging (October 22). The planting of these fruit trees should be proceeded with as fast as is possible. In planting cordon trees, allow a space of 2 feet between each. If a small space of wall is to be planted (say, in the place of a worn-out tree, which has occupied 30 feet run of wall), I certainly advise the using of cordon trees, as they will soon furnish crops of fruits, and soon cover the wall. Cordon trees are very useful for filling up blank spaces on walls. They may be single, double, or gridiron trained, according to the space to be filled. The trees should be planted as soon as they are received from the nursery, or many of the small fibrous roots will perish. If the positions in which they are to be planted are not ready for their reception, "heel" them in carefully in some light soil, and plant permanently as soon as is possible. The operation of planting should be performed carefully. If the ground has been recently trenched, holes should be dug the correct depth, and the soil at the bottom be well rammed, after which a little fresh soil should be sprinkled in the cavity. Place the tree on the solid bottom; carefully spread out the roots, and work the soil between them, filling up the hole gradually and with repeated rammings. The trees will in this manner be planted firmly and their roots will at once begin to lay hold of the soil. Fasten the tree in position to secure it against storms and winds, make the surface ground tidy, and fasten an "Acme" label to the wall or to the tree with a piece of copper wire.

Morello Cherries should not be allowed to hang after this date, as the heavy dews will cause them to decay, but if they are gathered carefully, and stored on a dry, airy shelf, they will keep for a week or two.

Autumn Raspberries.—Gather these when dry, for they will then be in the best condition for sending to table.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cataseta, Cycnoches, and Mormodes.—The different species which have passed out of bloom or have finished their growth without flowering should now be placed close up to the roof glass in the cooler end of the East Indian house or Mexican house, where they may be exposed to the sunlight. Everything that is possible should be done to enable them to harden and mature the latest-made pseudo-bulbs. They will only require watering at the roots until their leaves have fallen, when, if the plants have become well matured, no water will be needed for several months to come. To keep these plants in good health for any length of time it is necessary to give them a generous growing treatment, and afterwards a long rest. Some of them are very fine objects when in flower, and all are extremely interesting.

Roof blinds, &c.—The roof blinds may now be dispensed with, and any which are made of tiffany or similar material should be perfectly dried previous to their being stored for the winter. At Burford the lattice-wood blinds are not removed, as on very cold nights they are let down and they assist in keeping a requisite temperature in the house. Blinds that are so constructed as to roll down flat on the glass are especially useful in this respect. The calico or tiffany blinds are not serviceable for use in winter as a protection against cold, for on frosty nights they become frozen so stiff that they cannot be pulled up soon enough in the morning, and even if they are rolled up with frost upon them they soon become rotten and useless. The roof glass of the Dendrobium, Cattleya, Mexican and intermediate houses, which was covered with the flour and water mixture, should now be thoroughly washed, as the maximum amount of sunlight and sun heat will materially assist in hardening the pseudo-bulbs and leaves of the plants, and will also be very helpful to plants which are now forming their new growths, &c. After the shading materials have been removed from houses with a direct southern aspect, the sun's rays may yet prove too powerful for such plants as Phalænopsis, Aerides, Angræcums, Vandas, Bolleas, Phaius, Cypripediums, &c., or to unhealthy plants of other species, which may have been recently repotted. These plants should, therefore, still be protected from strong sunshine, independently of the other inmates of the house. A few sheets of tissue paper will be sufficient protection in most instances. Recently re-potted plants in the Odontoglossum house will also need to be lightly shaded when the sun is bright, and the whitening which has worn thin on the roof glass answers the purpose admirably. At Burford the plants of Phalænopsis Schilleriana, P. amabilis, P. grandiflora, &c., which are in a lean-to house facing the west, are carefully protected from the sun in a similar manner. The nights have now become considerably colder in the south, and at any time, without the least warning, sudden sharp frosts may appear, especially during the early hours of the morning, and when one is the least prepared for it. Persons, therefore, having the heating apparatus under their charge will need to exercise careful judgment in order to maintain proper temperatures in the various houses. Owing to the irregularity of our climate, it is at times very difficult to forecast the fluctuations in the outside atmosphere, and it is preferable, when finishing up the fires for the night, to err a little on the warm side, than to run the risk of having too low temperatures. Some tender Orchids, especially Phalænopsis, may very easily be permanently injured by cold, and particularly when the atmosphere is excessively damp. The night temperatures given in a former Calendar should be maintained for the present, and on cold, frosty mornings the temperatures should be raised by small, quick fires, and should the temperatures of the various divisions fall below the lower figures given, it is not advisable to do any watering or damping down until the requisite degree of heat is reached. If, however, owing to a change from a cold night to an unusually mild morning, the inside temperatures are higher than they should be, a little extra ventilation should be afforded and enough water sprinkled about the paths, &c., to tone down the desiccating atmosphere.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

Heating appliances should be thoroughly overhauled for the winter. Examine the boilers and see that they are in good working order. In gardens where a regular system is practised of cleaning the soot boxes and flues each week, there will be little trouble in regulating and maintaining the required temperatures in the various structures, but there is a tendency in some establishments, especially where labour is not too plentiful, to leave the stokehole to care for itself, and then in case of a sudden and severe frost at night, things are quite unready. See that the air taps and the valves are in a working condition, for thereby much anxiety will be averted. A little lamp-black and oil applied to the surface of the pipes when they are warm will give them a clean appearance, and act as a preservative to the iron. (Black surfaces are the best radiators.) The walls of the stokehole should be lime-washed and everything be in perfect order, ere the heavy duties of stoking commence.

Bulbs for early forcing.—The earliest potted bulbs of Roman Hyacinths and Narcissi should now be sufficiently rooted to allow of their removal from the bed of ashes where they have been plunged, into a frame where they can be shaded for a few days until the new growth has hardened and become green. Although the main supply of flowers from bulbous plants is not required until after the bulk of the Chrysanthemums are over, it is necessary to force a few, to supply choice flowers from the end of November and onwards. Although Roman Hyacinths can be readily forced into flower, the best inflorescences are produced by steady forcing; indeed, excessive heat frequently arrests the growth of these plants altogether; while in the case of early Narcissi undue forcing also leads to failure. A temperature of 55° to 58° will generally be found suitable in the early stages of these plants' culture, with an increase of temperature as growth develops.

Fuchsias.—If these plants have been treated as advised in the Calendar for August 11, the pots should now be filled with roots, and the plants will receive benefit from applications of weak liquid manure, for this will induce healthy foliage, and also strengthen the growths.

Richardias.—If these plants are intended for flowering about Christmastide, they should be given a position near to the roof glass in a light, airy house, having a temperature of 55° to 60°. Plants which have been kept in pots during the summer months are more amenable to early flowering than are those which have been recently lifted from trenches. These latter plants may, for the present time, be kept in cold frames or pits, from which frost is excluded. When the soil about them has become filled with their roots, give copious supplies of liquid manure.

Tea Roses in Pots.—All weak shoots, and any others that are not required, should be pruned back to a strong bud. Protect the plants from heavy rains, and do not keep them wet at their roots. They may be removed to the forcing house in the month of December.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Peaches.—The trees that will be forced first should now have the old wood that was overlooked after the trees were cleared of their fruit cut out. The old "snags" should be cut quite away, as they would otherwise appear so unsightly next season. Probably some of the young trees that were planted last season will have made some extra strong growths, and these should be cut back to good wood-buds, in order that next season they may produce fruit-bearing growths. Fruit-bearing wood should not be shortened unless for the purpose of obtaining a better balance in the trees. The woodwork in the house should be washed down with water containing soft soap and paraffin. In some cases the roots may need attention, such as relifting and the cutting back of thick thong-like roots, which will be the means of checking the strong growths and producing fruitfulness. Remove all the old ties, and afterwards paint the trees with a mixture of sulphur, Gishurst compound, and sufficient soot to make it of a dark colour, thoroughly dissolving these ingredients and making the mixture to the consistency of paint. Wash the walls with hot limewash, and apply to the borders a top-dressing of loam, lime, scraps, wood ashes, and soot all mixed thoroughly together. Should any fresh trees be required, they should be planted in their permanent positions as soon as possible. Any good-flavoured varieties in a fruiting condition growing against outside walls, and that were root-pruned last year, will now possess an abundance of fibrous roots, and be in a good condition for removal under glass. Keep the atmosphere of the houses as cool as possible at present, and ventilate it freely until the trees are started into growth. Do not put other plants into these structures if it can be avoided.

Successional trees.—As soon as the leaves have fallen from the trees let the necessary pruning be carried out as described above for the early trees. There should be little pruning necessary at this season, but if the growths are too numerous, do not hesitate to thin them out. The work of cleaning the trees and houses, and of training the shoots on the trellis, may then be proceeded with. If any root pruning has to be done, or renovation of borders to be carried out, such work must be given prompt attention. Apply a thorough good watering to the roots before any are lifted, and make a second application after the work is finished in order to settle the soil amongst the roots. Bone-meal is an excellent fertiliser, and if applied to the roots of old trees at the rate of ½lb. of meal to the square yard, it will greatly assist them.

Young trees.—It is a good practice to have always a few young trees growing on outside walls, to be in readiness for replacing any unsatisfactory trees indoors.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Standards of Weeping Roses.—Whatever we may think of the ordinary Standard Roses, which unfortunately are too often unsuccessful on account of the unsuitability of the varieties used for the purpose, there can be no hesitation about acclaiming the Standard Weeping Rose as being one of the most popular acquisitions in the ornamentation of the garden in recent years. That it is an object of surpassing beauty must be admitted by all who have had the privilege of admiring a well-grown example in the perfection of its bloom. In general effect the whole plant can be likened to a lovely and gigantic shower bouquet lightly and gracefully arranged. To be grown to the best advantage these Weeping Standards should be at least 6 feet in height, and be provided with ample space in which to develop and display themselves. An avenue of them with a bold breadth of turf walk would add a delightful and enjoyable feature to a rosary. Amongst the best Roses adapted for providing Weeping Standards are the Wichuraiana hybrids, particularly Dorothy Perkins, René André, Alberic Barbier, and Paul Transon, whose pendulous habit and pleasing foliage naturally lend themselves to this form of culture.

Arches and Arbours of Roses.—Arches over garden walks, or spanning paths in the pleasure grounds, and arbours to provide shady retreats for garden chairs, if suitably planted with the best of Roses make beautiful and attractive pictures. Particularly well adapted for this kind of work is Crimson Rambler, especially so if the arch is wide and massive. The peculiar depth of crimson of its flowers makes it impossible to share its position with other colours, so it should be given a position to itself. Crimson Rambler should always be grown in the open, exposed to free access of air and light, and should never be cultivated against a wall, in which position it becomes yellow and comparatively sickly in appearance. Dorothy Perkins, with its abundance of lovely soft pink coloured blossoms commencing its display when the freshness of the majority of other Roses is waning, is admirable for arches or trellises. When once established its growths should be well thinned out every autumn to ensure a lightness in its habit at the time of flowering. Lady Gay, of darker, and perhaps less pleasing, shade than Dorothy Perkins, and certainly of more ephemeral duration as regards flowering, is still a very suitable Rose for covering arches. Papillon is a splendid Rose for the purpose, both because of the profuseness of its lovely pink flowers, and for the long period of blooming it enjoys, which lasts until stopped by frost. Psyche is another Rambler well suited for arches. Gruss an Teplitz for smaller arches and bowers would be hard to beat with its brilliantly-coloured blooms produced in large clusters and sweetly fragrant, with foliage, too, of pleasing appearance. The flowers of Gruss an Teplitz last in perfection until late in autumn. In addition to those already mentioned, the following is a small selection of varieties specially suited for the purpose of covering arches and arbours: *Ramblers*—Felicité-Perpetue, The Dawson, Hélène, Leuchstern. *Teas*—E. V. Hermanos, Gloire de Dijon. *Hybrid Teas*—Bardou Job, Longworth Rambler, Reine Olga de Wurtemburg. *Noisettes*—Aimée Vibert, Alister Stella Gray, Madame Alfred Carrière.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Winter Lettuces.—Complete the means for affording protection to Lettuces that are expected to stand in the open garden ready for use as long as possible. Frames may be placed over the plants, or, if it is preferred, they may be lifted and placed closely together in frames. Two of the best varieties of the Cos section for yielding winter supplies are Sutton's Little Gem and Jefferies' Little Queen. They are of small size, possess splendid quality, and have solid, white hearts; such Lettuces heart quicker, are less liable to damping also, and can be planted much closer together than the larger growing varieties. Valuable use can be made of shelves in fruit houses by having a quantity of plants of the Cabbage section of Lettuce potted up and placed upon them. These will "turn in" gradually, and may be shifted from an atmosphere of one temperature to that of another as required. Golden Ball and Commodore Nutt are two of the best of this type for potting, and All the Year Round well maintains its value for frame-culture, and is very hardy. Much air should be admitted to Lettuces on all favourable occasions. Remove any decaying leaves as soon as they are observed.

Spring Cabbage.—There is still time to plant a second breadth of Cabbages to succeed the earlier batch. At this season it is the more imperative to select only the very strongest plants for use in making another plantation. Make good any blanks in the earliest section. Slugs have been unusually busy since the rainfall has increased, and they need to be kept in check.

French Beans have been abundant in cool houses, but from the present time onwards they will require a little warmth, in order that the plants may yield a profitable return for the space they occupy. Beans in pots cannot be expected to continue long in bearing in the dead of winter; frequent sowings are therefore necessary to maintain a good supply. Fill 7 or 8-inch pots nearly full of soil before sowing the seeds, instead of partly filling them, which is a common practice. I strongly advise the use of deep pans or half-pots for the winter months instead of large pots, say, of 9 or 10-inch size. The root-growth is never so strong at this season, and in consequence much damage is often done by over-watering and the soil remaining too long in a soddened state. With the use of deep pans, the water quickly passes away. Suitability of soil is an important factor. A porous compost of loam and manure from an old Mushroom-bed, with a small quantity of wood ashes, will grow Beans well, without the aid of chemical manures.

Young Carrots, which have been raised from seeds sown in July, and are becoming fit for use, should have some dry leaves placed amongst them so that they will be afforded some protection against frost and cold winds. The roots may be expected to grow for some time longer. Few vegetables are more appreciated at this season than these young Carrots. The season of such roots can be extended well into the spring if late sowings of suitable small-growing varieties are protected in frames.

Corn Salad.—Where this useful salading plant is grown, it is well to have some protection at hand to be placed over the crop in the event of severe weather. Young plants may still be planted in frames to succeed those in the open, keeping the atmosphere of such frames moderately close to induce the plants to grow.

EDITORIAL NOTICE.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Nov. 3	Soc. Franç. d'Hort. de Londres meet. German Gard. Soc. meet.
TUESDAY,	Nov. 6	Roy. Hort. Soc. Coms. meet. Ulster Hort. Soc. Chrys. Sh. (2 days). Nat. Amateur Gard. Assoc. meet. Brighton Chrys. Sh. (2 days). Croydon Chrys. Sh. (2 days). West of England Chrys. Sh. at Plymouth (2 days). Bournemouth & Dist. Chrys. Exh. (2 days). Southampton Roy. Hort. Soc. Sh. (2 days).

SATURDAY,	Nov. 10	Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick.—44·4°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, October* 31 (6 P.M.): Max. 52°, Min. 43°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November* 1 (10 A.M.): Bar., 29·3; Temp., 53°; *Weather*—Dull.

PROVINCES.—*Wednesday, October* 31 (6 P.M.): Max. 50° St. Albans; Min. 46° Liverpool.

SALES FOR THE ENSUING WEEK.

MONDAY TO WEDNESDAY—
Sale of Roses, Plants, Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY TO FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

WEDNESDAY—
Azaleas, Roses, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY—
Surplus Nursery Stock, by order of Messrs. B. Malller & Sons, at Bickley Hill Nursery, Bickley, Kent, by Protheroe & Morris, at 12.

Unripe Potato "Seed" Tubers.

In reference to one of the trials conducted by Messrs. Sutton & Sons this season concerning which some remarks were published in these columns on October 13, the following contribution from a correspondent signing himself *A. A. P.* is of great interest:—

"Of the results of the different experiments in Potato culture undertaken by Messrs. Sutton & Sons (see *Gardeners' Chronicle*, pages 75 and 260, current volume) none is of greater interest than that which goes to prove that 'seed' partially matured gives better returns than 'seed' fully matured. It should not be forgotten, however, that they are, after all, only confirmatory of the results of experiments undertaken more than a century ago; constantly observed during the early part of last century; and on which, moreover, practice seems to have been founded in, at least, some parts of the country.

"The experiments were then undertaken with a view to finding a means of preventing, or of checking, the disease of the Potato called 'The Curl,' a disease which, it would seem, was viewed with some anxiety in those days. That this was so is shown by the fact that one of the first steps taken by the Caledonian Horticultural Society, on its foundation in 1809, was to offer a prize for the best dissertation on the subject: 'The most effective means of removing that disease of Potatos known as Curl.' As a result, the Society's gold medal was presented to Mr. Thos. Dickson, nurseryman, of Edinburgh, and his essay has the place of honour in the Society's 'Memoirs,' being the first article in the first volume of that publication. Here Dickson tells us of the results of his experiments carried on during the years 1801, 1802, and 1803, and he acknowledges that they were undertaken with a view to testing a theory propounded some years previously by Baron Hepburn of Smeaton, that 'the curl was probably caused by the tubers used for seed-stock having been allowed to become too ripe the preceding year, and that this practice of over-ripening, being repeated year after year, was the real cause of the disease, the vegetative power in the tubers being thus exhausted.'

"Dickson's experiment took the form of planting trial plots of sets taken from the extreme base, or umbilical end, which is somewhat more sappy, and others from the apex, where the flesh is drier. The results were, uniformly, that 'the plants produced from the wet ends continued healthy, and produced abundant crops, while those produced from the dry ends continued to degenerate.'

"That the value of using 'seed' tubers which have grown in a more northerly part of the country was quite understood in those days is shown by the fact that the writer observes that 'those who cultivate Potatos most successfully in the low and early parts of this country, where the disease chiefly exists, bring a supply of seed-stock from the higher and later parts of the country, for a change, every second year at farthest; . . . (where) the tubers are never so highly ripened as to weaken the vegetative principle in them'; an extract which also serves to show that Dickson recognised the one question in its relationship to the other.

"Thomas Andrew Knight came to the same conclusions by a somewhat different process. Having taken, in 1811, a late crop of Potatos from 'seeds' of an early variety grown in the early part of the same season, he found the produce too watery for the table; but having inferred 'that the organisable matter there contained, being in a less firm and concrete state, would prove more disposable,' and that he 'might therefore expect, in the succeeding season, plants of stronger growth and more smooth and perfect foliage,' he used them for 'seed' in 1812. The results were as he expected. 'The plants presented the appearance of a different variety, and afforded a more abundant crop and larger tubers than' he 'had ever obtained from the same variety.' Moreover, the quality of the produce was perfect (*Trans. H.S.*, vol. II., page 64). Later (page 125) is another letter from Knight, in which he records the results of trials in 1813, serving to prove still further the great benefit accruing from planting watery tubers. One early variety with small tubers 'now produces as large Potatos as I wish to raise for my servants' hall'; and a variety whose tubers had deteriorated to the size of a Cherry was brought to produce tubers of its primary size.

"It may be remarked here that the leaf curl (Macrosporium Solani) is now recognised as a saprophyte (Cooke, in *Journal R.H.S.*, vol. 27, page 817), appearing only on the decayed parts of the plant; so that really the object of the experimenters was to obtain a more robust growth, and therefore prevent the appearance of the conditions of decay which would nourish the fungus.

"From Loudon's *Encyclopædia of Gardening* (1835 edition, page 831) one learns that in Lancashire, in some places, the sets for early crops were prepared from tubers which had grown late the previous year, as advised by Knight; and that in Denbighshire they were prepared from tubers lifted before they were ripe.

"Lastly, M'Intosh in his *The Book of the Garden* (1855, vol. 2, page 206) speaks of 'the well-known fact that fully-matured Potatos, fit for food, are less proper for seed than those that are much less perfectly ripened, and hence the demand for seed Potatos from upland and late localities, where, in fact, the Potato seldom ripens to full perfection.'

"With the knowledge of these records, one wonders why the use of immature 'seed' has not become in these days a matter of general practice; especially as it is a fact that none of the writers in our modern works even mention the practice, dwelling only on the benefits arising from an occasional change of seed-tubers. Further, does it not teach one that to winter the seed-tubers in boxes exposed to a drying circulation of air, as is generally advised, is exactly what should be avoided?

"One is tempted to make another deduction from the results of these experiments. May one not assume that Solanum Maglia from the humid coasts of Southern Chili is in the same relationship to S. tuberosum of its drier inland uplands, as, with us, plants from north country grown (or unripened) 'seed' are to those from south country (or ripe) 'seed'? Sabine (*Trans. H.S.*, vol. 5, page 255), with reference to the plants he had raised from tubers originating from Chili, and which he considered to be unquestionably S. tuberosum (but which are now regarded as S. Maglia) admits of his plants, however, that 'the leaves were compared with specimens of several varieties of the cultivated Potato, which generally were rather of a more rugose and uneven surface above, and with the veins stronger and more conspicuous below, but in other respects there was no difference between them.' Now (as quoted before) Knight expected and found this to be the case in plants from matured tubers, as compared with those from immature. Do Messrs. Sutton's observations bear out Knight's in this respect?"

SUPPLEMENTARY ILLUSTRATION, PACHIRA AQUATICA.*—We are indebted to Mr. F. W. MOORE, of Glasnevin, for flowers of this handsome stove tree. Its leaves are glabrous, and resemble in form those of the Horse Chestnut. The flowers, of which one is shown in our illustration of the real size, have a short cylindric, tubular, truncate calyx, and five very long, linear, whitish petals. The stamens are in numerous bundles, but all combined below into a tube. The pollen-grains observed by Mr. WORTHINGTON SMITH are triangular, with three pores at

* AUBLET, *Plant. Guian.*, ii., t. 291; SCHUMANN in *Flor. Brasil.*, xii., 3, t. 46; GRISEBACH, *Fl. Brit. West Indies* 87—[illegible]

the corners and a slightly granular surface. The tree is a native of Central America, Guiana, and of Brazil, and has been carried thence to the West Indies.

ROYAL HORTICULTURAL SOCIETY.—A meeting of the committees will be held on Tuesday, November 6, in the Society's Hall, Vincent Square, Westminster. A lecture on the "Chinese Flora" will be given by Mr. E. H. WILSON at 3 o'clock.

FRUIT AT THE MANSION HOUSE.—In accord with ancient custom, the LORD MAYOR and LADY MAYORESS entertained at the Mansion House on the 19th ult. the master, wardens, and court of the Fruiterers' Company. The Chief Magistrate was presented by the Fruiterers' Company on the occasion with a magnificent gift of British-grown fruit, consisting of the finest Grapes, Apples, Pears, Pines, Melons, Figs, and Peaches. The fruit was placed in two elegantly-shaped baskets, the handles of which were wreathed in vine and other leaves. Mr. GEORGE BUNYARD, the master of the Fruiterers' Company, as reported in the *City Press*, invited the Lord Mayor to accept the gift, emphasising the fact that all the fruit was British-grown. He thought that that was a fact of which they and the country might well feel proud. The Fruiterers' Company was a small guild, but it was an old one, its first charter having been given in 1606. In bygone times it was the custom of Lord Mayors to demand a sample of all fruit that found its way into the City. That tax led to much controversy, which, however, was entirely removed by a magnanimous-minded Lord Mayor, who decided to accept a gift of fruit from the company each year.

THE GREAT FRUIT SHOW.—It is significant, says a correspondent, that nearly all the reports of this Show begin with the anxious consideration whether it was the equal in bulk of its predecessors. Possibly the epithet "great" is intended to relate to size only; it is doubtfully applicable to the Show in attributes which should be much more important. As a spectacular accumulation, in response to the question how great a heap or how large Apples can be massed upon the available area, it was "great," in the American sense. But is this great pile of great fruits really all that the greatest Horticultural Society on earth has to set before the great British public? Is it great to edification? Briefly, this supreme annual effort ought to be *educational*, and it is not. By a reasoned arrangement of the material, and a sufficiency of succinct printed information, the Show could easily be made self-explanatory, which it is not. It should be more, but it is little else, than a mutual admiration meeting of experts. Turn a would-be grower and an inquiring house-wife loose into this great Show, and I defy them, unless rescued by a personal conductor, to learn even such an initial lesson as what are the best Apples in their several months for table and kitchen. The ticketing of the exhibits is obviously intended only for the exhibitors and for the F.R.H.S., who have had the Schedule (and have probably left it at home). Naked numerals are not illuminative to the uninitiated visitor. In an ocean of single dishes of Apples he comes across a lesser sea of thirty-three, surmounted by the bare label "Class 56." Why should this not say, "Class 56, Cox's Orange Pippin, reputed the best dessert Apple," and so teach him one fact for his orchard and table? Is it prohibitively costly and laborious to add to "Class 53" the elucidation "Allington Pippin, perhaps the best substitute for Cox's Orange on soils unsuitable to the latter"? Only a small proportion of the varieties shown would call for such notes. What the visitor needs is to be enabled to discriminate, and here is a yearly opportunity for the Fruit Committee to indicate and illustrate its selection. There should be no insuperable difficulty about giving an abundant of concise and valuable information on the spot. A small descriptive leaflet might be distributed at the door—the R.H.S. spends large sums in ways much less instructive. And why should not the 3 p.m. lecture on the first day of this Show be always a simple exposition of the Show itself? Ideally, the visitor who pays half-a-crown for admission should come forth better equipped to that value for the war with his gardener or fruiterer. Actually, he is not benefited to the extent of two-and-sixpence by wandering through a dumb wilderness of fruit, however "great."

BRITISH GARDENERS' ASSOCIATION.—Mr. JOHN WEATHERS, hon. sec., writes as follows: "At the last meeting, held on October 23 at the Royal Horticultural Society's Hall, Westminster, the vice-chairman, Mr. R. HOOPER PEARSON, presided. Nine new members were elected, bringing the total up to 952. It was decided that young men over 15 and under 20 years of age could join the Association (forming a junior division) upon payment of 1s. 6d. registration fee, and 1s. annual subscription, provided they have had at least one year's experience in some branch of gardening, and can produce a testimonial from a horticulturist recognised by the Association. Such junior members, however, cannot become fully qualified until they have had at least 5 or 7 years' experience in accordance with rules 25 and 26. It was decided that a delegate should be sent to address the gardeners of Bath on November 26, and that a meeting should be arranged at Richmond, Surrey, in December. Pending information as to cost, a proposal to have the Association legally registered, so as to place it on a firmer basis for the protection of its members, was not adopted. With the object of securing situations for members, it has been decided to issue a printed circular with particulars of each applicant, whose name will be suppressed, but who will be represented by a number. Members wishing to take advantage of this circular should draft an advertisement as to their qualifications, age, &c., and forward it to the Secretary, Talbot Villa, Isleworth, W., with a fee of 1s., which will entitle them to regular publicity until suited.

SMALL HOLDINGS. The Departmental Committee appointed by the President of the Board of Agriculture and Fisheries held sittings on the 24th and 25th ult. The Committee had under their consideration the draft report prepared by the chairman.

G. C. CHURCHILL.—A gentleman well known as a critical student of the European Flora and as a cultivator of rare plants died on the 11th ult., at Clifton, aged 84. With the late JOSIAH GILBERT he did much to bring the Dolomites into public notice. In former years he was an occasional correspondent of this journal, and wrote on the rarer Primroses and other Alpine plants.

CHRYSANTHEMUMS.—The following are the points to be discussed at the forthcoming congress at Caen, November 7-9 inclusive.—The means to be adopted for developing the culture of the Chrysanthemum; the best methods of packing Chrysanthemums in pots or as cut flowers; the sterilisation of composts, apparatus to be employed; the use of Chrysanthemums for decorative purposes; alphabetical nomenclature, rules to be adopted; conveyance of plants to exhibitions; accidents or sports, methods of fixing them; insects and diseases.

NOVELTIES.—Mr. HEINEMANN, of Erfurt, offers Begonia Crown Princess, with large white flowers margined with rosy crimson; Dianthus laciniatus, fringed and spotted vars.; Victoria Cyclamen, white with crimson fringed edges; Myosotis stricta alba, an erect growing white flowered form of M. alpestris; Nicotiana affinis, hybrids of various colours; Endive "Silverheart," pale coloured with much fringed leaves.

FLOWERS IN SEASON.—We are not sure that we are in order in including the Horse Chestnut and the Laburnum under this heading; at any rate we are indebted to the Countess of KINNOULL for a photographic representation of a tree at Dupplin, near Perth, which is as densely covered with bloom as it would be in June. Unfortunately the photograph is not suitable for reproduction. Mr. WILSON, of Dupplin Castle Gardens, remarks that it is not uncommon to see a few blooms on the Laburnum in autumn, but not such a profusion as in this case. The autumn blooms of the Laburnum, we may add, are generally not borne on "spurs," but on the ends of the shoots of the year, as happens with some Pears. Another correspondent, Mr. HOWARD, of Purfleet, Essex, sends us a box full of shoots of Horse Chestnut with young leaves, fully-developed flowers, and even young fruit. Such occurrences may be expected after the hot, dry summer, followed, as it has been, by warm, moist conditions.

SAXIFRAGA FORTUNEI.—Mr. AMOS PERRY, of Winchmore Hill, sends us specimens of this species with long-stalked, radical leaves, fleshy, glabrous, suborbicular, cordate, palmately, 7-lobed, the lobes coarsely and irregularly toothed. The flowers are very numerous, in large, loosely-branched panicles, the individual flowers 1 cent. and upwards across, petals strap-shaped, white, two outer ones often unsymmetrical, much longer than the rest; anthers pink.

SALVIA SPLENDENS IN OCTOBER. This exceedingly bright-flowered Salvia is a deservedly popular plant in glass-houses, and it is also occasionally bedded out in the open air, where in good weather it has a very fine effect. It is, however, somewhat tender, and its flowers are liable to suffer considerable injury from rain and wind. We were the more surprised therefore, when visiting Cobham Hall gardens, Cobham, Surrey, the residence of Mr. COMBE, on October 27, to behold a broad band of this plant in one of the borders in the highest degree of beauty. The plants were excellent specimens, and the inflorescences, 5 or 6 inches long, were as erect and the flowers as perfect and brightly coloured as if growing under glass. The effect was certainly the brightest the writer has ever seen in the open garden so late in the season from any plant. The pleasing shade of blue afforded by Salvia patens growing near by, and the white flowers of Anemone japonica alba around the Salvias were minor evidences of the genial weather. We fear, however, that the heavy rains on Sunday last would seriously damage the Salvia flowers. In one of the vineries at the same place were some plants of Eupatorium petiolare deserving of mention. They were growing in 10-inch pots, were 4 feet in diameter, very freely branched, and so dwarf and spreading that it was a matter of difficulty to discover the pots. Mr. HOXESS, the gardener, stated that they had been raised from cuttings rooted in the spring, and that the shoots had been stopped three times. They were showing their inflorescences abundantly.

FRUITS IN SEASON.—It is not often that the Editor's table can boast of such a dish of fruit as that lately sent by the kindness of Sir THOMAS HANBURY, from La Mortola (Italy). It comprised fruits of the true service tree, Sorbus domestica, which are eaten as Medlars, handsome fruits of the Japanese Diospyros Kaki (see fig. *Gardeners' Chronicle*, January 14, 1893, p. 51), which also require to be bletted, the fruits of Casimiroa edulis, a remarkable Aurantiaceous tree (figured in *Gardeners' Chronicle*, September 30, 1893, p. 393), the pulp of which is palatable, and, lastly, those of the Kei Apple, Aberia Caffra (see *Gardeners' Chronicle*, December 22, 1900, p. 402), very acid at first, but acquiring a rich flavour as they ripen.

KEW PUBLICATIONS.—The acceleration in the publication of the periodicals emanating from Kew is very satisfactory. A new part (Vol iv. part iii.) of the *Flora Capensis* has just been issued, containing the completion of the Ericaceæ by Mr. N. E. BROWN, the Ebenaceæ by Mr. HIERN and various minor orders by different botanists. The *Kew Bulletin* also appears more regularly and is full of interesting information. "Rubber," of course, occupies much attention, and there are articles on Potato curl, a complete list of the cultivated species of Mesembryanthemum, details relating to Scottish gardens, and other matters of interest to gardeners. The obituary notice of C. B. CLARKE will be read with sympathetic interest by all who had the advantage of his acquaintance. A list of the members of the staff of the various Government botanical establishments at home and in the Colonies has also been published recently.

A NEW ALPINE BOTANIC GARDEN.—A correspondent sends us the following note:—"The largest Alpine botanic station in the world, at Samoens, a small town in the 'Vallée du Giffre,' not very far from Chamonix in Savoy, was opened to the public on Sunday, September 2. What was formerly a waterless hill, an arid waste, covered with rocks and a scanty shrubbery vegetation, is now converted into a beautiful garden, some three hectares in extent (7·8 acres) and at an elevation of 2,400 feet above the sea level, with a broad avenue leading up to the top of the hill, waterfalls, a torrent with bridges, grassy slopes, shady bowers, and resting places with garden seats. The ground was bought by Madame Cognacq, a native of Samoens, with the idea of making it into a public park. M. Allemand, the landscape gardener, of Paris and Geneva, who created the Swiss Village at the last Paris Exhibition, the Geneva Botanic Garden, and many other works of gardening art, was chosen as the man most likely to make the best of this wilderness. Instead of making only a park, as the proprietress had at first intended, he divided the whole surface into 25 parts, and made a botanic garden, representing the vegetation of all the great mountainous parts of the whole world. A large part is devoted to the Alps from Nice to Trieste, sub-divided into Alpes maritimes, Dauphiny, Savoy, Switzerland, Piedmont, Lombardy, Tyrol, and 'Alpes orientales'; sub-divisions are alloted to Pyrenees, Apennines Corsica, Sardinia, Vosges, Cévennes, Jura, Carpathians, Balkans, Caucasus, Himalaya, China, Japan, North America, South America, New Zealand, Arctic Regions, Siberia, and the Scandinavian Alps—the latter three at the top of the garden. A large part is also devoted to the granite Alps the rocks were brought from the Valley of Chamonix, and also a few truckloads of granite debris, so as to imitate the natural conditions of the plants. There was great difficulty in finding suitable water for these plants as well as for some delicate North American subjects, as the water in the neighbourhood is of a very chalky nature, so for this purpose rain water is collected at the top of the garden and on the roof of the buildings. Some 50,000 trees, shrubs, and Alpine plants are already planted in their respective distribution, and every one labelled. The water brought from a neighbouring valley to supply the waterfall at a rate of 1,500 litres per second, and the 40 hydrants for watering has a temperature of 5° C. 41° F. summer and winter, and has a very cooling effect in summer. A very pretty picture is that of the little chapel, some 300 years old, which stands about half-way up the slope in the middle of the garden. The ruins of an old feudal castle at the top of the garden, which history traces back to the fifteenth century, have been renovated. From the terrace in front of the castle a magnificent view of the town of Samoens, the 'Vallée du Giffre,' and the surrounding mountains is obtained. There is a difference of 240 feet in height between the entrance and this terrace. A villa for the director and a cottage for the gardener have been built near the gate, which is practically in the town itself. To give some idea of the work that was necessary to bring about a satisfactory result it may be mentioned that 6,000lb. of powder had to be used to remove the rocks, so that the main road, waterfalls, paths, lake, &c., could be constructed, and it has taken nearly three years to complete the work, employing as many as 200 workmen at one time. Samoens is only some 30 miles distant from Geneva, and can be reached in three hours by rail."

FORMOSA.—Professor MATSUMURA and Mr. HAYATA, of the Botanical Institute of the University of Tokyo, have published a complete enumeration of the plants known to be indigenous to the island of Formosa. The work is in Latin and is well got up. It will be indispensable to students of the Flora of South-East China. Eighteen plates and a map add to the utility of the volume.

ABERIA CAFFRA, THE KEI APPLE.—From La Mortola comes the following note:—Aberia caffra Hook. & Harv., or, as it is now called, Doryalis caffra Warb., is a small, evergreen tree or large shrub, of irregular growth, with spreading and spiny branches. The leaves are small, leathery, and shining above, and crowded at the top of the short side shoots along the branches; those of the terminal shoots are larger and broader. The former are very variable in shape and size; they may be described as obovate-lanceolate, narrowed into a petiole, and obtuse or even retuse at the top. They measure about 6 cm. in length and 2 cm. in breadth above the middle, but some are longer and broader, others smaller. The leaves on the terminal shoots are as variable, but less narrowed at the base, and generally with a shorter petiole. In their axils stands a spreading woody thorn, sometimes over 7 cm. long, but very often much smaller. On account of these thorns the Aberia is not easy to handle, but is suitable for hedges. Its chief merit, however, is as a fruit tree. It produces regularly every autumn at the beginning of October an abundance of its pretty and pleasant-smelling small yellow fruits. Its taste, however, does not suit every palate, though it is much used for marmalade, &c. Aberia caffra belongs to the family of Flacourtiaceæ, like Azara, to which genus it is closely related. It is a native of Natal, where it is known as the Kei Apple by the colonists. The plants are dioecious, that is, each individual bears only male or female flowers; of course, only the latter will produce fruits. These flowers are small and greenish, and stand in axillary clusters. At La Mortola, Aberia caffra is absolutely hardy, and flowers and fruits in great quantity. Each fruit contains about 1 to 10 seeds. We have every year an increasing demand for these seeds from our colonial correspondents. *Hiain Béger, La Mortola, October 15, 1906.*

THE SCHOOL GARDEN.—By J. E. HENNESSY (London: BAYLIS & SONS, LTD., 50, Old Bailey). This small volume is described as being a handbook of practical horticulture for schools. It contains a wonderful quantity of information, not merely rules concerning the actual work possible in school gardens, but hints on establishing and managing such plots. Thus it is useful to teachers as well as to students; indeed, it may be especially recommended to the former for reference. *The School Garden* can be traced, in the pages before us, from its first planning and tilling, all through the various operations of the year with flowers, fruits and vegetables. The scientific side and the why and the wherefore of the work receive due consideration.

BROCKWELL PARK.—For some years past there has been a Chrysanthemum Show held at this park, and the superintendent, Mr. CURLE, has always done his best to make a good display. But the conservatory adjoining the old residence was not by any means the most desirable place for such a show. A new span-roofed greenhouse has, therefore, been erected at the other side of the old English garden in which the Chrysanthemums are staged. It is not so large as those in other parks, but it is a convenient house for the purpose, and must be greatly appreciated by the many visitors who live in this rapidly increasing neighbourhood. There are, in all, about 700 plants grown, comprising about 150 varieties. As is the case at some of the other parks, decorative effect is aimed at, besides an excellent display of big blooms. The greenhouse allows for a sloping bank of blooms on each side, with a central path, the visitors entering at one end and leaving at the other. The old English garden was at the time of our visit still untouched by the frost, early Chrysanthemums and Dahlias making a fine display, together with many other objects of interest, such as Gourds, and Cobea scandens on arches, Anemone japonica, Ricinus Gibsoni, Asters, Marguerites, Phlox, Antirrhinums, &c. In the greenhouse most of the popular Chrysanthemums, chiefly of the Japanese section, were on view, and were coming on in very promising style. Such shows as these have many hundreds of visitors on the fine Saturdays and Sundays during the season; in some cases, the visitors number as many as 8,000 on a Sunday.

THE WAGES OF KEW GARDENERS.—The gardeners and others employed at Kew consider that their conditions of employment as compared with those in other Government establishments are not fair. We learn that a deputation from the Royal Gardens, Kew Employees' Union, accompanied by the president and secretary of the United Government Workers' Federation, was received by Earl CARRINGTON, K.G., President of the Board of Agriculture and Fisheries, on Monday, the 29th ult. The deputation was introduced by Mr. WILL. CROOKS, M.P., the Director of the Royal Gardens also being present. The gardeners were represented by Mr. W. PURDOM, a sub-foreman at Kew. After hearing the opinions of the men as stated at considerable length, Earl CARRINGTON expressed his pleasure that they had combined, and promised that the whole question of the conditions of employment at Kew should be most carefully looked into. The wages of gardeners in the London Government parks are, we learn, 27s. per week, whilst the gardeners at Kew are paid 21s. per week, and they work longer hours.

SHOWY FLOWERING PLANTS.—From the report of the Ceylon Botanic Garden we learn that special effort has always been made, not so much to grow so-called English flowers, but to discover tropical or sub-tropical plants which can be adapted to the special requirements of a tropical flower-garden. The number of such plants now employed effectively at Peradeniya for massing in beds and borders is fairly considerable, and includes Caladiums, Cannas, Palms, Arundo Donax variegata, Agave, Poinsettia, Coleus, Siphocampylus, Salvia (blue and scarlet), Croskinnera, Acalyphas, Turnera, Helicomias, &c. Of sub-tropical annuals the following amongst others have made an effective display:—Zinnia (Linearis and Sutton's Fireball), Helianthus ("Miniature" and "Dwarf miniata"), Balsams (mixed varieties), Torenia flava, and Amaranthus tricolor. Another attempt made at establishing at Peradeniya the beautiful blue-flowered Salvia patens, which grows well in a few private gardens up-country, has proved a failure. The importance of this policy as regards the development of horticulture and plant improvement cannot be gainsaid.

A YEAR IN MY GARDEN.—By Mrs. ARTHUR TUCKETT. (Melbourne: MELVILLE & MULLEN, 262 and 264, Collins Street.) Mrs. TUCKETT, in publishing her gardening opinions in book form, has followed what has now become a very general custom. She begins, like some other lady writers on this subject, by reminding us of the antiquity of the first garden, that of Eden, and she does not spare us the opinions of Lord BACON, and other much-quoted authorities. Where Mrs. TUCKETT gives the result of her own experiences she writes pleasantly and wins sympathy by striking the mean between over sentimentality and the expression of dogmatic opinions. Her year is one that knows no lack of bright flowers, as her garden is untroubled by snow and frosts. It is in Australia; its whereabouts we are not told, and some English readers will be puzzled for a minute by the accounts of a June winter and of a January of "imperious summer." Some of the writer's wisest remarks are those referring to the value of her native flora. "In no sense," says she, "is it meant to decry the use of plants from other countries. For the discovery of many we must always be grateful. Poor indeed would our gardens be without them, but, at the same time, it seems a matter for regret that more plants indigenous to Australia are not grown in our gardens . . . How seldom one sees Acacias, Hakeas, Cassias, and many other equally good plants!" We have often tried to impress upon our colonial friends the extreme desirability of developing their native flora which is so much more interesting than the stereotyped copies of European efforts. Like all the ladies, Mrs. TUCKETT is enthusiastic about Roses, which indeed are practically indispensable. But she has an appreciative eye for other beauties, and we feel sure that her garden is as well arranged as it is avowedly gay and fragant. The illustrations in the book are pleasing but not flattering portraits of garden scenery, and the whole will be found interesting, though on this side of the water not exactly valuable to other gardeners.

DISHONEST SHOWING.—We have sometimes heard of exhibitors of horticultural produce begging particular "dishes" from their neighbours, which, of course, they should not do if the schedule requires that the exhibitor himself should also be the cultivator. But the following letter which has been forwarded to us by Mr. BARBER, Culham Court, Henley-on-Thames, is an audacious instance of this kind of thing. We suppress the name.

DEAR SIR,—Can you supply me with six or a dozen bag Onions for a collection? If so, will you kindly let me know by return the price of same and weight you can do them?

I should have liked to have seen those you exhibited at the Royal Horticultural Society on the 23rd ult. Perhaps you will have some of those to spare. I am open to give a decent price for some good ones.

Thanking you in anticipation,

I am, &c.

AGED GARDENERS AT WORK.—A correspondent sends us the following extract from a daily newspaper:—"During last week two gardeners, named Messrs. JAMES and JONES, of Lower Caversham, Reading, dug up 30 poles of Up-to-Date Potatos in 10 hours, the crops weighing over one ton. Mr JONES, aged 74, did the digging, and Mr. JAMES, 86, the picking up. This is a good instance of the toughness of some gardeners."

FRUIT REGISTER.

APPLE JAMES GRIEVE (see p. 295).

THIS is the best variety for dessert in October. I used it from October 15, and it kept in good condition until November 7; it is therefore unlike the early varieties which have to be used up quickly. The variety was so strongly recommended to me by the late Mr. Mackenzie, of Linton Park, that I determined to increase it as quickly as possible, and had the grafts put on a nice young standard Apple tree in the year 1900. The head of this tree now measures 12 feet in diameter, and is about the same in height, which shows that it is a good grower. This season the tree has borne a heavy crop of fruits. Like most other varieties it grows largest on the Paradise stock. The best point about it is its luscious melting flesh, which is quite distinct from that of any Apple I know, and almost as melting as that of a Marie Louise Pear. The class for this variety at the recent Royal Horticultural Society's fruit show was well filled. I append a description of it: fruit oval, inclined to conical, 2½ inches high, and 2½ inches wide, very even in its outline; eye small and closed, segments erect, connivent, with spreading tips, set in a shallow and slightly-ribbed basin; stamens median; tube conical; skin waxy yellow, slightly marked with russet, flushed with red on the sunny side, and striped with a deeper red; stalk thin, ¾ inch long, set in a deep and very even basin; flesh yellowish-white, very tender, melting, and juicy, sweet, with a slight aromatic flavour, and a strong perfume; cells obovate, axile, slit; a first-rate dessert Apple in use in October and November. The tree is moderately vigorous and bears well. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

——— Since I penned my note on this Apple I have had much experience with the variety and am impressed with it. It is one of the best sorts we have previous to the ripening of Cox's Orange Pippin. The fruits grow to a good size, are shapely, well-coloured, and possess an agreeable flavour, though not rich. Its flesh is white and does not remain crisp long after reaching maturity. The growth is vigorous, somewhat erect, and its cropping powers seem of the right kind. *E. Molyneux.*

APPLE LORD LENNOX.

I NOTICE in an interesting paragraph by Mr. Geo. Dyke on p. 290, that he speaks of a dearth of good Apples during September. There is a very excellent variety grown locally which I can recommend as a really good September Apple, called Lord Lennox. It is aromatic and very juicy, and has also a beautiful colour and good shape. I have rarely seen it exhibited outside the county, and it is never mentioned in the numerous lists of good Apples which appear from time to time in this journal. If Mr. Dyke is interested, I shall be pleased to send him some shoots for grafting. The fruit is not a long keeper, it ripens about the middle of September and "eats" best when gathered ripe from the tree. It is a large and reliable cropper, and is in every respect a first-class September variety. The flavour is delicious. *Fred Bostock, Spring Hill, Cliftonville, Northampton.*

[This is a well-known Apple and is fully described in Hogg's *Fruit Manual*. We have pleasant remembrances of the fruits eaten as gathered from the tree, in Staffordshire and Lincolnshire, but have not tasted any for some years past. ED.]

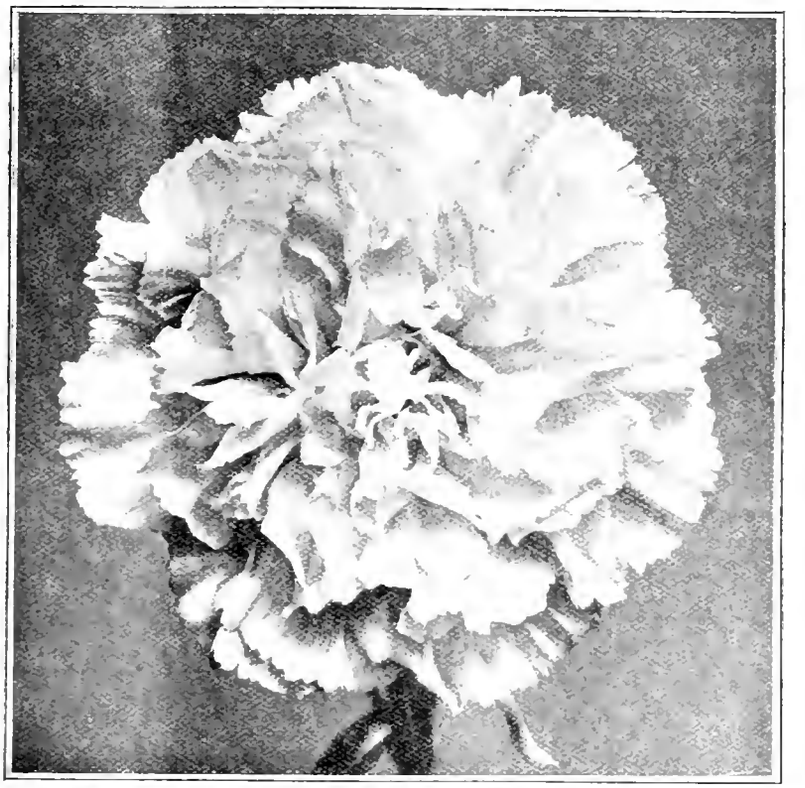

FIG. 123.—CARNATION WHITE PERFECTION (AWARD OF MERIT). (See description on page 247 of the last issue.)

(By permission of Messrs. Hugh Low & Co.)

GARDENERS AND THE AGRICULTURAL LAWS.

IN last week's issue we discussed the reasons why nurserymen apparently do not share the benefits conferred on market-gardeners jointly with farmers by the Agricultural Holdings Acts, which include the Market-Gardeners' Compensation Act, 1895, and it can scarcely be necessary to add that no one begrudges market-gardeners their statutory privileges; the point is that there can be no valid reason why Parliament should not place other growers on the same footing, and the object of the present article is to explain more fully the nature of the privileges in question.

MARKET-GARDENERS.

It is obviously most important for market-gardeners to have some knowledge of these Agricultural Holdings Acts, as they secure many valuable advantages under them, particularly as regards improvements which they may make during their tenancy. There is, however, in this connection one very serious trap for the unwary, as in many cases the tenant cannot, as the law now stands, get compensation from his

landlord for many of these improvements unless he has obtained the landlord's written consent before effecting them; while, in another instance (*i.e.*, that of drainage works), he has to give his landlord a notice in writing before doing the work, and if he fails to do so he loses his right to obtain compensation. Consequently it frequently happens that when a tenant is about to leave his holding, and begins to make out his claim to compensation for the improvements he has made during the tenancy, he finds himself a heavy loser, because at some time or other he failed, through ignorance, to give his landlord formal notice or to get his landlord's written consent, though such consent might readily have been given if asked for at the time.

NURSERYMEN.

Nurserymen also will find it well worth their while to devote some attention to this subject, for, although they share with market-gardeners the benefit of certain statutory reductions in rates and taxes, and are equally liable with them under the Workmen's Compensation Acts, yet (as explained in last week's article on this subject) there is serious reason to believe that nurserymen cannot at present claim the benefits of the Agricultural Holdings Acts, and if they will take the trouble to read through the present article they may think it worth their while to give their moral support to the efforts which the writer has recently initiated with a view to obtaining the early amendment by Parliament of this gross and unjust anomaly. As soon as the necessary arrangements are completed they will be publicly notified, and every nurseryman will then be able to lend valuable help by bringing the subject to the notice of the Member of Parliament for his division.

Now let us consider what are these benefits which market gardeners and farmers enjoy, but which hitherto appear to have been denied to nurserymen. The subject is a little technical, but we will deal with it as lightly as possible.

AGRICULTURAL HOLDINGS ACT.

Let us suppose that you go in for market gardening or farming as a business. The first question which will probably occur to you is what kind of tenancies or holdings come within the scope of those Acts of Parliament which are commonly called the Agricultural Holdings Acts, and which, for the sake of brevity, are usually referred to in this article as "the Special Acts." These Special Acts themselves give the necessary definition, viz.: "Tenancies commencing on or after the 1st January 1884 which are either wholly agricultural or wholly pastoral, or in part agricultural, and as to the residue pastoral, or in whole or in part *cultivated as a market garden*."

Therefore, if the land which you hold as a tenant is altogether agricultural land, or altogether pasture land, or a mixture of both (whether there are buildings on the land or not), then these Special Acts apply to you.

That part of the definition which relates to market gardeners is a little ambiguous, as its wording might seem to imply that where even only a *part* of a holding is cultivated as a market garden the Special Acts would nevertheless apply to the whole of the holding. This, however, is clearly not the intention, and, having regard to one of the provisions of a later and amending Act (which, by the way, is also not so clearly worded as might be desired), we must understand that the Special Acts only apply to *that part* which is actually cultivated as a market garden. Moreover, the term "market garden" is strictly confined to those holdings which are so cultivated *as a trade or business*, and does not extend to kitchen gardens attached to the grounds of private gentlemen, and merely cultivated as a hobby, even though the surplus produce may be habitually sold.

The next question which will probably occur is whether the length of the tenancy in any way affects the matter. The answer is: No, it does not, provided you are tenant for a period of not less than from year to year. Your tenancy may, therefore, be for a period of several years, or only from year to year, or it may be during the life of the landlord, or for the term of your own life, or the life of some other person or persons.

In all these cases the Special Acts in question will apply to you, but it should be borne in mind that these Special Acts apply only to a "tenant," and do not protect you if you hold land merely as an employee of your landlord.

Probably the next question will be: Does the size of my holding make any difference in deciding whether the Special Acts apply to my tenancy or not? The answer is: No, it does not make an atom of difference.

Now, having, I hope, cleared the air a little, we will suppose that your tenancy does come within these Special Acts on the lines indicated above. Your next question will naturally be: What special advantages do I get?

COMPENSATION FOR IMPROVEMENTS.

Well, first of all, you will be entitled to recover from your landlord on the expiration of your tenancy compensation for various improvements which you may have carried out. Before Parliament came to the rescue you might have permanently improved your holding by the expenditure of very considerable sums of money in erecting buildings, fencing, draining, and other matters, but, in the absence of any special agreement between yourself and your landlord, or unless there was some local or trade custom in your favour (these local customs varying according to different localities), you would have had no right whatever to claim any compensation for those improvements, even though the landlord might be able to re-let the property to a new tenant at a much higher rent on the strength of the improvements made by you at your own expense. Nowadays your position is a much more satisfactory one, and you can obtain compensation for many improvements; but if you intend to lay out much money you should endeavour to find out first whether your landlord is the full owner of the property.

The improvements for which you, as a market gardener or farmer, can now claim compensation (provided they are of such a kind as to be of value to an incoming tenant), are as follows:—

(1) Erection, alteration or enlargement of buildings. (2) Formation of silos. (3) Laying down of permanent pasture. (4) Making and planting of osier beds. (5) Making of water meadows or works of irrigation. (6) Making of gardens. (7) Making or improving of roads or bridges. (8) Making or improving of watercourses, ponds, wells, or reservoirs, or of works for the application of water power, or for supply of water for agricultural or domestic purposes. (9) Making or removal of permanent fences. (10) Planting of Hops. (11) Planting of orchards or fruit bushes. (12) Protecting young fruit trees. (13) Reclaiming of waste land. (14) Warping or warring of land. (15) Making embankments and sluices against floods. (16) The erection of wirework in Hop gardens.

In all these cases you can get compensation from your landlord provided (*a*) your landlord's written consent is obtained before the improvements are effected, (*b*) you claim compensation from your landlord before the tenancy comes to an end, and (*c*) you are leaving the premises. There is one important exception to these rules, viz.: in some cases it is not necessary for market gardeners (as distinct from farmers) to get their landlords' consent to the planting of orchards or fruit bushes, as numbered (11) above (see item 24 in this list).

Compensation can also be obtained for:—

(17) Drainage works, provided you give written notice to your landlord not less than three months and not more than two months before the work is begun.

Note that in the case of drainage work, only previous written notice to your landlord is required, and it is not necessary to obtain his consent. Unless you hand the written notice to your landlord in person you should be careful to send it by registered post. Observe also that the notice must be given to your landlord within a fixed period, and you must give details of the drainage work proposed.

The work must be commenced within three calendar months after the date when you gave your landlord the notice of your intention to carry it out. However, your landlord can, if he chooses to do so, elect to carry out the drainage work himself and at his own expense (raising your rent proportionately as provided by the Special Acts), if he informs you of his intention to do so within two months after he receives your notice.

Furthermore, you can obtain compensation for the following improvements (others which interest farmers rather than market-gardeners being omitted), and in respect of these it is not necessary for you either to give your landlord notice, or to obtain his consent:—

(18) Chalking of land.
(19) Clay burning.
(20) Claying of land or spreading blaes upon land.
(21) Liming of land.
(22) Marling of land.
(23) Application to land of purchased artificial or other purchased manure (*i.e.*, manure not produced on your holding but purchased elsewhere).
(24) If you are a market-gardener and hold your land under an agreement in writing made since January 1, 1896, to the effect that your holding shall be let or treated as a market-garden (or if on January 1, 1896, you were occupying the land as a market-gardener, with your landlord's knowledge, and have made, without having previously received written notice of his dissent, any of the following improvements since that date), then you can get compensation for such improvements, although you did not get your landlord's previous *consent*, namely: (*a*) Planting of standard or other fruit trees permanently set out.—(*b*) Planting of fruit bushes permanently set out.—(*c*) Planting of Strawberry plants.—(*d*) Planting of Asparagus, Rhubarb, and other vegetable crops which continue productive for two or more years.—(*e*) Erection or enlargement of buildings for the purpose of the trade or business of a market-gardener.

You should note carefully that the amount of compensation to which you are entitled under the Special Acts depends upon what would be the value of the improvements to a new tenant if one were about to succeed you, though there need not be such a tenant actually coming in or even wanting the land when you leave. What the improvement may have actually cost you does not affect the question. Also, if the value of your improvement is partly increased by the inherent capabilities of the land itself, you cannot claim to be paid for such special increase, as you could not take credit for that part of the increased value which was really attributable to the special virtue of your landlord's land. Note also that if, when you first became tenant, you paid your landlord or the previous tenant (with your landlord's consent) for improvements, which you took over with the land you will, at the end of your tenancy, be entitled to get back a certain amount of what you then paid if the value of such improvements is still running on.

The benefits given by the Agricultural Holdings Acts are additional to any benefit which you may be entitled to claim under the special agricultural customs which may prevail in your own locality.

It must not be forgotten that the above-mentioned privileges in respect of new improvements only apply to improvements which have been executed since January 1, 1884, that being the date when the most important of the Special Acts (viz., the Agricultural Holdings Act, 1883) came into operation; while item 24 only applies to improvements made after January 1, 1896. In the case of improvements executed before January 1 1884, the subject is too complicated to be dealt with in the present article. *H. Morgan Veitch.*

PETUNIA RHEINGOLD, flowers white with a yellow throat.—*Garten Welt*, October.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

Berberis × stenophylla Fruits.—With reference to the note on page 262, I may say that the *Revue Horticole* is rather belated in its announcement of fruits occurring on B. stenophylla ×. It is now about twelve years since I first saw fruits on this plant, and I enclose a dozen shoots cut from as many different plants of seedlings from B. stenophylla ×. Out of some three hundred or more seedlings that were raised here I have not seen one come true, but they have all been different from each other, and also from B. stenophylla × and its two parents, B. Darwinii and B. empetrifolia. Some of the forms closely resembled B. Darwinii, but these have all been destroyed to prevent their being propagated as that species. B. stenophylla × does not fruit very freely, but the seeds are quite fertile, though the resulting plants are practically worthless mongrels. The latter vary as much in the flower as they do in the leaf, some of the blooms being scattered and others densely clustered, while in colour they vary from pale yellow to deep orange. As B. stenophylla × can be easily raised from cuttings, its seeds are not often sown. The seedlings we have here were raised for curiosity more than for any other purpose. *J. Clark, Bagshot, Surrey.* [We have seen like forms in the nursery of Messrs. Paul & Son.—Ed.]

Lilium auratum var. platyphylla. This handsome Lilium has succeeded well in these gardens; the three taller inflorescences attained a height of 7 feet 6 inches, and they bore 30 flowers, each of great size and substance. Four bulbs of an ordinary size were planted 4 years ago, and on August 23rd last they produced 9 flowering spikes carrying no fewer than 139 of their beautiful, fragrant "bells." These Lilies receive copious supplies of water in their growing season, with an occasional watering of liquid farmyard manure. *W. H. Green, Eversham, Stillorgan, Co. Dublin.*

Araujia sericifera (Physianthus albens) was introduced into this garden from Angers, France, on March 18 last, and reached about 3 feet high. The plant was kept in a cold house till May 30, and then planted in ordinary soil at the foot of a south-east wall. During the summer it has reached the height of 15 feet, and has produced many good blooms. Just now two fine fruits are ripening, measuring 3 inches in length and 5¼ inches in circumference. The plant being native of South America (Brazil and Peru), this is, I think, an interesting fact. *Emmeline Crocker, The Gardens, Porthgwidden, Cornwall.*

Gardeners' Mutual Improvement Societies.—I would like to ask Mr. Divers whether, in relation to his objection to the inclusion of amateurs, or others not professional gardeners, into the membership of Gardeners' Mutual Improvement Societies, to be consistent, he declines to sit on the committee of any Horticultural Society which includes amateurs? As a Fellow of the Royal Horticultural Society, he is one of thousands of others, three-fourths of whom are amateurs. When he sits on the Fruit Committee he has to elbow amateurs, and if he enquires he will find there is probably not a Horticultural Society in the kingdom that does not include amateurs in its members and committee. What harm has resulted to professional gardeners because of such conjunction? There are many Gardeners' Mutual Improvement Societies which have been existent 20 years or longer. During all that time they have included in their membership amateurs, and even cottage-gardeners. Probably to-day there are not six such societies confined solely to the profession. They have been instituted purely for educational purposes, and in such case the amateur is often able to enlighten the professional. I doubt if ever a case arose in the whole history of these societies in which any amateur ever became a professional, and certainly, if the profession is overcrowded with men "not worthy of it," and whilst easy to assert it is difficult to prove, in any case, if such men belong to Gardeners' Societies their sole object is to improve themselves in professional knowledge. *A. Dean.*

——I often wonder how many of these associations, or of any other horticultural association in this country, there are composed entirely of professional gardeners. I, therefore, cannot understand Mr. W. H. Divers' objections towards these mutual improvement societies (see p. 296) in his recommendations to the professional gardener not to encourage these societies. His article is not consistent with the title of a great many of these societies. I wonder if the thought has ever occurred to him in his professional contributions to the horticultural Press that, by imparting useful knowledge of cultivation and experience of any one article to their columns, he offered it to the profession only? Curiously enough, his last question upon the suicidal tendencies of the gardening profession reflects upon himself, for, immediately following his article upon the federation of these societies, there appears an article from his pen, sending forth to the world his experience of rough plate glass for gardens. This will fall into the hands of amateurs, who will no doubt act upon his experience, and Mr. Divers would be delighted to hear that his words of wisdom had borne fruit; yet he would have us believe that the mutual improvement societies are committing the profession to destruction, solely because other professional gardeners are generous-hearted enough to give lectures upon such subjects as he contributes to the Press. There is not the slightest reason to eliminate the amateur from the ranks of such societies, but they should be encouraged to spread before the nation the delightful and healthy occupation of being horticultural enthusiasts. As one of the originators of the scheme of federation, I am pleased to inform your readers that I have received several replies from societies that they intend to support the scheme produced at the R.H.S. Hall on October 16 last; also the first meeting of the committee is in contemplation. *M. I. M.*

Gardeners' Discounts.—It is very obvious that the offer of a discount of 5 per cent., or more, or less, to any gardener on any account in his employer's name he may run up with any seedsman or nurseryman, constitutes a tempting bribe. The offer is an inducement to a gardener to be dishonest. That is a phase of the question to which all honest, upright traders should look. Did all employers inform traders that any such offer or payment of discount proved, would at once lose the employer's custom, and the receipt of the bribe result in the immediate discharge of the gardener, in both cases terribly drastic courses, it is difficult to assume that any trader would risk so much, or the gardener either. Seeing that the object of the discount is to induce the gardener to order largely, in fact, beyond his requirements, is not such practice very immoral? Defence of it seems to be impossible. That the best corrective of the evil is to be found in a material increase in gardeners' salaries, there can be no doubt. Were an increase of some 20 per cent. given with the drastic intimation above mentioned, gardeners would be greatly relieved from that form of temptation to which general low wages and the cupidity of traders subjects them. *A. D.*

——From time to time I have been interested in your notes and information on the Corrupt Practices Bill, but never more so than in your last issue, which contains some valuable and sound comments. I quite understand that there are some, possibly the majority, who would like that the usual discount of 5 per cent. should be treated as a recognised, legitimate custom, but I should be glad if someone of these would explain in your columns how it can be legitimate. I think if anyone will look at the matter fairly, their own conscience will convince them that the system is nothing but bribery and corruption—a curse to anyone trying to do business in a straightforward way. In place of any members trying to continue this 5 per cent., it would be far better for all if they would agree to fall in with the requirements of the Bill, and take advantage of the opportunity now offered to break the fetters upon honourable dealing. Certainly, as you say, the traders are chiefly to blame. There is some truth in the statement that if the master who pays the bill is aware of the practice there is no harm done; but these are few. I am certain that the great majority of the nobility and gentry throughout the country would "give points" to the gardener who was above receiving discount, compared with him who accepted it, knowing that with it a certain amount of influence was gained towards buying an order. I consider you strike the right keynote when you say "that the much better plan would be for the master to pay a fair price for his purchases, give higher wages, and not expose his servant to the temptation of receiving unearned increment." Whilst the traders are chiefly to blame, the gardeners also have their share. One can pity and sympathise with the poor fellows who are paid about 20s. per week, and on this have to struggle to keep body and soul together, not only for themselves, but for wife and family; one can almost excuse such an one from accepting the few shillings offered by the agent of the nursery or seedsman; but the gardener who holds a responsible position in a large place, and is paid from £3 to £5 per week, one cannot excuse. In this case, by the way, the orders are large and the discount large. The gardener purchasing for his employer is in the same position as a manager in any commercial house entrusted with the buying, where, if he is to be fully trusted, he would not think of, nor would he be allowed to accept discounts. What gardener starting business on his own account, finding it necessary to allow a servant to do the buying, would allow him to take discount? Therefore, whether the gardener who is poorly paid or well paid, so long as he is buying for another man, he is not justified in receiving discounts from those he is trading with; but knowing that gardeners are always willing to impart information to their fellows, and to give a reason for it too, I would now ask if someone will explain through your columns what right they have to accept discount from the traders, and how it is conscientious on their parts to do so? *A. S. A Nurseryman.* [The dealers have this matter in their own hands. The great difficulty we see lies in the fact that our traders cannot control the action of their foreign competitors.—Ed.]

Thefts at the Fruit Show. Will you allow me to draw attention to the petty thefts carried on at the Royal Horticultural Society's fruit show this year? As I was unable to attend personally on the second day, I sent two men to pack the fruit, but they arrived home minus my 1st prize fruits of Blenheim Pippin, Newton Wonder, Bismarck, and Pitmaston Duchess. Surely gardeners would not demean themselves by committing such thefts. As it is my first year of exhibiting, an unfavourable impression is left regarding the arrangements made for clearing. It would be interesting to me to hear if anyone else has had to incur similar losses and vexation. *B. J. [illegible], H[illegible] Place Gardens, Maidstone.* [We are convinced the R.H.S. officials take all possible means to ensure the safe custody of exhibits, but after the time has arrived for clearing they are powerless to prevent single dishes of fruit, for instance, from being taken by persons unknown to them. They may or may not be the exhibitor's assistants, or they may have been given the fruits, as is frequently the case. A voucher system would necessitate considerable delay, and it is questionable if the value of the exhibits is always sufficient to render its adoption advisable. Every exhibitor should look after his fruits directly the hour of exhibition closes.—Ed.]

Gros Colmar Grape (see Mr. Clayton's remarks on p. 274).—We should hear less of the poor flavour of this Grape if cultivators would give it a longer growing season and afford the vines plenty of heat and air. Some twenty years back, having charge of a vinery planted with this variety, being dissatisfied with the colour and flavour of the fruit, we decided to start the vines six weeks earlier, giving them more heat with a continual circulation of air in the house. The result was almost perfect colour and flavour. That well-known expert, the late Mr. Meredith, of Garston, tasting a sample in November, said they were equal to Black Hamburgh. The paragraphs in the *Gardeners' Chronicle* for November 25, 1893; January 14, 1896; and February 13, 1897, refer to these vines and Grapes. *J[illegible] B[illegible], M[illegible], St[illegible].*

Amaryllis Belladonna in Cheshire.—This delightful autumn flowering plant has succeeded well with us this year. Two years ago we planted four dozen bulbs, which flowered very freely last year, but we added still more to our stock this year. The results have been most satisfactory, the spikes being from 2 feet to 3 feet in length, and carrying from six to eight perfectly-developed blooms. These are planted under the greenhouse walls, a trench being taken out 18 inches deep, and filled with equal portions of good fibrous loam, leaf-mould, and

sand, the bulbs then being inserted 18 inches deep. Here, in Cheshire, we are very much exposed, which necessitates such deep planting. The bulbs were surrounded with sand and covered with the compost, which is pressed firmly around them. Eremurus himalaicus robustus does equally as well here. This year the plants had spikes 10 feet high. These are under the same treatment as Amaryllis. We always give them a good mulching of litter for protection. *R. Richards, The Hostages, Holmes Chapel.*

LATE FLOWERS IN THE ROCK-GARDEN.—In the rock-garden here we have still the following plants in flower: Androsace lanuginosa, Saxifraga Fortunei, Zauschneria californica splendens, Lithospermum prostratum, Œnothera Youngii, Plumbago Larpentæ, Schizostylis coccinea, Mesembryanthemums in variety, Convolvulus cneorum, Polygonum chamæbuxus purpurea, Campanula Portenschlagiana major, Sternbergia lutea major, Colchicum autumnale album, fl. pl., Eryngium pandanifolium, Metrosideros floribunda (on south wall), Solanum crispum and Romneya Coulteri. The herbaceous plants, including Dahlias, are as bright as ever. *W. A. Cook, Leonardslee Gardens, Horsham.*

NATURAL VARIATIONS OF GERBERA JAMESONI.—W. W. is much to be thanked for the highly interesting information conveyed under the above heading at p. 288 of issue of October 27. It should be borne in mind, however, that while crosses were raised within the species G. Jamesoni, to which reference is made, there was also a number of hybrids raised between the various varieties of G. Jamesoni and the quite distinct species G. viridifolia. The introduction of this species gave freer flowering and freer growing habit to the strain, so that many of the plants in the hands of Messrs. James Veitch & Sons are still quite different from anything found in nature. Some of the viridifolia hybrids, though not the most gorgeous, have been among the most attractive. *R. Irwin Lynch.*

APPLE JUDGING AT THE FRUIT SHOW.—As one of the judges in the single dish classes at the late Fruit Show, I thank *D* for his kindly advice anent the method of awarding the prizes (see p. 295). As a matter of fact, my colleagues and myself did collect the best dishes where the first three or four were close in point of merit, but in all cases we did not leave them so arranged, but returned each to its original position. I note also what is said about the fruits of Allington Pippin being so large. They were of exceptional size, but as they were well coloured, even, clean and uniform in size, what could the judges do but place them first? If they were too large for dessert, why is Doyenné du Comice Pear, or Muscat of Alexandria Grape cultivated as large as is possible, and yet admired and considered to be the right thing? *M.*

AMERICAN VARIETIES OF CARNATIONS.—At the meeting of the R.H.S. on October 23, an award of merit was given for a Carnation called St. Louis, which I am firmly of the opinion is none other than the new American variety Victory, it being identical in colour and general build. On one of the stands I noticed a variety labelled Mr. W. H. Oniwake: this, I believe, is Rose Enchantress, and sent out in America as such. This renaming of varieties by importers, if allowed to continue, will lead to complications. It brought much trouble years ago; for instance, Ethel Crocker which was re-named by a London firm Royalty, Enchantress re-christened Fascinator, and several other instances I could quote. Gardeners do not want to buy the same variety under two names. *New Yorker.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 23.—*Present:* G. Massee, F.L.S., V.M.H. (in the chair); Messrs. E. M. Holmes, C. E. Shea, G. Gordon, W. C. Worsdell, J. T. Bennett-Poe, G. S. Saunders, C. H. Hooper, H. T. Gussow, W. Cuthbertson, E. A. Bowles, F. J. Baker, Dr. A. B. Rendle, and F. J. Chittenden (hon. sec.).

Grit in Apples and Pears.—Rev. Prof. Henslow sent the following additional note regarding this subject, which had been adverted to at the last two meetings, together with the fruit of Pyrus japonica and dried slices of the same. "When the cellular tissue of the pseudocarp of Pyrus japonica contracts, the grit stands out conspicuously; it is thus seen to form a rather compact layer surrounding the core with ten radiating arms extending nearly to the circumference of the fruit. No grit occurs in the external part of the pseudocarp. The inference is that the original stone is still represented, but in a much reduced state, and that it is beginning to be dispersed through the pseudocarp. The numerous ovules in two rows in each carpel are worthy of note; they are reduced to two only in Apples and Pears." The members of the committee thought that much more evidence would have to be brought before it was proved that the sclerenchymatous tissue belonging to the endocarp could be diffused through an axial structure such as the flesh of the Pear.

Galls on Birch.—Mr. C. H. Hooper showed galls on Birch caused by the gall mite, Eriophyes rudis. The buds had failed to develop properly, and the trees suffered severely, sometimes dying after a short time, particularly when the attack on the tree is general. The result of a local attack is often the formation of the well-known "witches' broom." Trees locally affected often live for many years. In one case mentioned, a large "witches' broom" had been known upon a tree for forty years. The mite and its galls have recently formed the subject of a memoir by Mr. Gussow. (See Naturwissensch, Zeitschrift fur Land und Forstwirtschaft Heft 10, October, 1906, pp. 421-429. 2 pl. and 10 illus. in text.)

Fasciation in Ophiopogon.—A specimen of Ophiopogon spicatum was shown by Mr. E. M. Holmes fasciated at the apex of the inflorescence.

Fruiting of Lilium candidum.—Mr. Cuthbertson showed a plant with fully developed but unripe capsules, one of between thirty and forty that had so developed this year among about two hundred plants. The fruiting plants were just producing leaves, while those that had not fruited had produced foliage leaves several weeks ago. There had been no difference noticed among the flowers, but it was suggested that possibly the fruiting plants belonged to Lilium peregrinum, which differs from L. candidum in the narrower perianth segments.

Bi-coloured Marrow.—Miss Eddy, of Teignmouth, sent a small Marrow, the upper part of which was green, the lower yellow. All the fruits on one branch of the Marrow had been of this character, and on being cooked it was found that the green part tasted more like a Pumpkin, being hard, and having less flavour than the Marrow. The occurrence of these bi-coloured fruits is not uncommon.

Injury to Ferns.—An example of Pteris serrulata, one of some hundreds, was received from Chislehurst, having dark brown lines running along either side of the midrib of the pinnæ. Mr. Saunders will report upon them at the next meeting.

Winberries Dying.—Plants of Wineberry dying were received from Ranceby. No fungus or insect to account for the trouble could be found, and the roots were very thick and old. It was thought the plants had probably remained in one place too long a period.

Reputed Wild Dahlia.—Some sprays of a plant raised from seeds from America sent to Mr. Murray Thompson, secretary of the Royal Caledonian Horticultural Society, and reputed to be those of the wild Dahlia, were received from Messrs. Dobbie & Co., of Rothesay, who had had it growing outdoors until October 1, when it was placed in a tub and removed under glass. The habit of the plant was that of a Bidens. It had attained a height of 8 feet to 9 feet, and was of a very free branching habit. The inflorescences, however, lacked ray florets, and were by no means conspicuous. The seeds produced were like those of the Dahlia in most respects, but had two small horns on each. Dr. Rendle will report upon this at the next meeting.

Beetles in Beech.—Mr. Saunders reported that the beetles in the Beech wood shown at the last meeting were Smodendron cylindricum, a species nearly allied to the stag beetle. He considered that they fed in dead wood usually, and did not attack healthy trees.

Diseased Fruits, &c.—Several specimens of diseased Apples, Pears, Potatos, &c., were received and dealt with.

ROYAL HORTICULTURAL OF IRELAND.

FRUIT CONFERENCE AT DUBLIN.

OCTOBER 24, 25.—As supplementing our notes taken on the first day of the Irish Fruit Show, held in Dublin, and published in our last issue, it remains to be said that a conference held in connection with the show excited much interest.

Mr. F. W. Moore, in the unavoidable absence of Lord Ardilaun, President of the Royal Horticultural Society of Ireland, opened the proceedings by commenting on the importance of fruit-growing to Ireland, and the suitability of the country for its practice. Referring to the exhibits, they were collectively, in his opinion, superior to what he had seen the previous week at the Royal Horticultural Show in England, and a country which could produce such fruit need not fear foreign competition. Mr. Moore then read his paper, dealing with the best varieties of Apples, and enumerated a selection of 10 dessert and 12 culinary kinds, covering the season from July to May. He stated that, whilst his list excluded some old friends of proved merit, it had to be remembered that growers and vendors alike suffered from the existence of too many sorts ripening approximately together. This led to an animated discussion, old growers advocating the claims of old friends excluded from the list. That a plethora of sorts handicaps the grower for market, however, is a fact, inasmuch as a Dublin trader told the writer he always ordered "Americans," knowing that he would get one thing, in preference to home produce, which might mean anything save one variety in quantity.

INSECT AND FUNGOUS PESTS.

Professor Carpenter's lecture on insect pests, illustrated by lantern slides, chiefly dealt with the ravages of the sawfly caterpillar, winter moth, aphis, and scale, and the means of coping with them, adverting to the benefits which had accrued in America from the co-operation of cultivators and naturalists. At the resumption of the conference on the second day Professor Pethybridge, by the aid of lantern slides, exposed the doings of the American Gooseberry fungus, Sphærotheca mors-uvæ, which, although known to have appeared in 14 distinct localities in Ireland, had not, so far, been found in England. He next described the cause and cure of Apple canker. A graphic description of the evils of bad pruning, with the necessity of clean cutting, and the application of gas tar to the wounds in order to exclude fungoid germs, with some practical advice by Mr. James Harpur on preparing and packing fruit for market, concluded the conference.

HONORARY EXHIBITS.

Referring to exhibits unnoticed in the report in last week's issue, it should be stated that the exhibits comprising fruit, foliage, and plants staged by Messrs. W. Drummond & Sons, Ltd., and Sir James W. Mackey, both of Dublin, were each awarded the Society's Gold Medal.

In the vegetable classes, Colonel the Hon. F. C. Crichton, and John Jameson, Esq., were the chief winners in a keen competition, which, however, was absent in the Grape classes, where Sir Ernest Cochrane (gr. Mr. Colgan) had practically his own way with well-finished, medium-sized bunches.

The fruit-packing classes brought forth a spirited contest. For one dozen dessert Apples in a "flat," there were 29 entries; 25 for the two dozen class, and 33 entries for the two dozen cooking class. Classes for 14 barrels, 15 half-bushel cases, and smaller exhibits, exercised the expert called in to judge them for some time, and he afterwards impressed on those interested the principal points of success in marketing, viz., grading, quality, and condition of fruit, and suitability for transit. What the uninitiated observer would regard as virtues in packing, that is, considerable time spent over it, with the too liberal use of fine packing material, were described as vices by this expert.

As no entry fees were charged throughout this exhibition, which, by the way, was visited by the Hon. John Dryden, ex-Minister of Agriculture for Canada, pessimists predicted that a good deal of inferior stuff would be staged. Such was not the case. It was a remarkable show, and should do much to encourage Irish fruit growers, and extend the industry they are engaged in. *Erin.*

HORTICULTURAL CLUB.

IN THE WORLD OF FERNS.

On Tuesday, October 23, the usual monthly dinner of this Club was resumed after the autumnal vacation, and Mr. Chas. T. Druery, V.M.H., F.L.S., subsequently gave a lecture, illustrated with lantern slides and nature prints, on the marvels of Fern life. The first five slides were reproductions of the beautiful drawings with which Count Suminski, in 1848, illustrated his discovery of the final link in the life cycle of normal Ferns, by the discovery of the "archegonia" or equivalent of the female part of flowering plants. The series demonstrated all the stages of development from the spore to the young plant in the clearest manner. The lecturer then proceeded to describe and illustrate the abnormal modes of reproduction subsequently discovered, showing that every one of the stages in the normal life cycle could be suppressed singly or by twos and threes, and yet the final result of a new generation be secured. This purely technical part of the lecture was merely introductory to a number of beautiful slides, illustrating the marvellous capability of Ferns for sporting quite suddenly into different types from the parental ones. He proceeded to show what could be done, and had been done, by profiting by the known capacity of the spores of such finds to produce emphasised types on similar lines: a fern, for instance, with a small crest or tassel at all tips, yielding progeny with larger ones, and so on. Especially in connection with Ferns which had sported into more divided ones was this the case. A once divided or pinnate Fern, for instance, with smooth edges, may produce a sport with saw-toothed edges, and this may yield divided or bi-pinnate seedlings, or even tripinnate ones by selection. Representations of pedigree Ferns of this description were thrown on the screen, demonstrating that even in one generation an immense stride may be effected in this direction, and that even two distinct sections, tasselled and untasselled, may arise quite suddenly and unexpectedly in a single batch of sporelings. Mr. Druery then displayed a number of fine nature prints of the most marked wild sports selected from those prepared and issued to subscribers by the late Colonel A. M. Jones, of Clifton, one of the chief pioneers of the British Fern cult, of whom but very few now survive, but to whose efforts the Fern-loving world will be ever indebted. It is, too, on the scientific side of the study that we are indebted to British Ferns and their students for the chief discoveries in reproductive phenomena, some of which may have far-reaching results when the full reports of the experiments now in progress are published to the world. The discovered analogy between some abnormally reproductive Fern-cells and those of that terrible scourge cancer may be cited as a case in point, the botanist and the pathologist thus finding an entirely unexpected link which may quite possibly give a clue to the cure of that dread disease, and, in any case, furnishes some indication of its nature. A discussion, followed by a vote of thanks to the lecturer, concluded the proceedings.

NATIONAL CHRYSANTHEMUM.

OCTOBER 29.—On Monday evening last the Executive Committee of the above Society held a meeting at Carr's Restaurant, Strand, Mr. Thomas Bevan presiding. It was announced that the annual dinner was definitely fixed for November 27. It is expected that the president, Chas. E. Shea, Esq., will take the chair, and that it will be held in the Venetian Hall, Holborn Restaurant. Judges for the November show having already been elected, the committee proceeded to nominate them to the various classes appointed by the schedule. A question arose as to a new design for the Society's certificate, but it was considered too late in the season to make any alteration now, and the matter will stand over until later. An approximate financial statement was then presented by the secretary, and a good deal of discussion ensued upon finance generally. Among other matters it was resolved that the proposed issue of the Society's Yearbook should proceed without delay. A sketch of the Dean Memorial medal was submitted, and the matter was left in the hands of Mr. Witty, sen. Thirty-two new members were elected.

Obituary.

JOHN SHINGLER.—We have received from Messrs. Tom B. Dobbs & Co., nurserymen, Wolverhampton, news of the death of this gardener at the age of 86 years. Deceased was a native of Oaken, and his first position as head gardener was under the late Mr. George Benjamin Thorneycroft, who was the first Mayor of the Borough of Wolverhampton. He subsequently served under other local gentlemen, including the late T. P. Lamb, Colonel Thorneycroft, Tettenhall Towers, Mr. Sparrow, Graiseley, Mr. Fowkes, Penn Court, and Mr. John Ward. Deceased retired from the profession seven years ago. His son, Mr. William Shingler, is a gardener in the district.

HORACE HUNTLEY.—We regret to announce the death of this well-known gardener, and, for several years past, Instructor in Horticulture to the county of Dorset. Deceased, who had lately been suffering from general failure of health, passed away on Tuesday, October 23, at the age of 70. For the last 10 years he had occupied the position of Instructor in Horticulture, and beside serving the county of Dorset, he had previously held appointments as Instructor in Horticulture to the counties of Lincolnshire, Cumberland and Huntingdonshire. He was gardener at Moor Hall, Harlow, for 23 years, and he was also at Powis Court, Welshpool, which establishment he left when he commenced the work of lecturing. Deceased's son, Harry, is a representative of Messrs. W. Cutbush & Sons. The funeral took place on Friday, October 26, at Teddington St. George Churchyard.

ENQUIRIES AND REPLIES.

PEACH BUD-DROPPING.—I thank *H. W. W.* for his reply on p. 281, respecting the dropping of wood-buds. The trees were not forced, ripe Peaches not being required here until the latter part of July. The trees were free from red spider and aphis. I can't understand so many wood-buds dropping and yet not 3 per cent. of the fruit buds. My past experience has been quite opposite to this. Surely the reason *H. W. W.* gives would cause both fruit and wood-buds to drop. *S. I. D.*

WHAT IS MEANT BY "AN AMATEUR." The word "amateur," I think, is far from clearly understood. I, for one, always understood that an amateur meant a person who does not employ a gardener regularly, or one who does not get his living by gardening, or sell his produce for a living. I find this is not so: I know two cases in point. The first is a winner of two first prizes in the amateur class at one of the leading shows, but he sells seeds, bulbs, &c., for a living. The other is a gentleman showing as an amateur; he, too, was amongst the prize-winners, but he employs a gardener regularly. Curious to say, these two competitors were competing in the same class. *J. S. H.* [The schedule must be looked upon as the authority in each instance, for the simple reason that different constructions are placed upon the word by the various societies. The Royal Horticultural Society, in its "Rules for Judging," states that "the term amateur is here employed in its broadest sense, i.e., in contradistinction to nurseryman. In some schedules the word is used more strictly, defining an amateur gardener as one who employs no professional help whatever in the cultivation of his garden; in contra-distinction to an amateur owner who cultivates by means of professional gardeners in his employment." In the schedule of the National Dahlia Society, which should apply to your case, it states that "no person shall be allowed to compete as an amateur who sells plants, flowers or roots; nor any person in the employ of a nurseryman."—ED.]

ANSWERS TO CORRESPONDENTS.

ADDRESS. *C. T. D.* Messrs. Backhouse & Son, Ltd., York.

AVOCADO PEAR: *F. H.* This fruit is seldom cultivated in this country, although it may sometimes be seen in botanical gardens, such as that at Kew. The fruits are sold in Covent Garden, and may be obtained from Mr. H. Kauffman, Central Avenue, Covent Garden Market. See current list of market prices in this issue.

BRACKEN (PTERIS AQUILINA): *A Young Gardener.* Bracken may be increased either from spores, borne on the fertile fronds, or from rhizomes. If the latter means be resorted to, it is better to take rhizomes, or under-ground stems from the open ground in late winter or spring, and establish them in pots in an unheated frame. When established they should be planted where they are required. Bracken is very difficult to remove from one place to another by planting the rhizomes without establishing them first as advised. The Oak is Quercus coccinea, and the acorns are abortive.

CLIMBING FRENCH BEANS: *W. A. T.* Seeds of these may be sown at the present time with every prospect of success. A suitable atmospheric temperature is 60°, which may be permitted to rise 10° higher with sun heat. Sow the seeds thickly, and when the plants are well through the soil thin them out to 6 inches apart. A moist atmosphere is necessary to keep the plants free from red spider. The variety that most freely sets its flowers is Princess of Wales.

FIG. 124.—GLAZIELLA MICHELIANUS.

CORRECTION: In the article by Mr. W. H. Clarke on Apricots on p. 288, col. 2, under "Stocks," the fourth word in second line should read "Brussels" not "Mussel."

CURRANT-BUD GALL MITE: *Ribis.* Judging from the description contained in your letter, we fear there is nothing to be done in such a case except dig up the plants and burn them. If your garden is a small one, and surrounded by cottagers' gardens which also contain bushes affected with "big bud," the chances are that fresh stock would be likely to become contaminated. If you decide to get fresh stock, you had better select the variety Boskoop Giant, and spray the bushes frequently and thoroughly with soft soap and quassia in water.

DENDROBIUM UNDULATUM: *A. M. D.* This species produces upright spikes of whitish, brown-tinted flowers. We do not know where you could find a figure in a work easy of access.

FUNGUS: *R. P. B.* Geaster Michelianus, see fig. 124.

GOURDS: *C. W. J., Devon.* The plant shown in photo A, is that of Cucurbita ficifolia, and that in photo B, the bottle Gourd, an elongated form of Lagenaria vulgaris.

FUNGUS IN LAWN: *H. D. W.* The fungus is the Champignon, Marasmius oreades, an edible, and highly-prized Mushroom. Your best plan will be to fork out the mycelium (the white thread-like growths of the fungus) as far as is possible, and, after an application of fresh soil, to sow some grass seeds. See fig. 125.

IVY-LEAVED PELARGONIUMS: *H. K.* You may apply a little extra warmth from March onwards, but sunlight and fresh air are the chief essentials. Any straggling or runaway shoots may be stopped up to the end of April and all flowers removed until that period. Madame Crousse is one of the most popular sorts for baskets. Mrs. C. Banks is a white variety of the same habit of growth. Baden Powell is of blush mauve colour, and very free in flowering. Mrs. Hawley is deeper in colour than Souvenir de Chas Turner, and is one of the best. Galilee is another variety which is extensively grown, and may be recommended as very free in flowering.

MARGUERITES: *H. F.* The variety most generally grown for market is Chrysanthemum frutescens, variety Hallen maxima. The ordinary type of *C. frutescens* has glaucous, finely-cut foliage and there is a variety with smaller flowers and very finely-cut foliage of a blush grey tint named *C. frutescens tripinnatifida glaucescens*, but this is not much grown at the present time. The best yellow variety is Etoile d'Or. We have had no experience in raising them from seeds, but it is probable seedlings would exhibit variations.

MUSCIPELIVA: *H. W. P.* The bulbs are quite free from injury caused by fungi or bacteria. The cause of failure has yet to be determined.

NAMES OF FLOWERS AND FRUITS. We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruit. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *E. H. K.* Apple Blue Pearmain. *J. T. W.* 1, Sheppard's Fame; 2, Reinette de Canada.—*H. A. M.* 1, Alfriston; 2, Allen's Everlasting; 3, Fearn's Pippin.—*R. Blake.* 1, Welford Park Nonsuch; 2, Gipsy King; 3, Golden Noble; 4, Beurré Rance.—*M. C.* 1, Basmer; 2, Ribston Pearmain (not to be confused with Ribston Pippin); 3, Small's Admirable; 4, Warner's King; 5, Hawthornden; 6, King of the Pippins.—*W. H. E.* 1, Beurré Diel; 2, Winter Nelis; 3, Beurré Steckmans; 4, Joséphine de Malines; 5, Gansel's Bergamot; 6, Comte de Lamy.—*H. Nixon.* 1, Malster; 2, Lord Grosvenor; 3, Small's Admirable; 4, Waltham Abbey Seedling; 5, Pine Golden Pippin; 6, Winter Greening.—*W. Done.* Lemon Pippin.—*Interested.* No. 1 was much over-ripe, it resembled Pitmaston Duchess; 2, Beurré Diel. You should have given your name and address, not necessarily for publication.

NAMES OF PLANTS. *H. B.* 1, Aster Novi Belgi Robert Parker; 2, A. N. B. Purity; 3, A. Novæ Angliæ rubra; 4, A. vimineus variety; 5, Solidago serotina; 6, Helianthus decapetalus.—*J. M.* 1, Aster Novi Belgi Purity; 2, A. vimineus; 3, A. diffusus orientalis. *W. T. Y. Z.* Euonymus europæus (Spindle tree. British).—*H. H.* 1, Tibouchina semidecandra (Pleroma macranthum of gardens); 2, Arbutus Unedo; 3, Passiflora racemosa (P. princeps of gardens); 4, Griffinia hyacinthina; 5, Agathea cœlestis.—*W. H.* 1, Aster vimineus; 2, A. ericoides Cho; 3, A. diffusus horizontalis; 4, A. turbinellus; 5, A. cordifolius major; 6, A. Novæ Angliæ roseus. Our correspondent should have sent larger specimens, the tips of the flowering stems are not usually sufficient.—*W. L., Reading.* 1, Gymnogramma (Dictyogramma) japonica; 2, Adiantum Waltoni; 3, A. Pacotii; 4, A. cuneatum; 5, A. cuneatum grandiceps. *J. A. B.* 1, Cattleya labiata; 2, Oncidium cheirophorum; 3, O. candidum, often called Palumbina candida; 4, Octomeria diaphana; 5, Catasetum tabulare; 6, Cochlioda vulcanica. *F. A. P.* 1, Catasetum barbatum; 2, Gomesa recurva; 3, Miltonia Regnelli; 4, Stenoglottis longifolia.—*R. N. H.* Saccolabium bigibbum, figured in the *Botanical Magazine*, tab. 5,767.—*F. H.* Justicia carnea.—*W. R. H.* The Osmanthus is O. ilicifolius, a form of O. Aquifolium. The Abelia in flower is A. floribunda, and the other A. triflora. The flowers you send are a proof of the exceptional character of the weather.

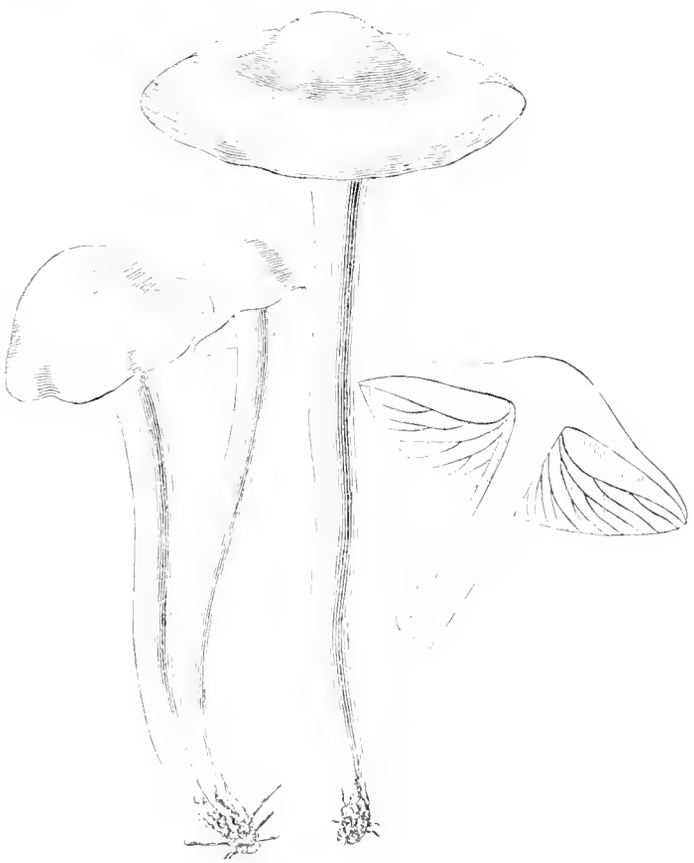

FIG. 125.—THE CHAMPIGNON: MARASMIUS OREADES.

POINT JUDGING OF FRUITS AND VEGETABLES: *T. S., W. M.* The only recognised basis for judging these products by points at exhibitions is found in the Royal Horticultural Society's "Rules for Judging," a copy of which can be obtained from the secretary of the society, Vincent Square, Westminster, S.W., by enclosing a postal order for 1s. 6d., or our publisher could supply it. It is on the basis of points laid down in these rules that collections of fruit are judged at Shrewsbury, and probably at some other exhibitions where "pointing" is the rule in making the awards, and the respective numbers of points are published. Vegetables are not judged by points at Shrewsbury such a system being in their case not insisted upon. Generally the system is best, but unless enforced on judges, they seldom adopt it. At Reading the practice is made compulsory, so far as vegetables are concerned, and the points awarded to each dish are published. In this case the "Rules for Judging" basis is adopted.

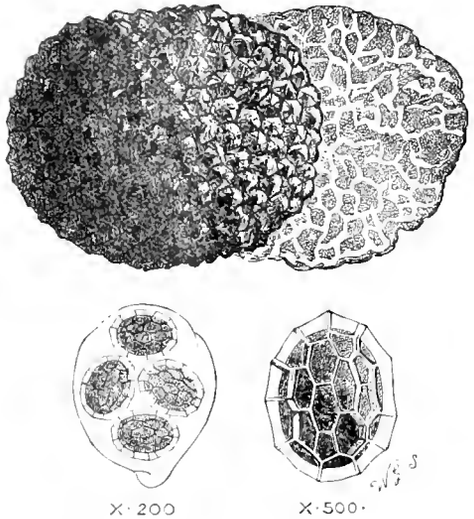

FIG. 126. THE TRUFFLE: TUBER ÆSTIVUM.

SEEDLESS GRAPES: *Author.* Yes, the Black Monukka Grape is usually seedless, so are the Sultanas which come into the market. The seedless Orange is probably the result of improper fertilisation. The Apple blossoms are fertilised by the agencies of insects, and wind.

TRUFFLES: *T. Z.* They are found wild, generally beneath the shade of Beech trees. The plantations of Beech trees on Salisbury Plain are especially productive of Truffles. Truffle hunters employ dogs, and occasionally pigs, to locate the plants. The commonest species met with in our markets is Tuber æstivum, illustrated at fig. 126. The plant known as the Pignut, or Earthnut, has no relation whatever with these esculents.

VINES: *H. S.* The condition is due to the wood having first received injury, and subsequently irritation has been set up by mites or other means which has caused hypertrophy or enlargement of the tissues.

VIOLETS: *H. R.* It is certainly advisable to plant from the runners in the spring, and destroy the old plants after the runners have become well established. Princess of Wales is the most popular large, single blue variety, and is sweet scented. La France and Kaiser Wilhelm are also fine varieties that produce large flowers. White Czar is an excellent white variety when it is true, but it is inclined to revert to the purple-blue, and sometimes it is only tinted with blue. The flowers of Rawson's White have generally a pink tinge. The blue Violets seen during the summer, which are scentless, are of a variety of Viola cornuta or a nearly allied species. Thanks for 9d. sent for the Gardeners' Orphan Fund. The other question will be answered next week.

THE AMERICAN GOOSEBERRY-MILDEW DISCOVERED IN ENGLAND.

IN the course of a recent article dealing with the outbreaks of the American Gooseberry-mildew in Sweden during 1905-6, of which I gave a translation in last week's issue of this journal, Professor J. Eriksson called attention to the important fact that Ribes aureum, the stock used in the raising of standard Gooseberry bushes, is very subject to the disease.

Immediately on receiving Professor Eriksson's article, I began making enquiries at English nurseries concerning the trade in imported plants of Ribes aureum, and I learnt that not only are unworked plants of Ribes aureum imported from the Continent, but also standard Gooseberry bushes on this stock. Subsequently I visited several nurseries. I have now to report that in one nursery I discovered the winter stage of the American Gooseberry-mildew on the young wood of a number of standard Gooseberry bushes on R. aureum stock. These standards had lately been imported from the Continent. In the nursery where the disease occurred there were large plots of ordinary Gooseberry bushes, but I was not able to detect that the mildew had spread to these. The owner of the nursery, on being informed of the occurrence of the mildew, and of the serious nature of the disease, at once volunteered to burn all the standards, and promised, should the disease appear next spring on other Gooseberry bushes, to carry out the strictest possible preventive measures.

In face of the recent articles which I have published on the subject, it is hardly necessary to dwell on the seriousness of the present state of affairs now that the actual existence of the disease in England is known. All associations and societies of nurserymen and gardeners should at once warn their members of the possibility of already harbouring the pest in their nurseries or gardens on recently imported standard Gooseberry bushes. Much good may be done in this way, if each nurseryman or gardener on discovering any trace of the disease will immediately burn all the affected bushes. But it cannot be hoped that this will be done throughout the country; the smaller firms of nurserymen and many gardeners, who belong to no association or society, will receive no warning of the danger, and the disease spreading from infected imported plants will speedily invade the commercial Gooseberry plantations of our country, as it has done in Ireland and on the Continent. Legislation alone can deal with the danger at its source. The trade in standard Gooseberry bushes is unimportant and negligible in comparison with the interests connected with commercial plantations of Gooseberry bushes and their cultivation in private gardens, and the temporary prohibition of the importation of Ribes aureum, as well as the European Gooseberry, is necessary.

I am still investigating the subject of the importation of Ribes aureum and standard Gooseberry bushes, and trying to ascertain exactly to what extent diseased plants have been sent over from the Continent. So far, the results obtained allow one to hope that but little disease has been imported up to the present, and with the whole winter before us to work in—for the fungus will remain dormant until next spring—there is still every reason to believe that the pest may be successfully fought if the necessary assistance be given by the authorities. But the fact must not be lost sight of that until preventive legislative measures are taken, diseased bushes will in all probability continue to be imported from Continental nurseries.

The facts show us that we are now at the very beginning of an outbreak of the disease in this country. The authorities have waited until the disease has appeared, although they were warned on the first outbreaks of the disease in Ireland and on the Continent in 1900-1905 that the disease must invade England if nothing were done. So far, perhaps, our commercial plantations are still free from the disease; the authorities have one more chance—and the last.

In my article last week I enumerated the protective measures which, in my opinion, should be taken at once. In view of the fact that the disease flourishes on R. aureum, and on standards on this stock, and that diseased standards have already been imported, it is most important that we should, in the first place, exclude further danger from this source by the temporary prohibition of the importation of R. aureum; and, secondly, that the work of extirpating the disease, wherever it has found its way into nurseries, should be proceeded with energetically.

I have examples of the mildew (poisoned, and therefore harmless) which I should be pleased to lend for educational purposes to any nurserymen's or fruit-growers' association, or to send to any private individual. A description, with illustrations, of the fungus will be found in my articles in the *Journal of the Royal Horticultural Society* (vols. xxv. and xxvii.). Any Gooseberry shoots suspected of being diseased can be sent to me for inspection. *E. S. Salmon, F.L.S., Hon. F.R.H.S., Mycologist to the South-Eastern Agricultural College, Wye, Kent.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUMS AT WARRINGTON.

It may be that many Southerners who know the chemicalised atmosphere of Runcorn and its vicinity will smile and say, "I should think there are none by now"; but if they will go to Wilderspool, just south of the town, they will be agreeably surprised both by the plants and the welcome extended to them by their owner, William Bolton, Esq., the popular Mayor of Warrington for probably the fourth year in succession.

To compare the growth of the Orchids here now, as compared to what it was three years ago, is to compare immensity to nothing, so great has the improvement become under the management of Mr. Bolton and his energetic chief, Mr. Kain. Natural conditions are here seen to be of the utmost value, and artificiality of any sort is taken the least advantage of in this establishment. The houses, and heating apparatus, are of the simplest kind, and the result is eminently good. I must admit that I was surprised at the great change in the plants.

There is one cardinal difference now as compared to then, and this will appear to be a contradiction of my statement regarding artificiality; it is that most of the plants then hanging on the glass roofs, even the Odontoglossums, are all standing on the stages, these being lower than in any establishment I have seen. Speaking of all the plants generally, I may say they are growing like weeds, and particularising, I wish to commend the details of the Odontoglossum growing to the careful consideration of all who specialise in this genus, which has now "par excellence" become the most highly valued of all genera of Orchids.

Wilderspool is somewhat peculiarly situated; the south end of the garden borders on the Manchester Canal, and to the north a short distance is the River Mersey. Readers must judge whether exhalations from these two well-known "pure water" ways have aught to do with the growth of the plants that are so happy in this flat place; for if they have, that is the only kind of "*loading*" they get, for no two men can be more "down on" manuring Orchids than are Mr. Bolton and Mr. Kain, who give the plants nothing but rain water, unless they have to put up with waterworks water for a short space now and then.

The Odontoglossum houses are somewhat unique, as the following description will prove. You enter a central corridor 70 feet long by 4 feet wide and 9 feet high, which runs north and south. Running east and west of it are four pairs of span roof houses 50 feet long, 12 feet wide, and 8 feet high to the ridge inside, separated by spaces of 3 feet; the ends are all free, there being no doors in them. At the end of the corridor there is one house which is equal to one of the pairs, having no door opposite the end of the corridor.

The ventilation of these houses is remarkable,

for at first sight there appears to be none at all, as there are *only* top lights *nor* side wall ventilators to open at all. The ventilation is gained by a few panes of glass being open at the ends and the use of *only two* doors from the corridor into the spaces between the houses, but there are no doors from the corridor into the houses themselves to control the admission of air if the "space" doors are opened. These "space" doors do not allow of much ventilation, being only two, one on each side of the corridor, not opposite each other, but if opened for any cause, of course, there is an inlet of air, but this is not the usual course practised for ventilating purposes.

FIG. 127.—WASHINGTONIA SONORAE (PALM), YUCCA ELEGANTISSIMA, TRELEASIANA, ETC. (For text see page 319.)

The heating is also remarkable, being one 8-inch pipe under each side stage, a thing I have never before seen in any Orchid-growing establishment. The stages are 3 feet 9 inches wide and only 2 feet from the ground, which has nothing of any sort on it; it is bare, to exhale anything which Nature may have put into it or drain off the water from the stages.

The plants stand directly on the slate stages, which are covered 1 to 2 inches deep in cinders crushed to the size of large peas or beans. The side walls of the house are 3 feet high, and are 1 foot above the stage level. From that height the roof runs to the ridge. The shading is one ordinary lath blind, and the hot water has this year been in disuse from May to the end of September. Tanks, as usual, are under the stages, and small iron cisterns placed along the paths to dip the can into complete this most successful group of houses.

The potting compost used is Oak leaves and sphagnum in equal parts; the leaves are gathered in autumn from the woods and kept in the open under a little shed; they are used after rubbing through a half-inch sieve. To this mixture is added about one-sixth silver sand, and into that goes the plant with no drainage of either crocks or rhizomes.

Out of that compost come plants that are as good as man can wish for, and into the pot go the roots in great quantity and in quality, such as no man can wish for better.

There are some 80,000 Odontoglossums, and in some of the houses are a few of the old rockwork still hanging up on the roof in the moss (above) that used to be the order of the day then. You do not need to look at them more than once to see the benefit of the new treatment, under which they are all going the same way, viz., from little plants into big ones.

The largest crispums and "luteos" are a sight to see, immense growths coming up everywhere and double breaks in quantity. To particularise them would be a positive labour; I measured one luteo-purpureum growth of 2¼ inches wide at base and 18 inches high, and the bulb had only just begun to form. Of these there are 30 plants in 8 to 12-inch pots, a couple of which have three heads. Large crispum plants are here by hundreds.

Mention must be made of the fine varieties as well as the fine growths, and among the crispums are Capartianum, Massangeanum, Mariæ, Lucieni, Lindeni, Raymond Crawshay, punctatum violaceum, Queen Victoria, Jeannette, Starlight, and Queen of the Earth. Fine Adrianæs are numerous, as also are Wilckeanums, including Stevensii, under its second name of crispum Alpha (kept on it to mark its origin).

Garden hybrids are seen by the hundred, and rapid propagation of these is being practised, for it is found that they are in increasing demand annually, and Mr. Bolton is not afraid of their value falling to "bed-rock level" as some people fear they will. Of course, as is well known, these garden hybrids grow themselves, but they do not always succeed in dividing themselves, so that each plant makes two of the same size, as will shortly be the case here.

The change in the quality of the growth is one of the most remarkable things I have seen in Orchid culture in so short a time, and if it continues upon its present lines (I see no reason why it should not) Wilderspool will be one of the sights of the North.

Passing on to Cattleyas and Lælias, here the same remark applies, rampant growth all round, in species and hybrids alike. All those usually grown are to be seen here, as well as many fine forms of each.

It is not my usual custom to dilate upon a Cypripedium, but I must give a note respecting them whilst here. It is a well-known fact that the insigne and bellatulum sections do well at Wilderspool, but perhaps it is not known how well. The question is, could they do better? Of insigne Sanderæ there are some 500 plants, many dozens of them being in 8 to 10-inch pots, and with a dozen growths or more. They grow like Tradescantia, under a damp stage, and it is no trouble to propagate them as fast as may be desired. When in bloom this house will be an extraordinary sight indeed, and well worth a journey to see them alone. C. Fairieanum is here in hundreds, and at present seems to like a coolish treatment, but sufficient time has not yet elapsed to prove its needs; and varieties of this "long lost" plant will now be rapidly forthcoming, and doubtless the "albino" variety will in due time appear. *De B. Crawshay.*

FIG. 128.—WASHINGTONIA ROBUSTA, AGAVE MEXICANA, FRANSONIANA, HAYNII, MULTIFLORA, VICTORIA REGINA, YUCCA VOMERINSIS &c., ETC. (For text see page 319.)

FIG. 129.—AGAVE SCHIDIGERA IN FLOWER TO THE LEFT, OPUNTIA MAXIMA, O. CAMANCHICA, IN THE CENTRE, PILOCEREUS SENILIS TO THE RIGHT, TOGETHER WITH AGAVE COCCINEA, ATROVIRENS, YUCCA ROSTRATA, WHIPPLEI, GLAUCA, ETC.

FOREIGN CORRESPONDENCE.

A GARDEN NEAR MOUNT VESUVIUS.

ONE of the few amateurs and lovers of plants in the vicinity of Naples is Mr. Gennaro Casertano, of San Giorgio à Cremano, who has in his splendid garden a fine collection of the choicest open air plants. Two years ago the first trees and shrubs were planted, and they are in as good a state as Mount Vesuvius has permitted. We can plant here only small young trees which become acclimatised in this arid volcanic soil; very many were lost this spring, when the ashes rose to a depth of 20 to 25 centimetres (8 to 10 inches). All the small shrubs and perennials planted during the winter and before the eruption died in consequence of the acid fumes, and the roots were baked; but the love of flowers never dies, and now the owner is beginning to replace his losses. Succulents and Palms are his favourites. All plants which do here in the open we have in larger or smaller specimens—Washingtonia filifera, robusta, Sonorae, and the new W. Purpusii. Of W. Sonorae there are six large seven-year-old plants doing very well. W. Sonorae is a nobler and more elegant Palm than robusta (fig. 127). Of the other Palms, Erythea or Brahea Roezlii has silvery leaves, but it is a very slow grower. Jubaea spectabilis is also one of the finest Palms when in good condition. There are two good specimens here of Phoenix—a very large collection of species, one with an enormous trunk. Among small plants is the very rare Nannorhops Ritchieana, which grows very slowly. Of Cocos australis there is a fine specimen. Cordyline indivisa, Sprenger's Hybrid Yuccas, and Strelitzia Regina are to be met with, and among the border plants are new varieties of hybrid Gazanias. In the spring and summer during the flowering time the effect is delightful. The lawn is composed of Lippia repens or Zapania repens, one of the best creeping plants for hot and dry places; during the summer it is covered with very pretty pinkish flowers. It is impossible to grow grass satisfactorily. The other photos show rockeries of lava from lava thrown up in 1872. Between these rocks are planted succulents, Yucca, Phormium, and Washingtonia Sonorae. In the spring bulbous plants—Tulips, a complete collection of the fine wild Italian Tulips; Fransoniana, neglecta praecox, Didieri, Sommieri, and others; Iris Susiana and other Oncocyclus varieties, and many other plants. In the summer Helianthemums, Arctotis, Statice, Gypsophila, Thymes, and other rock plants do well, and during the summer they are never watered except from the sky. You can distinguish Agave mexicana, A. Franzosiniana, stenophylla, atrovirens, multiflora (fig. 128), and the noble A. Victoria Reginae; Aloe vulgaris. Many of the little rock plants were damaged by the ashes, but are now replaced, and next season will do well. Another succulent group is composed also of Agaves, but the specialities are a complete collection of Yuccas, the true species including valida, macrocarpa, baccata, rigida, rostrata, Whipplei, and glauca. Fine specimens of Pilocereus senilis and Dautwitzii are only planted out during the fine season; during the winter they are kept in a small house containing succulents, including Phyllocactus and Epiphyllum and other Cactaceæ. The large Opuntia is maxima; of this there are a great many sorts. These two succulents between the rocks excite the admiration of all the visitors (fig. 129). Conifers are also present in many species; Pinus halepensis, Laricio var. calabrica, maritima, insignis, one of the finest and fastest growers; canariensis, with leaves that are blue in the spring; Montezumæ, Strobus, Sabiniana, Massoniana, and others. Cupressus macrocarpa, a very fast grower, has shot up in two years to a height of more than 2 metres; pygmaea, guadeloupensis, Cedrus, a fine collection of Abies, including sibirica, Pinsapo, nobilis, lasiocarpa, pungens glauca and Kosteriana. The last two planted in the spring have not suffered from the fall of ashes, and we may hope that they will do well; and also Abies balsamea, Menziesii, Biota, Sciadopitys, Cryptomeria elegans, Podocarpus, and others. Bamboos are also grown in large quantities. Especially fine are B. mitis (edulis), Thamnocalamus Falconeri, Bambusa nitida, B. Alphonse Karr, heterocycla, and others planted two years ago. As to trees and shrubs, there are Salix Safsaf, a large specimen with weeping

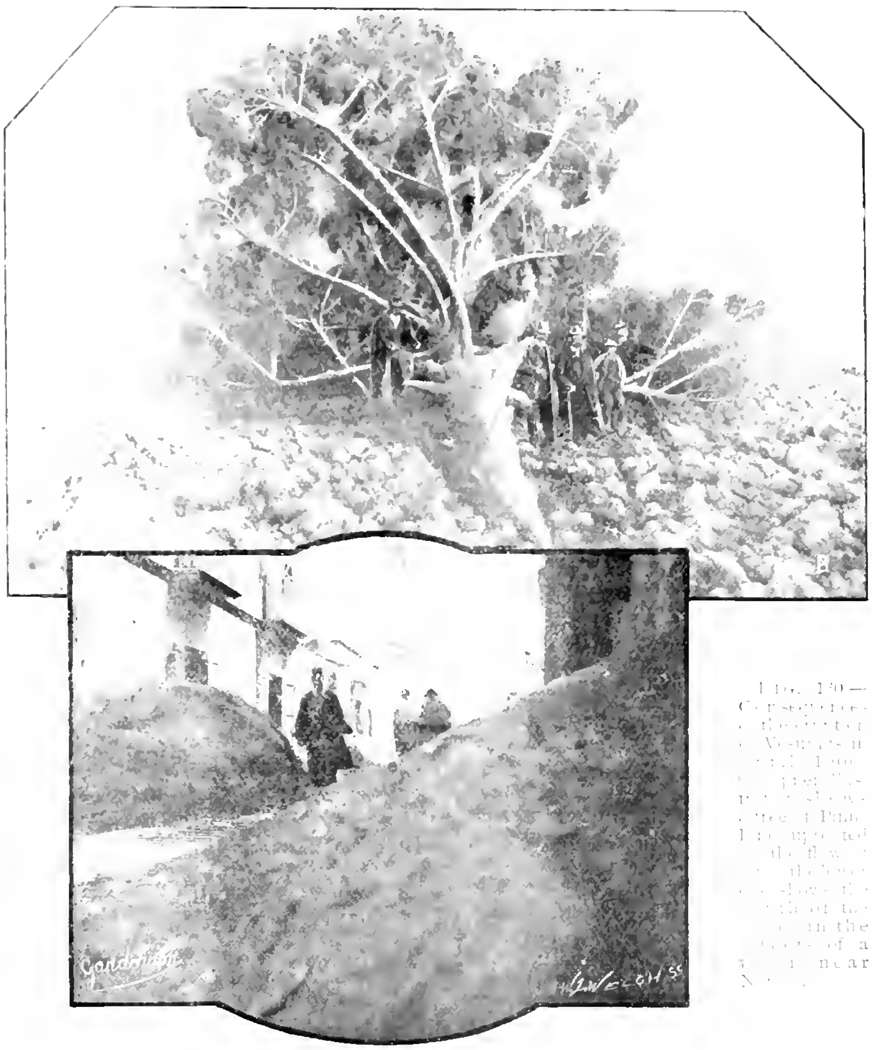

FIG. 130.—Consequences of the eruption of Vesuvius [illegible] in the [illegible] of a [illegible] near N[illegible]

branches: Acacias, Amelanchier asiatica, Japanese Oaks, dentata, serrata, and the laurel-like evergreen glauca and laevigata. The first is a very fine tree, especially in spring; the young shoots are very bright red. Japanese Cherries have flowered well, as have all the Japanese shrubs. Tamarix hispida aestivalis, Desmodium tiliaefolium, Buddleia Veitchiana are in flower the whole summer and autumn. Lippia asperifolia and the new Vitex Negundo and varieties, Indigofera atropurpurea, Dosua, and Bungeana are the best summer shrubs. Of perennials there is a good border, with Gerberas in large clumps, Romneya, Campanulas, Gaillardias, Michaelmas Daisies, and others. But never is the border so fine as are those representatives which I see sometimes illustrated in your columns, for here the flowering time is different to that in the north, and we plant more annuals for the sake of an effect. I hope to send you next year other photos of our plants if Mount Vesuvius will permit me to do so. *William Muller.* [Other photographs sent us by Mr. Sprenger show the depth of the ashes in the streets of the town, and a tree of Pinus Pinea uprooted by the lava. The tree served as the turning point to the flow of lava.—ED.]

COLONIAL NOTE.

PRETORIA.

I was glad to see Mr. Brown recently calling attention to Haplocarpha scaposa in the *Gardeners' Chronicle*. It is a beautiful plant, but is so common here in Pretoria that it is usually ignored. In the Transvaal it is widely distributed, growing in heavy, black, clay-loam in "vleis," *i.e.*, alluvial valley lands which become almost boggy in our summer rains, but dry out completely in winter. During winter the plant remains quite dormant in the dry soil, not even a leaf is to be seen.

Spring flowers are now coming out. Cyrtanthi, Vellozias, pink Indigoferas, yellow Gnidia, blue Pentanisia, and gay Liliaceae and Amaryllids of many sorts. The Aloes are over, and so are the Scarlet Erythrinas, which have made the kopjes so showy during the latter part of the winter, but the beautiful white Dombeya densiflora still persists.

Remarkably good rains have fallen generally over the Transvaal, and we are looking forward to a good agricultural season at last, after three years of such drought as appears to have been almost unknown before. *J. Burtt-Davy, Pretoria, October.*

NOTES FROM AN UNDERCLIFF GARDEN.

LAST year I contributed notes to this journal on the very interesting garden at Belvedere, St. Lawrence, Isle of Wight, the residence of Mrs. M. Gwytherne-Williams, and this year I was fortunate in being able to again visit it towards the end of June. The garden, which faces south, overlooking the blue waters of the English Channel, and entirely protected on the north by the high cliffs immediately behind, was a blaze of colour with Mesembryanthemums which grow and flower as well here as they do at the Isles of Scilly and at Abbotsbury. Numbers of succulents, growing in the fissures of the outcrops of rock that here and there broke the surface of the soil, showed evidence of being perfectly at home, and I noticed amongst others Aloe arborea, A. serra, Agave Victoria Reginae, Aporocactus flagelliformis, Cereus jamacaru, C. peruvianus, C. phoeniceus, C. flagelliformis, C. Lamprochlorus, Echinocereus viridiflorus, in flower, Echinopsis Eyresii, in bloom, E. multiplex, E. Pentlandi, Maximiliana, E. Zuccariniana, in flower, Gasteria verrucosa, blooming, Haworthia cuspidata, Mamillaria centricirrha, M. mussoniana, Opuntia humilis, O. cylindrica, O. Salmiana, O. arborescens, O. glauca, in bud, O. microdasys, O. monacantha, O. Rafinesquii, O. xanthostema rosea and Sempervivum anomalum. In another portion of the garden were a fine flowering plant of Kniphofia Northiae and a small specimen of Yucca elephantipes, said to attain a height of 40 feet. Among the shrubs and plants in bloom were Abutilon vitifolium, Andibertia grandiflora, Chorizema Lowii, Bouvardia triphylla, a sheet of scarlet, Bletia hyacinthina, Brodiaea laxa, Cestrum elegans, Buddleia Colvilei, Eriostemon densifolium, Convolvulus mauritanicus, Cypella Herberti, Cinerarias that had been out three years a mass of bloom, Dyckya longiflora, Gazania nivea, Gilia pungens, Gerbera Jamesoni, Ixias, Jamesia americana, Libonia floribunda, growing in front of a rock, Megacaryon orientale, Ornithogalum arabicum, Ozothamnus rosmarinifolius, Pimelea Hendersoni, bearing pink flowers, Pancratium illyricum with numbers of self-sown seedlings springing up around the parent plants, Rhabdothamnus Solandri, with red flowers, Rehmannia angulata, Salpichroa rhomboidea, Sphaeralcea Munroana, covering a space 10 feet square, and a sheet of soft red blossom, Solanum crispum, S. aviculare, Lavatera assurgentiflora, Sparmannia africana Sutherlandia frutescens, scarlet with bloom, Senecio sagittifolia, Trichonema Clusiana, Tritonia crocata, and the South African Tulbaghia violacea. Anacampseros rubens was in bud, as was the rare South African Bowkeria triphylla, the largest specimen of which was 12 feet in height. The fine Salvia dichroa, from the Atlas mountains, was past its best. A little later Limoniastrum Guyonianum, from the neighbourhood of Biskra, flowered, as did Fuchsia syringaeflora, from Mexico, of which there is a fine specimen. Cantua dependens flowered well earlier in the year. Lagunaria Patersoni, a rare shrub from Norfolk Island, which bears large white flowers about 3 inches across, with petals very firm in texture, as in a Camellia, of which there is a specimen 7 feet in height, covered with buds and Albuca Nelsoni was showing bloom. In July Kunzea pedunculatis, 5 feet in height, bore its bottle-brush-like flowers. Among other noteworthy plants were Aberia caffra, Acantholimon venustum, Agathosma rugosa, Aristaea Ecklonis, and the allied Witsenia corymbosa, the Chilian Aristotelia Maqui, Asparagus Sprengeri, perfectly happy in the open, Buddleia asiatica, Calophaca Wolgarica, the red-flowered climber Camptosema rubicundum, from Brazil, Callitris cupressoides, Castanopsis chrysophylla, Callistemon salignus, C. lanceolata, Chironia ixilera, the rare Crossosoma californicum, Daphniphyllum himalayense, several species of Dianella, from Australia, Dioclea glycinoides, Diosma vulgaris var. gracilis, Diospyros costata, Drimys Winteri, Distylium racemosum, bearing scarlet flowers, Echium simplex, Feijoa Sellowiana, Freylinia cestroides, 5 feet in height, which has not as yet flowered, Gordonia lasianthus, Hakea eucalyptoides, H. suaveolens, 8 feet in height, the South African Honeysuckle, Halleria lucida, Hovenia dulcis, Illicium religiosum, Incarvillea compacta, I. variabilis, I. Olgae, Jaborosa integrifolia, Kalosanthes coccinea, Lotonia modesta, Lycium europaeum, the Cape Silver Tree, Leucadendron argenteum, a small specimen, Leptodermis lanceolata, Melhosma myrrantha, Myrsine semiserrata, Origanum sipylenm, Osteomeles anthyllidifolia, Ostryopsis Davidiana [?], 6 feet in height, a shrub bearing yellow flowers like those of an Hypericum, as large as florins, at the extreme end of the branches before the leaves expand, very rare, Pterocarya sorbifolia, Plumbago capensis, Reevesia thyrsoidea, Rhododendron Dalhousiae, the new Sophora flavescens, Strophanthus capensis, Ungnadia speciosa, and Westringia rosmarinifolia. Even in Cornwall the collection of rare and tender plants named would be hard to beat, but there is probably but little difference between the climate in the southern part of that county and along the Undercliff, and certainly the excellent health of the great majority of the specimens indicates that they are perfectly happy in their surroundings. The attractions of the garden are much heightened by a clear stream that runs through its entire length. In a shady spot, hard by a little fall, a plant of the Elk's-horn Fern, Platycerium alcicorne, has been out four years and is doing well, and not far distant a fine specimen of Cypripedium insigne, generally cultivated under glass, grows and flowers freely. Lower down the garden the Table Mountain Orchid, Disa grandiflora, is planted in a moist spot by the stream-side, though as yet it is too early to say if this enterprising attempt—probably the first to grow the Disa in the open air in England—is likely to succeed. Cape bulbs thrive splendidly in this garden, Freesias propagating themselves by self-sown seed, and Sparaxis, Babianas, Ixias, Tritonias, Brunsvigias, hybrid Hippeastrums, Ismenes, and Cyrtanthi finding a congenial home, while in the early autumn the Nerines flower profusely. In the spring a gently sloping bank is covered with flowers of Cyclamen persicum. In these notes probably not a quarter of the plants grown in this interesting garden are specified, for they are merely intended as supplementary to the article that appeared on July 15th, 1905. *S. W. Fitzherbert.*

KEW NOTES.

THE VICTORIA REGIA AT KEW.

AFTER comparative failure at Kew for a number of years, this plant is again flourishing in the Royal gardens. At the time of writing (September 16), it has eleven fully-developed leaves, and numerous younger ones, in various stages of development. The largest leaf is 7 feet 2 inches in diameter, and the up-turned margin is more than 5 inches in height. In most of the fully-developed leaves, the diameter varies from 6 feet 3 inches to 7 feet. In addition to the foliage, numerous flowers are present in all stages of growth, from tiny buds to those fully opened.

For several years past, shortly after the young plants were placed in the large water-tank in House No. 1, they were attacked by a disease. The first appearance of the disease was the presence on the leaf of numerous small patches of a dull green colour, and these formed into holes and in a few days spread in all directions, until the whole of the leaf was more or less decayed. The young leaves were first attacked when they were about half developed, and when once the fungus was inside the tissue, it spread with great rapidity.

On submitting specimens to Mr. Massee, he reported that "the disease was due to a parasitic fungus called Pythium de Baryanum, and that the aquatic habitat and high temperature of the surroundings proved highly favourable to the development of the fungus by the asexual mode of reproduction, innumerable zoosporangia being produced, also large quantities of gonidia that closely resembled oogonia, but differed in being asexual and in germinating at once. These oospores were subjected to various tests with solutions of permanganate of potash (Condy's fluid), by which it was proved that a three per cent. solution caused their death." However, as the tank in which the Lily was grown also contained a number of other aquatic and bog plants, and numerous gold fish, caution in the use of this chemical was necessary. The tank was therefore impregnated with solutions of varying strength of the permanganate, and, in addition, the leaves of the Lily were sponged almost daily with a strong solution of the same substance. These efforts resulted in checking the disease to a considerable extent, and the plant improved somewhat, but the approach of

winter put an end to the experiment. It was thought from these results that little difficulty would be experienced in keeping the young plant free from the disease the following season, but, to the dismay of everyone concerned, it appeared the next year during the month of May with renewed vigour, and, in spite of every precaution, greatly disfigured the plant. Every means were taken to again check the disease. The same process of the previous season's treatment with Condy's fluid was again gone through, and the temperature of the water and of the atmosphere was raised and after a time lowered, but, in spite of all precautions, the disease continued to manifest itself. For three years this failure continued, until, in the spring of the present year, it was determined to place the new plant in the tank in House No. 15 (which was originally built for accommodating the Victoria regia), and to transfer the Nymphæas to the Victoria tank. The result has been entirely successful; the Victoria regia was never finer at Kew than at present, while the Nymphæas have also proved a success in their new quarters, and are apparently immune to the attacks of the Pythium.

I append a few notes on the culture of the Victoria regia. The plant is raised annually from seeds, which soon lose their vitality if allowed to remain dry for any great length of time. The seed are therefore best kept in small bottles of water. They should be sown singly in small pots in February or March, and be plunged in a tank, the water of which is heated to a temperature of 80° F., at which degree of warmth the young plants thrive best in their early stages. The young seedlings appear in a few days, and in the course of a week or more will be ready for a shift into a 6-inch pan and again into a 12-inch pan in another fortnight or three weeks. In this last pan it should remain until ready for transplanting into its permanent quarters, which should consist of a large tank, preferably a circular one, provided with a set of hot-water pipes sufficient to maintain the temperature of the water to about 80°. A good supply of clean water is a necessity, as is also an efficient overflow. At Kew the overflow goes to replenish a large pond near by, and hence serves a double purpose. The depth in the centre of the tank should be 4 feet, gradually sloping upwards towards the sides, which need not be more than 2 feet in depth. In the centre of the tank, provision must be made for a large bed of soil in which to grow the Lily. This may be made by building a wall of turves in the form of a circle or square to a height of 3 feet, with a diameter of at least 5 feet, and filling in the middle with good turfy loam mixed with about one-third its bulk of cow manure. It it is intended to permanently occupy the tank with this Lily, it is preferable to build a brick wall as a receptacle in which to hold the soil, the sides being perforated with holes at regular intervals in order to allow a free access of the water on all sides. If built to a height of 3 feet, this height will allow a foot of water above the crown of the plant, and this quantity is ample.

The young Victoria regias should be planted about the middle of May, and for the first few days the temperature of the water should be kept at about 80°, when it may, with advantage, be gradually lowered to 70° or thereabouts. I mention this because at Kew we found the plant this summer thrived best when kept at this temperature, and the water, even on hot days, has rarely been above 72°.

As the Victoria is a sun-loving plant, it should receive all the light possible. The best house for their culture is a span-roofed structure, fitted with both top and side ventilators and with glass sides to within 3 feet of the ground level, the bottom being of brickwork. The atmospheric temperature during the growing season should not be allowed to fall below 70° during the night time, rising to 80° by day, and, with sun heat, to 90°. A maximum amount of ventilation is essential during the hot summer months. *C. P. Ragill.*

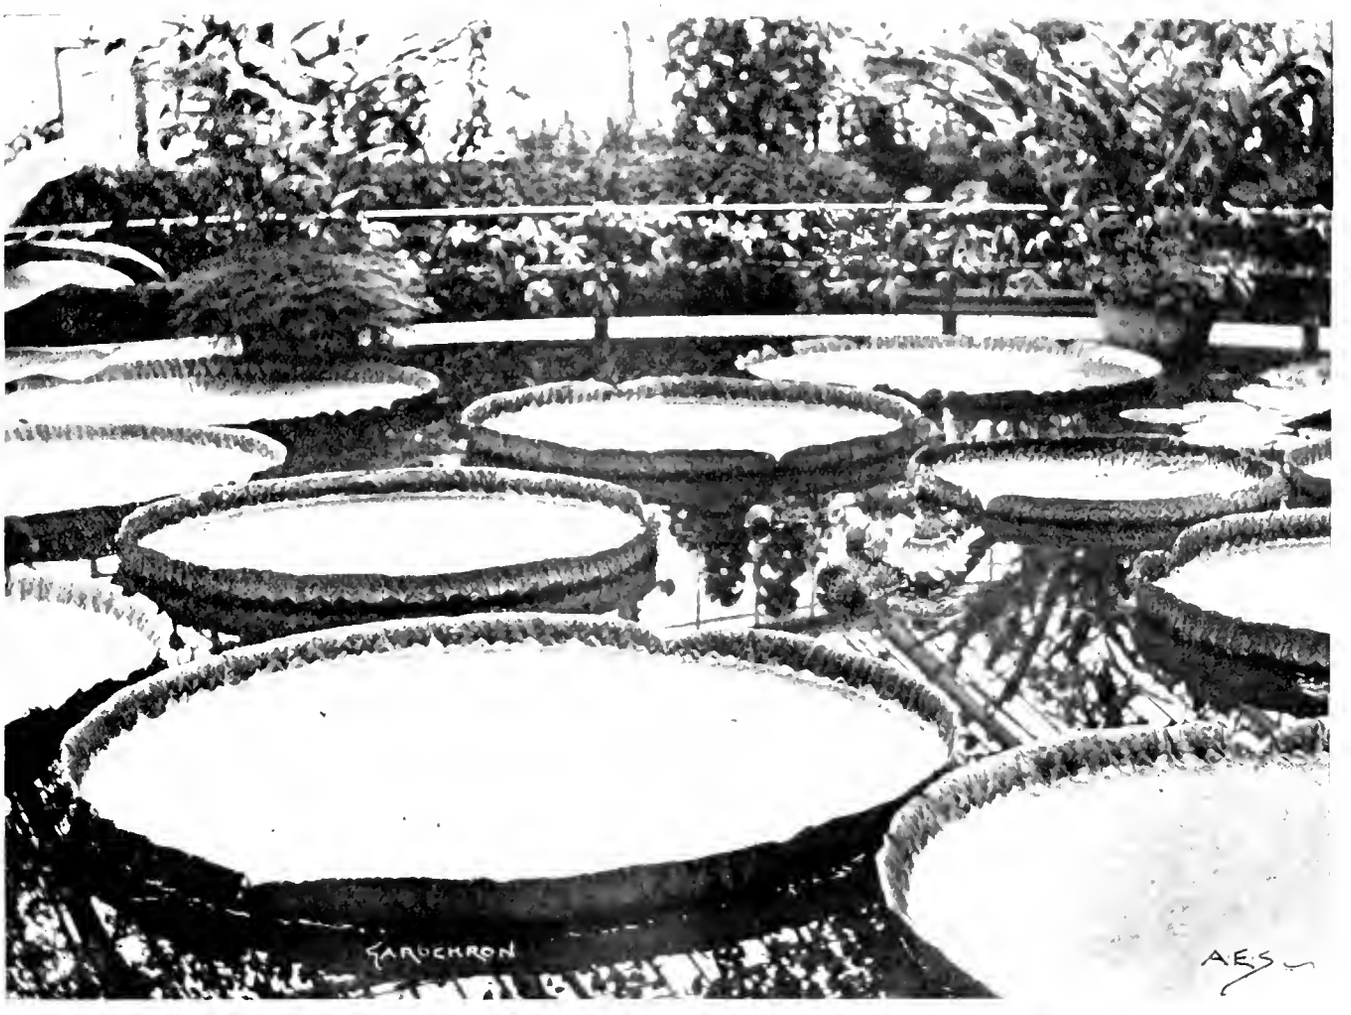

FIG. 131.—THE VICTORIA REGIA FLOWERING IN THE OLD NYMPHÆA-HOUSE AT KEW.

FUNKIA LANCIFOLIA VAR. TARDIFLORA.

It is now about 10 years since Herr Max Leichtlin, of Baden-Baden, sent specimens of this Funkia to Kew. The plant differs in a variety of characters from the type species. Its time of flowering is October, while that of F. lancifolia is July, and its leaves have a more leathery appearance than the latter, and the petioles are shorter, giving the plant a compact appearance. The light purple or lilac flowers are more numerous, averaging from 20 to 30 on each raceme, while on very vigorous racemes there are sometimes as many as 40.

For growing in a small bed in the pleasure grounds, as a patch on the front of the herbaceous border, or as an edging to a shrubbery border, the plant is equally useful. Moreover, it thrives well, for at the present time the plants in a small round bed near the Victoria Gate (always a dry position, and especially so during the past summer) are covered with racemes of flowers, although in close proximity to an Oak tree.

Propagation is effected by division of the roots, but if flowering plants are desired the following year the operation must not be severe.

This plant is sometimes employed as a pot plant for the cool greenhouse, where it will flower at a season when greenhouse flowers are none too plentiful.

PLANT NOTES.

MARANTAS.

THERE are some 30 or 40 varieties of this beautiful and easily-managed, moisture-loving stove genus in cultivation at the present time, as compared with the half-dozen varieties to be met with in English hothouses some 30 years ago, and which consisted, among others, of M. zebrina, M. regalis, and M. lineata rosea. The plants are generally of moderate growth, and are propagated easily by division of the crowns. The divisions should be potted singly into 3-inch or 4½-inch pots, according to the size of the portions. The pots should be provided with ample drainage, and the potting medium should consist of good fibrous peat, with a liberal sprinkling of silver sand added, this being made moderately firm in potting. Afford water to settle the soil about the roots, and shade the plants from sunshine for a few hours during the heat of the day until the roots have pushed into the new soil, when the shading can be dispensed with. The Maranta will succeed under the conditions of atmospheric moisture and temperature usually afforded to ordinary stove plants, namely, a minimum night temperature of from 55 to 60 degrees, according as the weather is cold or warm, during the winter months, with a rise of 5 degrees in the springtime, allowing the thermometer to register 5 degrees higher during the summer and early autumn months, rising 10 degrees to 15 degrees with sunshine (when opportunity offers) during the first three months in the year. The plants should be syringed lightly overhead with clean, tepid water in the afternoons of bright, sunny days. In April and the five following months a good growing atmosphere should be maintained, and the plants and house generally should be well damped early on bright mornings, and again at closing time, which should range from 2.30 p.m. in March to 4.30 p.m. during July and August. When the thermometer registers from 75 degrees to 80 degrees in the morning fresh air should be admitted, afterwards increasing and decreasing the amount given, according to the rise and fall of the thermometer, until the ventilators are finally closed for the day.

The following brief list and description of the more useful varieties of the Maranta may prove useful to cultivators: M. argentea, leaves large, oblong, of a silvery-grey colour, and marked with narrow lines of green; M. fasciata, leaves 8 to 12 inches in length, ground colour bright green relieved by broad bands of white; M. illustris, leaves bright pea-green, streaked with deeper green, and blotched with white; M. illustris rosea-picta, leaves like those of the type, but marked with rose; M. lineata rosea, ovate-lanceolate, bright green leaves, with rose-coloured lines running from mid-rib to margin, the undersurface being purple; M. major is a plant of graceful habit, 2 to 3½ feet high, leaves 4 to 9 inches in length, of varying shades of green, a useful and effective decorative plant; M. regalis, having leaves of a dark olive-green ground, with pink stripes; M. Veitchii, with leaves over 1 foot in length and 6 inches in width, colour a rich glossy green, and marked on either side of the mid-rib with crescent-shaped blotches of yellowish green, purplish on the under side, a very handsome variety; M. vittata, with light green leaves marked with transverse bars of white; M. zebrina, an old and favourite species, the foliage of which is light velvety-green barred with purplish-green on the upper surface, dull purplish-green on the under surface. *H. H. W.*

NOTICES OF BOOKS.

GARTENKULTUR BODENHEIZUNG KLIMA-VERBESSERUNG (Horticulture, warming of the soil, and improvement of climate).

WE have received from the Forcing Gardeners' Company, at Grunewald, Berlin, a pamphlet of 13 pages dealing with a patented method of forwarding and protecting the growth of garden plants, both culinary and ornamental, the inventor of the system being Dr. H. Mehner. The idea of conveying warmth to the soil in which plants are growing is not new, trade and private gardeners in our own country, France, and Italy having had some methods of imparting warmth to Asparagus, Seakale, Rhubarb, vines, &c., for many years. The only novel point is the use of steam in underground drainpipes, in conjunction or otherwise with some kind of covering for the plants. It is a matter worthy of that attention of our cultivators who may be resident in the outskirts of manufacturing towns, where waste steam may be easily obtainable free of cost, or at a small rental. There are numerous crops mentioned by the author which can be forwarded to a great extent by the system, besides the few that are mentioned. Practically we have an extension of the spring at the beginning and protection from frosts, so injurious to early crops, up to the end of the month of May, as well as from the early autumn frosts, which often bring ruin to many kinds of vegetables and flowers whilst these are still in growth and beauty, as cultivators only too well know to their cost. The method is particularly applicable to early Carrots, Spinach, Kohlrabi, Peas, Beans, Lettuces, Endives, and Radishes, in early spring; to Cucumbers (out-of-doors sorts), Tomatos, and Cauliflowers; and in autumn and winter to Spinach, Parsley, Chives, potherbs, salads, Kohlrabi, and Cauliflowers. It is hoped by the inventor to carry out experiments with Lily of the Valley, Violets, Narcissus, Lilac, &c., on a large scale. As overhead protection and for side walls cheap sackcloth is recommended. There are likewise Strawberries, Roses, and many other kinds of plants which require protection in the spring; and in autumn Tomatos, late French Beans, Asters, Dahlias which can be protected from cold. What this would mean to the commercial gardener is very considerable in the matter of income. Appended are an outline plan of the system as arranged to be carried out at the Dahlem Horticultural School, and a table giving the names of varieties of various kinds of vegetables and flowering plants, times of sowing, and vegetation planting, taking the crops, vegetative warmth, growing warmth, and the kind of covering employed. There are striking illustrations from photographs of various crops on warmed and unwarmed plots of ground. The pamphlet is obtainable from the *Verlag der Treibgartnereigesellschaft, Grunewald-Berlin, Auerbach Strasse 10. F. M.*

The Week's Work.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Winter Spinach.—Keep the ground between the lines quite free from weeds. Winter Spinach seldom makes too much growth, and it requires all the care possible to maintain a regular supply. So far this season it has done well, but the advent of severe weather may alter matters, especially after so much rain, which has caused the growth to be very soft. New Zealand Spinach should always be grown as a substitute when the ordinary variety fails. The New Zealand type has a suspicion of bitterness, but this can be overcome in the cooking if care is taken.

Celery.—All but the latest batch should by this time have received its final earthing-up. There will be but little growth from now onward, and the third earthing-up will act as a protection from frosts. This last application of soil should be made quite smooth, and with sufficient dust that rains will run off quickly, otherwise an excessive rainfall might cause the plants to decay in the centre.

Mushrooms.—The crops from the fields being exhausted, the indoor crops will need attention if they are to yield a constant supply. Maintain a succession of beds as far as possible. After the recent heavy rains the horse droppings will not be in so good a condition for making the beds, unless the precaution was taken to collect them daily, which is the best practice at all times. Syringe the walls daily, especially when fire heat is employed, and maintain the atmospheric temperature at 57°, or at the most 60.

Asparagus will now force easily, either in heated frames from hotbeds, or grown on a bed in the Melon or Cucumber pit. Lift home-grown plants and rest them for a few days before forcing. All ripened growth on the open beds should be cut off and burned, and the beds cleaned and made neat for the winter. Many make a practice of heavily coating the beds with cow dung. This, I think, is the wrong time to apply such a top dressing, as the manurial properties would be much better made use of by the plants when in full growth during the summer. Such heavy dressings on heavy soil do more harm than good, and if any top-dressing be given at the present time, it should be of a lighter material, such as horse droppings and leaves, thus allowing the air to pass through it, and the beds in consequence will be kept warmer and the growth in spring commence earlier.

Onions in store.—Examine these frequently and remove any decaying bulbs. If they are stored thickly, turn them over and allow plenty of air to circulate continually amongst them.

Trenching.—The recent wet weather has put a stop to this work. It is a mistake to trench land in a state of soddenness, more especially if it is of a heavy nature, as the "spits" in spring harden like bricks, and are never so easily brought down into condition that affords a good rooting medium. When the soil and weather are suitable, get as much of this work carried out as possible at this season. There are many gardens where the young lads never get an opportunity of learning how to handle a spade. No finer chance can be given them of doing so than by allowing them to do a little trenching. It will show them the necessity for deep cultivation.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Peach and Nectarine Trees.—The planting of these trees should be proceeded with as fast as possible. The ground may not require draining. Most gardens are already well drained, and some sites do not require so much draining as others, but the matter should be given attention. The ground should be afforded some fresh loam, chopped up rather roughly. Employ all the fibrous portion for putting at the base, and use the finer soil for working in amongst the roots. The soil in which the trees are planted should be made good, for at least two feet deep. A few half-inch bones may be employed with advantage, but quickly decomposing manures should be avoided at the time of planting. If trees are to be planted against a wall, they may be put at distances of 18 feet, or, if preferred, one at every nine feet, alternate ones to be removed subsequently. In most gardens such young trees are very useful for removing indoors as occasion for them arises. Any transplanting needing to be done should be carried out at once, and if the roots were pruned last season, such trees will be likely to produce a good crop next year. When taking up trees of this kind the hole or trench should be made deep enough to enable the operator to work the tools right under the ball of roots, when it can be lifted out on a mat and taken away. After the process of planting, the ground should be firmly rammed about the roots for the purpose of inducing short-jointed and firm growth. Many lifted trees are ruined by being re-planted whilst dry, therefore, if the roots are in this condition let them be thoroughly soaked in water before planting is done.

Varieties.—The following varieties of peaches I have found to be satisfactory out-of-doors: Amsden June, Waterloo, Early Alexander, Hales Early, Goshawk, Grosse Mignonne, Dymond, Royal George (this is subject to mildew when grown in cold soils), Noblesse, Early Silver, Stirling Castle, Barrington, Thomas Rivers, and Sea Eagle. From these varieties Peaches can be gathered from the middle of July till the end of October. *Nectarines:* Cardinal, Lord Napier, River's Early, Violette Hative, Humboldt, Pine Apple, and in a good season, the fruits of Victoria are delicious, and of a fine colour.

Apricots.—These trees may be planted in rich loamy soil after the walls have been made good, as was advised on p. 259. Apricots require much care in lifting, but after they have been lifted several times, the operation is effected with much greater success, because such trees possess a good ball of fibrous roots. When grown in a cool house the trees should be moved every year. As much of the pruning as is possible should be done in the early stages of growth with thumb and finger, and so obviate the making of wounds with the pruning instrument. Some good varieties are Kaisha, Moor Park, Frogmore Early, Shipley's, and New Large Early. Apricot trees require more moisture than is sometimes afforded them. If the drainage

is in good condition one cannot easily apply too much water. The planting of Apricots should be encouraged, there having been a tendency to discard them because a tree sometimes has died occasionally, or lost some of its branches.

Strawberry Beds.—Old beds that have become very hard may be lightly pricked over with a fork to let in rain and air, but this should not be done deeply enough to destroy any roots.

Gooseberry Bushes may now be planted, and the necessary partial pruning effected. The ground should be made suitable by deep digging or trenching, and plenty of lime should be incorporated, especially if the soil contains much humus. Gooseberry bushes should have fairly long stems, so that the branches when loaded with fruits will not touch the ground. A neat and tidy plan on which to grow the best dessert varieties of Gooseberries is to train the stems up horizontal wires. In a short time the growths reach a goodly height, when they bear large crops on spurs. By this system of training, the fruits can be easily protected and gathered. Cordon-trained Gooseberries are very quick in giving a return, especially when they are trained to tall stakes. Place one stake in the centre and one at either corner of each square yard. Appended is a list of a few of the best varieties of Gooseberries:—Langley Beauty, Yellow Langley Gage, Yellow Champagne, Speedwell, Whinham's Industry, Whitesmith, Pitmaston Greengage, Crown Bob, Keepsake, Leader, Red Warrington, Levella, Trumpeter, Yellowsmith, and Dan's Mistake. Gooseberries are easily propagated from cuttings, and these can now be inserted.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Vandas.—Strong plants of the V. tricolor and suavis sections, from 4 feet to 6 feet in height, with fine healthy leaves down to the rim of the pot, are, whether in or out of bloom, always greatly admired. Owing to the unusually hot summer just passed, some of these plants may have lost more of their lower leaves than usual, and are showing a foot or more of bare stem. Those in this condition will require repotting, and this is the best season to do the work, as during the next few months the plants make roots more freely than at any other time of the year; and less foliage is likely to be lost than when the operation is done in spring or summer. When repotting, carefully remove the old potting and drainage material, healthy plants invariably have a number of living roots clinging to the sides of the pot, these roots should not be interfered with unless it is absolutely necessary. The base of the stem may then be cut off so far that when the plant is pressed down in the pot the lowest pair of leaves will be level with the rim, or a trifle above it. In some cases, where the specimen has roots that are firmly fixed to the sides of the pot, it may be necessary when lowering the plant, to ease a few off to prevent their destruction. Some of them may get cracked, but no harm will accrue if the work be carefully performed. Place a few large crocks at the bottom of the fresh pot for drainage, replace the lowermost roots, and work in amongst them some moderate-sized crocks, and rough, unchopped sphagnum-moss in about equal proportions. Press these materials down firmly, and distribute more roots in a like manner, filling up to within half an inch of the rim, and finishing off in cone-like fashion with a surface of clean and healthy sphagnum-moss. Any of the large, fleshy aerial roots that are long enough may be carefully pegged down on the surface of the moss, and these in time will make a number of roots which will enter the moss, &c. Such roots will help the plant to grow vigorously, and aid also in the retention of the lower leaves. Long, straggling roots may be tied in a downward direction toward the potting material, as they will then afford more nourishment to the plant than if left to ramble about in the air. Plants which have sufficient room for further development, and those that do not require cutting down, should have the surface material removed and be re-furnished with fresh sphagnum-moss, &c. After repotting or re-surfacing, afford water with a fine rose watering-can, in sufficient quantity only to keep the surface moss in a growing condition. These Vandas are not benefited by a dry atmosphere at any time, therefore it is advisable that they should be stood on some thorough moisture-holding material, and the spaces well syringed between the pots several times daily. The cooler end of the Cattleya-house is the best place for them, and after root disturbance they should be well shaded from all direct sunlight.

Habenaria multans, H. carnea, &c., and such plants are now passing from the flowering to the resting stage, and as the flowers fade the pots should be placed near to the roof glass in the warmest house, and in full sunlight. The amount of water at the root must be gradually lessened until the leaves and stems die down, and afterwards, through the resting season. Although the tubers are seemingly dormant, they must be given a little water occasionally, or they will shrivel and become useless.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

Palms.—In the growing of Palms a common error made by cultivators is that of over potting. If the plants are grown in small pots and treated properly they may be kept as useful decorative subjects for a long time. Under ordinary circumstances Palms grow so easily that they are apt to be treated carelessly. When they have their pots well filled with roots, extreme care is necessary to maintain them in a healthy condition. Inattention to the application of water may cause the plants to suffer such a check that the leaves will assume a sickly appearance, and, on the contrary, if an excessive supply is given in the winter months, when plants absorb less moisture, much injury may occur by decay of the roots. The need for a little extra care in applying water to plants at this season of the year should not be overlooked. Palms are gross feeding plants, and to maintain that dark green, healthy condition of the foliage, we continue to afford stimulants through the whole season. These are varied and consist of the drainage from the cowshed, and soot-water used in a clear state; blood manure in a soluble state is highly beneficial, while Standen's manure is used at intervals throughout the season. The potting compost should consist of good turfy loam three parts, and Oak leaf-soil one part, with charcoal siftings and bone meal added. Pots measuring 6 or 7 inches in diameter are quite large enough for plants to be used for general decorative purposes. The white scale which is usually so troublesome may be destroyed entirely by spraying with X L insecticide, and if the liquid is applied at a temperature of 95° to 100° in cases where plants are badly infested, it will have good effect.

The Stove.—The atmospheric temperature should be reduced as low as is consistent with the health of the plants. If a mixed collection of plants is grown, the minimum given last month will still apply. The present is a favourable time to give stove plants a perfect cleansing, but any pruning or shortening back of misplaced shoots should be done first. Any plants which have become unsightly should be thrown out and their places filled with a healthy stock of small but growing plants. Clean the glass at short intervals so that all the light possible may reach the plants. Keep a watchful eye on all bulbous and tuberous-rooted plants which have died down. Such plants as Caladiums, Gloxinias and Achimenes must not be left in a cool house if even for a few days at this season of the year, but must be wintered in a heat equal to 58° or 60°.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to LT.-COL. SIR CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Pot Vines.—Where Grapes are required very early in the season, they should now be brought into the forcing house or pit, and if convenient the pots should be plunged in gentle bottom-heat provided by freshly gathered leaves, which will serve to stimulate the roots and cause the buds to break more freely. The bottom-heat should not exceed 70° for some considerable time to come. Carefully bend the rods down to a horizontal position to ensure that they will break into growth strongly at the base as well as at the top, and keep the atmospheric temperature at night at about 50° for the first fortnight or three weeks, allowing 5° rise during the day, with a further rise of 5° during sunshine. Close the house at midday, syringing the vine-rods, and damping down the walls and paths to cause the atmosphere to be moist. Change the air of the pit daily by opening the ventilators for a short time. In the early stages, and before the roots become fully active, much water must not be applied to the roots, but later, when they are making growth freely and new roots are pushing into the soil, liberal supplies are necessary to ensure success. It is advantageous to have the vine-rods fully 2 feet from the roof-glass if possible; a too close contact with the cold glass in winter during the early stages of forcing would be detrimental to them. The forcing of fruit trees during the last two months of the year requires much care and moderation. What little is done should be carried out in the day-time.

Early Vinery.—Where no vines are grown in pots, but Grapes are, nevertheless, required early in the season, let the permanent vines in the earliest house be pruned, and afterwards let the vines be washed down with a little soft soap and warm water, adding a little paraffin to it, but do not remove more bark from the rods than is really necessary. The variety Black Hambro is usually forced first. The shoots should be cut back to one and two eyes, preferring the former, if the wood is stout, well ripened and short-jointed. The result will be compact, well proportioned bunches, which are most serviceable. Thoroughly cleanse the house. If ripe Grapes are wanted during April or May, the house should be closed about the middle of the present month, and the atmospheric temperature regulated as advised for pot vines.

Late Melons.—When these are grown for very late use, and if they are not already ripe, they should be cut from the plants and placed on a shelf in a dry and warm atmosphere. Those that are ripe will keep much better if suspended in nets in the late vinery, as the fruit-room is not sufficiently ventilated at this time of the year to preserve them from decaying.

THE FLOWER GARDEN.

By H. or A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Climbers in conjunction with trees and shrubs.—The practice of covering trees and shrubs in the pleasure grounds and in the wild garden with suitable and appropriate climbing plants has become very popular of late years, and the results thus obtained are very beautiful and effective. Take, for instance, the picture of a Laburnum tree completely covered with climbing Wistaria sinensis. The flowering period of each is simultaneous, and the blending of their drooping panicles of golden and lilac coloured blooms provides a pleasing and delightful effect, which it would be difficult to excel. Again, imagine the sweet-scented Vitis (V. vulpina odoratissima), a vigorous grower, and never happier than when scrambling upward in any way, planted at the foot of a large tree, in time making its presence and whereabouts known from a long distance away while in flower by suffusing the air with its delectable odour. In planting climbing plants the usual method is to dig a hole near the trunk of the tree, avoiding the latter's roots as much as possible, and introduce fresh loam and manure. This is often the only way in which it can be done; but, where practicable, it is preferable to plant them on the outside of the tree, where the branches are nearest to the ground, training them over the intervening distance by means of a strong stake well fixed in the ground and firmly attached to the branch to prevent the latter swaying about. In a year or so the climber will have secured such a hold that the stake will be unnecessary. Rambling Roses are particularly suitable for this kind of work, and one of the prettiest and most effective ways a rambler can be used is to allow it to scramble through and over an unsightly shrub, or a dwarf tree, which, perhaps, of itself, has long ceased to be an object of attraction. Once a Rose becomes established in such a position all the care it requires afterwards consists in thinning out the oldest branches to make room for the younger wood. One can readily picture the glorious display made by a Rose such as Aimée Vibert, throwing out its long, pendulous streamers, profusely covered with those delightfully fragrant, white flowers, from a point of vantage gained at the expense of some unappreciated Holly or such-like tree or shrub. Other Roses equally suitable for this kind of decoration as Aimée Vibert, are Félicité-Perpetue, Claire Jacquier, The Dawson, Dundee Rambler, Alister Stella Gray, Madame d'Arblay, and Madame Alfred Carrière.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Nov. 10	Dutch Gard. Soc. meet.
MONDAY,	Nov. 12	Unit. Hort. Ben. & Prov. Soc. Com. meet. R.H.S. Hall.
TUESDAY	Nov. 13	Birmingham & Midland Counties Chrys. Sh. (3 days). South Shields & N. Counties Chrys. Sh. (2 days). Winchester Chrys. & Fruit Sh. (2 days). Highgate Chrys. Sh. at Alexandra Palace (3 days).
WEDNESDAY,	Nov. 14	Liverpool Chrys. & Fruit Sh. (2 days). Roy. Hort. Soc. Exh. Chester Paxton El. Sh. (2 days). Tonbridge Chrys. & Fruit Sh. (2 days).
THURSDAY,	Nov. 15	Edinburgh Chrys. Sh. (3 days). Weston-super-Mare Chrys. Exh. Linnean Soc. meet.
FRIDAY,	Nov. 16	Sheffield Chrys. Sh. (2 days). Bradford Chrys. Sh. (2 days). Bolton Hort. & Chrys. Sh. (2 days). Newport & Dist. Chrys. Sh.
SATURDAY,	Nov. 17	German Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty three Years at Chiswick.—44°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, November 7* (6 P.M.): Max. 55°, Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November 8* (10 A.M.): Bar., 29·3, Temp., 53°, Weather—Much rain.

PROVINCES.—*Wednesday, November 7* (6 P.M.): Max. 52° St. Albans; Min. 45° Scarborough.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Roses, Plants, Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY to FRIDAY
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY AND WEDNESDAY
Surplus Nursery Stock at Woodside Nurseries, Thongsbridge, Huddersfield, by order of Messrs. S. Broadhead & Son, by Protheroe & Morris, at 11.30.

WEDNESDAY—
150,000 Fruit Trees, &c., at Perry Hill, Cobtree, near Rochester, by order of Messrs. W. Horne & Sons, by Protheroe & Morris, at 11.30.
Palms, Azaleas, Roses, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY—
1,502 cases Japanese Liliums and other Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris at 1.
Nursery Stock, at the Royal Gardens, Hampton Court, by order of Mr. J. Saxton, by Protheroe & Morris, at 12.

FRIDAY
Orchids in variety, at 67 & 68, Cheapside E.C., by Protheroe & Morris, at 1.45.

The Hungarian Water Lily.

For the opportunity of figuring this interesting Water Lily we are indebted to the Hon. Charles Rothschild, of Ashton-Wold, Oundle, who received the plant from Bishopsbad, Navygarad, Hungary. It is exceedingly like the Egyptian and African N. Lotus. The flowers have a calyx of four pale olive sepals marked with whitish veins, the petals being white, flushed with pale purplish rose on the outer surface; the anthers are yellow. All the Lotos section have the same arrangement of the air-canals in the leaf-stalk (namely, two large central canals side by side), which renders the members of the section easy of recognition even when not in flower. The flowers are very attractive, but their beauty by no means constitutes their only or even their chief interest. The plant, as we have said, is so like N. Lotus of Egypt, parts of India, and tropical Africa that many botanists consider it to be specifically identical. Others, basing their opinion chiefly on geographical considerations, acclaim it a distinct species under the name of N. thermalis, and the latest monographer of the genus, Mr. Conard,* points out some minute differences in the venation of the leaf.

The history of the plant is interesting. It was first made known to botanists by Waldstein and Kitaibel in 1802. Those authors give an excellent description and figure of the plant in their *Plant. Rar. Hungar.*, p. 13, tab. 15, in which also the peculiar arrangement of the air-canals is mentioned. It is described as growing in the warm springs at Peeze, where the water in April has a temperature of 25 deg. Réaumur (90 deg. Fahrenheit, 32 deg. C.), and also in other adjacent spots where the water is of a lower temperature (70 deg. Fahrenheit). Some of these springs contain sulphur, others do not; but the Water Lily flourishes in both. It flowers in April or in May, according to the temperature of the water. The tubers are said to be greedily eaten by pigs—memorandum, keep the swine out of the garden. Probably the pheasants and swans would be equally destructive! There are numerous specimens in the Kew herbarium from the classical locality, but dried specimens of Nymphæas are not very satisfactory. Amongst the specimens are some prepared by Mr. Fraser for Lord Aveb ury, showing the germination of the seedling, with the first leaves, small, linear, oblong, and entire, passing gradually into a sagittate stage, and ultimately into the orbicular, sinuate, sharply-toothed blade characteristic of the adult plant.

The questions to be solved are—What is the plant, and how did it get into the warm spring near Budapesth? To the first question the answer seems to be that it is practically identical with the N. Lotus of Egypt. If this be so, how did it get into Hungary? It is not found, so far as we know, in the intervening country. Was it separately evolved in harmony with the conditions offered by the warm springs? If so, from what species was it evolved? There is no means of answering that question; we can only say that such an explanation seems improbable.

Did the Turks introduce it, or were the seeds transported by some migratory bird? That seems not improbable, but there is no evidence to support either notion. Then comes the question whether in past aeons Nymphæa Lotus, still very widely spread, occupied a still wider area. Upon this latter point it may be interesting to cite in abstract what Conard has to say on the subject. He quotes a German writer, Staub, who thinks it is almost certainly a relic of preglacial vegetation, when the whole of Europe enjoyed a comparatively mild climate. When the plants of this period were driven back towards the Equator by colder conditions this one remained in the favourable temperature of the thermal springs. Along with it has continued a snail Melanopsis parcssi, very near of kin to M. costata of Egypt. According to Staub, the genus Melanopsis was common in Europe in the drift period, and he considers that the warm springs of Grosswardein are older than the drift. It is also notable that there were in recent geological times throughout Europe Water Lilies resembling the Lotus group, which may have been the ancestors alike of the Egyptian and of the Hungarian plants. There are the best reasons, therefore, for considering N. thermalis as truly native in its present habitat, and if we can believe that its specific characters were demarcated as early as the drift period and have not changed since, we must follow those botanists who make this name a synonym of N. Lotus.

Such are some of the profound speculations to which the Hungarian Lotos gives rise. If the case of this Water Lily stood alone, we might shrug our shoulders at the imaginative faculties of the speculators, but when the case is backed up by similar evidence furnished by the snail, it becomes evident that the views of the philosophers are at least entitled to respectful consideration. May those who look on the flower be duly impressed with the fact that there are other considerations besides its beauty which entitle it to our wonder and admiration.

* CONARD.—The Water Lilies, a monograph of the genus Nymphæa. Published by the Carnegie Institution of Washington, 1905. 8vo, coloured plates.

MR. WILSON PRESENTED WITH THE VEITCH MEMORIAL MEDAL.—The meeting of the Royal Horticultural Society on Tuesday last was, if somewhat smaller than usual, really of a brilliant character. The Orchids were superb, the collections of Ferns equally so, and the stove-plants of Messrs. VEITCH reminded one of the groups shown at the Ghent quinquennials. All this is recorded on another page in the ordinary course. Special interest was given to the afternoon general meeting, by the presentation, on behalf of the Veitch Memorial Trustees, of a medal to Mr. E. H. WILSON, as some public recognition of his invaluable services to Botany and Horticulture. The occasion was the more appropriate, as the lecturer was Mr WILSON himself. By the aid of numerous lantern slides, Mr. WILSON was enabled to give a concise summary of what is known of the botany of Central and Western China and of his own explorations in those regions. As we have been privileged to give in these pages full details of his wanderings, and as many of the novelties introduced by him have already been figured and described in these columns, we need only say that the lecture was of a very interesting character, and that the warmest good wishes for his further success in the new journey that he is about to undertake were expressed.

LINNEAN SOCIETY.—At a meeting to be held on Thursday, November 15, at 8 p.m., Mr. HORACE W. MONCKTON, Treasurer and Vice President, will give an account of his recent researches in Norway, illustrated by a series of lantern slides.

THE SELBORNE SOCIETY.—The current issue of *Nature Notes* announces that during the absence of Professor BOULGER in South America, the magazine will be edited by the honorary secretary, Mr. WILFRID MARK WEBB. All editorial communications should therefore be sent to his private address, Odstock, Hanwell, W. In the same number a prize is offered for the best collection of autumn fruits accompanied by descriptions showing what the specimens illustrate.

FLOWERS IN SEASON.—Messrs. CUTBUSH & SON send us fruits of Periploca græca in the shape of long slender pods like French Beans, but cylindrical and united at the tips. Messrs. CUTBUSH tell us the plant has fruited very freely out of doors this season.

THE JOINT RAILWAY AND PARLIAMENTARY COMMITTEE.—We are requested to publish the following note:—"On October 24, 1905, the first meeting of the above committee was held, when it was decided that something must be done at once to improve the facilities for the carriage of fruit and other perishable goods in this country. With this object in view it was considered that the only satisfactory means would be to draw up a Bill for Parliament which would cover all the grievances of the traders in perishable articles, and to obtain the necessary support to carry such a Bill through Parliament. The committee has now been at work for twelve months, and feels that it would be as well to publish some report of the business transacted. The committee has been able to obtain the fullest support from all branches of traders in perishable goods. Among the members of the committee are numbered the presidents of the National Fruit Growers' Federation, the Green Fruit Section of the London Chamber of Commerce, the National Federation of Meat Traders' Associations, the Central Markets Meat and Poultry Association, the Federation of Grocers' Associations, the Market Gardeners', Nurserymen, and Farmers' Association, the Horticultural Trades' Association, the Guernsey Growers' Association, the Jersey Growers' Association, the English Grape Growers' Association, and the National Federation of Fruit and Potato Trades Associations. After getting all the information possible bearing on the question, and obtaining numerous instances of unjust rates, delays in delivery, careless handling, &c., and tabulating them, a Bill was drafted which we believe covers all the points of grievance. Copies of this proposed Bill have been sent to the members of Parliament, and we have received in almost every case notes of approval and promises of support when the Bill comes before the House. Further, we have received several offers from members of Parliament to take up the Bill, but we are endeavouring to get it accepted as a Government measure if it can possibly be so arranged. As to monetary support, we have a guarantee fund at our back of considerable amount, but we would remind all those interested that the larger the total amount we have to call on, the greater the weight of the committee, and also the less we shall have to call for from each guarantor. Calls can only be made as to 10 per cent. of the amount guaranteed for the first call, and 5 per cent. at any future call, these calls being made at intervals of not less than two months; so that even on a good guarantee the amounts

FIG. 132.—NYMPHÆA THERMALIS (see page 324).

to be paid cannot come as a hardship to anyone. We have also waited on the Presidents of the Board of Trade and the Board of Agriculture, when the different interests were represented, and we are greatly encouraged by the reception accorded to us. As we are anxious to get the Government to take up the Bill, and having the promise of these influential members of the Government to look into any complaint sent them, we would strongly advise traders to accept the offer, and besides sending in a claim to the railway company to lodge a complaint with the managers, sending a duplicate to the Board of Trade and the Board of Agriculture. All communications respecting the committee to be addressed to HENRY W. GOODALL, secretary Joint Railway and Parliamentary Committee, Tavistock Hotel, Covent Garden, W.C."

THE WEATHER IN THE NORTH.—The weather experienced in Scotland for some considerable time past can be described in no better term than atrocious. October went out with general and heavy rain, and November came in with a flood. A widespread depression, which is slowly moving northwards, is the immediate cause of the east wind and the excessive rainfall. A change to a drier and clearer atmosphere would now be most welcome, for since the beginning of October there has been rain almost every day. The agriculturists on the high lying lands are suffering severely, many being doomed to look hopelessly on while the elements are causing disaster around them.

ROYAL MEDALS.—Among the recipients of the medals presented by the Royal Society with the concurrence of HIS MAJESTY, we notice Dr. DUKINFIELD SCOTT, who has done so much to elucidate the floras of past ages and to bring them into relation with existing vegetation, and Prof. HUGO DE VRIES, whose practical researches in morphology are of so much importance, and who has given an amount of significance to "sports" and "mutations" in plants which they were previously not thought to possess.

Publications Received.—Royal Botanic Gardens, Kew. *Bulletin of Miscellaneous Information.* Appendix IV., 1906. Contents: List of Staffs in Botanical Departments at Home, and in India and the Colonies.—*The Animal Friend.* June.—*Royal Botanic Gardens, Ceylon, Administration Reports, 1905.* Report of Dr. J. C. Willis, director. The work increases, and want of space is a great inconvenience. The gardens at Peradeniya have been enlarged and improved.—*Colombia, a Land of Great Possibilities.* By John Barrett, U.S. Minister to Colombia. A pamphlet intended to awaken greater interest in the Republic. The land is a large one, rich in resources and capable of development for the benefit of all concerned.—National Poultry Organisation Society (12, Hanover Square, London): *Report on the Poultry Industry in America.*—*Species of Crataegus found within twenty miles of Albany.* By C. S. Sargent and C. H. Peck.—U.S. Department of Agriculture, Bureau of Plant Industry. Bulletin No. 100. *Orchard Grass.* By R. A. Oakley.—Harvard University. *Bulletin of the Bussey Institution, Jamaica Plain, Boston.* Vol. III., Part 5. Contents: Field experiment to test phosphate, potash and nitrogen on fine sandy loam. By E. Hersey; and the use of bark-bread, by F. T. Dillingham. From the Cornell University Agricultural Experiment Station, Bulletins 231. *Report on the Forcing of Strawberries and on the Forcing of Tomatoes, Cucumbers and Melons.* By C. E. Hunn and John Craig. 233. *Two New Shade-tree Pests. Saw-fly Leaf-miners on European Elms and Alder.* By M. Slingerland. 234. *The Bronze Birch Borer.* An insect destroying the White Birch. 235. *Co-operative Spraying Experiments.* Both these by M. Slingerland. 236. *Blight Canker of Apple-trees.* By H. H. Whetzel. 237. *Alfalfa.* A report of progress made under the direction of Thomas F. Hunt. 239. *Some Diseases of Beans.* By H. H. Whetzel.—From the New Zealand Department of Agriculture. *Viticulture in New Zealand,* with special reference to American Vines. By Romeo Bragato. An endeavour to impress upon growers the necessity for replanting their vineyards upon a phylloxera-resisting basis now that the ravages of the dreaded pest are known in the country.—*Jamaica Bulletin of Miscellaneous Information,* October. Edited by William Fawcett. With notes on the cultivation of vegetables, Camphor, and Rubber.—*Reports on the Botanic and other Stations, Grenada, 1905-06.* A severe drought was experienced, but Mr. Buttenshaw records a satisfactory fight with the Black Blight fungus, and that the introduction of several interesting plants has improved the appearance of the gardens.

GARDENERS AND THE AGRICULTURAL LAWS.

(Concluded from page 312.)

[Readers are reminded that this article, commenced in our issue of last week, explains the privileges given to market-gardeners and farmers by the Agricultural Holdings Acts. At the present time nurserymen and seedsmen do not share these privileges, though efforts are now being made to get this anomaly rectified.]

ARBITRATION.

Any difference between landlord and tenant as to the amount and time or mode of payment of compensation for improvements is determined under the Special Acts by arbitration, and these Acts contain provisions with regard to assistance from the Board of Agriculture when necessary.

CONTRACTING OUT.

You cannot, even by agreement with your landlord, deprive yourself altogether of the benefits of the Special Acts; but it is always open to you at the end of your tenancy to agree with your landlord as to the amount, and mode, and time of payment of any compensation, instead of having the question referred to arbitration under the Acts. Moreover, you may, before carrying out any of the works mentioned in the foregoing list, enter into an agreement with your landlord, providing either for the payment to you of a fixed sum by way of compensation at the end of your tenancy, or for the ascertainment of the amount of compensation in some other manner than that which is provided by the Acts. It would appear, however, that in the case of improvements such as liming, marling, &c. (Nos. 18 to 23 in the above list), you would be entitled at the end of your tenancy, notwithstanding such an agreement, to have an arbitrator or arbitrators appointed to inquire into the question whether the agreement previously entered into was a fair and reasonable one, and if the arbitrator were to hold that it was not, the agreement would be set aside. But one is bound to admit that here again the Special Acts are not as clear as they might be.

EJECTMENT BY MORTGAGEE.

It may be convenient to mention here that, under an Act passed in 1890, a special privilege is given to market-gardeners, farmers, and small allotment holders, in cases where they might otherwise suffer damage through their landlord having mortgaged (*i.e.*, raised money upon) his interest in the land without having obtained from the person lending the money permission to let the land in those cases where such permission may be necessary. In former times the person lending the money could seize the land and turn out the tenant without warning or compensation: but now the person thus seizing the land must not only give the tenant six months' notice before turning him out, but must also give him the same compensation as he would have been entitled to recover from his landlord if there had been no such change of ownership.

FIXTURES AND BUILDINGS.

We have already seen the favourable position in which you are placed in being able to obtain compensation for improvements to the land, including drainage works and the erection of buildings; but suppose you put up certain valuable fixtures in such a manner that they must inevitably be looked upon as "landlord's fixtures" (see the article on "Garden Fixtures" in the *Gardeners' Chronicle* of September 29, 1906). Here, again, you have valuable rights against your landlord, as the Agricultural Holdings Acts provide that where, on or after January 1, 1884, a tenant affixes to his holding any engine, machinery, fencing, or other fixture (even if it would otherwise be deemed a landlord's fixture), or erects any building for which he would not otherwise be entitled to obtain compensation, then such engine, machinery, fencing, or other fixture, or building, shall be the property of, and be removable by the tenant before or within a reasonable time after the termination of the tenancy.

There are, however, certain conditions affixed to this very valuable concession to market-gardeners jointly with farmers, and it will pay you to bear them in mind, viz.:—

(1) The provision does not apply where you have put up a fixture or building on account of being under some special obligation or promise to do so, or if you have only put it up in place of some other fixture or building which belonged to your landlord.

(2) Before removing the fixture or building you must pay all rent owing by you and satisfy your other obligations to your landlord under your lease or tenancy agreement.

(3) You must effect the removal before or within a reasonable time after the expiration of your tenancy.

(4) In the removal of the fixture or building you must not do any avoidable damage to any other building or any other part of the holding.

(5) Immediately after the removal of the fixture or building in question you must make good all damage done to any other building or other part of the holding where such damage has been occasioned by such removal.

(6) You must not remove any fixture or building without giving one month's previous notice in writing to your landlord of your intention to effect such removal.

(7) At any time before the expiration of such one month's notice the landlord has the option to purchase the fixture or building which you have informed him you propose to remove. If your landlord wishes to exercise this option of purchase he must give you written notice that he intends to purchase the fixture or building in question, and thereupon you will be entitled to receive what would be the fair value of such fixture or building according to what it would be worth to an incoming tenant.

Unless, therefore, before the expiration of your month's notice your landlord gives you notice of his intention to buy the fixtures or building in question, you are at liberty to remove it on the above conditions. On the other hand, if your landlord wishes to buy it, he is entitled to do so provided he pays you its fair value. If there is any dispute between you and your landlord as to what is the fair value of the fixture or building in question, then the amount has to be fixed by arbitration in the special manner provided by the Special Acts.

Readers should remember that these privileges are in addition to, and not in substitution for, the ordinary common law right of a market-gardener to remove fixtures set up for the purpose of his business (such as glasshouses), which was discussed in the previous article referred to above.

Even now we have not yet come to the end of your special advantages.

LANDLORD'S RIGHT OF DISTRESS.

You have a special privilege, even if you should get into arrears with your rent, as under these Special Acts the ordinary rights of the landlord to distrain are considerably cut down. For instance, your landlord cannot distrain for rent which became due more than a year before the date when the distress is made, although, in the case of a tenancy of ordinary dwelling-houses, shops, &c., the landlord can distrain for six years' arrears. The only exception is that if it has been the custom between you and your landlord for your rent not to be paid till a quarter or half-year after it legally became due, then the landlord is able to distrain for a little more than a year's rent.

Of course, the Special Acts do not take away your landlord's right to bring an action against you in the courts to recover six years' arrears of rent, nor do they prevent him from seizing your goods by putting in the sheriff to levy execution after he has obtained judgment in the courts for the amount due. But legal proceedings in the courts take time, during which you may be able to get your rent together. Meanwhile, you are safe in the knowledge that, even if the landlord should distrain on your land, he cannot do so for more than one year's arrears (or a little over when the exception mentioned above applies), and that he will have to withdraw the distress on being paid one year's rent plus the costs of the distress.

Hired Machinery.

The Special Acts give protection to machinery hired by market-gardeners in the event of a distress by the landlord for rent in arrear.

Notice to Quit.

Lastly, market gardeners and farmers have a special privilege to themselves in being entitled to a whole year's notice to quit where they hold their land from year to year. Very likely you are aware that, in the case of ordinary yearly tenancies (such, for instance, as in the case of dwelling-houses, shops, etc.), if your landlord wishes to put an end to your tenancy and turn you out, he can do so (in the absence of any special agreement to the contrary) by giving you a half-year's notice, provided his notice expires (or runs out) on the last day of the current year of the tenancy (*i.e.*, on the corresponding day of the month on which your tenancy commenced). If, however, you are a yearly tenant of land (with or without buildings on it) which comes within the scope of the Special Acts as above explained, then these Acts provide that your landlord must give you a whole year's notice to quit, but you will lose this benefit if you choose to agree to take a shorter notice when you are arranging terms with your future landlord.

Allotments and Cottage Gardens.

In conclusion, the writer feels that, at the risk of appearing tedious, this article would scarcely be complete without some reference to an Act passed in the year 1887, which conferred special privileges on the tenants of allotments and cottage gardens. The Act defined an allotment as "any parcel of land of not more than two acres in extent held by a tenant under a landlord and cultivated as a garden or as a farm or partly as a garden and partly as a farm," and further defined a cottage-garden as "an allotment attached to a cottage."

This Act was no doubt intended primarily for the benefit of persons belonging to the labouring classes, but it is clear that its provisions would also apply to the tenant-occupier of any farm of less than two acres in extent. The question has also arisen as to whether seedsmen and market gardeners can claim the benefit of the Act in the case of holdings of less than two acres. As to seedsmen, the question has been answered in the negative by a decision of the High Court of Justice, and the wording of the judgments delivered in that case would seem to exclude market-gardeners as well. It is, however, open to doubt whether the judges intended their remarks to apply to the case of a man occupying a plot of land of less than two acres on which he grows fruit and vegetables for market *exclusively*. Such a person would undoubtedly be a market-gardener although on a small scale; and, notwithstanding certain expressions used in the course of the judgments which would seem to place him in the same category as a seedsman, it is possibly still arguable that such a person would be entitled to the benefit of the Act in question, except where it overlaps the Special Acts. In cases to which the Act applies the occupier will be entitled, at the end of his tenancy, to obtain from his landlord compensation in money for crops of all kinds growing upon the holding in the ordinary course of cultivation, including fruit, and also for labour expended and manure applied to the holding (since the taking of the last crop therefrom) in anticipation of the future crop, whether the tenant has obtained the landlord's consent to the work or not. Moreover, if he has taken the precaution of getting his landlord's previous consent in writing to the execution of the works, he will also be entitled to compensation in respect of the following matters, viz.: for the planting of fruit trees and fruit bushes, and for drains, outbuildings, pigstys, fowlhouses, and other structural improvements made by him. Contracting out of the Act is not allowed, as it is expressly provided that the compensation to which a tenant may be entitled under its provisions shall be payable "notwithstanding any agreement to the contrary." The above privileges belong to the tenant however short his tenancy may be. It would certainly be to the benefit of the small nurseryman, seedsman, and market-gardener if Parliament would expressly declare that this particular Act should apply to the trades in question, not in substitution for, but only in so far as they give additional benefits to, those conferred by the Special Acts.

Conclusion.

We have now discussed fairly fully the rights which, under the Special Acts, are enjoyed in common by market-gardeners and farmers, and which the writer earnestly hopes may also before long be equally shared by nurserymen and seedsmen. The subject of this article has, it is feared, necessarily been somewhat long and technical, but it is one which touches the pocket and affects the legal liability of the entire trade. For this reason it cannot safely be ignored.

As pointed out last week, the remedy now required to put nurserymen on an equal footing with market-gardeners is the insertion of a simple clause in two Bills now before Parliament, viz., the Land Tenure Bill and the Agricultural Holdings Acts Consolidation Bill. The latter Bill seeks to codify the Agricultural Laws, but there is serious reason to fear that pressure of other matters may prevent its becoming law for a long time to come. It is, therefore, most important that the clause proposed should be inserted in the Land Tenure Bill. This is not the place to discuss the merits or demerits of the Bill in question, but even its most vigorous opponent will surely admit that, in so far as it will confer special privileges on market-gardeners jointly with farmers, these privileges ought also to be extended to nurserymen and seedsmen as a matter of fair play. *H. Morgan Veitch.*

[A Step Forward.—In connection with the above article which was commenced in our last issue by Mr. H. Morgan Veitch, we are pleased to be able to announce that Lord Carrington, President of the Board of Agriculture and Fisheries, has, through his secretary, written to Mr. Veitch consenting to receive on Monday next, November 12, a deputation of the Horticultural Trades' Association, when the subjects dealt with in Mr. Veitch's article will be discussed.—Ed.]

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

Willows.—Now that the planting season is approaching, it would be well for intending buyers of Willow "setts" to see that they are being supplied with the right kind, namely, Salix alba or "Close-barked Willow." This tree with careful planting should be ripe for cutting in 16 to 20 years, and as 12s. 6d. to 15s. per foot is easily obtainable for the timber, it should be a good investment. Of the other varieties, Salix Russelliana, or "Open-barked Willow," is only used by cricket-bat makers. This species matures as quickly as the Salix alba, but 4s. per foot is a good price for the timber. *D. Adams.*

Gardeners' Mutual Improvement Associations.—Mr Dean (p. 313) has quite needlessly dragged in the name of the Royal Horticultural Society into this discussion, but it does not help his case in the least. His references to the Fruit Committee are equally unfortunate. I wonder how many of his fellow members will thank him for calling them amateurs; out of the forty-three gentlemen whose names are on the list, at least forty have had a professional training, and are, or have been until recently, actively engaged in growing either fruits or vegetables, or both; in regard to the other three, two are unknown to me personally, and one I am not certain about. This proves that the committee is almost entirely composed of professional members. Let Mr Dean try how much information he can get gratis from a lawyer, and then explain why a gardener should have to teach his profession to all and sundry, and thus equal the folly of the man who sawed off the branch of a tree on which he was standing. Mr. Mills (page 313) jumps at a wrong conclusion, and then proceeds to argue from it. I write solely for the purpose of exchanging notes with other professional gardeners. If the paper falls into the hands of non-professional gardeners I cannot prevent it. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

——— It is acknowledged that many of the Mutual Improvement Societies are composed of amateurs as well as professional gardeners. A proper title for the federation will therefore be the "Federated Horticultural Mutual Improvement Societies." I would go further than this, and suggest that every individual society that admits amateurs to membership should amend its title if it at present uses without the prefix "Amateur," the word "Gardeners," substituting for this "Horticultural." Professional gardeners should see to it that the one term that alone distinguishes them from other folk is not, by their consent at any rate, brought into contempt by misapplication. Another thought arising out of the discussion is that seeing many of the debating societies are composite bodies, it is the more imperative that branches of the British Gardeners' Association should be established in as many districts as possible, that meetings may be held at which questions affecting the relationship of employers to their gardeners may be discussed, as well as many other similar questions, debate upon which would be quite out of place in the presence of amateurs. *A Member of the British Gardeners' Association.*

Fruit Exhibits at the Recent Show.—Mr. B. J. Mercer is not the only person who lost fruit at the Royal Horticultural Society's show. I was an exhibitor in three classes, and, like Mr. Mercer, was unable to be present to pack my fruit at the close of the show. I therefore arranged with one of the leading nursery firms to send a man to pack and return the exhibits as in previous years. Through an error on the part of the man sent, he omitted to pack and return two baskets of outdoor Grapes, one of Chasselas de Fontainebleau, which was awarded the first prize, and one of various sorts, not for competition. Inquiries were made on the following day, as soon as I found they were not returned with the other fruit, but all trace of them had gone: baskets, boxes to pack them in, and card with my own and my employer's names and award on. I quite understand the rules relating to exhibits, and the difficulties the officials of the Royal Horticultural Society have to contend with. *J. Potts, gardener to Ed. Ascherson, Esq., Potts Place, Charing.*

Holland Pippin Apple.—Will some of the many readers of the *Gardeners' Chronicle* send me fruit of what they know as Holland Pippin in England. There is a variety of Holland Pippin in the South of Ireland—a wonderful cider Apple—and I fancy that when Arthur Young visited this country at the end of the eighteenth century, it was this variety he saw at Drumholland Castle Gardens, when he mentions trees laden down with a crop the like he had never seen anywhere else in all his travels. I am trying to put the Apples of Ireland right, as I did the Daffodils and Tulips, and have been forming a collection for the last four or five years. I have some twenty-two sorts already. I should also like to see fruit of Grange, Forge and Golden Knob of Kent and Sussex. I shall be greatly obliged, and will willingly remit stamps for postage and trouble. There is an Apple in the South of Ireland called Quaker Russet, a long-shaped fruit, soft, and tasting like a Peach. The Holland Pippin, as we know it, is a flat-shaped, white fleshed, but yellow fruit full of juice, and ripening in October. The skin is speckled all over like Nelson's Codlin. It and Gibbons' Russet are very old favourites locally with Irish gentry. *Wm. Baylor Hartland, Ard Carra, Cork.*

Chrysanthemums and the "Rust" Fungus.—Two or three years back, when "rust" on Chrysanthemums was causing most growers much anxiety, I wrote to the *Gardeners' Chronicle* stating my opinion that the cause of this pest was the excessive amount of moisture in the air, especially towards the end of that summer. I must admit now, however, that this cannot have been the real cause, as after such a hot, dry summer as that of 1906, I have several out of my 80 varieties badly attacked with "rust," while the majority are quite free from it. Therefore it would appear that these sorts have taken the "rust" through being grown in too rich a compost. The constant feeding by various manures is unsuitable to some varieties. I cannot remember observing "rust" on any Chrysanthemums that have been planted out and grown in the kitchen garden. *A. J. Long.* [We have.—Ed.]

THE WHEAT CROP OF 1906.—In reading through the interesting report of the Rothamsted Wheat crop (see page 271), I was struck with the closing paragraph, which states: "The weight per bushel of grain is in all cases from 4 lb. to 5 lb. above the average weight." From this I gather that the average weight per bushel of Wheat in that neighbourhood is about 60 lb. Here the average weight is 62 lb. per bushel, showing how wheat varies in localities. With me this year it weighs 64½ lb. per bushel, with a crop of 48 bushels per acre. This is from land previously carrying two green crops—Swedes and Rape—both fed off with sheep, which is perhaps the best preparation for Wheat in this locality. *E. Molyneux, South Hants.*

THE PREVENTION OF CORRUPTION BILL.—I fail to see why the gardener should be branded as a dishonest man because he receives (secretly and corruptly) a little discount from seedsmen, when the same thing exists in almost every branch of business. The cook, the coachman, and the butler as a rule receive far more than the gardener from the tradesmen that supply goods to their different departments. Allow me to give just one instance of honesty and dishonesty, or, rather, dishonesty according to your correspondent's views. Some three years back, to be correct, our coachman went to town about a week after Christmas for his (?) Christmas boxes. The first place he called at was the coachbuilder's. The books were referred to, and work had been done to the amount of £35; the Christmas box he received was 35s. The next place visited was the corn-dealer's: here he received £1, that being 5s. for each horse; the shoeing forge 4s., or 1s. for each horse. At the saddler's the books were again referred to; the amount to come was 7s. 6d. These princely sums were Christmas boxes, therefore, perfectly legal, and honestly obtained. At the same time I called at a seed shop, as I had been asked to do by the traveller, and received 3s. 6d. discount on a few bulbs we had from them. Now, I suppose I came back from town that day a dishonest and degraded man, and should have hung my head in shame, having received discount off my employer's account. Now, I don't see why nurserymen and seedsmen shouldn't do as others do. If they must give discounts or presents, whichever they choose to call them—and they say they cannot do business without—why not keep them till Christmas, and call them Christmas boxes? I fancy, then, those stricken-conscience ones would feel no qualms about accepting a Christmas box, as the stigma of dishonesty would be removed, and if some kind-hearted nurseryman made his Christmas boxes more equal, and sent more to those poor gardeners of the low wage and small order, and less to those of the high wage and large order, I think it is quite likely we should hear of dissatisfaction at the small amount of the Christmas box. My object in writing is to point out that even Christmas boxes are regulated according to the amount of orders. Whilst at the same time I think it would be difficult to find the employer that would object to his servant receiving them, or consider them dishonest. *A. T., Birmingham.*

——Until the employer appreciates the service of a good and practical gardener, and treats and pays him accordingly, you will never prevent the gardener from receiving tips from tradesmen or friends of his employer (nor do I blame him). As a well-known nurseryman said to me: "It makes no difference to your employer if I give you a present. There is my catalogue and the prices: take them or leave them. If you take them I give you a present to do your best to keep up my good name." Some time ago I applied for a place as gardener where there were two under gardeners, a labourer at times, and a boy, also the help of the cowman. The cowman was paid £1 6s. per week, with a house, the labourer 6d. an hour, often making £1 13s. 6d. per week. I was asked what wages I wanted, and said £2 per week. The gentleman told me he could get 20 gardeners to-morrow at 30s. a week who would be pleased to come. Both the cowman and labourer were better paid than the gardener. The labourer had no responsibility whatever, but the gardener was supposed to look round at night to see all was right, and twice on a Sunday. I took the place at 35s. per week, and the discount I took, although I never asked for one in my life. My employer opened a letter addressed to me one day with a P.O. in it for 4s. from a well-known firm. That was the beginning of the end; there was never any more peace for me in that place. Now, if that gentleman had given me £2 per week, with instructions that no discount was to be taken, I should have carried out his wishes. But until there is a better understanding between the employer and employed I fancy most gardeners will look for their discount, and, as *A Scot* says, the bigger the place the better is the discount. *J. F.*

——I think it should be headed "Nurserymen and Seedsmen's" discounts. You are correct when you say "the dealers have matters in their own hands," and, as a gardener, I should like to see every catalogue of seeds that comes out this season headed, "No discounts are offered to gardeners." Mark the word offered. For years I have hated this practice, and think that the much-abused gardener is not answerable for it. [No.] Surely we are not such a low, greedy lot as some would have us believe. Gardeners have consciences as well as others; nurserymen have no monopoly of good ones. I know some gardeners who would not take it if it were not thrust upon them. In July, 1904, one firm's representative said we must have part of your bulb order if it costs us a case of the best whiskey made. A firm of good repute in the Midlands said I was one out of six or seven in 3,000 or 4,000 customers. *A. D.* says it is "gardeners'" discount. No, gardeners are not so bad: they do not ask for it. Their employers read the *Chronicle* too (and often pays for it, mine does), so do not make them doubt whether they have honest men, because doubt is worse than anything else. Why did not the British Gardeners' Society have a rule thus: no discounts accepted? I feel thankful I have not taken that which is offered. *R. G. O. F.* has had all the small amounts that it did not pay to return. Firms of repute do not offer it now to the writer: they give him satisfaction with their goods and better quality. *A Briton.* [Our correspondent sends us printed offers of discounts from certain Dutch firms, as well as from one English one. We believe that in future the recipient of a secret commission will run the risk of prosecution, whether the offer be made by a foreign or a British firm. Moreover, we have reason to believe, though we have at present no authority for making any definite statement, that an influential body of well-known nurserymen will publicly announce their intention of entirely discouraging the practice. Whilst these changes are taking place it will be for the employers to see to it that an adequate remuneration is offered to the gardener, who is now often grievously underpaid in comparison to the requirements demanded of, and the responsibilities imposed upon him.—ED.]

AN APPLE CENSUS.—I should like to see a census of Bush-tree Apples, but I quite agree with Mr. Molyneux that information should be given upon certain defined points. It would only be a waste of time and space to give a list of the best dessert and cooking varieties. This information can be gathered from any reliable fruit nurserymen's catalogue. In my opinion all who care to give their experience on this question must of necessity state what varieties succeed *best* with them, next come the locality, position of garden, character of soil and subsoil. Now I come to what I consider the most important point, "the determination of the hardiest varieties, and the one able to withstand, say, 10° of spring frost, or escape them by late flowering." I do think this is a great factor in successful fruit culture in our fickle climate, and during the nineteen years I have had charge of the gardens here, it has been frequently impressed upon me by bitter experience. Take this season for example. Apples generally are a good crop, but not with me; the chief cause for this arising from our position, wrong altogether, laying low in a valley, and with, on the average, 3° more of frost than experienced by my neighbours on the hills, who have all good crops. Now I come to my list which stood the test. Lady Sudeley, Worcester Pearmain, Juneating, Cellini, King of the Pippins, Old Nonpareil, Wyke House Russet, Lady Hemmiker, Lord Suffield, and Lane's Prince Albert. The following were mostly failures or carried only a few fruits: Cox's Orange, Ribston and Allington Pippins, Scarlet Pearmain, Scarlet Nonpareil, Gooseberry, Peasgood Nonsuch, Cox's Pomona, Annie Elizabeth, Brownlees and Rosemary Russets, Gloria Mundi, Kentish Fillbasket, Duke of Devonshire, Reinette du Canada, Bramley's Seedling, Newtown Wonder, Manx Codling, and Ecklinville Seedling. I may say that most of the above were spoilt before the bloom expanded, as in April we registered on the 14th, 11°; 19th, 11°; 23rd, 10°; 25th, 10°; 30th, 8°. No Pears or Plums were left except on walls where protected. *W. Peters, Gwyns Gardens, Leatherhead.*

SOUTH DEVON.—My Nerine Fothergilli major in the open have been very fine. I cut the last blooms a week ago. The Shamrock Pea (Parochetus communis) is very lovely now, and Crinums are still flowering. C. Moorei variegatum, said by Mr. Elwes to be the best of them, is just throwing up a flower-spike. *S. W. F.*

CARNATIONS WITH MANY NAMES.—If *New Yorker* had read the American trade papers last spring he would no doubt have noticed that Mr. H. Eichholz, of Waynesboro', U.S.A., offered for many weeks Mrs. W. T. Omwake as a deep pink sport of Enchantress slightly pencilled with a darker shade. So whoever exhibited a variety under the name of Mrs. Omwake had as much right in doing so as the introducer had in naming it. But as long as the societies permit mere sports of Carnations to be named otherwise than "white" Lawsen, "red" Lawsen, "white" Enchantress, "rose-pink" Enchantress, &c., there is sure to be a hopeless muddle. For if any variety has a tendency to sport it is most sure to sport in different localities at more or less the same time, and if everybody were to name his particular sport we might get ten names for the same variety. I have had at least 12 sports of Enchantress; two pure white, one clear rose-pink, and the rest more or less striped or pencilled. The white one has been named by one grower Iver White, the pencilled ones I have seen as W. T. Omwake, and Helen M. Gould, and no doubt we shall get a score or more new names for the Enchantress if our Carnation Society does not put a stop to the naming of sports. By the way, if our *New Yorker's* rose-pink Enchantress is not better than Mrs. Omwake, I don't think it should be called "rose-pink," as this colour should be a clean self and not marked in any way. *C. Engelmann, Saffron Walden.*

DESSERT APPLES AT THE FRUIT SHOW.—I should be very sorry if your correspondent *M.* assumed that I found fault with the judges because they, in the Allington Pippin class, placed the large fruits first. They had really no other option. What I animadverted upon was the incongruity seen in the Society's conditions that fruits of Blenheim Pippin should be of a specified size, whilst those of other varieties might be of any size. As I then mentioned, that limitation with respect to the dimensions of Blenheim Pippin is to be remedied, and next year we may see fruits of the biggest shown in the dessert class. Still I think some definition or model of what should be esteemed table and dessert size is desirable as a guide to judges. We are now discussing Apples solely. Pears can wait. The real point at issue is, may dessert Apples be of literally any size, or should they be subject to limitations? I regret to read of lost dishes at the Fruit Show. It is an old complaint. Helping a friend to collect his, I took care to secure every single dish first. It is those which disappear the soonest. *A. D.*

VARIATION IN GERBERA JAMESONI (see pp. 288, 314).—Much variety really exists in what is regarded as the typical G. Jamesoni. This is more noticeable in the size of the flower-head, the comparative breadth or the narrowness of the ray-florets, and more particularly in the colour of the latter. One of the largest and most brilliantly-coloured forms I have seen was in the garden of the late Rev. H. Ewbank, at Ryde. I believe I spoke of it to Mr. Ewbank at the time as of a vermilion-crimson shade, so very remarkable was it. The plant carried a score or so of its nearly 4½-inch-wide blossoms. But one could not apply these colours to the type Gerbera Jamesoni. Doubtless the species seeds very freely in the wild state, which explains much. *E. H. Jenkins.*

SOCIETIES.

ROYAL HORTICULTURAL.

(Concluded from p. iv. of Supplement.)

BOTANICAL CERTIFICATE.

Mormodes, Buccinator variety, from Sir TREVOR LAWRENCE, Bart. Flowers cream coloured, with a greenish hue.

Maxillaria nigrescens, from Miss E. WILLMOTT, Warley Place, Great Warley (gr. Mr. Gooch). Flowers dark red-purple.

CULTURAL COMMENDATION.

To Mr. G. G. Whitelegge (gr. to J. BRADSHAW, Esq.), for an immense specimen of Cattleya Mantini.

To Messrs. SANDER & SONS for Cymbidium Tracyanum magnificum with five spikes.

To Messrs. MCBEAN, Cooksbridge, for a noble specimen of Cattleya Bowringiana.

To Mr. W. H. White (gr. to Sir TREVOR LAWRANCE, Bart.), for a fine Angræcum distichum.

DIPLOMA AWARDS.

CATTLEYA LABIATA.—*1st Diploma:* C. I. Capt. J. F. Laycock, from Capt. LAYCOCK. *2nd Diploma:* C. I. Hector, from J. BRADSHAW, Esq.

C. LABIATA HYBRIDS.—*1st Diploma:* C. Fabia Bradshawiana, from J. BRADSHAW, Esq. *2nd Diploma:* C. Fabia, Fowler's variety, from J. GURNEY FOWLER, Esq.

SOPHRONITIS GRANDIFLORA HYBRIDS.—*1st Diploma:* Sophro-Cattleya eximia, from J. GURNEY FOWLER, Esq.

DENDROBIUM PHALÆNOPSIS.—*1st Diploma:* D. Phalænopsis Miss Louisa Dean, from G. F. MOORE, Esq.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (chairman), and Messrs. Jos. Cheal, S. Mortimer, A. Dean, W. Fyfe, W. Pope, Geo. Keif, H. J. Wright, J. Davis, G. Reynolds, J. Willard, J. Jaques, Chas. Foster, Owen Thomas, A. H. Pearson, and W. H. Divers.

Several seedling Apples were shown for awards, also some varieties as James Grieve and St. Edmund's Pippin, &c., that have been the subjects of recent correspondence in this journal.

A fruit of Doyenné du Comice Pear was shown by the ROYAL JERSEY AGRICULTURAL & HORTICULTURAL SOCIETY (gr. Mr. Saussey).

The Duke of RUTLAND, Belvoir Castle, Grantham (gr. Mr. Divers), showed about 60 varieties of Apples and nearly 40 of Pears. The exhibit was prettily decorated with sprays of Smilax and autumn-tinted leaves, while three tripods had bunches of Grapes hanging from their centres. Among the Apples, prominent dishes were those of James Grieve, Stone's Apple, Allington Pippin, Emperor Alexander, Peasgood's Nonsuch, Belle de Boskoop, and Mère de Ménage. Among the Pears was a fine basket of Beurré Clairgeau, the fruits being coloured to a high degree. (Hogg Memorial Medal).

Messrs. HUGH LOW & CO., Bush Hill, Enfield, N., about 50 varieties of Apples of well-known kinds. (Bronze Banksian Medal.)

Mr. H. J. DOVER, Bath Road, Langley, Bucks, showed half a dozen bunches of Muscat of Alexandria Grapes. (Bronze Banksian Medal.)

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed a collection of Capsicums. Great diversity was seen in the fruits, some of which were red-coloured, others being yellow. Some of the names, if correctly written, were very formidable, thus C. paradiesonialakii is the Tomato-shaped Capsicum, and C. Cseresznyealakii has Cherry-like berries. (Silver Banksian Medal—for the plants, not for the names.)

A. KINGSMILL, Esq., The Holt, Harrow Weald, showed the blue Grape Vitis heterophylla, and heavily-fruited sprays of Pernettya mucronata.

FIRST-CLASS CERTIFICATE.

Apple James Grieve.—This early-ripening dessert Apple was described in our last issue, p. 311, by Mr. W. H. DIVERS, Belvoir Castle Gardens, Grantham, who now exhibited very pretty, medium-sized fruits.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 25.—*Committee present:* Messrs. E. Ashworth, R. Ashworth, Ritchie, Leemann, Thorp, Cowan, Stevens, Rogers, Ashton, Parker, Cypher, Williamson, Warburton, Upjohn, Smith, Weathers.

H. J. BROMILOW, Esq., Rainhill (gr. W. Morgan), exhibited Cypripedium × Editha and C. × Fulshawense, the latter receiving an Award of Merit.

W. THOMPSON, Esq., Stone (gr. Mr. Stevens), exhibited a new hybrid Odontoglossum called "Elmor," the parents of which are O. Harryanacrispa × O. crispum (Award of Merit). Cypripedium × "Optima," the parentage of which was not recorded, also received an Award of Merit.

PHILIP SMITH, Esq., Ashton-on-Mersey, exhibited Cattleya × inversa, Haddon House variety, and a seedling, the parentage of which appeared to be Lælia præstans × L. Perrini.

H. LOW & CO., Enfield, exhibited a very fine new hybrid Cypripedium, the parents of which were C. insigne, Harefield Hall variety, × C. × nitens magnificum, "Balls' variety." This plant received a First Class Certificate. In habit it resembles the former parent very much, and, although a very fine acquisition, we hope to see it not quite so "squat" as when shown on this occasion. The same firm received an Award of Merit for Cypripedium × Charlesworthii nitens.

Messrs. CYPHER & SONS, Cheltenham, gained a First Class Certificate for a handsome and distinct form of Cattleya × Hardyana var. "Illuminator." Also an Award of Merit for a splendid form of Miltonia vexillaria var. Leopoldi superba.

A Silver-Gilt Medal was awarded to Messrs. CYPHER & SONS for a fine display of Orchids.

Messrs. KEELING & SONS, Bradford, were awarded a Bronze Medal for a group of Cypripediums.

Messrs. WRIGLEY, P. SMITH, MCLEOD, ALLEN, THOMPSON, and BROMILOW were accorded votes of thanks for contributions to the meeting. *W. H.*

PORTSMOUTH CHRYSANTHEMUM.

OCTOBER 31, NOVEMBER 1, 2.—The twentieth annual autumn exhibition of this society was held in the Town Hall, Portsmouth, on these dates, and was a distinct success, the entries being in excess of former exhibitions of the society. In previous years the leading class has been a combination of incurved and Japanese blooms in equal numbers, a class which was not at all satisfactory, and the committee this year substituted for it a County Class, offering a Challenge Cup and £5 as the premier prize for exhibitors in the county of Hants for thirty-six Japanese blooms in not fewer than eighteen varieties, but not to include more than two of any one variety. Four growers competed, the premier award being won by Mr. G. Hall (gr. to Lady ASHBURTON, Melchet Court, Romsey) for a heavy lot of fresh and well-staged blooms. Noticeable specimens were Bessie Godfrey, F. S. Vallis, Madame Rivol, Mrs. W. Knox, Mrs. Mileham, Reginald Vallis, Edith Smith, Mrs. A. T. Miller, Algernon Davis, and two seedlings of much promise. 2nd, Mr. Dawes (gr. to Mrs. OGILVIE, Rosecroft, Hambledon), with slightly irregular blooms, although the example of F. S. Vallis was very fine.

CUT BLOOMS.

OPEN CLASSES.

The premier class was for twenty-four Japanese Chrysanthemums in not fewer than eighteen varieties. Three exhibits were staged, and of these Mr. HALL again showed the best, and thus secured the leading position. He showed similar examples to those in the Cup Class. 2nd, Mr. G. Treagus (gr. to C. R. SHIPHAM, Esq., Bognor Road, Chichester).

In the class for twenty-four incurved Chrysanthemums in not fewer than sixteen varieties, and not more than two blooms of one variety, two competitors only were seen. Mr. W. G. ADAMS, The Strand, Southsea, was easily 1st with large and somewhat rough flowers, the best examples being C. H. Curtis, Buttercup, W. Biddle, and Ma Perfection. Mr. J. AGATE, the Nurseries, Havant, the remaining competitor, was awarded the 2nd prize.

Pompon Chrysanthemums, in twelve sprays, three blooms to a spray, and in not fewer than eight varieties, made an interesting class. Mr. H. SNOOK, 5, Fitzroy Street, Fratton, won easily with typical examples of W. Sabey, W. Westlake, and Toussaint Maurisot.

There was keen competition in a similar class for single Chrysanthemums, and a good display of these useful decorative flowers resulted. Mr. G. Ellwood (gr. to W. H. MYERS, Esq., Swanmore House, Bishop's Waltham) won the 1st prize with fine examples of Edith Pagram, Mary Richardson, Florence Robinson, and Mary Anderson.

GROUPS.

For a group of Chrysanthemums in pots, occupying a space of 60 square feet, £4 was offered as the principal prize. Mr. W. E. GILL, Florence Road, Portsmouth, won with dwarf plants that were carrying good blooms; 2nd, the VICTORIA PARKS COMMITTEE. A class was also provided for twelve plants of not fewer than eight varieties, with twelve or more blooms to a plant. This was intended to show the decorative value of the Chrysanthemum. Mr. G. LAMBERT, 17, Bognor Road, Chichester, was first with capital examples of Japanese varieties.

"Single-handed" gardeners and amateurs in Portsea Island had numerous classes provided for them. Cut blooms were well staged by Mr. ADAMS, Mr. GILL, and Mr. SNOOK.

A Silver Medal and a cash prize were offered for the best table decoration of Chrysanthemums and foliage occupying a space 6 feet by 4 feet. The competition was restricted to ladies. Among five contestants Mrs. COLSTON HALL, Warminster, was placed first with a table extremely lightly arranged; 2nd, Miss M. SNELLGROVE, Southampton. The schedule included classes for table plants, and these added much to the interest of the show, relieving the otherwise flat appearance of the tables. Messrs. W. TURNER & SONS, 14, Green Road, Southsea, was first with elegant Crotons; 2nd, Mr. ELLWOOD.

Fruit and vegetables were numerous and good. Mr. SHIPHAM staged the best black Grapes, and Mr. ELLWOOD the best Apples.

Mr. ELLWOOD won the Society's prize in the vegetable classes for nine dishes, and he also won Messrs. Sutton & Sons' prize for six, in both classes, staging fine examples.

Messrs. SUTTON & SONS, Reading, were awarded the Society's Gold Medal for an exceedingly fine collection of vegetables.

WINDSOR CHRYSANTHEMUM.

NOVEMBER 2.—The fifteenth annual autumn exhibition of this society was held in the Albert Institute on this date. The entries were, perhaps, not so numerous as in past years, but the quality of the exhibits left little to be desired. The arrangements were of the best character.

CUT BLOOMS.

The leading class was that for six varieties of Chrysanthemums arranged in vases, five blooms of each, Chrysanthemum foliage only to be employed. The premier award carried with it his Majesty the King's special challenge cup. Unfortunately, but one grower entered: his exhibit, however, was a magnificent one, and worthy the award made to it. Mr. T. Stevenson (gr. to E. MOCATTA, Esq., Addlestone) was the fortunate exhibitor. The blooms were large, solid, richly-coloured, and well staged. The varieties were Duchess of Sutherland, F. S. Vallis, Walter Jinks, Mrs. G. Mileham, Edith Smith, and Henry Perkins.

Eighteen Japanese blooms, distinct.—These were required to be arranged in a space measuring 5 feet by 3 feet, with other plants or foliage to illustrate the value of large blooms for decoration in combination with other subjects. Mr. H. Hearn (gr. to Mrs. GERALD GOODLAKE, The Fishery, Denham) was 1st with handsome blooms, moderately well arranged on a base of Adiantum Fern. Mr. C. Page (gr. to J. B. FORTESCUE, Esq., Dropmore) secured the 2nd prize with a better arrangement, but he had smaller flowers.

Twelve incurved and twelve Japanese, distinct.—Mr. H. Elkington (gr. to OWEN TUDOR, Esq., Old Windsor) staged the best collection, especially good being the incurved varieties. 2nd, Mr. PAGE, with somewhat smaller examples.

Mr. W. Jinks (gr. to L. J. DREW, Esq., Knowle Green) won in the class for twelve incurveds with good examples of popular varieties. 2nd Mr. G. Baskett (gr. to P. NELKE, Esq., Virginia Water).

Mr. STEVENSON, with blooms similar to those in the Cup Class, won in the class for twelve Japanese varieties; especially fine was Mrs. R. Hooper Pearson. 2nd, Mr. W. JINKS.

Six Japanese blooms of one variety.—This proved a strong class, the winner being Mr. H. ELKINGTON, with fairly good flowers of Bessie Godfrey. 2nd, Mr. W. JINKS, who staged his namesake in fairly good condition.

Six incurved blooms of one variety.—The best half-dozen were shown by Mr. BASKETT; 2nd, Mr. ELKINGTON.

An interesting class is that for twelve Chrysanthemums arranged with any natural foliage in a vase or basket. Mr. JINKS, with handsome examples arranged with suitable foliage, won easily. 2nd, Mr. ELKINGTON.

Single Chrysanthemums made an effective display. Mr. W. Cole (gr. to Mrs. E. B. FOSTER, Clewer Manor) won the 1st prize in the class for five sprays, each of six blooms, having a really good exhibit, amongst six competitors.

Groups of Chrysanthemums and foliage plants made an effective display at the sides of the building, four growers competing. The best was a good exhibit staged by Mr. W. Lane (gr. to Sir E. DURNING LAWRENCE, Ascot), who thus secured the Society's Challenge Cup offered in this class. 2nd, Mr. W. COLE.

BATTERSEA, CLAPHAM, AND WANDSWORTH AMATEUR CHRYSANTHEMUM AND HORTICULTURAL

NOVEMBER 2, 3.—This suburban society held its sixteenth annual exhibition on these dates in the Town Hall, Battersea. On former occasions there have generally been a few striking exhibits from professional gardeners, some of whom at present reside some little distance from Battersea; consequently their exhibits were grown under better conditions than obtain in London. At the recent show, if we except a few flowers brought from Roehampton, all those present were grown in Battersea or Wandsworth, and were exhibited by amateurs. The result was creditable to the cultivators, who must have exercised considerable skill and much perseverance.

The best group of Chrysanthemums in pots, arranged on a space of 8 feet by 5 feet, was exhibited by Mr. L. STRINGER, 67, Taybridge Road, Battersea; and the 1st prize for a smaller group was won by Mr. E. YARHAM, Junior. Other successful exhibitors were Mr. H. BOSWELL, H. G. MCLEAN, S. H. STREET, W. FORTH, W. COOPER, A. B. FREEMAN, W. J. KENT, W. H. WINNETT, G. GEALE, E. J. SLATON, J. GREEN, W. LAVENDER, and Mrs. W. STRINGER.

DERBY CHRYSANTHEMUM.

NOVEMBER 2, 3.—The annual exhibition of the above association was held on these dates. The show generally was a vast improvement on those of previous years, and proved the most successful exhibition, financially, in the history of the society. On the second day 4,000 school children visited the show, and an appropriate address on the cultivation of the Chrysanthemum was given by the Vice-Chairman, Mr. Seymour.

Among exhibits not for competition was a fine display of Chrysanthemums, Carnations, &c., from Messrs. CLIBRAN & SONS, Altrincham.

Rev. BURKSTON, Sutton Hall, filled a considerable space with a collection of Orchids.

Mr. J. KING, Derby, staged a collection of Crotons of fine quality, and kindly lent Palms and specimen trees to decorate the Hall.

Mr. A. Simeson (gr. to W. S. POWER, Esq., Littleover), who competed at Derby for the first time this year, proved a most successful exhibitor.

CUT BLOOMS

In the class for 18 incurved blooms four growers competed. Mr. A. SIMPSON won the first prize with a good display, though the blooms were somewhat lacking in finish. His most perfect specimens were two examples of Mrs. F. Judson. 2nd, Mr. J. Wood, Alvaston; 3rd, Mr. J. Evans (gr. to Miss WILMOT, Chaddesden Hall).

The class for 18 Japanese blooms brought the same number of entrants, and again Mr. A. SIMESON was first. He showed fine blooms of Mme. W. Rousseau, Mrs. J. Hardaway, H. Perkins, Duchess of Sutherland, and others.

Mr. SIMESON also led in the class for six vases containing 18 Japanese Chrysanthemums in six distinct varieties.

The best group of Chrysanthemums was also staged by Mr. SIMESON, whose fine quality blooms and taste in arrangement left nothing to be desired. 2nd, Mr. S. POTTER; 3rd, Mr. G. POTTER.

Mrs. NORMAN, Derby, showed the best bouquet of Chrysanthemums.

A class was provided for a table decorated with one epergne and not more than six specimen glasses. The best arranged table was that decorated by Mr. J. A. WARWICK, Alvaston.

Mr. G. BROWN, Aston Hall Gardens, showed the premier dozen plants suitable for table decoration.

Mr. TOMLINSON, in the members' classes, secured the N.C.S. Certificate for a bloom of Mrs. Knox, the premier flower in the members' classes. *F. Meakins.*

ROYAL HORTICULTURAL OF ABERDEEN.

NOVEMBER 3.—The annual meeting of this society was held in the Music Hall Buildings, Aberdeen, on the above date. There was a good attendance of the members, and Mr. Samuel Pope, Vice-Chairman of the Society, presided.

The annual report stated that the income for the past year has amounted to £470 1s. 11d., and the expenditure to £395 14s. 4d., leaving a surplus for the season of £74 7s. 7d.—a result which is especially encouraging when compared with the deficit last year of £77 12s. 11d.

The Chairman, in moving the adoption of the report and the balance-sheet, said the balance-sheet last year showed a loss and a debt balance against the Society of £5 10s. 1d. This result was largely due to the unfavourable weather on each of the days of the show, more especially on the Saturday, when the receipts were nearly £100 below the average. The directors had adopted a policy of economising, and they had managed to reduce the prize list by more than £20, and they had dispensed with such things as military bands and fireworks, with the result that the debit balance of £5 10s. 1d. and every other claim against the Society could be met.

Mr. Alexander Robson, seedsman, Aberdeen, in seconding the motion, congratulated the directors on their balance-sheet, and said that the result was most gratifying.

Lord Provost Sir Alexander Lyon was re-elected Hon. President, and the Hon. Vice-President and Hon. Directors were also re-elected, and Mr. Samuel Pope was also elected Hon. Vice-President.

Mr. Ogilvie, who has been Chairman for the past two years, wished now to retire, and Mr. J. G. Burnett, of Powis, was elected Chairman in his stead. Bailie Milne was appointed Vice-Chairman in the place of Mr. Pope. The Directors were elected, and Mr. J. B. Rennett, advocate, was re-appointed Secretary and Treasurer.

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.

CHRYSANTHEMUM SHOW IN PARIS.

NOVEMBER 3-11. The autumn show of this Society, held in Paris, was opened in very unfavourable weather. The show is very large, the exhibitors being numerous and the exhibits very varied. Fruit, particularly Apples, Pears and Grapes, are seen in enormous quantities, and there are large displays of ornamental trees and shrubs, Orchids, Dahlias, Carnations, Primulas, Cyclamen, Begonias, and other seasonable flowers. Among Chrysanthemums one of the finest exhibits is that set up by Messrs. VILMORIN, ANDRIEUX & CO., who have also staged an immense collection of almost everything that the vegetable garden can possibly supply. Besides a charming little decorative group of Chrysanthemums at the entrance to the show, Messrs. VILMORIN, ANDRIEUX & CO. have also a collection of finely-grown plants in pots, some being bush-trained and with large specimen blooms, 20 or 30 on a plant. Among the trained plants we noticed Ville de Phenice, a large, spreading Japanese variety, with colour a deep rich golden yellow; Tokio, a curious and effective variety, with narrow, stiff florets, the colour being pale rosy pink—an excellent decorative variety and one much appreciated by the French growers for exhibition. Many of the varieties are quite unknown to the majority of English growers, but Mme. Ed. Roger, William Duckham, Mrs. R. Hooper Pearson, M. Chenon de Leché, Mme. Gustave Henry, Nivose, Mrs. W. Knox, Mrs. Barkley were a few of the best and most readily-recognised flowers.

M. AUG. NONIN has a fine group and also many novelties, as have also Messrs. VILMORIN. M. NONIN'S group is edged with a pretty pale yellow pompon, Gerbe d'Or, in pots. His best specimen blooms are Duchesse d'Orleans, a fine white, incurving Japanese variety, and one largely grown for the French florists' shops; Lt.-Colonel Ducroiset, a grand yellow Japanese bloom; Fusée, another fine yellow; Solange, a large greenish-white Japanese; Sapho; Souvenir de Lombez; Le Peyrou, a fine yellow, incurved variety; Lady Hopetoun. The group also embraces a collection of freely-flowered plants of Baron de Vinols, a decorative Japanese Chrysanthemum, with bright rosy-amaranth-tinted florets, together with several sports from the same variety.

M. MONTIGNY has novelties for 1906 in 130 new varieties. They are mostly medium-sized blooms, but the collection is an interesting one to those in search of novelties.

Some nicely-grown specimen plants, carefully trained and freely flowered, are staged by the ECOLE HORTICOLE ET PROFESSIONNELLE DU PLESSIS-PIQUET. Among the best examples we noticed Souvenir de Petite Amie, Mme. Gustave Henry, Mme. Ed. Roger, Charles Schwarz, and M. Massange de Louvrex.

M. LEON CAVRON, of Cherbourg, has curiosities in Chrysanthemum culture, for besides having a large number of specimen standard-trained plants, he has quite a number of grafted standards, each bearing many varieties of the various sections, large and small-flowered varieties being together on the same plants, and also incurved and Japanese types—curious, but not beautiful. M. CAVRON has also plants in pyramidal form, after the style of the Japanese training, which, although curious, are scarcely up to the best Japanese standard.

A very fine display is that shown by M. DUBUISSON FOUBERT. He has some gigantic flowers of such kinds as Princesse Bessarabade Brancovan, Mrs. Wm. Duckham, Pride of Madford, Mme. Paolo Radaelli, and Mrs. C. Harman Payne. In one vase are seven blooms of F. S. Vallis that surpass anything we have ever seen at a French show before, for they each measured from 44 to 48 centimetres in diameter—18-19 inches.

M. LAVEAU has a commendable exhibit. His flowers of Lt.-Colonel Ducroiset are of colossal size, and he has other good ones, including Sapho, Jean Calvat, Verge Montbumoise, a grand white variety, and Mlle. Pouzac, a variety of a peculiar shade of blush and buff.

Other exhibitors are M. DEFAULT, M. JULES CORTIN, MM. LEVEQUE ET FILS, M. LARUE, &c.

In cut blooms special mention must be made of Messrs. A. CORDONNIER ET FILS, of Bailleul. They have a fine collection of big Chrysanthemums, besides showing Grapes in grand form. Chief among their Chrysanthemums, considered from an exhibition standpoint only, are Mme. Vigneau, a large, spreading, Japanese bloom, having medium florets, curly at the tips, a compactly-built flower, colour pure white. Aug. Testier was another large flower of yellow and buff shades. President Loubet, an immense Japanese bloom, with very long florets, a big, spreading, white flower, slightly tinted. Ministre Morgeot is another very large variety, the pure golden-yellow flowers are spreading; President Viger, Mme. Gustave Henry, Henry Perkins, Extase, Mrs. C. Harman Payne, and W. R. Church are others shown by this exhibitor.

M. GEO. TRUFFAUT exhibits Roses and Chrysanthemums cultivated with the aid of his new manure, "Biogine."

In the section for seedlings is seen considerable competition. M. ERNEST CALVAT secures a Gold Medal for a fine collection of nearly 20 novelties. The best are M. Paul Randet, Mme. de la Rocheterie, S. A. Naceur Beg, President

Dubost, Carlo Knacht, Touring Club, and Algesiras.

The Marquis DE PINS also has many seedlings of new shades of colour. Among these we may mention Mme. Bougere, colour dull rose on a white; Comtesse Alice de Lancy, resembling Pallas: La Tonkinoise, Lydia, La Dame Blanche, and Quo Vadis.

M. ALFRED CHAUTIER is a raiser of Chrysanthemums not widely known to English growers, but he has sent out many varieties that are grown in France. He has a neat collection, grown in good style, but most of them are scarcely large enough to judge of their merits for English growers. Prefect Lepine, an orange-amber-coloured Japanese variety; Alphonse XIII.; St. Fereol, and Mme. Louis Tinchant, a large, pure white Japanese bloom, slightly tinted green in the centre of the flower, are the more promising in this group.

A very pretty variety, raised by M. LIGER-LIGNEAU, called Mme. Madeline Lenoble, of a bright, warm shade of rose, with centre shaded buff, is the only other seedling shown in the special class for new seedling Chrysanthemums, although many other novelties for 1906 are staged by Messrs. VILMORIN, M. NONIN, and others in their groups. *Paris, November 5.*

COMING POTATO SHOW.—A new feature will be included at the third annual show of the National Potato Society on December 13 and 14 at the Royal Horticultural Hall, Westminster. The Executive Committee has arranged for cooking competitions each day. These will serve the double purpose of demonstrating the cooking qualities of a number of leading varieties, and of showing the most efficient culinary methods. The Universal Cookery and Food Association is assisting in the arrangements, and is offering medals. The Society's medals will be awarded by the popular vote of the visitors.

CATALOGUES RECEIVED.

W. WELLS & Co., Merstham, Surrey—Chrysanthemums.
S. BIDE & SON, Alma Nurseries, Farnham, Surrey—Rose Queen of Spain.
W. & T. SAMSON, Kilmarnock, N.B.—Trees, Shrubs, Roses, Fruit Trees, &c.
E. P. DIXON & SONS, Ltd., Hull—Nursery list.
AMOS PERRY, Hardy Plant Farm, Enfield, Middlesex—Border and Rock-garden Plants, Trees and Shrubs, Roses, Fruit Trees, Wall Plants, &c.
HERD BROS., Penrith—Nursery Stock.
GUNN & SONS, Olton, near Birmingham—Perennial Phlox.
CLIBRANS, Altrincham—Chrysanthemums.
HOLLAND PLANT CO., Boskoop, Holland Nursery Stock, Roses, Azaleas, &c.
JAMES VEITCH & SONS, LTD., King's Road, Chelsea—Strawberries, Carnations and Picotees.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Another Wet and Damp Week.—During the past week the days have been rather warm for the time of the year, while the nights were, as a rule, cold. On the two coldest nights the thermometer exposed on the lawn showed 5° of frost. Both at 1 and 2 feet deep the ground is now 1° warmer than is seasonable. Rain fell on five days during the week, and to the total depth of an inch. Nearly the whole of that quantity has come through the bare soil percolation gauge, and more than half of it through the gauge on which short grass is growing. The sun shone on an average for 1¼ hours a day, or for about a quarter of an hour a day less than is usual at this season. On one day the wind was rather high, and during the windiest hour the mean velocity reached fifteen miles—direction west, but during the rest of the week calms and light airs prevailed. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by one 1 per cent.

OCTOBER.

Remarkably warm, wet, and humid.—This was with one exception (1898) the warmest October I have recorded here in the last twenty years, and not even in October, 1898, was the temperature in the daytime as high. The highest reading in the thermometer screen was 70°, while the exposed thermometer at no time registered more than 6° of frost, both of which extreme temperatures are exceptionally high for the month. Rain fell on as many as twenty days, and to the aggregate depth of 5¾ inches, which is nearly twice the average rainfall for October. There were seventeen wet nights, but only eleven wet days. Twenty-one gallons of rainwater came through the bare soil percolation gauge during the month, or as much as in the whole of the previous eight months taken together. The sun shone on an average for three hours a day, or for about ten minutes a day less than is usual in October. The winds were, as a rule, light, in fact in no hour did the mean velocity exceed eleven miles. For 440 hours, or eighteen days, the direction of the wind was from some point between south and west, but for 26 hours, or only one day, from any point between north and east. The amount of moisture in the air at 3 p.m. was 3 per cent. in excess of the average—a very exceptional degree of dampness for October. *E. M., Berkhamsted, Nov. 7, 1906.*

MARKETS.

COVENT GARDEN, November 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

REMARKS.—Barrels of Almeria Grapes are arriving in large quantities, and the supply is expected to exceed that received in any previous season. There is expected to be a good sale of Californian Plums and Pears during the present week. Muscat Grapes are dearer owing to short supplies. The supply of English Melons will probably be exhausted next week. Marrows are past. Trade generally is quiet. *E. H. K. Covent Garden, Wednesday, November 7, 1906.*

POTATOS.

Bedfords, 60s. to 65s.; Blacklands, 55s. to 60s.; Kents, 70s. to 80s.; Lincolns, 65s. to 75s. Trade is dull except for tubers of extra good quality. Many of the tubers on sale are badly diseased. The arrivals are light and prices are advancing. *Jas. Bath, 32 and 34, Wellington Street, Covent Garden.*

COVENT GARDEN FLOWER MARKET.

Of the varieties of Chrysanthemums Ivory and the pink variety which are known in the market as White and Pink Star are now among the best dwarf sorts. I wrote last year that a good white variety was wanted for late in Octo-

ber and November; this is now confirmed, for good whites are cleared out very early. Boule de Neige, as grown by Mr. Ward, of Walthamstow, is fairly good. Val d'Andorre, from Messrs. Butler Brothers, is good. The best pink variety is still Mrs. Wingfield; La Pactole may be regarded as the very best October bronze-coloured variety for culture in pots. Soleil d'Octobre and its bronze variety are good, but taller. Market Red is one of the best reds. Kathleen Thompson is very bright and makes the best dwarf plant; its parent, Caprice du Printemps, is also very good. Erica hyemalis was never seen better, but unfortunately it is over plentiful, and the best plants do not clear out well. E. gracilis is also very good, the ordinary form being of good colour as well as profusely flowered. The white "Nivalis" is, though good, like the earlier variety "alba," being a little inclined to reversion. Cyclamen are now very good. Begonias Gloire de Lorraine and Turnford Hall are seen in well-flowered plants from Messrs. H. B. May & Sons and from Mr. Lang. Other growers are also supplying good plants. Marguerites and Spiræa japonica are capital. Lily of the Valley has been excellent, and has been cleared at very low prices. Lilums are only fairly good. I find that Solanums have ripened too early this season with many. When calling at Mr. F. Cubbs' nursery I noted house after house full of plants having ripe berries. Another grower who rarely starts with them until just before Christmas started bringing them to market a fortnight ago.

CUT FLOWERS.

Chrysanthemums still kill the trade for all other flowers. One man who receives them to sell on commission told me this morning that out of a large number of boxes of Soleil d'Octobre he was unable to sell a single box at a reasonable price. Roses were down in prices again at the end of last week, and do not seem likely to rise again. Carnations are plentiful, and one salesman comparing prices with those of a year ago finds that what he is now selling at from 2s. to 3s. per doz. were making on the same date a year ago from 3s. to 5s. Lilums have sold for higher prices since I wrote my last notes. Zonal Pelargonium, scarlet and white (double), are over plentiful. Orchids do not clear out readily; large quantities of Cattleya labiata remain on the stands at closing time; also Cypripediums, Eucharis, Gardenias, Camellias, Tuberoses, &c. Azalea Fielderi is down to about half the price it used to make. Lily of the Valley is still a drug in the market. Good English Violets are plentiful, but the imports much depreciate their value. The Parmas have advanced a little in price. Among other imported flowers Narcissus Paper White and Soleil d'Or are good, also Ranunculus, Rose Safrano, "Mimosa," and White Lilac. Asparagus, Smilax, Croton leaves, and other indoor foliage is plentiful. In hardy foliage the Scarlet Oak (Quercus coccinea) is now very bright. *A. H., Covent Garden Market, Nov. 7, 1906.*

Answers to Correspondents.

COLEUS THYRSOIDEUS: *J. W. Kenley.* There is no disease present to account for the leaves dropping. These have probably fallen as the result of some cultural defect, such as insufficient or too much water at the roots, or from subjecting the plants to a cold temperature. Keep the plants healthy, and do not overcrowd them. It requires much care and skill to prevent these Coleus from becoming "leggy" in dull weather.

CYCLAMEN: *W. A. W.* An article on the cultivation of this plant was published in our last issue, p. 302. Any further questions you may ask respecting the species we shall be glad to answer.

DISMISSAL FROM SERVICE: *Enquirer.* 1. The length of notice to be given depends upon the custom of the trade, and you should make enquiries of others in a similar position in your own locality; 2. If dismissed summarily through no fault of your own you could probably recover a sum representing wages equivalent to the time for which you would be entitled to receive notice. The fact that you receive your wages weekly will not necessarily be conclusive as to the length of notice you should receive. We are, of course, assuming there has been no special arrangement between you and your employer on the subject.

FIG TREES: *L. F.* Assuming that your Figs are of suitable varieties for fruiting out of doors, and that they have been planted in a suitable situation, and in soil which is not likely to induce them to make gross and sappy growth, there should be little difficulty in securing a crop. Figs growing under such conditions, and providing that the root action and top growth are well balanced, need very little stopping, excepting of such shoots as extend beyond their proper boundary. It is only in exceptionally favoured situations that out-of-door trees can produce two crops of Figs in the season. Therefore, those which have formed at the present time should be rubbed off. It is the small embryo "fruits" formed towards the extremity of the shoots that will mature the crop next season. Thorough ripening of the wood is essential. Immediately the crop is finished remove all exhausted and useless branches, leaving only a sufficient number of those of the current year's growth and that are strong enough to produce fruit. These should be nailed close to the wall that the sun-heat will harden and ripen them. In your locality it would not be advisable to pinch the shoots as suggested; seek to obtain short-fruited, hard wood. In the spring when growth commences many more shoots will appear than are required for laying in. Severely disbud therefore, so that sunlight and air may easily reach each individual shoot.

GERMAN AND FRENCH DIRECTORIES: *J. T. M.* We do not know of such works. We advise you to write to the Editor of one of the German and of one of the French gardening papers.

GRAFTING ROSES ON TO OLD APPLE TREES: *A. C. H.* We do not think this would be impossible, for the relationship between the genera is quite as close as in many instances where successful grafts have been made by M. Daniel. At the same time, we may point out that many things are possible that are not expedient, and it is difficult to see what good purpose would be served by such grafts unless they were undertaken for the sake of scientific investigation.

GRAPE LADY DOWNES SHRIVELLING: *J. McC.* The berries are not diseased. Shrivelling is often found in this variety, and is generally the result of growing the vines in too cool an atmosphere, from which reason the fruit does not ripen perfectly. They should have a south aspect and sufficient artificial heat to properly finish their berries. See that the roots are not in a cold underdrained border. In the great vinery at Chiswick, Lady Downes always developed in a manner similar to that shown in your specimens. They were planted on the north side of the house, whereas on the opposite and warmer side Muscat of Alexandria was brought to a fairly successful condition of ripening. These remarks apply also to the other varieties you mention.

KNOWLEDGE OF TREES AND SHRUBS: *Magi.* We suppose you are referring to private gardening in this country and, if such is the case, the knowledge obtained by the study of trees and shrubs would the better equip otherwise good and experienced gardeners for the management of big country estates where trees and shrubs are leading features, and for fulfilling the duties of park superintendents. But unless you obtain experience of other horticultural practice the mere study of trees and shrubs would not be likely to help you to a successful position. If your education is sufficiently advanced to enable you to pass the examinations of the Indian Forest Department, previous experience with trees and shrubs would help you in obtaining an appointment, and these positions carry with them satisfactory remuneration.

LIGHT: *N.* The clearer and freer from colour the glass, the better for the plants. Yellow and red are less prejudicial to the growth of plants than blue, which, as it were, destroys the yellow rays. Under blue or violet glass very little carbon dioxide is decomposed, and consequently comparatively little starch is formed and relatively little growth takes place.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* C. H. 1, Scarlet Loddington; 2, Sam Young; 3, not recognised; 4, Welford Park Nonsuch. —*Subscriber.* 1, Madame André Leroy (a fairly good variety); 2, Marie Louise (good); 3, Fondante de Cuerne (fairly good); 4, Doyenné du Comice (good); 5, Hessle (inferior); 6, not recognised. With the exception of Nos. 2 and 4 the others are but little use for show purposes. —*A. M.* 1, Court Pendu Plat; 2, Blenheim Pippin.—*F. Walstead.* Keeping Red Streak.—*A. Bateman.* 1, a very nice Apple which we fail to recognise, but one worthy of planting; 2, Reinette van Mons; 3, Small's Admirable; 4, Harvey's Wiltshire Defiance; 5, Blenheim Pippin; 6, Lodgemore Nonpareil.—*W. D. S.* 1, White Paradise; 2, Old Nonsuch; 3, much resembles a very fine Ribston Pippin.—*F. A. Allchin.* 1, Ross Nonpareil; 2, Blenheim Pippin; 3, Hanwell Souring; 4, Hollandbury.—*J. J.* 1, Golden Nonpareil; 2, Malster; 3, Warner's King; 4, Winter Hawthornden; 5, Niton House; 6, Ross Nonpareil.

NAMES OF PLANTS: *E. C. Lowndes* (delayed). Fraxinus Ornus (Manna Ash).—*C. E. F.* Probably a small flower of Gloire de Dijon.—*Shelley.* Lycium sinense, sometimes called Tea-tree, because it is not a tree and has nothing to do with Tea.—*G. M. D.* 1 and 2 are perennial Asters, but you do not send sufficient for identification; 3, Solidago serotina; 4, Nepeta glechoma variegated variety.—*C. A.* 1, Eulophia englossa; 2, Epidendrum ochraceum; 3, Masdevallia nidifica; 4, Pteris tremula; 5, Adiantum gracillimum.—*P. J. P.* Maxillaria picta and Cotoneaster Simonsii.—*C. A.* Strelitzia Reginæ.—*G. F. D.* Potentilla reptans.—*J. W. B.* Maxillaria grandiflora.—*J. A. C.* Pinus contorta.

NARCISSUS OBVALLARIS FOR FORCING: *A. R. B.* When preparing all kinds of Daffodils for forcing, the possibility of injury from frost should be effectively guarded against at the start. For many sorts the covering you mention would be quite inadequate, and a more vigorous-rooting kind than that mentioned would long ago have lifted itself clean out of the soil. The consequent re-planting of the bulbs and breaking of the root fibres would have injured the plant and have caused a heavy loss to the grower. Are you quite sure the bulbs are not even now uplifted, it being early for even this early kind to have made much growth? If you can convince yourself that the bulbs are safe and resting on the planting-base, afford them an additional covering of 2 inches of the same material; 4 to 6 inches of thoroughly seasoned coal ashes is best, or this and cocoa-fibre in equal parts. Remove the bulbs under cover at the end of the present month, allowing them to remain a week or 10 days in a cold house. After this period has elapsed, close the house and commence to force with an atmospheric temperature of 45° by night. A few days later, if progress is apparent, increase the heat very gradually to 55°. Ample moisture in the atmosphere and a cool base for the plants are essential conditions.

RATING FOR BUILDINGS: *Ashtonian.* You are rightly assessed so far as the Agricultural Rates Act is concerned. This Act draws a special distinction between land and buildings, and the courts have held that greenhouses are buildings in this sense, although not necessarily so regarded for other purposes. For instance, an occupier of land in an urban district used as a market garden or nursery ground is entitled to be assessed for rates levied under the Public Health Act, 1875, only in the proportion of one-fourth part of the net annual value of the land, notwithstanding that such land may be covered with greenhouses. This decision was given in an appeal made against a General District Rate.

TOMATOS: *Tomato, Ayr.* After a more careful examination we have failed to find any evidence of fungoid disease, but are confirmed in the opinion that the marks have been caused by punctures. We should not hesitate to employ seeds from such fruits for raising stock next season.

WHITE CARNATION: *G. & W.* The flowers are pleasing in appearance and very fragrant. You should send three plants in flower to the Royal Horticultural Society's meeting, on November 20, for the consideration of the Floral Committee. A good, white variety is that known as White Perfection, and although your seedling is a good one, it may not be superior to that. The habit of the plant is an important point to consider, and the calyces should be "non-splitting."

SHOWS OF THE WEEK.

National Chrysanthemum Society.

NOVEMBER 7-8-9.

CHRYSANTHEMUMS have come to us this season whilst the gardens are still green, and Dahlias, Salvias, and even Heliotropes, in many localities are uninjured in the beds and borders. Border Chrysanthemums, even in the London gardens and parks, are still flowering freely as we write, and yet the National Chrysanthemum Society has opened its biggest exhibition of the season in the Crystal Palace, at Sydenham. All these circumstances have the effect of making us feel that the exhibitions have fallen upon it unusually early, and perhaps the thick fog London experienced on Tuesday morning last was needed to bring the fact more clearly home to us that, November being already a week old, winter is at hand, in spite of the appearances of the vegetation out-of-doors.

The display at Sydenham was opened in good weather, and the attendance of visitors, especially in the afternoon, appeared as large as usual. The exhibition was, perhaps, not equal to some preceding ones, but it was, nevertheless, a fine display, and the general quality of the blooms was good. The competition in some of the larger classes was weak, but, generally, the smaller ones were well contested. We noticed a falling off in some of the classes in which the blooms are shown in vases, although the quality of the flowers staged in this decorative section was generally of a high order of merit. The decorative classes were better than ever.

The Society's FLORAL COMMITTEE granted their Certificate of Merit to six new varieties, among which were three single-flowered varieties. Outstanding features were the large non-competitive displays, staged by Mr. H. J. JONES, Mr. NORMAN DAVIS, and Messrs. H. CANNELL & SONS, which were deserving of unqualified praise.

This is the first November exhibition to be held since the appointment of Mr. Witty as Secretary. If the weather during the summer had been less hot, and the atmosphere less dry, it is probable the exhibition would have been as large as any which has been held.

There were classes for hardy fruits and Grapes in addition to those for Chrysanthemums, and Mr. Robert Sydenham offered special prizes for vegetables, which brought together a display of good produce.

DISPLAYS OF CHRYSANTHEMUMS.

The floral display of Chrysanthemums consisted of plants in pots, cut blooms arranged as bouquets, in vases, single, semi-double, Pompon, &c., with foils in foliage plants, such as small Palms, Crotons, Asparagus plumosus, Ferns, and a variety of stove and greenhouse plants of that class. The form was circular and pyramidal, rising to 10 feet in the centre. It was really a great mass of bloom, not much relieved by the greenery employed. The Japanese blooms formed, together with the single and semi-double flowered varieties, the main points of attraction. The group was rendered lightsome by the employment of cut blooms arranged in vases near the margin of the group. The exhibitors were Messrs. JOHN PEED & SON, West Norwood, S.E. To this group a large Gold Medal was awarded.

The second prize for a group was awarded to Mr. W. Howe (gr. to Lady TATE, Park Hill, Streatham Common). From this class the trade was excluded. The group covered a space of 200 square feet, as against 300 feet in the group just mentioned, but the contour was the same, and the varieties of which it consisted were mostly Japanese, yellow tints being predominant. As affording desirable contrasts, Crotons, dwarf Ferns, Dracaenas, Palms, and slender Bamboos were used as solitary examples near the outside, and a Palm capped the group. The general effect was somewhat heavy, and what tended to heighten this feature was a large group adjoining, which was very differently arranged.

COMPETITION OF AFFILIATED SOCIETIES.

The objects to be shown may include any section of Chrysanthemums, but not fewer than four, and a table space of 24 feet by 3 feet was allowed for each exhibit, flowers to be shown with foliage, in vases.

The 1st prize was awarded to the DULWICH SOCIETY, the exhibitors being Messrs. Winter, Croft, Taylor, J. Faulkner, M. Faulkner, Rouse, and Sibley. Incurved Japanese, small-flowered decorative, Anemone-flowered, semi-double, single-flowered, and Pompons being the types included in the exhibit, and, as staged, a good display resulted. The 2nd prize was awarded to the EPSOM & DISTRICT CHRYSANTHEMUM SOCIETY, Mr. J. Hunt showing. The section shown were Japanese, single-flowered, semi-double, decorative, but only two Incurved varieties. The arrangement of the blooms with foreign foliage had a pleasing effect. The 3rd prize was awarded to the WANSTEAD & DISTRICT CHRYSANTHEMUM SOCIETY, with exhibitors Messrs. Runciman, Place, Fisher, and Jones. Here were observed blooms in fair condition of Japanese and Incurved varieties, and a number of varieties of the single-flowered decorative, single-flowered Pompon types, &c. The awards consisted of a Challenge Trophy and also of money prizes.

BLOOMS SHOWN IN VASES.

Sixty blooms in twelve varieties.—This class calls for 12 vases, each to contain five specimen blooms of one variety. The 1st prize fell to Mr. W. IGGULDEN, Locke Hill Nurseries, Frome, Somerset. The varieties were F. S. Vallis, Mrs. A. H. Lees, Miss Elsie Fulton, Mrs. W. Knox, President Viger, Mad. P. Radaelli, Gen. Hutton, Mrs. Mease, Reginald Vallis, Mrs. J. Dunn, Lady Henderson, Mad. R. Oberthur. 2nd, Mr. C. BECKETT, Chilton Lodge, Hungerford, whose flowers were of very fine quality. The 3rd prize fell to Mr. C. J. DECKER (gr. to the Hon. Miss CANNING, Frant Court, Sussex). These were large, fresh-looking blooms, but were lacking in finish compared with the two other exhibits.

For the Challenge Trophy offered by the Ichthemic Guano Co., Ipswich, for six vases of Incurved blooms, shown to the number of six in each vase, there were many excellent blooms shown, clean, large, and in perfectly good condition. The 1st prize lot, shown by Mr. W. Higgs (gr. to J. B. HANKEY, Esq., Fetcham Park, Leatherhead), consisted of Duchess of Fife, Mr. G. Denyer, Emblème Poitevin, C. Curtis, Buttercup, and Mad. Vrembley. The three yellow flowers in this exhibit could scarcely be surpassed. 2nd, Mr. G. J. Hunt (gr. to PANTIA RALLI, Esq., Ashtead Park, Epsom), whose only fault, perhaps, in the estimation of the judges, consisted in the slightly unequal size of his blooms. The following were the finer, viz., Lady Isabel, Godfrey's Eclipse, Globe d'Or, and Duchess of Fife. 3rd, Mr. R. J. JOLLIFFE, Fern Bank, Bonchurch, Isle of Wight, his best being Mrs. J. P. Bryce.

VASES OF JAPANESE VARIETIES OF SPECIAL COLOURS.

Three classes were provided, for vases of half-a-dozen blooms of white, yellow, and any other colour than white or yellow. These usually make a fine display, but this year's competition was poor, although the quality of the flowers staged left little to be desired. The best in the white section was Mrs. A. T. Miller, a splendid variety of pure white, by the side of which Miss Elsie Fulton appeared creamy-white. JOHN BALFOUR, Esq., Moor Hall, Hadlow (gr. Mr. A. Jefferies), staged the premier vase (Mrs. T. A. Miller), Mr. G. MILEHAM being 2nd with the same variety; 3rd, Mr. W. IGGULDEN, Frome, Somerset, with Miss Elsie Fulton. Rather stronger competition obtained in the class for a yellow variety, seven vases being seen, and of these the best was Mr. JEFFRIES' vase of F. S. Vallis. 2nd, Marquis CONYNGHAM, Bifrons, Canterbury (gr. Mr. D. Fairweather), with the same variety.

Mr. JEFFRIES also showed the best vase of any other coloured variety in Reginald Vallis, with blooms of great depth, Mr. IGGULDEN being 2nd with Mad. Paolo Radaelli.

Single bloom of Mrs. W. Knox.—Mr. W. Wells offered special prizes for one bloom of Mrs. W. Knox, a yellow Japanese variety. 1st, Mr. MEASE (gr. Downside, Leatherhead), receiving Mr. Wells' Gold Medal; 2nd, Mr. C. Beckett (gr. to Sir W. G. PEARCE, Bart., Chilton Lodge, Hungerford); 3rd, Mr. HOWE (gr. at Park Hill, Streatham). Eight competed.

POMPONS.

The principal class for these flowers was that for nine distinct varieties in vases containing six blooms in each vase. Only two growers competed, and of these Mr. CARVER, Aldenholme Gardens, Weybridge, was easily first. He had the peerless Mad. Elsie Dordan in fine style, also La Vogue (a beautiful yellow variety), Prince of Orange, Pygmalion, Black Douglas, &c. 2nd, Mr. J. A. HUMPHRIES, with flowers of less perfect form. Prince of Orange was, however, very good.

Mr. HUMPHRIES was the only exhibitor of six bunches of Anemone Pompons, shown in vases of six blooms, and he was awarded the 2nd prize.

Single varieties.—The only open class for these delightful flowers was that for twelve vases of not fewer than six varieties. They were allotted a space measuring 8 feet by 3 feet for each exhibit, and grasses and natural foliage were allowed for their better display. There were five exhibits, the premier one being staged by Mr. H. Redden (gr. to G. W. BIRD, Esq., Manor House, West Wickham, Kent). This was certainly the best exhibit, the flowers being large and remarkably refined. Miss Tackey Bird (white) was shown splendidly, and equally good were Crown Jewel Improved (bronze), a soft yellow unnamed seedling; Mary Foreman (white), Maud Matthews, &c. 2nd, J. COURTENAY, Esq., The Whim, Weybridge (gr. Mr. W. C. Pagram), who showed a fine vase of A. Farina. 3rd, Mr. G. HEMMING, Alexandra Palace, N., who had the charming flower named after Miss Mary Anderson in excellent form.

BLOOMS SHOWN ON BOARDS.

JAPANESE VARIETIES.

Forty-eight blooms, distinct.—The Holmes Memorial Challenge Cup and the 1st prize were won by Mr. T. Stevenson (gr. to E. MOCATTA, Esq., Woburn Place, Addlestone) with a large, even lot of flowers of H. Perkins, Reginald Vallis, Duchess of Sutherland, Mad. Carnot, Bessie Godfrey, Magnificent, a variety truly deserving its name, the colouring crimson and gold, and form good; Algernon Davis, W. Goldring, Mrs. J. Dunn, Norman Davis, Mrs. R. Hooper Pearson, Valérie Greenham, Mad. Oberthur, Miss Codrington, Mr. J. Haddaway, Lady Conyers, Wickham, M. G. Henri, Mrs. A. H. Lee, Mr W. Mease, Miss M. Ware, Mad. C. Nagelmackers, Mrs. F. W. Vallis, Miss Olive Miller, Maud de Crozy, Edith Smith, Sensation, J. H. Silsbury, Mrs. J. F. Duck, Mad. A. Debono, Montigny, W. Etherington, Gen. Hutton, W. R. Church, Mrs. G. Mileham, Yellow Nagelmackers, Nellie Bean, May A. Pockett, Leigh Park Wonder, Lord Ludlow, Kathleen Stoop, Mrs. C. Beckett, Mrs. W. Knox, F. Sargeant, F. S. Vallis, Walter Jinks, and Mrs. A. F. Miller. The 2nd prize in this class was awarded to Mr. W. MEASE (gr., Down-

side) with blooms but little in quality and size behind the winning stand. The finest blooms were Valerie Greenham, a prodigious bloom; Mrs. W. Knox, Lord Ludlow, Leigh Park Wonder, Lady Lennard, Miss Codrington, Mrs. E. J. Brooks, Bessie Godfrey, Miss O. Miller, Florence Penford, Walter Jinks, Donald McLeod, Norman Davis, Algernon Davis, Mrs. R. H. Pearson, and F. S. Vallis. 3rd, Mr. G. J. Hunt.

Twenty-four blooms, distinct.—The President of the Society, C. E. Shea, Esq., offered a special prize of five guineas for the best 24 blooms of Japanese varieties, distinct. There were seven entrants, the premier collection being staged by A. James, Esq., Cotton House, Rugby (gr. Mr. A. Chandler). It was a closely-contested class, and the 1st prize collection was closely followed in point of merit by those shown by John Balfour, Esq., Moor Hall, Hadlow, Essex (gr. Mr. A. Jefferies), while the 3rd prize collection was also of high merit, this being shown by E. Mocatta, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson). Mr. Chandler's flowers were F. S. Vallis (a beautiful specimen), Miss M. Ware, Mrs. A. T. Miller, President Viger, Henry Perkins (a full flower of exceptional merit), Duchess of Sutherland (weak), Miss O. Miller, Algernon Davis, Walter Davis (a grand Incurved flower), Ethel Fitzroy, Valerie Greenham, Mrs. R. Hooper Pearson, Marquis V. Venosta, Henry Stowe, Mad. P. Watme, Mrs. G. Mileham, Mrs. E. Crossley, Australie, Gen. Hutton, Mad. A. Bertrand, Mad. G. Rivol (a fine flower), Reginald Vallis, and Bessie Godfrey (soft sulphur-yellow). Mr. Jefferies had also a very even lot of flowers, all clean and well coloured, his best examples being Mrs. A. T. Miller (a magnificent white Chrysanthemum of immense size), F. S. Vallis, E. J. Brooks (beautifully coloured), Montigny, Mrs. A. H. Lee (red), and Godfrey's Pride.

Twelve Japanese blooms, distinct.—Half-a-dozen entries were seen, the best six blooms being equal to any in the show. Mr. Chandler was again the successful exhibitor, and he had F. S. Vallis, Valerie Greenham, Algernon Davis, W. Jinks, Bessie Godfrey, Henry Perkins, Paul Watme, Miss M. Ware, Gen. Hutton, Mrs. G. Mileham, and Ethel Fitzroy, all up to the best exhibition standard, the first-named being a wonderful bloom. Mr. Jefferies again followed with an exhibit of much merit, and was worthily awarded the 2nd prize, Reginald Vallis, Mrs. A. T. Miller, Godfrey's Pride, and J. H. Silsbury being among his best examples. 3rd, J. Barker, Esq., M.P., The Grange, Bishop's Stortford (gr. Mr. G. Beech), whose flower of Norman Davis was intensely coloured and was a bloom of exceptional merit. Mr. Beech is to be congratulated on his first entry as an exhibitor of Chrysanthemums.

Incurveds.

Thirty-six blooms, distinct.—This competition, for the Holmes Memorial Challenge Trophy and valuable money prizes, brought the best blooms of Incurved varieties observed on this occasion, many of them scarcely to be excelled. The winner of the 1st prize was Mr. W. Higgs (gr. at Fetcham Park). His back-row flowers were Bryant, Mrs. J. P. Bryce, Lady Isabel, Buttercup, Hanwell Glory, Mrs. E. Judson, Doris Raymon, Godfrey's Eclipse, Emblème Portevin (a grand flower; Duchess of Fife, Miss E. Holden, and Violet Carpenter. 2nd row, Frank Hammond, Le Peyton, Mrs. G. Denyer, Margaret Brown, Mrs. B. Hankey, Topaz Oriental, Mrs. A. H. Hall, Somerset de W. Chisman, W. Higgs, Ma Perfection, W. Biddle, Beacon. Front row, Countess of Warwick, Lady Wall, of a peculiar lilac tint, very attractive, Oshkosh, Fred Palmer, Amber Beauty, J. Agate, W. Pascoe, C. Curtis, Frank Treshan, Mrs. J. Seward, C. B. Whitnall, and Mad. Vrembley. 2nd, Mr. G. J. Hunt (gr. at Ashtead Park), extra good being Duchess of Fife, R. C. Kingston, W. Fuller, Mrs. B. Hankey, Ada Owen, Buttercup, Mrs. J. Seward, Frank Treston, W. Pascoe, Emblème Portevan, Amber Beauty, and Mrs. E. Judson. 3rd, Mr. W. Mease (gr. to A. Tate, Esq., Downside, Leatherhead), with good flower, rather undersized. Commendable were Triomphe de Montbrun, W. Pascoe, Mad. de Vernene, a lovely lilac, Cecil Cutts, a very brilliant yellow flower, Miss N. Southam, Mrs. E. Judson, C. Block, and Doris.

Twelve blooms, distinct varieties.—This was a well-contested class, seven exhibits being staged, but great difference was noticed among the individual collections, the winning flowers being double the size of some of the others. Again Mr. Chandler was to the fore, his examples being Buttercup (a very large and well-coloured bloom, but rather loose), Lady Isabel, W. Biddle (a very large flower), Mrs. Judson (highly refined and of excellent shape), Mrs. Chas. Crooks, Emblème Portevin, Ada Owen, Mrs. Aphin, Mrs. J. P. Bryce, C. H. Curtis (one of the best yellow varieties), Fred Palmer, and Margaret Brown. 2nd, A. T. Miller, Esq., Emlyn House, Leatherhead (gr. Mr. G. Mileham), whose flowers were little inferior to those shown in the 1st prize exhibit, with Ada Owen, C. H. Curtis, Lady Isabel, Duchess of Fife, &c. 3rd, J. B. Hankey, Esq., Fetcham Park, Leatherhead (gr. Mr. W. Higgs), with a smaller but very even lot, his Duchess of Fife being perfect in form.

Six Incurved blooms of one variety.—Mr. Mileham had the best among six displays, his variety being the large yellow Buttercup. 2nd, Panyta Ralli, Esq., Ashtead Park, Epsom (gr. Mr. G. J. Hunt), with Duchess of Fife; 3rd, A. Kempt, Esq., 15, Ross Road, South Norwood (gr. Mr. A. Osmond), with the variety C. H. Curtis.

Reflexed Varieties.

A class was provided for 12 blooms of Reflexed varieties, which brought three entrants. The largest and the best flowers were those exhibited by A. G. Meissner, Esq., Aldenholme, Weybridge (gr. Mr. T. Carver), whose best examples were Dorothy Gibson (a large yellow variety), Clara Jeal (white), Cullingfordi (deep red, a beautiful and rich colour), Miss F. Lunn (magenta), and Golden Christine. 2nd, J. L. Burgess, Esq., Marsey Hampton, near Fairford, Glos. (gr. Mr. J. A. Humphries). King of Crimsons and Dorothy Gibson were his best examples. 3rd, J. Courtnay, Esq., The Whim, Weybridge (gr. Mr. W. C. Pagram).

Anemone and Pompon Varieties.

Twenty-four large-flowered Anemone blooms, distinct.—Japanese blooms were allowed, but these were less beautiful than the pure Anemone type of flower, appearing ragged by comparison. The best among two displays were those shown by T. L. Boyd, Esq., North Frith, Tonbridge, Kent (gr. Mr. A. C. Horton). As a selection we may instance Sir W. Raleigh, Le Chalonais, Delaware, Mrs. Judge Benedict, Sabine, Mad. Chas. Lebocq, Lady Margaret, Descartes, and John Bunyan. 2nd, Mr. Humphries, Hill House Gardens, Fairford; Mr. Horton and Mr. Humphries also contested in the class for 12 varieties, and were again awarded the 1st and 2nd prizes respectively.

Twelve large-flowered Japanese Anemone varieties.—The only contestants were again Mr. Horton and Mr. Humphries, and again the awards were the same. Mr. Horton showed good examples of Sabine, Sir W. Raleigh, Owen's Perfection, Sœur Dorothee Souille, Hugh Gardiner, &c.

Decorative Classes.

Three vases of Chrysanthemums. This was a keenly-contested class, and the judges must have had no light task in apportioning the awards. There were nine exhibits, that shown by Miss C. B. Cole, The Vineyard, Feltham, being adjudged the best. Yellow and red Chrysanthemums, of small varieties, intermingled with grasses and sprays of Ampelopsis, formed a light and graceful exhibit. 2nd, Mr. D. B. Crane, Highgate, who utilised white and pink single varieties.

Two vases of Pompon or Anemone-Pompon Chrysanthemums. Mr. A. Robertson (gr. to F. J. Yarrow, Esq., 18, Abbey Road, St. John's Wood) won with a somewhat heavy arrangement. 2nd, Mrs. Conn, Peak Hill Lodge, Sydenham.

One vase of a Japanese variety, arranged with any foliage.—Mr. Jefferies, Moor Hall Gardens, Hadlow, Essex, showed magnificent blooms of F. S. Vallis, arranged with Beech and Maple foliage, and these were awarded the 1st prize. Six exhibits were seen in this class, the next best being a vase of the same variety shown by Mr. D. Fairweather, Bifrons Gardens, Canterbury.

A basket of autumn foliage and fruits.—Miss Cole was to the fore with a very large basket, tastefully decorated with Honesty, Iris fruits, Bracken, Clematis vitalba, Blackberries, Physalis, Mountain Ash, and many others of equal beauty.

Plants.

Six bush specimens.—1st, Mr. H. Runciman, nurseryman, Nightingale Lane, Wandsworth, with examples 3 to 4 feet in height, with about a dozen blooms on each, Japanese, Anemone Japanese, well grown and stiffly trained. 2nd, Mr. C. Hazelgrove (gr. to W. Bander, Esq., 13, Crescent Wood Road, Sydenham Hill), having taller plants carrying more blooms than the foregoing, that were less in size.

Four trained Pompon specimens.—2nd, Mr. Runciman.

Four trained specimens, any varieties.—Here the previously named exhibitor was again 2nd. So far as we could learn, no 1st prizes were awarded in either competition.

One trained specimen was shown by Mr. T. W. Stevens (gr. to W. H. Stone, Esq., Donnington, Sydenham); a good plant, finely flowered.

Amateur Classes.

Section A.

Keen competition was seen in these classes, and among the Japanese section some fine exhibits were staged.

Eighteen Japanese blooms, distinct.—Half-a-dozen good displays were seen. Not much difference in quality obtained between the 1st and 2nd prize groups, but J. L. Burgess, Esq., Fairford, Glos. (gr. Mr. J. A. Humphries), had slightly the better flowers, and he was awarded the premier prize. They were a fresh, even lot of blooms, the pick being Mr. F. S. Vallis, Ethel Fitzroy, Mr. T. Carrington, Mad. P. Radaelli, T. Humphries (small, but well coloured), Montigny, and Godfrey's Masterpiece. Mr. C. B. Gabriel, Horsell, Surrey, followed, having Mrs. J. Brooks, W. R. Church, Walter Jinks, Bessie Godfrey, Mrs. W. Knox, &c.

Twelve Japanese blooms, distinct.—One more exhibit than in the preceding class was seen, Mr. Cordell winning with large, refined blooms. He showed an excellent bloom of Walter Jinks, an Incurved mauve-pink variety.

Six Japanese blooms, distinct.—This smaller class brought eight entrants, the best being shown by A. F. Blades, Esq., Reigate, Surrey (gr. Mr. F. Cordell). The flowers were heavy, but somewhat flat. J. H. Doyle was a prominent variety. 2nd, D. Link, Esq., The Avenue, Beckenham (gr. Mr. Trowell).

The best six Japanese blooms of one variety were shown by W. H. Stone, Esq., Sydenham (gr. Mr. T. W. Stevens), the variety being F. S. Vallis.

Twelve Incurved Chrysanthemums, distinct.—This proved a weak class. Mr. A. Osmond won with much the best flowers among two, Mr. J. A. Humphries taking the 2nd prize.

Mr. Osmond also won in the class for six Incurved blooms, being again followed by Mr. Humphries; but they reversed these positions in the class for six Incurved blooms of one variety, the winner having Buttercup in splendid form.

Section B.

Special prizes were offered by the President and others in this section for a decorative display of Chrysanthemums arranged with any suitable foliage and occupying a table measuring 8 feet by 6 feet. Quality of flowers was not the first consideration, but lightness and general decorative effect. All flowers had to be grown by the exhibitor. There were not many exhibits, but the premier one staged by Mrs. Brewster, Canterbury, formed a charming display. It was decorated with small single and Pompon flowers in rustic flower holders, bowls, and as a centre piece a charming basket of the red Mrs. Chas. Curtis (single) with Asparagus and tinted leaves. 2nd, Mr. A. Taylor, 5, Vernon Terrace, East Finchley, with a more heavily arranged exhibit.

Eighteen Japanese blooms, distinct.—Mr. T. Sharpe, 1, Railway Terrace, Stone, Greenhithe, Kent, showed the better of two good exhibits, his competitor being Mr. T. J. Cutting, Hedley, Hendon, who was awarded the 2nd prize.

Twelve Japanese blooms, distinct.—Mr. Sharpe again won against rather stronger competition, there being five exhibits. His best flower was F. S. Vallis, but he had others of good quality,

notably Henry Perkins, Godfrey's Pride, and Valerie Greenham. 2nd, Mr. C. M. COLLINGWOOD, St. David's Hill, Exeter.

Twelve Incurved Chrysanthemums.—Not fewer than six varieties were permitted in each group. Mr. T. SHARPE won with much the best flowers, a really fine exhibit, the best among three.

Mr. T. W. STEVENS, Laurie Bank Gardens, Sydenham, showed the best pair of bouquets of Chrysanthemums, the one being composed of white and rose-coloured "singles," the other of small yellow and bronze-coloured decorative varieties, with Asparagus plumosus as greenery.

The best vase of five large Japanese blooms arranged with suitable foliage was put up by Mr. C. B. GABRIEL, Horsell, Surrey, who showed F. S. Vallis, with grasses, Oak foliage, &c.

Mr. D. B. CRANE, 4, Woodside Terrace, Archway Road, London, N., showed the best vase of large decorative Chrysanthemums, having yellow flowers with beautiful sprays of Berberis vulgaris.

Mr. W. C. PAGRAM exhibited the best vase of single Chrysanthemums.

CERTIFICATES TO NEW VARIETIES.

C. Fred Duck.—A Japanese variety of a shade of red, with a lighter reverse, a flower after the style of Mrs. F. W. Vallis. Shown by Mr. HENRY PERKINS, Greenlands Gardens, Henley-on-Thames.

C. Glitter.—A Japanese variety, described on p. iv. Shown by Messrs. W. WELLS & Co., Merstham.

C. Miss Olive Dumsday.—A small Japanese or market variety, of a soft shade of pink. Shown by Messrs. CRAGG, HARRISON & CRAGG, Heston.

C. Lizzy.—A single-flowered variety of a rosy-pink colour, with a white zone around the disc.

C. Beauty of Weybridge.—Another single flower, with bronzy-chestnut-coloured florets. The two last-named varieties were shown by Mr. W. C. PAGRAM, The Whim, Weybridge.

C. Mrs. H. Redden.—A large single variety, buff-yellow, faintly tinted with rose. Shown by Mr. F. MATTHEWS, Wood Lodge, West Wickham.

NON-COMPETITIVE EXHIBITS.

Mr. H. J. JONES, Ryecroft Nurseries, Hither Green, Lewisham, staged a magnificent group of Chrysanthemums that was awarded the Simpson Gold Medal as being the best non-competitive exhibit in the show. It was circular in form, and was arranged on a drapery of green muslin, in excellent taste. Large tripods furnished with Japanese blooms, handsome vases filled with choice blooms, dwarfer vases and clumps of decorative varieties interspersed with suitable greenery in the form of Ferns, Bamboos, Palms, and other graceful plants that gave additional beauty, all contributed to a magnificent display. (Large Gold Medal.)

Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, put up a large and beautiful group of Chrysanthemums that contained many excellent blooms of the best Japanese varieties, interspersed with epergnes of single and decorative kinds. The best feature of this praiseworthy exhibit was the extra good quality of the flowers it contained. (Small Gold Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, showed many large Japanese blooms, including very large flowers of Valerie Greenham, General Hutton, Botleigh Grange (crimson), Violet Carpenter (creamy-white Incurved), Mrs. A. T. Miller, &c.: also a table filled with the best single varieties, another of Celosias and winter-flowering Begonias, and vases of Zonal Pelargoniums, and a small group of select varieties of Cannas, including the new Franz von Vecsey (rosy-pink, a new shade in these flowers). Messrs. CANNELL also showed a fine display of hardy fruits, including about 150 varieties of Apples that were coloured to a high degree. (Large Gold Medal.)

Mr. J. WILLIAMS, 4a, Oxford Road, Ealing, W., showed a pretty exhibit, utilising metal arches, epergnes, &c., for the display of single varieties, relieved with autumn leaves. (Small Silver Medal.)

Mr. W. J. GODFREY, Exmouth, Devon, showed many of the newer varieties of Japanese Chrysanthemums, with epergnes of smaller flowering varieties at the background, the whole being relieved with sprays of ornamental foliage and having an edging of Asparagus Sprengeri and Panicum variegatum. (Silver Gilt Medal.)

Mr. W. J. COLE, Midland Road Nursery, Peterborough, showed blooms of Japanese varieties of Chrysanthemums in exhibition boxes and vases. (Small Silver Medal.)

Messrs. JOHN LAING & SONS, Forest Hill, London, displayed a group of pot plants of Japanese varieties of the best garden kinds, with a few plants of "singles" in the foreground. On an adjoining table Messrs. Laing exhibited small plants of Codiæums (Crotons), with Palms, Ficus radicans, &c. (Large Silver Medal.)

Mr. PHILIP LADDS, Swanley Junction, Kent, exhibited bunches of market varieties of Chrysanthemums. The blooms were not excessively large, but they were exceedingly bright, and quite the best for decorative purposes as cut flowers. On another table Mr. Ladds displayed Ericas in variety, Callas, Palms, Ferns, and other florist's plants. (Small Gold Medal.)

HOBBIES, LTD., Dereham Nurseries, Norfolk, showed garden Roses and the large Pæony-flowered Dahlias. (Silver Gilt Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, London, N., staged plants and cut flowers of choice American Carnations, and a handsome group of miscellaneous plants—Ericas, Liliums, Azaleas, Begonias, Ferns, Skimmia japonica in fruit, Astilbe (Spiræa), &c. (Small Gold Medal.)

Messrs. RASMUSSEN & CRONE, Woodbine Nurseries, Wanstead, N.E., filled a table with well-grown plants of Begonias Gloire de Lorraine and Turnford Hall. (Large Silver Medal.)

Messrs. HUGH LOW & Co., Enfield, showed plants and flowers of Carnations. (Large Silver Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, filled a large table with Chrysanthemums, having tripods of large Japanese blooms at the back, with single varieties in the foreground and vases of many of the newer Japanese kinds along the front. (Silver Gilt Medal.)

Messrs. CRAGG, HARRISON & CRAGG, Heston, Middlesex, displayed a large array of single Chrysanthemums in no fewer than 30 distinct varieties. (Large Silver Gilt Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, staged a collection of Apples and Pears, all well-grown produce. (Large Silver Medal.)

Royal Horticultural Society.

NOVEMBER 6.—The ordinary fortnightly meeting of the committees of this society took place on Tuesday last in the Society's Hall, Vincent Square, Westminster. The hall was by no means full of exhibits, but there was an excellent display of Orchids, and a group of Ferns from Mr. H. B. MAY, and one of fine foliage plants from Messrs. JAMES VEITCH & SONS well deserved the gold medals awarded for them.

The ORCHID COMMITTEE recommended four First-Class Certificates and seven Awards of Merit to novelties, and a Gold Medal for a collection from G. F. MOORE, Esq.

The FLORAL COMMITTEE recommended three Awards of Merit to varieties of Chrysanthemum, and similar awards to Crocus Boryi (Marathoniseus) and a variety of Capsicum annuum.

The FRUIT AND VEGETABLE COMMITTEE recommended a First-Class Certificate to Apple James Grieve, a variety which has been discussed recently in these pages.

At the afternoon meeting Mr. E. H. Wilson read a very interesting paper on his travels in Central and Western China, illustrated with lantern slides. Previous to the delivery of the lecture, Mr. Wilson was presented with a Veitch Memorial Medal by Dr. Masters, acting on behalf of the Trustees of the Veitch Memorial Fund.

Floral Committee.

Present: H. B. May, Esq. (in the chair), and Messrs. C. T. Druery, Geo. Nicholson, G. Reuthe, R. Hooper Pearson, C. R. Fielder, H. J. Cutbush, J. Jennings, C. Jeffries, Chas. Dixon, F. Page Roberts (Rev.), J. T. Bennett-Poë, C. E. Shea, E. H. Jenkins, W. J. James, W. G. Baker, J. Walker, and G. Paul.

Messrs. JAMES VEITCH & SONS, King's Road, Chelsea, showed a handsome group of stove plants, relieved with a number of showy Cattleyas and other Orchids. The group was very extensive, and was remarkable for the high culture seen in the plants, which were large specimens. A magnificent plant of Cocoloba pubescens (grandiflora) occupied a place in the centre of the display, and the corners were furnished with Aralia Veitchii, and Dracæna Victoria respectively. A row of Jacobinia coccinea found a place near the edge, which was finished with a row of small winter-flowering Begonias. Crotons, Alpinias, Aralias, Marantas, Anthuriums, Dracænas, and many other handsome foliage plants were the principal subjects of the group. A plant of Phyllotænium Lindeni, whose handsome sagittate leaves are veined with white, is deserving special mention. On an adjoining table Messrs. VEITCH displayed a number of winter-flowering Begonias. (Gold Medal.)

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, staged a group of Ferns of superior merit. The exhibit represented most of the genera of Ferns, and embraced 300 distinct species and varieties, that ranged from tiny members to large tree Ferns. A prominent position was given to Nephrolepis exaltata canaliculata (figured in the *Gardeners' Chronicle*, Sept. 15, p. 198). The curious form of Osmunda palustris var. Mayi (see fig. 65) was also represented. The group was rich in Nephrolepis, and among these were such fine things as N. Piersoni var. elegantissima, and N. exaltata superba (a grand plant). In the centre of the display was a batch of Adiantum Farleyense of remarkable culture, and overhanging these was a noble plant of Cibotium Schiedei, a handsome Tree-Fern. Drynaria quercifolia, the giant Oak-Fern, was represented by a well-grown plant, and near by was the rare Asplenium fijiense. The group reached the whole length of the building under the wall opposite the clock. We noted as especially choice, plants of Platycerium Congolense, the very graceful Davallia Veitchii, and Acrostichum linguæ (Gold Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, London, N., staged a pleasing group of plants, among which were seen retarded plants—Liliums, Azaleas, Lily-of-the-Valley, &c., clumps of Ericas in variety, Astilbe (Spiræas), Skimmia japonica, with standard-trained plants of Cotoneaster buxifolia, Palms, &c., interspersed among them. Messrs. CUTBUSH also displayed some vases of winter-flowering Carnations. (Silver-Gilt Flora Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, showed choice Carnations of the popular American varieties. (Silver Flora Medal.)

Mr. C. ENGELMANN, Horneybrook Nurseries, Saffron Walden, showed vases of Carnations and Sweet Peas.

Messrs. W. WELLS & Co., Merstham, Surrey, staged a semi-circular group of Chrysanthemums of the best single varieties, and a few large blooms of Japanese varieties. (Bronze Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, displayed several interesting plants, including the curious Narcissus viridiflorus.

Mr. G. REUTHE, Keston, Kent, showed some choice Alpine and bulbous plants, and several hybrid Nerines. (Bronze Flora Medal.)

LEOPOLD DE ROTHSCHILD, Gunnersbury Park, Acton, W., displayed a hanging basket of Callicarpa purpurea, whose long growths were furnished at each node with panicles of the pretty lavender-coloured berries.

Mr. J. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, again showed small-berried plants of Aucuba vera.

Mr. GEO. H. SAGE, 71, Manor Road, Richmond, showed a very fine blue Violet, much resembling the variety Princess of Wales, but said to be of exceptional robustness and very floriferous. It was named London Market.

Messrs. J. PEED & SON, West Norwood, London, staged a large number of Alpine plants, among which were many hardy succulents.

Messrs. RICHARD SMITH & Co., Worcester, again displayed dwarf trees, shrubs, Conifers, &c.

AWARDS OF MERIT.

Odontoglossum amabile "*Celestial*."—This variety was included in a group of these plants shown by J. GURNEY FOWLER, Esq., Glebelands. There were many varieties shown, but Celestial was selected as being of great decorative value. The fruits are somewhat wedge-shaped, but often almost conical in shape, always broader at the base. The mature fruits are of deep and rich red colour, but previously they are pure white or cream coloured. In either stage they are ornamental, and in some cases fruits in either stage could be seen on the same shoot.

Chrysanthemum Buttercup.—A large, bold-looking Incurved flower of rich golden yellow colour. The florets are moderately wide, and the variety is already very popular at the exhibitions. Shown by Messrs. W. WELLS & Co., Ltd.

C. Glitter.—This variety has very deep flowers composed of somewhat short florets, and will doubtless be suitable for decorative uses and for market supply. In colour the flowers are a very rich shade of yellow. Shown by Messrs. W. WELLS & Co.

C. Mrs. Brewster.—A semi-double-flowered variety, having several rows of bronze-coloured florets, and a yellow ring round the somewhat prominent disc. The plant, as shown, was a magnificent specimen, very full of flower. It is a good decorative plant, but the blooms lack refinement. Shown by Mr. D. FAIRWEATHER, Canterbury.

Crocus Boryi [*Marathonisicus*].—This variety has pure white flowers 3 inches across, with broad, obtuse petals. The centre, which is composed of the bases of the petals, is of bright canary yellow. The style is 1¼ inch long, and has a much divided, reddish stigma. The foliage is very narrow. Shown by Mr. GEO. REUTHE.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. secretary), Harry J. Veitch, Francis Wellesley, De B. Crawshay, R. B. White, W. A. Bilney, H. A. Tracy, J. W. Potter, H. Ballantine, W. H. White, R. G. Thwaites, A. Dye, W. H. Young, G. E. Moore, A. A. McBean, F. Sander, W. Boxall, and J. Colman.

G. E. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr. Mr. Page), had one of the most extensive and elegantly-arranged groups of the year, and for which the Society's Gold Medal was recommended by the Committee. The centre was of finely-flowered specimens of Oncidium varicosum and other graceful species, and midway between the centre and each end were batches of Dendrobium Phalænopsis, showing great variety, two of the best being the pure white variety hololeuca, and the charming white and blush variety Miss Louisa Dean. Other fine effects were made by selections of rare and handsome Cypripediums, including most of the best forms of C. insigne, C. Olivia, C. Evenor, C. Maudiæ, Dendrobium superbiens, D. bigibbum, a nice selection of Cypripedium Fairrieanum grouped with some of its hybrids, and a very great number of other showy varieties.

J. BRADSHAW, Esq., The Grange, Southgate (gr. Mr. Whitelegge), was voted the Gold Medal for a very fine group, the centre of which was of white forms of Cattleya labiata, which included the varieties alba, G. G. Whitelegge, R. I. Measures, Lowiæ, Amesiæ, Penelope, Daphne, and others. The coloured varieties of C. labiata were equally remarkable, Hector and Hercules being two model and finely-coloured flowers. On each side were a fine selection of Cattleya Mantini, C. Mrs. J. W. Whiteley, and other hybrids, including fine forms of C. Fabia, C. Fabia alba, Lælio-Cattleya Decia alba, and other handsome Lælio-Cattleyas. Two of the most beautiful and richly-coloured in the group were L.-C. Haroldiana "John Bradshaw," which made a sensation when it secured its F.C.C. in 1903, and has since improved, and Cattleya Bowiana Rosita, which is a very good companion to the other variety mentioned. The unique yellow Oncidium Forbesii Bradshawiæ, the yellow Odontoglossum Lindeni, the white Brasso-Cattleya Queen Alexandra, and many other rare species were also noted.

Messrs. CHARLESWORTH & Co., Bradford, secured a Silver-Gilt Flora Medal for a very fine group rich in handsome hybrids finely grown and well flowered. Of the most remarkable were a beautiful Odontoglossum Phœbe, with a spike of fifteen finely spotted flowers; a selection of Brasso-Cattleyas, two batches of the showy Lælio-Cattleya luminosa, and similar arrangements of Cattleya Ferdinand Denis, a few choice Cypripediums, and of species and varieties a plant of the rare Bulbophyllum Remwardtii, three white forms of Cattleya labiata; Odontoglossum crispum La France, a finely formed, prettily spotted variety, and other fine Orchids.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), was awarded a Silver Flora Medal for an interesting group, in which were a good example of Vanda Sanderiana, some excellent Cattleya labiata, C. Mantini, and other Cattleyas; the beautiful Cymbidium erythrostylum, a good selection of Cypripediums, including the massive yellow and white C. Troilus, Cattleya labiata Princess of Wales, a nice white variety, Lælio-Cattleya luminosa, &c.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr. Mr. W. H. Young), was awarded a Silver Flora Medal for a pretty group, the leading plants in which were some fine Cattleya Fabia, Miltonia Bleuana "Our Queen," a very delicately tinted variety, and Odontoglossum Skinneri splendens, with a fine rose-spotted lip. The group also included a selection of Cypripediums, including Fairrieanum and two good C. insigne Harefield Hall, the dark-red Sophro-Cattleya Veitchii, and other showy hybrids.

H. S. GOODSON, Esq., Putney (gr. Mr. Davis), secured a Silver Flora Medal for a group of good Cattleya labiata, Odontoglossum grande, Cypripediums, &c., the best plants being Cypripedium Chapmani superbum, C. Maudiæ, C. Chas. Rickman, C. Memoria Moensis, and C. Niobe superbum.

Messrs. SANDER & SONS, St. Albans, secured a Silver Flora Medal for an excellent group, in the centre of which was a noble plant of Cymbidium Tracyanum magnificum, with five spikes. The forms of Cattleya labiata included several white varieties, and the hybrids were of excellent quality. Cattleya Fabia The Queen and C. Lord Rothschild alba being two white-petalled forms of great beauty. A fine specimen of Cycnoches peruvianum, a good selection of Cypripediums, &c., were also noted.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. Hudson), was awarded a Silver Banksian Medal for an effective arrangement of Oncidium varicosum, Vanda cœrulea, Cattleya aurea, and Epidendrum vitellinum, set up with Maidenhair Ferns and variegated Panicum.

Mrs. SPICER showed a group of Cypripedium Spicerianum, for which a Silver Banksian Medal was given.

R. I. MEASURES, Camberwell (gr. Mr. Smith), secured a Silver Banksian Medal for a group in which were noted good Cattleya Bowringiana and its hybrids, a selection of Cypripediums, including Chas. Rickman, varieties of C. insigne, C. Chixia, C. concolor-tonsum, C. Allardianum, various Masdevallias, &c.

Messrs. J. W. MOORE, Ltd., Rawdon, Leeds, were awarded a Silver Banksian Medal for an interesting group, in the centre of which was a specimen of Vanda cœrulea with many spikes, Cymbidium Tracyanum, Aerides Lawrenceæ, and other uncommon species. The Cypripediums included a pretty and finely coloured hybrid between C. œnanthum superbum and C. vexillarium, and another distinct and pretty cross between C. tonsum and C. Godefroyæ. Good forms of C. Euryades and others were also noted, and among species a very fine variety of C. Dearei, Odontoglossum madrense, Masdevallia gemmata, M. Davisii, Stanhopea churnea, &c.

Messrs. STANLEY, ASHTON & Co., Southgate, staged a group which contained the rare Odontoglossum Duvivierianum, Cattleya Fabia alba, C. F. W. Wigan, C. aurea, C. Dormaniana, varieties of C. labiata, &c.

Messrs. HUGH LOW & Co. had a small group of fine Cattleya labiata, the variety King of Greece being white, with a slight blush tint on the lip; a nice white Dendrobium Phalænopsis, Cypripedium Milo, Westonbirt variety, and other good varieties.

Messrs. EDGAR & Co., South Woodford, had a group of Cypripediums, &c.

FRANCIS WELLESLEY, Esq., Westfield, Woking, showed Cypripedium Felicity superbum, a charming light-coloured form; C. Sheba, Westfield variety (Harrisianum superbum × triumphans), one of the darkest hybrids, with shining dark mahogany-red flowers with a white margin to the dorsal sepal; Cattleya labiata Wellesleyæ, a very large flower, broad in all its parts, bright rose with purplish-rose front to the lip; Lælio-Cattleya Kelpie (Cranstoniæ × aurea), and the fine C. × Germain Opoix, Westfield variety. (See Awards.)

Major G. L. HOLFORD, C.I.E., C.V.O., Tetbury (gr. Mr. H. G. Alexander), sent Cattleya Fabia illustris of very rich colour, C. fulvescens, and the pretty variety delicata, Cypripedium Charlesianum virginale, and two others, for which see Awards.

Sir TREVOR LAWRENCE, Bart., Burford (gr. Mr. W. H. White), sent Cattleya Clarkiæ and C. Ella, both hybrids of C. bicolor, and three others, which secured awards.

JEREMIAH COLMAN, Esq., Gatton Park (gr. Mr. Bound), sent a selection of Cattleya labiata, C. Portia, C. Fabia, &c.

The Marquis DE WAVRIN, Somerghem, Belgium (gr. Mr. de Geest), showed the new Cattleya Adrienne de Wavrin (maxima × Warscewiczii).

Mr. MEERTENS, Mont St. Amand, Ghent, showed a small selection of hybrid Orchids.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Leda, Westonbirt variety (superba × aurea), from Major G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. Alexander). A very beautiful hybrid with finely-formed flowers of thick substance and bright rose in colour, the showy lip being ruby crimson, with gold veining at the base.

Cypripedium Germain Opoix, Westfield variety. A great beauty, only second to the phenomenal C. Thalia Mrs. Francis Wellesley, which it resembles in its perfect form and in the disposition of the colour. Dorsal sepal very large, closely set with dotted, blackish purple lines on a yellowish ground, the margin being clear white. Petals broad, tinged with purplish-brown, and bearing blackish spots on the lower halves. Lip yellowish, tinged on the face with purple.

Cattleya Fabia superba (labiata × aurea), from from Sir FREDERICK WIGAN, Bart. (gr. Mr. W. H. Young). A grand variety of a very dark colour, the lip being velvety purple with gold lines at the base.

Cattleya labiata Capt. J. F. Laycock, from Captain J. F. Laycock, Wiseton, Bawtry. Probably the finest, typical, coloured C. labiata yet shown. Flowers rich purplish-rose, the large lip ruby-purple in front with a narrow light margin.

AWARDS OF MERIT.

Cattleya fulvescens delicata (Forbesii × aurea), from Major G. L. HOLFORD. A very pretty hybrid with greenish-buff sepals and petals and yellow lip veined and tinged with purplish-brown, the front tinged rose.

Cattleya Fabia Bradshawiana, from J. BRADSHAW, Esq. A very handsome and finely-coloured variety.

Cypripedium nitens, Ball's variety, from Major G. L. HOLFORD. Upper sepal green with spotted lines of dark chocolate; upper part white.

Cattleya Mantini, Fowler's variety, from J. GURNEY FOWLER, Esq. (gr. Mr. Davis). The darkest and brightest form, flowers bright purplish-rose with maroon lip with gold veining.

Lælio-Cattleya Golden Beauty (L.-C. Ernesti × Hy. Greenwood), from Messrs. SANDER & SONS. A fine hybrid with clear yellow flowers having a ruby blotch on the lip.

Dendrobium Phalænopsis splendens, from W. M. APPLETON, Esq., Weston-super-Mare. Flowers bright magenta-rose with white bases to the segments.

Cattleya Mantiniæ superba (Loddigesii × labiata), from Messrs. J. W. MOORE, LTD., Rawdon, Leeds. A pretty form of the hybrid which originally flowered with Messrs. Veitch in 1878. Flowers of good shape, rosy-lilac.

BOTANICAL CERTIFICATE.

Epidendrum floribundum, from Sir TREVOR LAWRENCE, Bart. Flowers in erect spikes, the pure white lip spotted purple.

(Continued on page 339.)

PACHIRA AQUATICA, A STOVE TREE FROM TROPICAL AMERICA, WHICH FLOWERED RECENTLY AT GLASNEVIN.

THE HERBACEOUS PHLOX.

IT has interested me lately to see this fine subject taken in hand as a speciality, and on a large scale, by more than one firm of florists, notably by Messrs. Gunn, of Olton, near Birmingham. Presumably, they have a suitably moist and heavy soil, with facilities, perhaps, for copious watering. Under less favourable conditions, Phloxes were scorched and starved out of recognition in the fierce and ceaseless drought of the past summer and early autumn.

There is a great deal still to be done in the development of the Phlox along its best and most legitimate lines of excellence. Hitherto the work has been almost exclusively in the hands of Continental raisers, notably of Messrs. Lemoine, of Nancy, but there is no reason why it should not be pursued in England, where there is always such a demand for improved herbaceous plants. There is sometimes a difficulty in ripening seed in a cold English August or September, but this can be met by growing single spikes under glass. The Phloxes have always been favourites of mine, and I have watched their progress with some attention during the past 25 years or so. A great many varieties have been distributed season after season, some with considerable brilliancy and purity of colour. But the advance, on the whole, has not been so large as might have been supposed, and in certain important respects there has indeed been a loss. It seems to be too readily taken for granted that a plant must be improved all round when it gets into the hands of a keen worker. But the truth is that in the concentration of effort upon some one of the attributes of a flower, other points may be effaced which contribute to make up the plant's entirety of beauty. Looking back to the early eighties, when I began to seek out the best "Phlox decussata" obtainable from Mr. T. S. Ware, of Tottenham, and other nurserymen, it seems to me that it was a better thing—speaking broadly and taking into account all its points—than it is to-day. To review some of its characters severally, in height it was a stately plant, ranging from 3 to 5 feet or more. In those days we had none of the modern dwarf race, 18 inches, or even only a foot high. As Mr. E. H. Jenkins observes (p. 222), such a Phlox as the white Tapis Blanc (see fig. 74 in *Gardeners' Chronicle* for September 8) may be useful as a bedding plant in companionship with coloured plants which demand similar conditions of moisture. But the trouble is that when raisers hit upon a greatly dwarfed seedling of a Phlox, or any other naturally tall plant, they are apt to fall in love with the small form, as a novelty, and to employ it to reduce the stature of the whole of their seedling output. Now a Phlox 4 or 5 feet high, with a dozen great spikes, is a magnificent object in the late summer border, and has not its equivalent in any other plant. No other can give a mass of salmon-scarlet or clear white at a yard and a half from the ground. But "pretty" is the comparatively insignificant word one would use of a Phlox, however vividly red or purely white, if only 12 inches high. *There is not enough of it.* It is as great an error of judgment to reduce a Phlox to this pigmy size as it would be to shorten a Delphinium or a Foxglove to a few inches. In Messrs. Gunn's catalogue, probably the best and most complete of modern Phlox, out of 113 varieties, 61 are under 3 feet and only 10 over. Thus not only a few varieties, but the whole race has suffered this dwarfing process. The panicles of the older Phlox were deeper—the tendency now is towards a flatter, shallower head—and the stem for some way down threw out charming little successional sprays of bloom, which lengthened the season and were most useful for cutting. To give an instance, the comparatively new white variety Mrs. E. J. Jenkins has this excellent habit, and is proportionately more valuable than the more massive Sylphide with its one broad head of finer flowers. But the greatest loss of all is that of the shining black stem which used to be associated with the richer reds. I cannot now buy a Phlox with this stem, though I have it in some of my own raising. Twenty or more years ago I obtained from Mr. T. S. Ware a variety named Triomphe du Parc de Neuilly, a lovely thing, with coral-salmon flowers of an exquisite tone, and very dark, polished stems. Such a flower as this seemed a promising element in breeding, and I found it readily transmitted its qualities. Unfortunately, a run of dry summers, on the hot chalk soil of my former home, forced me to abandon the cultivation of Phlox, and in course of years both the original and most of its seedlings disappeared. It is strange that the French raisers, who would be thought to have an eye for the beauty of such a feature, should have thrown away the dark stem and put the enhanced orange-scarlet of flowers like Etna and Coquelicot on plants with coarse green stems and leaves too pale to accord with the bloom. Colour is indeed all that these varieties can claim, for Etna has poor, scanty panicles, and the much-praised Coquelicot has a flimsy flower of very bad shape. An individual Phlox flower should be very slightly reflexed, with thick, much overlapping petals, whereas Coquelicot is somewhat cupped, with thin, ill-formed petals. Its colour, too, to my eye is harsh, and wanting in the delicacy of tone of some of the older Phloxes, which did not strike the eye so much. The most desirable colours in the Phlox, that is to say, those that are most valuable because scarcely to be found in other herbaceous plants, are difficult to describe. The nearest one can get is to say they are compounds and links between scarlet, orange, pink, and salmon. The terms "coppery" and brick-red are also fairly descriptive. Messrs. Veitch's series of Javanese Rhododendrons present something of the same delightful range of colour. There is scarcely a pure dark red; the old Coccinea is the best known to me. Whenever I meet the epithet "crimson" in a list of Phloxes, I always suspect at least a tinge of the unpleasant magenta. The purples and so-called blues are one and all impure in colour, and are also common and not distinctive—i.e., can be found abundantly in other herbaceous flowers. It is true that tastes in colour differ, but it is also true that there is such a thing as a positively bad colour in a flower. In my judgment, coloured Phloxes with white centres are a mistake. They are fashionable with the French raisers, but this inverted colouring gives a weak and washed-out appearance to the spikes. Pale salmon-pinks, really pure, with no trace of blue, are rare and desirable, and quite self-coloured flowers without darker eyes would be effective and an acquisition. A yellow herbaceous Phlox is a possibility. I once had a single flower of pure and very beautiful yellow on a truss of one of my own salmon-pink seedlings, but though I self-fertilised it and used every grain of its pollen to cross other suitable flowers, nothing came of it. It is difficult to get seed from the advanced scarlets and salmons, the whites for the most part seed readily. The most beautifully pure white known to me is Amazone, but it is not tall enough. Sylphide is very fine, having a great truss of very large, solid flowers, remarkably stout in growth with dark foliage. But an occasional plant will have all its flowers stained with pink, and it makes few side shoots. It is a fault that too many of the best white varieties are too early to flower with the coloured; good late whites are wanted. Another mistake has been the aiming at too dense a spike, so that the flowers crowd one another and the spike cannot clear itself of water in wet weather. The white La Fiancée and the otherwise good pink Lady of the Lake are instances.

PROPAGATION.

The best routine of propagation is to strike short, stout cuttings in March, plant them out in reserve beds of rich soil when rooted, and move them to permanent quarters in September. In light soils they will not stand more than three years, but in cool, heavy soil,

with ample surface-food, I have had five-year-old clumps giving such a mass of splendid bloom as cannot be obtained from younger plants. Phloxes will flower to perfection in situations where they never see the sun at all, and this is the only way to keep the vivid but fugitive salmon-scarlets from bleaching—an inseparable defect of their quality. It is a pity that the badly-named Phlox suffruticosa—the name is much more appropriate to the larger Phlox decussata—has almost disappeared from our gardens and nurseries. The probable reason for this neglect is its still greater impatience of drought and its earlier season, bringing it more into the heat of summer. But the refined wax-like texture of its flowers, especially in the white varieties, makes it well worthy of care in our cooler soils. *G. H. Englehcart.*

FRUIT REGISTER.

EARLY DESSERT APPLES.

I HAVE not noticed that either of your correspondents have mentioned Mabbott's Pearmain. This I find a very prolific variety, of a suitable size either for market or private consumption, handsome appearance, good flavour, and what many now prefer, soft-fleshed. This is in excellent condition during October. It follows James Grieve, and is in turn followed by Cox's Orange Pippin, thus bridging over what is sometimes an awkward period in keeping up a regular supply for dessert. I am not sure whether James Grieve will not be more satisfactory on the crab than on the Paradise stock, unless the nurserymen confine themselves to the one kind of Paradise stock. Worcester Pearmain has colour to recommend it, but beyond that one

FIG. 133.—NEPETA VEITCHII, SHOWING THE LEAVES.

may go into the Devonshire orchards and find a sweet cider Apple equally good. Wealthy is fit for use during October, but is too acid for many. It crops well, and the fruits colour well. *T. H. Slade, Feltimore, Exeter.*

——I think that your correspondents (see pages 249 and 920) will find all that they require in September Beauty, an Apple very like in appearance and quality to the good old Ribston Pippin. The tree is a good bearer and clean grower, and the fruits ripen in the last half of September and the first half of October. It is catalogued by Messrs. J. Veitch & Sons, but I cannot find it in any other lists that I have by me. *Fredk. Bedford, Straffan House Gardens, Co. Kildare.*

——The late Mr. Harrison Weir stated in a letter to the *Gardeners' Chronicle* (vol. xxxvii., page 124): "Some people prefer an acid or semi-acid Apple, others one that is less so, while a large number give preference to varieties that are sweet, and not a few like what is termed a pine flavour." When reading the recent notes on "Early Dessert Apples," the opinion then expressed came to my memory. Are there not Apples which ripen in September possessing the flavour, and in some cases the colour, to suit the most fastidious? It is true that locality, soil, &c., have an important bearing on this question, and trials of the various kinds cannot always be undertaken, but the following Apples ripen in September, possess a distinct flavour, and have been pronounced excellent individually:—Akero syn. Okera, Duchess's Favourite, Devonshire Quarrenden, Kerry Pippin, Langley Pippin, Red Astrachan, September Beauty, Worcester Pearmain, William's Favourite, and Yellow Ingestre. Care must be taken when purchasing Yellow Ingestre that a true stock be obtained. *C. R.*

NEW OR NOTEWORTHY PLANTS.

NEPETA WILSONI, DUTHIE N. SP.*

A HARDY herbaceous perennial, 2 to 2½ feet high, with crenate leaves and large, handsome, dark blue flowers arranged in distant clusters. Its affinity is with N. macrantha of Fischer, from which it may be distinguished by its crenate leaves and much broader bracteoles. It was introduced by Mr. E. H. Wilson from Sungpan, in the extreme west of China, and flowered at Coombe Wood for the first time in August, 1905. (*Hortus Veitchii*, p. 425.)

NEPETA VEITCHII, DUTHIE N. SP.†

A HANDSOME herbaceous perennial, with crenately dentate leaves and large light blue flowers arranged in distant clusters. This plant is very similar both in habit and foliage to specimens collected by Souhé (No. 918) near Tongolo, in E. Tibet, during the year 1893. In the latter, however, the leaves are more distinctly crenate, the flowers are smaller, and the bracts are proportionally much broader. N. Veitchii was raised at Coombe Wood from seed collected by Mr. Wilson in Western China. The accompanying illustrations are from photographs kindly taken by Miss Temple, at Kew, from a living specimen.

* NEPETA WILSONI *n. sp.* Herba perennis 3-4.5 dm. alta. Caules acute quadrangulares, angulis puberulis, saepe purpurei. Folia 6-3.7-6 cm. longa, 2.5-3.2 lata, breviter petiolata, superiora subsessilia, ovato-oblonga, obtusa, basi truncata vel rotundata, margimbus late crenatis, supra subglabra, subtus pallida et puberula; costa venisque prominentibus, rubescentibus. Flores violacei, in verticillastros distantes dispositi, breviter pedicellati. Bracteae inferiores foliaceae, sursum minores, apice basique acutae, margimbus integris. Bracteolae oblique elliptico-lanceolatae, acuminatae, calyce breviores, margimbus ciliatis. Calyx bilabiatus, 1.3 cm. longus, dense pilosus, labio superiori breviter 3-fido, inferiori ad medium 2-fido. Corolla circa 2.4 cm. longa, tubo erecto, basi alho, sursum curvato, superne amplato, labio superiori 2-fido, lobis lateralibus rotundatis, terminali suborbiculari, emarginato, margimbus reflexis, medio elevato, piloso. Stamina superiora paulo exserta, filamentis glabris, antheris demum divaricatis. *J. F. Duthie, Kew.*

NEPETA VEITCHII, *n. sp.* Herba perennis, tota pilis minutis subhispida; caules usque ad 18" poll. alti, acute quadrangulares. Folia decussata, infima petiolata, superiora sessilia, 2.5-4.5 cm. longa, circa 1 cm. lata, anguste oblongo-lanceolata, acuta, basi cordata, margimbus valde crenato-dentatis, summa rugosa, subtus prominenter reticulata. Verticillastri 6-7 flori, internodiis inferioribus 4.5-5 cm. longis. Bracteae inferiores foliaceae, sursum minores. Bracteolae setaceae, calyce breviores, 1-nervia. Flores manifeste coerulei. Calyx 2.3 cm. longus, ad medium bilabiatus, tubo 15-nervis, lobis anguste lanceolatis, apice setaceis, margimbus ciliatis. Corolla 2.8 cm. longa, lateraliter compressa, tubo 1.9 cm. longo, deflexo, superne amplato, labio inferiori 3-lobato, lobis lateralibus rotundatis, terminali medio elevato, apice late emarginato. *J. F. Duthie, Kew.*

COLONIAL NOTE.

UNMATURED POTATO SEED IN INDIA.

INDIA probably affords in this matter of unmatured Potato seed the greatest example of the axiom that "necessity knows no law."

Within 50 miles of the railway down at the foot of the Kumaon Himalayas is a large scattered area largely devoted to Potato culture; indeed, so first-class are the profits on this crop compared with any other, and so liable are the prices to go very low, and to rise to magnificent proportions, it is the one

FIG. 134.—NEPETA VEITCHII IN FLOWER.

crop grown in these parts about which there is extraordinary keenness, and no small amount of speculation. Here is a brief example. Only yesterday 45 mules arrived here, the previous understanding being the buyer was coming for Potatos at Rs.2-8 per maund, say, 3s. 4d. per 100 lb.; but the market is rising, so my seller is given a hint, the mule men have come 25 miles, an Indian altercation takes place—a very characteristic affair—words flow, mules go half a mile, a halt is called, another conference—and a good smoke—during which time they all sit down in the road; result, after two hours vigorous parley, Rs.2-10-9 per maund. It takes an Englishman a quarter of a lifetime to understand the finesse of dealing with the very astute Indian.

At this time of year innumerable ponies, mules, donkeys, and coolies are incessantly on their way up and down the hills for about six weeks, all taking Potatos down to Haldwani, a small town some four miles below the foot of the Himalayas. The aggregate of these amount to a lakh or two of maunds (a lakh is a hundred thousand, and a maund of Potatos, that is, Haldwani maund, is 100 lb.).

While it remains a fact that the bulk of these Potatos are for consumption, it is yet true that many hundreds of maunds are sold for "seed." It is likewise true that October is the great month for digging up in the Himalayas, and also the great sowing month on the plains, and that, too, with these self-same Potatos. They go direct from the Himalayan field to be sown on the plains field, and a matured seed Potato, as understood in England, is quite an impossible institution—that is, on the plains of India. Here in the Himalayas, with a climate which much more closely approaches a mild West of England clime than that of the rest of India,

we get the matured Potato and plant in April much as in England.

These October-sown Potatos come to maturity on the plains principally in February, and while they do not produce such a large crop, and the tubers and quality are not equal to the Himalayan-grown Potato, nevertheless Potato culture on the plains from hill seed is quite a success.

But such are the hot season and the subsequent monsoon on the plains, that up to this date the plains Potato-grower has wholly failed to save seed for succeeding year from plains crop, and it is quite certain that every mountaineer Potato-grower is ready to respond, "Amen, so let it be," for in his inability to save "seed" depends the permanent demand on the mountains for many tons of Potatos annually.

It is a remarkable circumstance that while we have a marvellously forceful period of full three months—July, August, and September—during which time the rainfall is enormous, and vapour dense and prolonged, my own estate enjoys one of the smallest rainfalls in the province, as during these three months it was 40 inches, while the town of Naini Tal, 14 miles away, had in the same time upwards of 100 inches, yet the real Potato disease is unknown here.

By far the worst evil is supertuberation, due in nearly all cases to delayed monsoon, or erratic seasons.

I would draw the particular attention of Potato experts to the fact that something more than rainfall, and moisture in abundance, are necessary to establish these, and these alone, as the great predisposing causes of the disease. We have a vastly greater and continuous rainfall for three months, with dense vapour prolonged for many days together, veritable cloudland, but no Potato disease!

At the same time important differences should be noted. During this period the temperature rules high by day, and about 60° by night; the elevation is great, and possibly the density of vapour is less than in sea-level countries. But the main fact to which I personally attach much importance is gradient. There is no such thing as water-logged soil, drainage is everywhere perfect, so much so in fact that after, say, a 6-inch rainfall, the next day will afford no visible evidence of any such fall: it simply rained the previous day. The mountains summarily reject all excesses of rainfall. Hence, after heavy rain, the surrounding ravines roar like distant thunder, with rushing waters from the mountain slopes.

I suggest herein is the great matter. The dominating cause of [the growth of the fungus causing] Potato disease is, in the main, a question of drainage, far more than of atmosphere; and I suggest to those having land with gradient to try experiments, running the Potato lines with the gradient, and never across it or obliquely; earth up well, and see the results. For example, the Welsh mountains should grow Potatos wholly free from disease, that is, if sound Potatos are planted to begin with. *F. W. Sears, Hasia Dunga, viâ Naini Tal, India.*

AUTUMN CROCUSES.

By autumn Crocuses we do not mean Colchicums, which are often so called, but true autumnal flowering Crocuses. Many of these are, or were till lately, in great beauty in the open air at Kew, but bearing in mind the uncertainties of the climate in November, it would seem preferable to grow them in a cold frame. All the species were monographed in these pages both by Mr. Baker and Mr. George Maw. The last-named botanist eventually published a superb monograph of the genus with 67 coloured plates.

CROCUS HADRIATICUS.—A white flowered species native of Greece and Albania. The leaves are ciliate at the edges. Maw (tab. 30), though retaining the specific name, says he cannot distinguish it from C. sativus except in the colour of the flowers, but there are white forms of sativus growing at Kew.

C. CANCELLATUS.—A species of wide oriental distribution, great altitudinal range and consequent great variation in colour, whence several varieties, or, as some would say, species have been enumerated. The typical form is blue. Maw, tab. xxxib.

C. TOURNEFORTII.—A Grecian species with lilac flowers. The stamens are densely pubescent thus offering a point of distinction from C. Boryi.

C. ASTURICUS, a common species in the north of Spain, with flowers very variable in colour, ranging from lilac, deep purple, or pure white.

C. CLUSII is also a Spanish species extending into Portugal. The rich red papillose seed, says Maw, serves to distinguish it from any other west European species.

C. OCHROLEUCUS, a native of Syria, with flattish corms and cream-coloured flowers. Maw, tab xi.

C. LONGIFLORUS, a native of southern Italy, Sicily, and Malta; distinguished from C. sativus by its glabrous leaves and red seeds. Maw, tab xxviii.

C. BORYI MARATHONISEUS.—Crocus Boryi is a Grecian species, flowering in late autumn, and producing whitish flowers, with much divided, orange-coloured stigmas, longer than the anthers. In the variety marathoniseus, according to Mr. George Maw, the stigmas are less divided, and do not usually exceed the anthers in length. The transverse section of the leaf shows the margins of the leaf recurved, and a midrib very prominent but flattened on the under surface. Our illustration was taken from a specimen exhibited by Mr. Reuthe, of Keston. For full details we refer to Mr. Maw's paper in *Gardeners' Chronicle*, vol. xvi., p. 559, and especially to his Monograph of the genus Crocus (1886), p. 241, tab. 47b.

FIG. 135.—CROCUS BORYI MARATHONISEUS: FLOWERS WHITE.

KEW NOTES.

THE GREENHOUSE AT KEW.

MOST of the varieties of Chrysanthemums are well-known decorative kinds, practically all the sections being represented. Some of the bushes of the single, pink variety Ladysmith must be nearly 6 feet through. Specimens of Soeur Melanie, Ryecroft Glory, James Salter, Source d'Or and La Triomphante are almost, if not quite, as large. Most of the plants are naturally grown bushes, and very little disbudding has been done. Dotted here and there amongst them are seen examples of the beautiful blue-flowered Salvia

azurea grandiflora (syn. Pitcheri) and Cosmos bipinnatus. The latter plant is naturally late in flowering outside, but grown in pots it is very useful for the cool greenhouse. The plants average 6 to 8 feet in height, and have rose, purple and white flowers. Two large standard plants of Sparmannia africana, already well clothed with flowers, from the quantity of buds visible, give promise of continuing effective for some time to come. The giant Groundsel, Senecio grandifolius, is conspicuous with its very numerous golden-yellow flowers, forming a head 18 inches to 2 feet across. Readily propagated from cuttings in spring, the plants can be plunged in pots outside in summer, until the flowers commence to open usually towards the end of September.

Probably the most interesting plant in the house just now is Montanoa (Montagnea) mollissima represented by a specimen 10 feet in height. A handsome shrubby Composite from Mexico, the ray florets are white and the disc florets yellow. Judging from the habit and free-flowering qualities, it should be a good plant for cultivation in large conservatories. The specimens in a group of Cassia corymbosa growing in 5-inch pots; average 18 inches to 2 feet in height. Each plant has two or three growths terminating in corymbs of yellow flowers. Raised from seeds last year, the plants were cut back to within 3 or 4 inches of the base in spring. Towards the end of July the pots were half plunged in ashes in the open air and liberally supplied with manure water. The orange-red flowers of Leonotis Leonurus are very prominent on one of the side stages with a groundwork of Begonia Knowsleyana. Tecoma Smithii is represented by good heads of tubular yellow flowers. Growers often fail with this species, because the plants do not perfectly mature their growths. A rich patch of yellow is furnished by Jacobinia chrysostephana, quite a contrast to another member of the same genus close by, namely J. Ghiesbreghtiana with less conspicuous, red flowers. Lindenbergia grandiflora is a pretty Himalayan plant with numerous axillary, yellow flowers. The white variety of the Willow-leaved Angelonia salicariaefolia succeeds well treated as an annual. The half-hardy perennial Saxifraga Fortunei with its light panicles of white flowers and dark green leaves is growing in 5-inch pots. The re-introduced Buddleia asiatica has very fragant flowers, thickly arranged on long racemes. The following species and varieties of Ericas are in flower here. E. mammosa, E. gracilis, E. conspicua, E. verticillata major, E. melanthera, E. hyemalis, and the variety alba. *D. D., November 7.*

NERINES.

These lovely South African bulbs constitute a genus of beautiful and desirable plants. There are not more than a dozen species, but varieties and hybrids are numerous. They are all natives of the Cape, excepting N. japonica, syn. Lycoris radiata. Some may be grown in the open air in the warmest parts of the country, such as the well-known N. sarniensis, or "Guernsey Lily." One chief point of value in Nerines is that they flower during the autumn. Their colours are vivid, and range from the most brilliant scarlet, through rose and pink, to the most delicate tints. Their requirements are easily afforded, but, unlike a good many bulbous plants, they make their growth during the dark days of winter, and should therefore be afforded all the light possible at that time. After the flowering period, which is during September and October, the plants should be grown on shelves near the glass, in a cool, well-ventilated house, facing due south, having an atmospheric temperature at night of 45° to 50°. Watering should be judiciously done during the last two months of the year, one or two applications each week being quite sufficient for their requirements; but with the turn of the year and brighter days they require looking over every other day. When they commence to show signs of decay, water should be gradually withheld. While at rest the plants should be cleared of all dead foliage and placed in frames in the full sun, baking them all through the summer months, keeping them entirely without water until the flower scapes appear, which will be at about the middle of August. Any potting that is necessary should now be taken in hand, shaking the roots free from all the old soil, and replacing it with good fibrous loam and sand. Use comparatively small pots, a pot-bound condition being favourable for the production of flowers. This operation provides an excellent opportunity to clear the bulbs of any pests that may infest them, mealy bug being the most troublesome. Stand the plants, whether repotted or not, in pans containing water, allowing them to become thoroughly soaked, afterwards placing them in the glasshouse to flower. All the species may be crossed freely with each other, and advantage should be taken of a sunny day for pollinating the flowers. When the seeds are ripe they should be sown in a light, sandy compost, in pots containing good drainage, only affording the seeds a very slight covering. Stand the pots in an atmospheric temperature of 70°, and afford water freely to the roots till growth is well advanced. Prick off the seedlings into pans or pots filled with a similar compost, after which place them in an atmosphere of intermediate temperature well up to the glass. Young bulbs usually flower when four to five years old, whereas, if one has a frame in which frost is excluded, planting out the young bulbs in a good light soil would, no doubt, bring about a stronger growth and the plants would flower at an earlier period than if kept in pots.

The accompanying illustration (fig. 136) shows Nerine flexuosa alba, which belongs to a distinct group, differing from the N. sarniensis type in having small and differently shaped flowers. The plants were treated as described above, and not as evergreens, as in some establishments. *G. H. Banks, Botanic Gardens, Cambridge, October 30, 1906.*

Fig. 136. Nerine flexuosa var. alba.

VEGETABLES.

ONION CULTURE.

In reference to *A. D.'s* note, p. 305, I recommended, when lecturing some few years ago, the culture of autumn-sown Onions to market-gardeners. I knew that they grew a large quantity of these Onions, but all were pulled up when they were green, and my advice to them was that they should leave some to mature, as large Onions were in demand, and were largely imported. Some of the members of my audience gave significant nods to each other, which I took as signs of approval of my remarks, but I afterwards learned that they were smiling at my ignorance, for the growers had found to their sorrow that persons refused to purchase these home-grown Onions, whether spring or autumn sown. They prefer those grown in Brittany or in Egypt, for they contend that these are milder in eating. Is this due to climate or to the variety? In this part growers sow the white Lisbon variety, the bulbs of which are white, and for that reason sell readily in the market. These Onions are dibbled into the ground, and the growers are not particular if they drop two or three plants into the same hole. By this manner of planting they are said to winter well. Tons of this vegetable also come from other parts of the country, for Onions are hawked about before our Lancashire bulbs are ready. *W. P. R., Preston.*

POTATO SEED-TUBERS FROM IRELAND.

The trials of Potatos undertaken by Messrs. Sutton & Sons at Reading have attracted widespread attention. The comparative trial of South of England, Lincolnshire, Scotch and Irish-grown seed seems to be regarded as the most important and far-reaching of the series.

Having had the honour of contributing the Irish seed of five out of the eight varieties tested, four of which came out "on top," and having been unable to accept Messrs. Sutton and Sons' kind invitation to be present at their demonstration when the facts could have been stated, I beg to ask your kind permission to make the explanation now.

The "seed" of Up-to-Date supplied had been

grown here for the three previous years, that of Duchess of Cornwall, King Edward VII., and British Queen for two years, and Sutton's Ninetyfold (seed direct from Sutton's) for one year.

The following table of results may prove of interest:—

	Irish. lbs.	Scotch. lbs.	Lincolnshire. lbs.	South of England. lbs.
Up-to-Date	172	76	100	33
Duchess of Cornwall	112	101	85	27
Sutton's Ninetyfold ...	98	65	53	10
King Edward VII. ...	81	59	59	22
British Queen ...	165	130	111	58
Totals	528	431	408	150

The supremacy of the Irish-grown seed in this unquestionable test, supplemented as it has been by similarly marked success in other English trials, notably those of the Harper-Adams Agricultural College in 1906, and of the Surrey County Education Committee in 1905 and 1906 (for both of which I also supplied the Irish seed), is a factor of much importance to Ireland.

Irish farmers should, in the words of the *Farmers' Gazette*, now turn their energies to the great market for the dispersal of large quantities of sound, reliable Potato "seed" which lies open before them, and it is entirely dependent on their own tact and enterprise whether they shall go in and take possession of the advantages offered.

As was wittily said at the Sutton demonstration, "The Irish growers have the ball at their feet if they had only elbow grease enough to kick it."[!]

Unfortunately for the average Irish farmer, there appears to be only one Potato—the worn-out Champion. This, in spite of constant and widespread failure, he still clings to, and he will doubtless continue to grow it long after it has caused his death from starvation [!] *J. F. Williamson, Summer Hill, Mallow, Co. Cork, November 9, 1906.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

RAINFALL AT LEONARDSLEE.—During the month of October, the rainfall was 4·50 inches, and during the present year 21·86 inches; from November 1 to November 8, 3·17 inches have fallen. In October, 1905, the rainfall was 1·41 inches, and for the year 18·13 inches. *W. A. Cook, Leonardslee, Sussex.*

RIVERS' CONFERENCE PEAR is now in use and comes in well between Souvenir du Congrès and Pitmaston Duchess. It flowers later than most varieties and sets a fair proportion of fruit. It is of excellent flavour and has flesh of a deep reddish colour. Here, at an altitude of 300 feet, we have had a good crop of Pears. The rainfall for the month of October measured 4·96 inches. *Wakefield, Yorks.*

COLOUR IN APPLES.—*D.* (p. 295) when raising the question of the merit that colour possesses in a culinary Apple, might have gone a step farther and made the same inquiry in the case of dessert kinds. In both instances this skin-deep beauty is about the first thing to be discarded before the fruit is eaten, and everyone knows that a greenish-coloured fruit of Blenheim Pippin is excellent in eating. In judging Apples, however, colour in all classes should, I think, be taken into account, just as the "bloom" on the Grape and the "netting" on a Melon merit attention. Generally the external appearance of a fruit is an evidence of good cultivation, and in Apples it may be due to the influence of stock, soil, or locality. Growers in districts where fruits do not usually colour well are handicapped when in competition with others from districts where high colouring is general. In such a case, and at a great fruit show, two sections of a given class would meet the objection: for example, Cox's Orange Pippin (*a*) and Cox's Orange Pippin (*b*), the colour being regarded in the one class and disregarded in the other. *E. H. Jenkins.*

RE-NAMING VARIETIES OF AMERICAN CARNATIONS.—I may remind *New Yorker* (p. 314) that, although the flowers of Carnations may be identical in colour and in general build, it does not prove them to be of the same variety, since the habit of growth in the two plants may be, and often is, quite distinct. As to the new variety Mrs. W. T. Omwake and Rose Enchantress *New Yorker*, while blaming the importers for this so-called renaming, seems to be unaware of the fact that certain of the American horticultural journals freely advertised the variety for some weeks, and some growers on this side of the Atlantic bought it under the two names and now, at flowering time, they are discovering them to be one and the same variety. It is obviously a case of sporting in several districts spontaneously and hence different names have been given. I believe Enchantress has sported, not only in America, but in Guernsey and in England, a case in point being White Enchantress and Ivor White, which are identical. Royalty and Fascination (not Fascinator) are not parallel instances, for these were, I believe, renamed by market growers. To show that British firms have some sense of just dealing, I may instance that Messrs. Cutbush, in their new Carnation list, cite Mrs. W. T. Omwake as "a deep pink sport of Enchantress." Could anything be more clear than this? although the firm adheres to the name under which the variety was imported. *E. H. Jenkins, Hampton Hill.*

——— Mr. Engelmann's letter (see p. 328) certainly enlightened me respecting Carnation Mr. W. T. Omwake, but I "guess" he is wrong when he calls Rose-pink Enchantress no good. The true sport is undoubtedly the finest Rose-pink Carnation existing as yet, and is being bought in thousands by the Chicago growers, but it only proves the foolishness of English growers buying from stocks they know nothing about, and from firms they never hear of again. Further, Mr. Engelmann displays lack of information by classing Mr. W. T. Omwake (as grown in England) with Helen M. Gould. I have seen the latter on show, also growing at home. It is a winner. If Mr. Engelmann's stock of Enchantress has thrown off twelve sports, he can "calculate" that it is a very poor one, and I advise him to change it, but he will find that many of his so-called sports are not fixed. My main object in writing was that the raiser of Victory may be given fair play, and if it eventually proves that St. Louis and Victory are identical, could not the Royal Horticultural Society step in and prevent the use of the second name? No one would think of robbing a famous artist of the credit for painting a great picture. *New Yorker.*

AN APPEAL TO CHRYSANTHEMUM LOVERS. At the banquet given to the Jury and Officials of the French N.C.S. at Caen, M. Philippe Rivoire announced that while at Marseilles he had learned that the two grand-daughters of M. Blancard were living in London, and were in a state of pecuniary distress. There is no need to remind the readers of the *Gardeners' Chronicle* that we owe the introduction of the large-flowering Chrysanthemum to M. Blancard, who in 1789 imported it from China into France. Considering the enormous success of this flower in England during the time that has elapsed, I am sure there must be many growers and admirers of our popular autumn flower who would like to spare a trifle to help these two ladies. The French N.C.S. started a subscription list with 100 francs, which will be supplemented by other donations on the part of French Chrysanthemum growers and admirers. M. Rivoire has asked me if I will interview the ladies later, and I have promised to do so, as they are living in London. This is a matter that will be brought before our own National Chrysanthemum Society in due course, but if there are any readers of the *Gardeners' Chronicle* who are not members, but who would like to help these ladies no matter in how small a way, I should be extremely glad to hear from them, or to receive any contributions they may like to send me. *C. Harman Payne, 141, Wellmeadow Road, Catford, S.E., Foreign Secretary, National Chrysanthemum Society.*

WILLOWS.—Mr. Adams (see page 327), is no doubt right in advising that the close-barked Willow only should be used, as, without doubt, at the present time it is much more valuable than any other variety, but I fear he must be wrong in stating that Willow of this class realises from 12s. 6d. to 15s. per foot cube. Never having been able to obtain anything approaching this figure when selling this class of timber, and now having some to dispose of, I should be only [illegible] to learn of so desirable a market. Again, from my experience, he is wrongly informed when stating that the open-barked Willow is used only for cricket bats, as it is the close-barked or white Willow that makers of bats are so keen in obtaining and who will only give a very poor price indeed for the other variety. I believe, when planting, if young trees, say from 10 to 15 feet in height, grown from small cuttings could be obtained they would be far preferable to sets. *George Wood, Brandon.*

POTATO TRIALS AT WISLEY.—With a desire to see trials of Potatos at Wisley conducted on a much wider basis than now exists, the six hitherto conducted there and at Chiswick being limited to a test of varieties only, I suggested at a recent meeting of the Fruit and Vegetable Committee that the Council of the Royal Horticultural Society be invited to have at Wisley a series of trials of Potatos relating entirely to the results seen in planting tubers of the same variety derived from diverse localities, and Mr. Wright said the matter should have full consideration. This question of the effect of planting seed-tubers from Northern, Irish, and Midland soils here in the South is of first-class importance. My own limited trials have shown it so conclusively that for the moment the matter holds first place in Southern Potato commerce. I trust that not only will the Council sanction the proposed trial, but will also authorise Mr. Wright to obtain seed-tubers of not fewer than twelve varieties which may have been grown at Wisley this year, and of which some thirty tubers of each can be saved for planting, getting duplicates of these varieties from both the East and West coasts of Scotland, from Yorkshire, Essex, and Ireland, and using those of his own sowing from the Wisley sand. Ireland must be on no account left out of the trial, because tubers from that country are found to have first-class reproductive powers. With respect to the planting of immature or unripe tubers, and mature or ripe tubers of similar varieties, as a farther trial, that cannot be done at Wisley next year, the immature tubers not being available. But were, say, a dozen tubers of as many of the varieties from Scotch or Irish seed planted separately from the former trial to be lifted whilst still immature and the tips green, then the farther trial could be carried out the following year on lines of the utmost fairness. In both these matters the Wisley Potato trials would have interest of the highest importance for all concerned in Potato culture. *A. D.*

THE MARKETING OF FRUIT.—The announcement by the Swanwick and District Fruit-growers' Association (Hants.), that one of the chief objects of its existence is to check the alleged "unreasonable dealings of salesmen," has brought forth a letter of remonstrance from Mr. W. B. Shearn, vice-president of the London and Provincial Fruit Buyers' Association. Mr. Shearn writes:—"I should like to point out to the fruit-growers their own unreasonable mode of dealing, in the strawberry season especially, when they send their strawberries in eaten-weight baskets instead of using baskets of an average weight, as they have been asked to do for years. The baskets they send hold from 2½lb. to 6lb., and that is where the unreasonableness of it comes in, as the grower who sends the 2½lb. basket expects as much money returned as the one who sends the 6lb. basket." The foregoing letter bears out in a remarkable degree the remarks contained in an article entitled "The Strawberry Crop"—and which referred to this particular district of Hampshire—published in the *Gardeners' Chronicle* of July 28 last (pp. 72-74). The passage in question ran as follows: "If the Hampshire grower could improve his methods still further by using baskets of one uniform size with a guarantee to the salesman and the subsequent purchaser as to the nett weight of the fruit, the kind of package he employs could hardly be improved upon." It is indeed a great pity that the English fruit-grower cannot bring himself to adopt more careful methods in his business. In this respect he has much to learn from the foreigner, who learned long ago that his chance of disposing of his goods at satisfactory prices depended a great deal upon the manner in which those goods were marketed. The English grower, on the

other hand, often seems to think that it does not matter in the least how he sends his fruit to the shop or the salesman, the outcome of which state of affairs is a feeling of mistrust between grower and distributor—a feeling which extends to the customer when he finds that he is more often than not buying a "pig in a poke." The customer likes to know the quality and quantity of what he is buying, but he is often very much in the dark in both these respects when he purchases fruit put up in growers' original packages, as Strawberries from the Swanwick district usually are. It is as bad a policy to give short weight as it is to put the inferior fruit underneath and the good on the top. A salesman will naturally be more pleased to handle fruit which is carefully graded and carefully weighed, because the sale of such fruit is easy and entails little trouble in handling. Growers who are particular in these respects will therefore get the top prices of the market, and their fruit will be sold first, while the improperly-graded and short-weight consignments of others wait until the majority of the salesman's customers are satisfied. Fruit packages of this latter description are profitable neither to the producer, the salesman, the retailer, nor to the eventual purchaser. It is very evident therefore that while the British fruit-grower may have many grievances, the remedy of which is quite outside his power, the salesman has similar reason for complaint against the producer. And the sooner that every fruit-grower realises that it pays to be especially careful in marketing his fruit, the better will it be for the reputation of British fruit generally. Above all, it will do more than anything to keep the foreigner out of our own markets. We should, at least, not be too proud to learn for ourselves what he has been teaching us to do ever since he invaded the markets of Great Britain. *East Sussex.*

THE PREVENTION OF CORRUPTION BILL.—As a 45 years' subscriber without a break, perhaps you will allow me to join *A. T.* and *J. F.* in protesting in this matter, now that some your correspondents, like *A Briton*, for example, have had their say. I am neither going to condemn nor defend the discount practice, but I protest against the conspicuous manner in which gardeners and other private estate employees have been dragged into notice in the Parliamentary discussion of the Bill, and by almost every paper that has discussed the subject, as if they were the greatest and only sinners, whereas, probably, their share in the business has been infinitesimal. Gardeners' average salaries are, if anything, below the living wage figure, and probably no class stands more in need of the discount on their comparatively insignificant purchases, or are to be more excused for accepting it. Gardeners who accept discount are, at any rate, in first-class company. The practice pervades nearly all industries. The poor gardener and nurseryman "cannot hold a candle" to the big manufacturer and his customers. What would you say of a pair of pomes, worth a hundred guineas each, and a carriage, given in the expectation of favours to come or already had, in the way of discount, or of cellars stocked with wines on the same principle, probably without the word "discount" ever being uttered? These are samples of what happens, and could be vouched for, between vendors and purchasers of "materials" for certain nameless departments and contracts. I am not personally concerned in such transactions, but the facts are common knowledge in certain quarters, and I am sometimes so placed that I cannot help knowing of them or being told. Indeed, Chambers of Commerce have often alluded to such things at their meetings. I am not pleading justification, but I am a gardener—an honest one, I hope, and have been disgusted at the way in which the gardener has been made a scapegoat, and one of the excuses, at least, for the Act. The authors of the Bill, when it was introduced, were careful to avoid giving offence by any allusion to corruption among the audience they were addressing, some of whom must have grinned. The gardener, the coachman, the cook, and the butler are the wicked ones. The idea conveyed to outsiders was that the promoter or promoters of the Bill had quarrelled with their domestics about perquisites, and rushed to Parliament in a vindictive temper against the whole fraternity. What would be far better than any Act of Parliament would be for employers to allow their gardeners to receive the few shillings or pounds discount after bills and prices had been scrutinised and goods got at a reasonable price. At one nobleman's place that I can speak for this was done, and, in order that the heads of departments might have their proper share of the discount, the gardener, coachman, cook, housekeeper, and butler were all allowed to pay their own bills, and then return the vouchers to the estate office. It is not discount that hurts estate owners so much as gross neglect and mismanagement in high quarters. As regards the Corrupt Practices Bill itself, as far as its practical application is concerned, it is not worth twopence halfpenny of bad money, because it may be easily defeated without risk or danger. That anyone with the least glimmer of common sense can see. The Act is being simply treated with derision in business circles at the present moment. Let your "influential body of nurserymen" come out with their manifesto by all means, and publish the same in their catalogues, and we shall see who gets the discount. It won't be the buyer. That game was tried years ago by a well-known London firm now defunct, and gentlemen were flooded with circulars on the subject. The failure was complete, and much fun was made of the reformer in the gardening Press at the time. There is, moreover, another aspect of the subject. Gardeners' working hours are, nominally, about the same as those of others, but the hours gardeners actually work, or are obliged to be on duty, including Sunday and night work, average 11 hours per day or more, for which they seldom receive or expect any acknowledgment. A few shillings or pounds discount under such conditions need not cause any great qualms of conscience. *Scotch Thistle.*

———From the articles recently appearing in your paper it appears to me that there is no need for so much alarm about the subject. This new Bill was never intended for the seed or nursery trade, but to put a check upon municipal and other large bodies. My experience of many years has been that the majority of gardeners in England are engaged at low salaries (and, in many cases, too low), with the understanding of the employer that, after the house is supplied, the surplus can be disposed of for the gardener's benefit, also that they are allowed to take 5 per cent. from nurserymen or seedsmen, and, in some cases that have come under my notice, the employer gives instructions for his gardener not to deal with firms who do not give this amount for themselves. I fail to see where "corruption" comes in in making a present to a man any more than giving a waiter a tip. There can be no bribery in that, as in both instances value has been received. I do not think there is a firm of any good repute that would offer bribery as an inducement to get orders, but a legitimate old-standing arrangement of 5 per cent. (not more) no employer could possibly object to, as it is simply an encouragement for the gardener to look properly after the seeds, plants, bulbs, or whatever may have been supplied. There should be a straight line drawn, and the sooner the better; and I think the London trade should all meet as soon as possible and settle the matter before the 1st of January, so that all connected with the horticultural trade should know how to proceed for 1907. "*Viator*" (*Nurseryman*).

The Week's Work.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Climbers on trees.—In addition to those plants enumerated in these notes last week as being suitable for covering the stems of trees, there are many others, foremost amongst which are the Clematis, especially the early summer flowering *C. montana*, and *C. flammula*, which flowers late in autumn. For a giant Pine the Virginia creepers, particularly *Vitis quinquefolia muralis* (*Ampelopsis Engelmani*), would make a capital plant. One can readily imagine its fine colour in the autumn making a brilliant picture conspicuous to the eye from far and near. *V. monstans* (*A. Veitchi*) on the trunks of the least ornamental trees of the pleasure grounds proves effective, and its use in this manner is desirable. *Schizophragma hydrangeoides* (*Hydrangea scandens*), a Japanese plant, is a distinct climber, with picturesque habit, and is excellent for covering the clean boles of an Ash tree. In seashore gardens, as, for instance, in Cornwall, it grows with vigour, and attains to a great height, but it is doubtful if the species is sufficiently hardy in localities other than those in the south and south-west. *Polygonum Baldschuanicum* is a beautiful hardy climber, eminently adapted for smothering a dwarf tree or shrub. It grows to the height of 20 or 30 feet in a very short time, and its graceful pendent fascicles of white—slightly rose-coloured—flowers, which appear twice a year, are distinctly pretty. *P. multiflorum* is even a quicker and more vigorous grower than *P. Baldschuanicum*, but more tardy in its flowering. It is a desirable addition, however, to tree Climbers, for ever, without flowers it is handsome, owing to its peculiarly tinted foliage in summer, and in winter because of the attractiveness of its numerous long, slender, reddish stems.

The Ivy.—In regard to ornamental trees care should be taken now and every winter to examine them all and remove that most rapacious of climbers, the common Ivy. If this has not been done annually, and the work is only to be commenced at the present time, then caution and much discretion must be exercised. If Ivy has once secured full possession of a tree, it is wise to leave it undisturbed, but means should be taken to safeguard sound trees from its attack.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Late Cauliflowers.—Cauliflower plants are not capable of standing so many degrees of frost as Broccoli. Any "heads" becoming fit for use should be cut immediately, and those not so far advanced can safely be lifted and transplanted into frames. The check to the growth suffered at this season of the year is not so severe as it would be during hot summer weather, so there need be no fear of failure. Young seedling plants wintering in frames need an abundance of fresh air, and this may be admitted on mild days. Keep the plants as hardy as possible.

Winter Cucumbers.—The next two months form the most critical period for this crop. The short, dull days are not favourable to the production of fruitful growth. Keep the young shoots thinly trained, and apply frequent top dressings to the roots to encourage them to extend. The water should be heated to the same temperature as that of the atmosphere before its use for syringing or for applying to the roots. It is advisable to keep a supply of young plants in various stages of growth, instead of trying to continue through the winter with an unhealthy or unfruitful batch; employ a succession of young and more vigorous plants. Bottom heat is an essential aid to cultivation in winter, and there should be plenty of material available at the present time at least for making hot beds. Lockie's Perfection is one of the best winter fruiters.

Tomatos.—The present is a good time to sow seeds for raising plants to fruit early next year, and if successfully grown they should afford ripe fruits early in May. Select a variety that "sets" its flowers easily, such as Winter Beauty, a variety which is at the same time a good serviceable one for any purpose. An excellent yellow fruit, somewhat plum-shaped, is Sutton's Sunbeam. Tomatoes are more eagerly sought for early in the year than at any other season. Tomato plants in bearing should have the side growths removed when they are still quite small. If the plants have set a good crop, a slight top dressing with soil having a little wood ashes and "Le Fruitier" manure mixed together, will sustain the growth and help the fruits to grow to a larger size.

Early Potatos.—"Sets" intended for early forcing should now be gently started into growth by placing them in boxes in any house having an atmospheric temperature of about 50°. By Christmas time the tubers should be nicely sprouted and the sprouts should be thinned to not more than two growths as soon as this can safely be done.

Expose the tubers to the full light in order to strengthen the young growth. The tubers used for this purpose should have been selected when the previous crop was being dug, and some "greened." If this was done there is a better chance of sound growth than when the tubers are bought straight from the vendor and immediately started into growth. Last season I tried many varieties in frames for experiment, and the best of them for early digging was Sutton's Ringleader, Sharpe's Victor, May Queen, and Sutton's Gladiator. The last-named variety is an improvement on May Queen, and, being handsome and of good quality, it will be sure to meet with much appreciation.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Figs in Pots.—Trees that require larger pots should be attended to at once, and any that only need top-dressing should also be given immediate attention, so that they can be placed in the forcing house by the latter part of the present month. The pots should be plunged in a bed composed of fresh leaves and long stable litter, which will furnish a steady and lasting bottom heat. The Fig requires considerable heat and a humid atmosphere to induce it to start into growth thus early. The best compost for potting or top-dressing is a rather strong loam, with a sprinkling of wood ashes, half-inch bones, and a little Kirk's Vine Manure, with plenty of old mortar added. The soil should be made very firm in potting, and reach to within 2 or 3 inches of the top of each pot, which space will allow of a further top-dressing later on. As Figs require a large quantity of water, both at their roots and overhead, during the first few weeks of active growth, perfect drainage must be provided in the receptacles. Little pruning of the branches will be necessary, but some of the stronger roots should be cut back a little. If the trees are infested with red spider or with brown scale, they must be thoroughly cleansed with sulphur and Gishurt Compound dissolved in warm water, and applied with a stiff brush. The temperature to commence with should not be lower than 50° Fah. at night time, with a rise to 60° or more by day, maintaining the bottom heat at 60°, and, as the trees burst into leaf, increasing the day temperature gradually above 60°.

Propagating Fig-trees.—If it is intended to increase the stock of any particular variety, the present is a suitable time to propagate the Fig by means of cuttings. These should be made of ripened growths, and be placed around the sides of 5-inch pots, or singly in 3-inch pots in sandy soil. Plunge the pots in a brisk bottom heat, when the cuttings will soon form roots and be ready for potting singly into 4 and 5-inch pots. Keep them in active growth and pinch the shoots occasionally to obtain well-shaped trees. A trio of good varieties for early fruiting are Osborne's Forcing, White Ischia, and Negro Largo. The last-named variety is a somewhat vigorous grower, and, if planted in the border, needs almost annual root-pruning to maintain the tree in a fruiting condition.

Bananas.—Suckers that have been planted in their permanent fruiting beds should be given liberal supplies of water at their roots, and if either mealy bug or scale is present, early remedies should be applied to eradicate the pests. The temperature of the house should be maintained at 65° at night time, with a rise of 5° during the day. If a little bottom heat can be given them it will be an advantage. Musa Cavendishii is one of the freest fruiting and best all-round varieties.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Raspberries.—The Raspberry requires a good well-drained soil, and a fairly open situation. The best varieties are Hornet, Norwich Wonder, Superlative, Carter's Prolific, Baumforth Seedling, and, as an autumn fruiter, Belle de Fontenay. Yellow fruiting varieties are not cultivated largely, for they are generally weak growers, and the flavour of the fruits is not of the best. The Raspberry is not a deep-rooting plant, therefore, if the ground has been trenched recently it will not be necessary to do it again before planting, but if the soil is hard and unfertile it should be trenched. A good dressing of lime, burnt rubbish and manure should be worked into the soil. The best system of training the canes is to horizontal wires stretched from iron standards. Wooden posts can be used, but iron lasts much longer. Wooden poles, if employed, should be creosoted or painted with "Stop Rot." The uprights should be a foot higher than the canes are trained, for this will allow a net to be thrown over them to protect the fruits when ripe. Three wires will be sufficient, and of these the top one should be 6 feet and the first at about 2 feet from the ground level. The canes should be planted about 9 inches to a foot apart. A mulching of dry straw litter or manure should be placed over the roots after planting as a slight protection from frost. It is not advisable to plant in wet weather. In established plantations of Raspberries the canes should now be tied in position their full length, and be pruned later on. It is advisable not to prune till the end of February. Do not tie the canes too closely together, but remove all weak ones if this has not been already done. Any suckers should also be removed. A goodly sprinkling of lime about their roots will be an advantage, and after this is applied cover it with a good mulching of manure.

Black Currants.—All "big buds" should be picked off and burnt, and the trees should receive a spraying with XL.-All winter wash, and at the same time a thorough dressing of lime. If bushes are very badly infested with the mite they should be grubbed up and burnt and a fresh plantation made elsewhere, with healthy bushes. Black Naples, Carter's Champion, and Boskoop Giant are all good varieties. The Black Currant does not require much pruning, merely the wood thinning out and the bush made shapely.

Red Currants may be pruned any time after the foliage has fallen. If the branches have been summer pruned, the main shoots will not require much shortening, but if the bush is as large as is desired, then hard pruning produces the best results. Use a spraying of petroleum emulsion to render the buds distasteful to birds.

The Fruit Room.—Arrange the fruits in their order of ripening. The fruit room should be aired constantly, especially during damp, wet weather. I have finished gathering Doyenné du Comice Pears to-day (Nov. 7), but Olivier des Serres, Glou Morceau, and a few stewing varieties are yet firm on the trees. Apples Bismack Beauty, Schoolmaster, and Dutch Mignonne are still ungathered. Quinces and Medlars will soon be ready for harvesting.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cattleyas and Lælias.—The spring-flowering plants that have completed their new growths will now require less water at the root. Expose them to the sunlight so that the newly-formed pseudo-bulbs may become thoroughly matured. Plants of C. Lawrenceana that are in mid-growth should also be placed in the lightest position possible. Afford water to plants of this species very carefully, as the young growths are liable to decay if there is any excess, especially in dull or wet weather. C. gigas, C. Dowiana, and its variety aurea being at rest should be kept on the dry side; the same remarks apply also to C. labiata when it has passed the flowering stage. After the flowers are cut it is advisable to remove the remaining part of the spike and sheath down to the base of the leaf, and as close to the apex of the pseudo-bulb as possible, so that it will not be possible for them to set up decay in the new pseudo-bulbs, which, if so affected, would need immediate amputation. C. Bowringiana, when it has done blooming, may be repotted, and after that operation has been done the plant should be only sparingly watered.

In the cool house plants of Sophronites grandiflora will soon begin to unfold their glowing scarlet flowers. The plants will require copious waterings at the root, and if one part of the house is warmer than the other it is there that the plants should be arranged, keeping them elevated well up to the light. S. g. Rossiteriana, S. rosea, and C. cernua require similar treatment, but the pretty S. violacea succeeds better in the cooler part of the Cattleya house. The hybrids which have been obtained from S. grandiflora are charming plants when in bloom. The following are among the best of these hybrids:—Sophro-Cattleya Chamberlainiana, S.-C. Queen Empress, S.-C. eximia, S.-C. Calypso, S.-C. George Hardy, S.-C. Batemanniana, S.-C. Leemani, S.-C. Saxa, also Sophro-Lælie Heatonensis, S.-L. Gratrixiæ, S.-L. Orpetiana, S.-L. Marriottiana, S.-L. Psyche, S.-L. Veitchii, and its variety Eros, &c. These plants grow very well in summer when suspended from the roof of the intermediate house, but the slightly warmer atmosphere of the Cattleya house is preferable for them during the winter months. At all seasons these hybrids are at various stages of growth, and where a collection of them is formed, some will be in bloom during the greater part of the year. Those plants which are growing and sending up flowers will need plenty of water at the root; prevent water lodging in the centre of the young growths, as they and the flower-buds are apt to decay from this cause; others which have completed their growth and have done flowering will need very little water at the root, affording just sufficient to keep them in a fresh and plump condition.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Clevelea, Allerton, Liverpool.

New Holland Plants.—Afford as much space as is possible to these plants on the stages, in order to admit a free circulation of air about them, without which hard-wooded plants will not remain in a healthy condition. At this season of the year, when the external air is heavily charged with moisture, a little heat should be circulated in the pipes to maintain a somewhat dry atmosphere. The plants should be carefully guarded against mildew, the presence of which may, if neglected, prove fatal to the plants. A preventive, and also a check, to the spread of the disease may be found in dusting lightly the under sides of the leaves with sulphur, and this should be done at intervals through the dull, damp days of winter. Great care should be taken in applying water to Epacris, Epacris, and New Holland plants generally, as these firmly-potted subjects do not absorb much moisture at this season of the year. Rainwater should be used exclusively, and it should be given in sufficient quantity to thoroughly moisten the whole "ball" of earth. Watering should be done early in the day, as this will allow the atmosphere to become somewhat drier before night-time. No plants recently repotted should be placed where cold draughts from the ventilators can reach them, but they should be allotted a position in the warmer part of the house. A temperature of 48-50° Fah. during the day-time will suffice for most of the Cape and New Holland plants, with a minimum of 45° at night, but Pimelias and Statices should have a warmth 10° higher than these temperatures.

Hardy plants for forcing, which have been suitably prepared in the reserve ground, should now be potted. Lift the plants carefully with a good "ball," retaining all the fibrous roots, for the destruction of these causes the plants to drop their buds prematurely, and often causes the plants to die. A careful selection should be made, choosing plants which have their buds well set. When potting, see that the soil is worked down to the bottom of the pots and made firm. Azaleas need a compost of two parts peat and one of loam, with a free addition of sand, while loam and leaf mould will suit most other hardy plants. After potting, afford the plants a good watering and plunge the pots in ashes in a spot where a little frost will reach them, for after being subjected to this, they will respond more readily when brought into the forcing house. Forcing should be done gradually, and especially does this apply to Azalea mollis and its varieties.

General Remarks.—Any decaying leaves on plants in pits and frames must be removed. Take every opportunity of affording ventilation, especially to frames containing Violets, otherwise many of the flowers will be injured by damp. Early batches of Fuchsias, Primulas, and Cyclamen, will benefit from a little heat in the pipes necessary to maintain a night temperature of 50°. The plants will improve by an application, twice a week, of some approved fertiliser. Do not allow the chemical to get into the crown of the Cyclamen, or injury may result to the flowers that are now pushing.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Nov. 17	German Gard. Soc. meet.
MONDAY,	Nov. 19	Nat. Chrys. Soc. Com. meet.
TUESDAY,	Nov. 20	Roy. Hort. Soc. Coms. meet. Hort. Club meet. British Gard. Assoc. Exec. Council meet. Leeds Paxton Soc. Chrys. Show. (2 days).
WEDNESDAY,	Nov. 21	Darlington Fl. Sh.
THURSDAY,	Nov. 22	Manchester & North of England Orchid Soc. meet.
FRIDAY,	Nov. 23	Aberdeen Chrys. Sh. (2 days).
SATURDAY,	Nov. 24	Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—41·7°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, November* 14 (6 P.M.): Max. 49°; Min. 45°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November* 15 (10 A.M.): Bar., 30°, Temp., 50°; Weather—Dull.

PROVINCES.—*Wednesday, November* 14 (6 P.M.): Max. 50° Liverpool; Min. 42° England N.E.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Roses, Plants, Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY TO FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Sale of Nursery Stock at Bullhousen Farm Nurseries, Bisley, by Protheroe & Morris, at 12.

WEDNESDAY—
Palms, Azaleas, Roses, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.
Fourth Annual Sale of Fruit Trees at Platt Nurseries, Borough Green, Wrexham, by Protheroe & Morris at 11.30.

FRIDAY—
Orchids in variety at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Land Tenure Bill.

In connection with the movement for extending to nurserymen, seedsmen, and florists the benefits conferred by the Agricultural Holdings Acts on market-gardeners and farmers, and which it is proposed to extend still further by the Land Tenure Bill, as explained in our previous issues, an influential deputation, representing the Horticultural Trades' Association of Great Britain and Ireland, waited upon Lord Carrington, as President of the Board of Agriculture and Fisheries, on Monday last. The deputation, which was introduced by Mr. Marnham, M.P., consisted of the following well-known gentlemen: Mr. T. A. H. Rivers (President), Harry J. Veitch, George Bunyard, A. G. Jackman, Stuart H. Low, H. Morgan Veitch (hon. solicitor to the deputation), and Charles E. Pearson (hon. secretary of the association).

Mr. RIVERS (the president of the association) explained that it was seriously open to doubt whether, owing to the peculiar wording of the Agricultural Holdings Acts, nurserymen, seedsmen, and florists at present enjoy the benefits conferred by those Acts on agricultural tenants, which benefits it was proposed to still further extend by the Land Tenure Bill. He hoped, therefore, that his lordship would see his way to advise Parliament to adopt some such clause as that suggested by Mr. Morgan Veitch as being necessary for the purpose of defining accurately the position of nurserymen and seedsmen.

Mr. PEARSON (the hon. secretary of the association) pointed out that, although it seemed probable that nurserymen could not technically be described as market-gardeners for the purposes of the Acts in question, the matter could not be said to be wholly free from doubt in the absence of a judicial decision on the subject, and he suggested that no time should be lost in putting the matter right if a great amount of litigation were to be avoided. The oversight had probably arisen owing to the fact that their trade had practically been unorganised until about seven years ago, and from the very nature of their business nurserymen were a scattered class. He gave a concrete instance within his own experience of the hardship under which nurserymen at present laboured as compared with market-gardeners. Some time ago he had removed from a piece of extra ground he had rented for the purposes of a nursery, and, although he had carried out many improvements, which had, in fact, almost doubled the value of his late holding, he was not only unable to obtain compensation from his landlord, but had actually to meet a contra account for dilapidation of old buildings on the holding. The speaker concluded by pointing out the special advantages which nurserymen would get under the Acts as regards improvement of land by manuring, as well as the machinery for arbitration.

Mr. MORGAN VEITCH, as hon. solicitor to the deputation, pointed out that the Agricultural Holdings Acts applied to market-gardeners jointly with farmers, as both classes were specifically mentioned in the Acts, but, presumably through an oversight on the part of Parliament, no provision had been made for including nurserymen, seedsmen, and florists within the purview of these Acts. The oversight was especially noticeable, because, when it came to imposing liabilities, as in the case of the Workmen's Compensation Act, Parliament had been careful to declare that "agriculture" should be deemed to include "horticulture." Both nurserymen and gardeners were treated as one under common law, and also for rating purposes, and the two trades might accurately be described as sister trades. Having regard to these facts, Mr. Veitch invited his lordship to compare the difference in the position of a market-gardener who, as a yearly tenant, was quitting his holding, and the position of his next-door neighbour, the nurseryman, under similar circumstances. In such a case the market-gardener would get full compensation for various improvements effected by him, even without his landlord's consent, as well as compensation for various crops left behind for the landlord's benefit. The nurseryman, on the other hand, would get compensation neither for his buildings nor for his plants and shrubs left behind. All the privilege which the nurseryman enjoyed at the present time was the bare right under common law to remove his glasshouses and his stock-in-trade, but it might so happen that the time when his landlord turned him out might be quite unfavourable for transplanting. Mr. Veitch further pointed out that in the case of yearly tenancies a market-gardener was entitled to a year's notice, whereas a nurseryman was on the same footing as an ordinary householder, and would be entitled to have only six months' notice expiring at the end of the current year's tenancy. [Lord Carrington here consulted his legal adviser, who agreed that such was the case, although the position might be varied by special agreement on the point.] Finally, the speaker urged that it would be illogical to deny the desired benefits to the nursery trade on the ground that in some cases market-gardeners and farmers had been known to abuse the privileges given to them by the Acts, and the fact that the Land Tenure Bill contained no machinery for checking any such isolated cases of abuse entitled one to assume that, generally speaking, no undue advantage had been taken of the Act at the expense of the landlord. Furthermore, it would be illogical to say to nurserymen, "We cannot give you the benefit of these Acts, because occasionally the agricultural tenant has been known to abuse his privileges," while in the same breath one would have to admit that the Land Tenure Bill was conferring even further privileges on the agricultural tenant.

Lord CARRINGTON, in reply, said that it had given him great pleasure to receive so influential a deputation, and he thought that the object with which the deputation had approached him showed that the benefits conferred by the Agricultural Holdings Acts were appreciated by tenants, and were working satisfactorily. He had taken the opportunity of obtaining the opinion of the law officers of the Crown on the novel point now raised, and they quite agreed that probably a nurseryman could not obtain the benefits of the Agricultural Holdings Acts as the law now stood. He entirely sympathised with the position of the nursery and seed trade under these circumstances, and, although he could not venture to alter the Land Tenure Bill as now before Parliament by the insertion of a clause in the desired form, he would strongly advise the Horticultural Trades' Association to lose no time in having a special Bill brought in for the purpose of remedying their grievances, and he would be happy to see representatives of the association at any future time in connection with this subject.

Mr. MARNHAM, M.P., pointed out to his lordship that there was no need for him to directly make any addition to the Land Tenure Bill in order to comply with the request of the deputation. As a matter of fact, a Conservative member, Mr. Gardner, had already put down an amendment of some kind on the subject, and the deputation hoped that his lordship would see his way to accept this amendment when it came to be raised.

Lord CARRINGTON stated that he was sorry to say he would have to oppose the amendment, and still considered that a special Bill would best meet the case.

We understand that it is hoped to raise this question again when the Land Tenure Bill comes to be considered in the House of Lords. Those desirous of assisting the movement, and who wish for further information on the subject, should lose no time in communicating with the hon. secretary, Mr. Charles Pearson, Lowdham, Notts, or with Mr. Morgan Veitch, Norfolk House, Norfolk Street, Strand, London.

OUR SUPPLEMENTARY ILLUSTRATION.—The variety of Œnothera (Godetia) forming the subject of our supplementary illustration this week was shown by Messrs. DOBBIE & Co., Rothesay, at the Royal Horticultural Society's meeting, held on July 21 last. The plants then exhibited, and there were many, were perfect specimens of good habit, as may be seen in the small sketch at the corner of the illustration. The flowers were of large size, and double, the colour being of a rich shade of rosy-pink. The same variety, when exhibited by Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr. Mr. W. BAIN), on August 29, 1905, was granted an Award of Merit. The value of Godetias in summer flower-gardening is so generally known, we need not say much upon that subject now, but it may be noted that wherever Godetias are employed the plant known as "Schamini" should be given a place.

ROYAL HORTICULTURAL SOCIETY.—Meeting of the Committees: The next fruit and flower show will be held on Tuesday, November 20, in the Society's Hall, Vincent Square, Westminster. A lecture on some recent researches at Wisley, illustrated by lantern slides, will be given by Mr. G. MASSEE, V.M.H., at 3 o'clock.

HORTICULTURAL CLUB.—The next House Dinner of the club will take place on Tuesday, November 20, 1906, at 6 p.m., at the Hotel Windsor, when Mr. T. W. SANDERS will talk about "The Country Life of Sweden, Holland, Denmark and Belgium."

FLOWERS IN SEASON.—APONOGETON ANGUSTIFOLIUM.—Under the name A. capense (which we do not find in any book) Mr. AMOS PERRY has sent us flowers of this pretty little species. It differs from the common A. distachyon in the much smaller size of its leaves and flowers. It was described originally in Aiton's *Hortus Kewensis*, t. 495, and is figured in the *Bot. Mag.*, t. 1268. It is described under the above name by Mr. ARTHUR BENNETT in vol. vii. of the *Flora Capensis*, p. 43. For the identification of the plant we are indebted to Mr. N. E. BROWN.

CELERIAC.—We have often wondered, when seeing the large quantities imported from Germany of this root, which pass our windows on their way to the adjoining market, why it is not more often grown here. That it can be produced at home is evidenced by a fine sample sent us by Mr. HONESS, gardener to C. COMBE, Esq., Cobham Park, Surrey. One of the roots weighed 2 lbs. 7 ounces, and the lightest 1 lb. 12 ounces. The quality was proportionate to the size. Mr. HONESS would do good service if he would kindly detail his method of cultivation.

THE BOTANICAL MAGAZINE.—In the November number we find descriptions and coloured illustrations of the following plants:—

LILIUM MYRIOPHYLLUM (*Franchet*), tab. 8,102.—A Chinese species discovered by PÈRE DELAVAY, and introduced by Mr. E. H. WILSON. See *Gardeners' Chronicle*, 1905, ii., with figure. The present description is furnished by Mr. C. H. WRIGHT.

LYCASTE DYERIANA (*Sander ex Rolfe*), t. 8,103.—A topsy-turvy species growing head downwards like Cattleya citrina. Flowers greenish-yellow. See *Gardeners' Chronicle*, 1895, ii., 49. Described by Mr. ROLFE.

COTYLEDON DEVENSIS (*Hort.*), tab. 8,104.—A supposed hybrid between C. glauca and C. gibbiflora, alias Echeveria metallica, received at Kew from Messrs. DICKSON, of Chester. The relatively gigantic size renders its parentage uncertain. It is a handsome plant well worth cultivating. The name devensis is derived from Deva, the Roman name for the town we now call Chester. Mr. N. E. BROWN contributes the note on this species.

RIBES CRUENTUM (*Greene*), tab. 8,105.—A Californian species with reddish flowers, and globose very bristly berries each the size of a small Cherry. The description of the Kew plant is from the pen of Mr. S. A. SKAN.

PLEIONE YUNNANENSIS (*Rolfe*), tab. 8,106.—This is the very pretty rose-coloured Pleione exhibited by Messrs. SUTTON in February last. See *Gardeners' Chronicle*, 1906, vol. i., p. 115. Mr. ROLFE is responsible for the determination of the species.

SMALL HOLDINGS.—The Departmental Committee of Small Holdings, of which Lord ONSLOW is Chairman, expect that their draft report will be presented to the President of the Board of Agriculture and Fisheries at an early date. The committee was appointed in April, 1905, to enquire into the various arrangements made by landowners in recent years for the provision of small agricultural holdings, and to report as to the conditions under which such holdings are most likely to be attended with success and as to the measures which may most advantageously be taken, either by legislation, co-operative association, or otherwise, to secure the increase of their number. Earl CARRINGTON was a member of the committee until his appointment as President of the Board of Agriculture and Fisheries.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. A. J. BROWN informs us that the eighth local annual concert, in aid of the above charity, will be held at the Constitutional Hall, Chertsey, on Thursday, November 22. The following ladies and gentlemen, with others, have already accorded their patronage:—Sir EDWARD and Lady STERN, J. A. MULLENS, Esq., Sir PHILIP WATERLOW, Bart., and F. J. MARNHAM, Esq., M.P. The prices for admittance will be as follows. Reserved seats, 3s. (four for 10s. 6d.), 2s. and 1s. Plan of hall at RAWLINGS & WALSH, Limited. We trust that the event will be as successful as previous ones have been. Any information can be had from Mr. A. J. BROWN, 73, Eastworth Road, Chertsey.

FRUIT CONFERENCE AT WYE COLLEGE.—Under the chairmanship of Mr. LAWRENCE HARDY, M.P., a large and representative conference of fruit-growers from the fruit-growing counties of England, was held at the South Eastern Agricultural College on November 7. Papers were contributed on the "Planting of fruit trees," "Strawberries," "American Blight," and "Fungus Diseases." In the latter paper, reference was made to the American Gooseberry-mildew, the appearance of which in England has been noted (see p. 317) by the College mycologist (Mr. SALMON), and a resolution, calling upon the Board of Agriculture to take immediate steps to prevent further importation of Gooseberry bushes and to destroy infected stocks in this country, was unanimously passed.

HORTICULTURAL EXHIBITION AT MANNHEIM.—We are informed by the Board of Agriculture and Fisheries that, as we have already announced, a Horticultural Exhibition will be held at Mannheim, in the Grand Duchy of Baden, from May to October, 1907. Exhibits of fruits, vegetables, Orchids and Cacti will be admitted from this country. Applications for information should be addressed to the Office of the Exhibition, Friedrichsplatz 14, Mannheim, Germany. A copy of the provisional programme can be seen at the Offices of the Board of Agriculture and Fisheries, 4, Whitehall Place, S.W.

VINCA MAJOR.—In this country, at least, it is not common to see the fruit either of Vinca major or of V. minor. Messrs. BARR & SONS send us a pod of Vinca major with ripe seed produced in a garden at Sydenham. Once before we had a specimen from Mr. CADGE, of Norwich, and once a pot-plant of V. minor on our own balcony produced a pod, which was knocked off by a respectless housemaid. The pod is what botanists call a double follicle.

ROYAL METEOROLOGICAL SOCIETY. An ordinary meeting will be held at the Institution of Civil Engineers, Great George Street, Westminster, S.W., on Wednesday, November 21, 1906, at 7.30 p.m., when a paper will be read on "The Abnormal Weather of the past Summer, and some of its Effects," by WILLIAM MARRIOTT, F.R.Met.Soc.

THE LATE C. B. CLARKE.—The *Journal of Botany* for November contains an interesting notice of the career of the late botanist with an excellent portrait. His many and wide travels in India are detailed, and his amazing versatility, on which we have already commented, are well brought out. Mr. BLISS, the Vicar of Kew, a personal friend, in commenting upon the "variety of the fields of knowledge in each of which CLARKE seemed equally at home" says truly: "Whether the subject were Tea-planting in Assam, Christian missions in Bengal, University studies at Cambridge nearly half a century ago, or a score of others, he seemed not only to know about it, but to know and have at his fingers' ends all about it. . . . . In one of the earlier years of our friendship I was anxious to find someone to tell a gathering of parishioners something about Christian missions in India . . . . . When I broached the subject to him I could not help feeling tickled at his at once replying 'Well, if there is one thing I think I know more about than another it is Christian missions in India.' The only difficulty he felt was to keep his interesting and instructive information within moderate limits."

BERLIN BOTANIC GARDEN.—Professor Dr. A. ENGLER announces that the Royal Botanic Garden, the Botanical Museum, and the Central Office for the Colonies are now transferred from Berlin, together with all the offices and departments connected with them, to Dahlem, near Berlin. It is requested that all communications intended for the above-named establishments be in future addressed, 6-8, Königin Luise Strasse, Dahlem, near Berlin.

DISCOUNTS.—It is not always easy to distinguish between what is "corrupt" in a legal sense and what is legitimate. Circumstances alter cases, and what may be deemed legitimate in one case is not expedient in another. We have alluded on more than one occasion to the fact that the law which will control our home traders will not affect their foreign competitors. Here are two examples from Holland:—"Messrs. ——— beg to inform [sic] that a discount is allowed of 15 per cent. on all orders sent by you or your employer. Our prices are moderate, our quality is unsurpassed, and all orders are immediately forwarded."—"To gardeners. We allow a discount of 10 per cent., which amount will be sent to them by post-office order as soon as the amount of invoices has been remitted to us." If the employer who pays the bill is aware of this practice, and does not object, there is of course no "corruption," but he would do better to pay a fair price for his goods and give his gardener remuneration adequate to the responsibility cast upon him, and the skill and knowledge required of him. At present this is by no means universal.

ARTIFICIAL FERTILISERS: THEIR NATURE AND FUNCTIONS.—Mr. A. D. HALL is announced to deliver a course of five lectures on this subject at the Society of Arts, John Street, Adelphi, London. The lectures will be divided as follow: November 19, "The nutrition of the plants"; November 26, "The fixation of nitrogen"; December 3, "Nitrogenous fertilisers"; December 10, "Phosphatic fertilisers"; and December 17, "Possic fertilisers" and "Consumption of fertilisers." Each lecture will commence at 8 p.m.

THE PROFESSORSHIP OF BOTANY AT CAMBRIDGE.—Mr. A. C. SEWARD, well known for his researches into the structure and affinities of fossil plants, has been appointed as Professor in the room of the late Professor MARSHALL WARD.

"INDEX FILICUM."—We are pleased to be able to record the completion of Mr. CARL CHRISTENSEN'S *Index Filicum*. This is a complete list of all the names of Ferns published between the years 1753 and 1905. It will be remembered that the late THOMAS MOORE among his many services to horticulture included an *Index Filicum*. This was, unfortunately, never completed, and although we have had many works on Ferns, we still lacked a complete list of names and synonyms. This has now been given us in a very complete form by Mr. CHRISTENSEN, who acknowledges the assistance he has had from Dr. CHRIST, of Basle; Mr. GEPP, of our own Natural History Museum; and Dr. HIERONYMUS, of Leipsic. To the names of each species is appended a reference to the founder of the species and to the work in which it is described, with the date of publication. Reference is also made to the standard authorities such as HOOKER and BAKER, Dr CHRIST, and ENGLER and PRANTL. The Ferns are divided into twelve families, distributed in 149 genera and 5,940 species. Of these latter 953 are recorded as of doubtful nature or as indicated in gardens without sufficient identification. The total number of names dealt with is 22,680. An important feature of the work is a complete alphabetical and systematic enumeration of all the books and periodicals in which species of Ferns have been described and published, with the names of the authors and the dates of their publications. The work is one entirely for systematic botanists, as we find few references to the biology or phylogeny of Ferns. The names of SUMINSKI and HOFMEISTER are not even mentioned. BOWER is named only as answerable for one species of Ophioglossum without reference to his researches on apogamy and apospory. The names of FARMER and DIXLEY are not included. We mention these facts with no intention of disparaging the present book, as such details did not enter into the author's programme, but solely in the hope that some competent botanist will take up the thread where Mr. CHRISTENSEN has left it, and give us a complete summary of the life-history of Ferns so far as it is known. In the meanwhile Mr CHRISTENSEN'S work will be of as great value to students of Ferns as the monumental *Index Kewensis* is to investigators of flowering plants. It is, in fact, indispensable. It may be had through WILLIAMS & NORGATE, or other foreign booksellers.

THE CULTURE OF CORDON FRUIT TREES.—Gardeners have long since realised that it is possible to grow the very finest fruits on young trees, and on espalier trained trees rather than upon bush, pyramidal, or standard specimens. It is a well-known fact that a very large proportion of the hardy fruit displayed at the exhibitions are the produce of the former types. Those concerned with the sale of fruit have told market growers again and again that there is always a sale for the best produce, even when the market is glutted with fruits of common place quality. Hearing, therefore, that one of the well-known salesmen in Covent Garden Market was about to sell by auction a collection of 5,000 young fruit trees at his residence at Hook, near Surbiton, we called there on Monday last with a view to ascertaining how far the successful salesman had succeeded as a cultivator. These trees, it appears, were planted five years ago for the purpose of producing fruits of the highest quality. In nine cases out of ten the trees are cordons, and trained obliquely to wires strained across the ground to posts erected at either end. The soil is of rich loam overlying clay, and may be regarded as a first-class medium for the roots of hardy fruit trees. It was evident that Mr. LIDDIARD had given much personal care to the growing of the trees, and he has succeeded in obtaining excellent fruits of Apple and Pear. Whether it would have proved a profitable undertaking or not we do not know, but now that the land is to be prepared for building upon, gardeners have a good opportunity for purchasing cordons of the best varieties of Apples and Pears, of a size it is sometimes difficult to obtain in large quantities at the nurseries. Being seven, eight, or more feet in height, a wall or fence could be covered with them at once, a convenience which is sometimes much desired. The goblet-shaped trees have been trained by taking three or four shoots out horizontally for the first two years or so, and then turning the ends up to grow vertically, afterwards cutting out the centre.

AGAVE AMERICANA.—This, the longest known and most widely cultivated species, is, according to Dr. TRELEASE, not known in a wild state. Along the shores of the Mediterranean it has been naturalised and grows like a weed.

BLACK CARROTS.—The *Tribune Horticole*, in a recent number, speaks of some Black Carrots exhibited in Paris. They were derived from seed obtained in Morocco. Whether Black Carrots are likely to prove any improvement on better-known kinds is open to doubt. So far as mere colour is concerned, we should think the black colour offers no temptation.

CONSERVANCY OR DRY SANITATION VERSUS WATER CARRIAGE.—This is the title of a pamphlet, published by E. & F. N. SPON, for Mr. J. DONKIN. When the enormous waste of fertilising material, and the concurrent danger that exists in the pollution of air and water, are taken into consideration it becomes increasingly evident that the whole question of the proper disposal of sewage matter still needs the fullest investigation. Mr. DONKIN is a strong advocate of the dry earth system coupled with arrangements for keeping the dry and the liquid elements of sewage apart. The circumstances are so different in town and country that no one system is suitable for isolated houses, for aggregates of dwellings as in villages, and still more in towns. Mr. DONKIN'S remarks are worthy of attentive consideration.

RUBBER.—So great is the interest now taken in all that pertains to the natural history and utilisation of rubber that we welcome the reproduction in a collected form from the Kew Bulletin of various previously scattered papers. The articles are of a very varied character, dealing as they do with numerous species belonging to widely different natural orders, growing in very diverse situations. Those concerned either scientifically or commercially with Rubber plants will find this summary of great service to them. The utility of reproducing mere formal official correspondence between one Government department and another is not obvious. If it is necessary to preserve them at all, such letters should be kept in the official "pigeon-holes" till required.

CHRYSANTHEMUM NOTES.

CERTIFICATED CHRYSANTHEMUMS AT THE PARIS SHOW.

THE Floral Committee had a busy time at the recent Paris show judging the numerous novelties. This was done the day before the opening of the show, with the result that 102 Certificates of Merit were awarded. These were divided among 13 exhibitors, and of these M. Aug. Nonin received 17; the Marquis de Pins, 14; M. Alfred Chantrier, 12; M. Ernest Calvat, 11; M. Ducault, 10; M. Delbois, 8; M. Montigny, M. Durand, and Messrs. Vilmorin, Andrieux & Co., 5 each. The Prix d'Honneur—a work of art—was awarded to the Marquis de Pins for his new seedlings, and Gold Medals to M. Chantrier and M. Calvat. Large silver-gilt, silver and bronze medals went to the other exhibitors. *C. H. P.*

CHRYSANTHEMUMS AT THE CRYSTAL PALACE.

THE entries in the classes for large Japanese blooms at the N.C.S. exhibition at the Crystal Palace, of which a full report was published in the last issue of the *Gardeners' Chronicle*, were fewer than ever, and there is no doubt but that there is less enthusiasm displayed over these classes than was formerly the case. Exhibitors are fewer, and those who do not exhibit large blooms do not cultivate them so freely as they did. The reason is that such huge blossoms are almost useless for decoration. Again, the method of displaying them in boxes at shows is not a good one. The Chairman of the Committee stated at the luncheon on the show day that he would be glad to see all the boards swept out of the show. This was a strong condemnation of the present system of displaying the blooms. Even the "vase" classes for large flowers seemed to lack in interest for the admirers of this flower. Much more interesting were the well-filled classes for single-flowered varieties and for decorative kinds shown in vases, epergnes, and so forth.

Take, for instance, the class for "singles" in not fewer than six varieties, set up for effect with any natural foliage and grasses. Here there were five entries, making an imposing display. In this class we saw the Chrysanthemum in its true decorative aspect. I am not sure the prizes were correctly awarded in this class, and, bearing in mind the wording of the schedule, I am inclined to say that the 3rd prize exhibit filled better the true aim of the class. This was made up of a quantity of flowers arranged in a truly decorative manner. The 1st prize exhibit was made up with specimen blooms in limited numbers.

The vases and epergnes of small-flowered varieties so pleasingly associated with suitable autumn foliage, Ferns, &c., were indeed of a high order of merit, and attracted many admirers.

No one who saw the Reflexed flowers could admire the puny specimens flopped down as they were on green boards, quite pygmies as compared with what this type was a few years ago. It would be better to eliminate such a class from the schedule. The Anemone-flowered varieties were distinctly creditable from a grower's point of view, but they, too, should have been arranged in a more attractive manner.

It used to be said that the Incurved flowers must be staged in cups upon boards to give them effect. The exhibits in the class provided for this section in vases, six blooms of each, was a contradiction to such an idea, as this was really an interesting class, and the blooms were of much decorative value.

In the classes for Japanese flowers there was an absence of any blooms of a startling character. Possibly the two best stands of blooms in the show were the first and second in Class 14—twelve Japanese distinct. If the judges had reversed the positions of the first and second prizes, few persons would have found fault with the decision.

The exhibit made by Mr. P. Ladds with market varieties in bunches was distinctly interesting and instructive. *E. Molyneux.*

TRADE NOTICE.

Mr. F. KNIGHT EAMES, late Fulwell Nursery, Strawberry Hill, Twickenham, informs us that he has disposed of the nursery business to Mr. G. Neville Smale.

NEW INVENTIONS.

RANDALL'S PLANT HOLDER.

Mr. Randall, Double Street, Blackburn, has lately invented a "Tilting Plant Holder." This may be briefly described as an iron ring to hold a flower-pot, springing from a curved arm on a firm support. The holder is adjustable to any desired height or curve, and is intended to aid in the satisfactory arrangement of pot-plants at exhibitions or in conservatories by enabling them to be fixed in almost any required position.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 6.—*Present:* Dr. M. T. Masters, F.R.S. (in the chair); Messrs. A. W. Sutton, G. Nicholson, J. W. Odell, E. M. Holmes, W. C. Worsdell, E. A. Bowles, A. Worsley, G. S. Saunders, C. T. Druery, J. T. Bennett-Poe, H. J. Elwes, and F. J. Chittenden (hon. secretary).

Mites on Ferns.—Referring to the fronds of Pteris serrulata sent to the last meeting, Mr. SAUNDERS reported that they were evidently attacked by the mite Tarsonymus tepidariorum, but he was only able to find a few cast skins. The mites had evidently been killed by the fumigation or by the dipping the plants had undergone.

Reputed wild Dahlia.—Dr RENDLE reported that the plant shown at the last meeting, raised from seed alleged to be that of the wild Dahlia, was Bidens tripartita!

Galls on roots of vine, &c.—Mr. G. S. SAUNDERS showed galls on the roots of vine caused by Phylloxera. He also showed fruits of Crataegus pyracantha, apparently affected by a fungus, which will be further examined, and a drawing of a double Banana fruit. The fruit had appeared single, but when the skin was removed was seen to be double.

Malformed flowers of Plantain.—Mr. E. M. HOLMES showed spikes of Plantago major very much branched, and having some of the flowers converted into small foliage leaves.

Wolffia arhiza.—Mr. G. NICHOLSON showed plants of Wolffia arhiza, a native of south-east England and other parts of Europe, the smallest of the flowering plants appearing like small grains of green sand.

Fruits of Periploca and Ficus repens.—Dr. MASTERS showed fruits of the shrub Periploca græca from Mr. CUTBUSH, of Highgate; and Mr. CHITTENDEN showed fruits of Ficus repens from Mr. HAMMOND, of Widford, Chelmsford, under whose care the plant fruits freely.

Muisel scale on Apple.—A letter concerning this pest was received from J. B. DOWSON, Esq., of Pershore, who said he had used the winter wash against it in vain in the previous year, the pest having increased enormously during the past season. It was recommended that the trunks of the trees and the thicker branches should be scrubbed with paraffin emulsion during the winter, and the trees sprayed with the same (of course, of much less strength) in June of next year.

Acorns of Quercus rubra.—Mr. C. PARROTT, of Springfield Park, Clapton, sent ripe acorns of Quercus rubra to show that this Oak perfects its fruit in this country. This Oak, like Q. coccinea and Q. rubra, perfects its fruit in the second year after flowering, and both perfect and partially developed fruits are to be found upon the same tree.

Botanical Certificate.—An inflorescence of the Orchid Bonatea Ugandæ, Rolfe, was shown by Mr. BROWN, of Haverfield Gardens, Kew. It is a newly-introduced species from Uganda in the way of B. speciosa. On the motion of Mr. C. T. DRUERY, seconded by Mr. BENNETT-POE, it was unanimously awarded a Botanical Certificate.

Plant diseases.—Specimens of diseased Violets from Exeter and Northwich, and Celery from Colyton, were received and will be reported upon at the next meeting.

LINNEAN SOCIETY OF LONDON.

NOVEMBER 1.—Professor W. A. Herdman, F.R.S. (president), in the chair.

The president exhibited spirit specimens of young plaice hatched and reared in captivity at Port Erin, Isle of Man, and pointed out the different rate of growth occasioned by different surroundings at the station.

Mr. George Talbot exhibited abnormal specimens of Equisetum maximum, Lam. (syn. E. Telmateia, Ehrh.), from Broxbourne, Herts, where they grew on dry ground and in a narrow area. They were characterised by the development of a fruiting zone on an otherwise typically sterile stem; one specimen showed a prolongation of the stem bearing branches beyond the cone; another showed an extremely reduced cone borne on the summit of a branch.

Professor F. E. Weiss, F.L.S., also sent three lantern-slides for exhibition, of specimens of the same species from one spot near Stockport which annually produces normal and abnormal cones from the same rootstock.

The General Secretary exhibited a collotype print, 42 centimetres by 33 centimetres, two-thirds the size of the original portrait of Carl von Linné, by P. Krafft, which had been presented by Herr. J. Cederquist of Stockholm. It had been prepared for the forthcoming 200th anniversary of the birth of Carl von Linné, and was considered an admirable specimen of collotype printing.

The first paper was one by Sir Dietrich Brandis, who spoke on the structure of Bamboo leaves. He explained that while the leaves of other grasses exhibit a great variety of structure, those of Bamboos are exceedingly uniform. In bud they are always convolute; they all have in the upper epidermis, alternating with the longitudinal nerves, bands of large "bulliform cells," known as motor-cells. In most species these motor-cells are filled, entirely or partially, with solid masses of silica. Between the bands of bulliform cells and the longitudinal nerves, Bamboos (with one exception as far as known, Chusquea pinifolia of South-east Brazil) have large apparent cavities, which are completely filled by large flat thin-walled cells, lying one over the other, like the leaves of a book. This tissue is entirely different from that which, in a young state, fills the cavities in the leaves of Glyceria aquatica, G. fluitans, and other aquatic grasses. The species placed by Dr. Stapf in "Flora Capensis" in the new tribe Phareæ have, as far as known, leaves with a structure similar to Bamboo.

The last paper was a brief one by Professor A. J. Ewart, on the systematic position of Hectorella cæspitosa, Hook f., which had previously been regarded as belonging to the Portulaceæ, but which the author suggested might be transferred to the Caryophyllaceæ.

FRENCH NATIONAL CHRYSANTHEMUM.

The eleventh annual show and congress of this Society was held this year in the old Norman town of Caen, and, for a provincial show, was one of the best we have seen in France. It was held in the Hotel de Ville, partly in the building and partly in the courtyard under canvas awnings. The fruit trees, shrubs, &c., were accommodated in the public square opposite.

Pot plants were largely staged, a grand exhibit coming from Messrs. VILMORIN, ANDRIEUX & Co., who had good specimen plants freely flowered. They were awarded the grand prix d'honneur. The following were some of the best varieties: Nivose, Col. W. B. Smith, Viviand Morel, W. R. Church, R. Hooper Pearson, Miss Alice Byron, F. S. Vallis, &c. There were also in the courtyard several other large collections of pot plants, M. HALOPE, Messrs. FOUCQUEREAU-LEUFANT & Co., M. GERVAIS, and others being represented.

A large exhibit came from M. L. CAVRON, Cherbourg, most of the popular varieties being included. He also staged several grafted plants and some curious imitations of Japanese pyramid trained plants in tubs.

Several good exhibits of seedlings were seen. M. CALVAT'S lot were the best, and of these we specially noted Mme. Mathieu, a big yellow Japanese, Mlle. Jeanne de la Cronée, not unlike Mrs. Coombes, Gouverneur Jonnart, a fine large yellow, Tums, pale blush, Roi d'Yvetot, yellow-shaded cream.

M. ALFRED CHANTRIER also showed novelties. La Sontiela is a fine amaranth-coloured Japanese, with a silvery reverse; Montague d'Aspenin, a lilac-purple, being the best of his Japanese varieties, while in Incurveds, Col. Labouchère was one of the finest blooms we have seen at any French show. It is a big, massive, deeply-built flower of perfect form, with broad florets very regular in curving, the colour being a pure golden yellow of the richest shade. Altogether this grower staged 22 varieties.

Cut blooms were well shown in classes varying from 12 to 100 blooms, many of the flowers being quite equal to those shown the previous week in Paris. M. F. COUILLARD, M. PAUL L'ABBE, M. HALOPE, M. CH. GERVAIS, and M. CHARVET, a well-known French amateur of Avranches, all had splendid collections.

A collection of 110 novelties of 1906 was shown by M. GERVAIS, but only in medium-sized blooms.

M. ROSETTE, of Caen, had a fine display of cut blooms hors concours. Messrs. LECLERC, ERNEST MASSIEN, also staged cut blooms in good style.

Around the sides of the salle des fêtes there was a continuous border of plants in pots, with a verdant bank of large Palms, &c.

A charming circular group of ornamental and foliage plants was staged by Messrs. LETELLIER, FILS ET CIE. The same firm also staged paeony-flowered Dahlias. Messrs. FOUCQUEREAU-LEUFANT & Co. likewise had a collection of cut blooms of Dahlias.

In the section for fruit trees and shrubs, staged on the square of the Place de la République, Messrs. LETELLIER, FILS ET CIE made a fine display. M. L. DAVY, Caen, showed ornamental shrubs, &c.

THE CONGRESS.

This was held on the afternoon of the first day, M. Viger presiding. Papers were read on the best means of popularising the Chrysanthemum. M. Pergallo and M. Vigaux were the authors.

It was decided that the society should issue a cheap cultural manual. The place for next year's show and congress was by vote decided to be Toulouse.

On the following morning a second sitting of the congress took place.

WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 6. This society held its annual exhibition at the Guildhall, Plymouth, on this date. Entries in the open classes showed some falling off from those of previous years, but the great hall was nevertheless filled with brightly-coloured flowers, and a large marquee contained vegetables. The day was fine and the attendance both in the afternoon and evening was satisfactory.

The class for a group of Orchids produced a splendid display, the 1st prize being won by Messrs. J. WEEKES & SONS.

Forty-eight Japanese blooms, distinct.—Mr. F. S. VALLIS took the 1st prize in this class, as he has done for several years past, with a fine stand, scarcely, perhaps equal to his exhibits of former years.

Twenty-four Japanese blooms, distinct.—Mr. F. S. VALLIS again easily won the 1st prize with a stand of heavy flowers, among which were two magnificent specimens of F. S. Vallis and an equally good example of Reginald Vallis.

The 1st prize for six blooms of a white Japanese Chrysanthemum, was won by Mr. B. H. HILL, and the 1st prize for six Japanese Incurveds by Mrs. GULSON, who was also successful in taking 1st prize in the class for 18 Japanese, shown in vases.

Mr. G. SOLTAU-SYMONS secured the 1st prize for a group of Chrysanthemums.

Fruit. The important class for 36 distinct varieties of Apples saw Mr. B. H. HILL to the fore, while for 20 varieties the Earl of MORLEY obtained the 1st prize. Other prize winners in the fruit classes were Mr. B. H. HILL, Mrs. GULSON, the Earl of MOUNT EDGECUMBE, the Earl of MORLEY, Rev. S. BARING-GOULD, Mr St. MAUR and Mr. F. R. RODD.

Vegetables.—The chief prizes were carried off by Mr. B. H. HILL. The Earl of MORLEY was awarded the 1st prize for a collection of salads, which was considered one of the best exhibits in the show.

Nurserymen's exhibits contributed much to the interest of the show. The DEVON ROSARY, Torquay, exhibited a collection of over 60 varieties of Apples, many Pears, and a collection of Cactus Dahlias. Messrs. R. VEITCH & SON, Exeter, staged a large assortment of flowering and berried plants. Messrs. ROSSITER & Co., Paignton, staged Apples and sprays of flowering shrubs. Messrs. TOMLINSON & SONS, Devonport, showed a collection of Apples and miscellaneous plants. Mr. E. C. ARNOLD, Plymouth, staged vegetables.

SOUTHAMPTON ROYAL HORTICULTURAL.

NOVEMBER 6, 7.—The annual autumn exhibition of the above society was this year held in the Volunteer Artillery Drill Hall, Southamp-

ton, on these dates. This society, like many others this year, had not so many entries in the Chrysanthemum classes as usual, yet the quality of those seen was good.

Cut blooms in vases.—An important class was that for twelve Japanese blooms in distinct varieties, arranged in vases, three blooms in each vase. The 1st prize included the handsome Victoria Challenge Trophy and £7 in money. Mr. G. Hall (gr. to Dowager Lady ASHBURTON, Melchet Court, Romsey) easily secured the coveted position with large, heavy examples of Mrs. W. Knox, Mme. P. Radaelli, J. H. Salsbury, Magnificent, Bessie Godfrey, W. A. Etherington, Valerie Greenham, Edith Smith, Mrs. A. T. Miller, F. S. Vallis, and Mrs. H. Weeks. 2nd, Major CHICHESTER, Embley Park, Romsey (gr. Mr. B. Hollis).

Mr. HALL also won the first prize in the class for six white Japanese blooms of any two varieties, having Edith Smith and Marquise V. Venosta in superb condition. Mr. HOLLIS again followed.

A class was provided for twelve Japanese blooms in four varieties, open only to gardeners and amateurs. W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), was an easy first with typical blooms of F. S. Vallis, Beauty of Leigh, and Mrs. F. W. Vallis. 2nd, Mr. H. Pearce (gr. to Mrs. TRAGETT, Awbridge Danes, Romsey).

Nine competed in a class for single-flowered varieties. Mr. ELLWOOD won with good examples of Edith Pagram, Roupell Beauty, Nelly Richardson, and Mary Anderson. Mr. E. Cook (gr. to A. F. FYNN, Esq., Bassett), closely followed.

Cut Blooms shown on boards.—The principal class was for 24 Japanese blooms in not fewer than 16 varieties. Mr. HALL had the best among four; 2nd, Mr. HOLLIS. Mr. HALL also won in the class for 12 Japanese blooms, distinct.

Incurved varieties were few in number, but they were of neat finish, and especially that was the case in the premier exhibit of 18 blooms shown by Mr. W. Neville (gr. to F. W. FLIGHT, Esq., Cornstiles, Twyford, Winchester). Mr. A. J. Marsh (gr. to M. HODGSON, Esq., Morton House, Kingsworthy, Winchester), who secured the 2nd prize, was awarded the 1st place for 12 varieties. The example of F. S. Vallis in Mr. HALL'S "Cup" group was adjudged the best Japanese bloom in the show. A similar honour was conferred on Mme. Ferlat in Mr. NEVILLE'S exhibit.

Groups of Chrysanthemums arranged for effect were of moderate quality. Mr. F. GREEN, Swaythling, showed the winning group. Chrysanthemum plants suitable for conservatory decoration made a good display. Mr. A. COOPER, 115, Hill Lane, Southampton, was 1st amongst four entrants. Bush-grown plants were really well represented. Mr. C. DYMOTT won in the class for four plants with freely-flowered examples. A group of miscellaneous plants arranged for effect, shown by Mr. E. WILLS, was an interesting exhibit.

Displays of fruits and vegetables added much interest to the show. J. WILLIS FLEMING, Esq., Chilworth, Romsey (gr. Mr Mitchell), had the best Grapes. Sir S. MONTAGUE, Bart., South Stoneham House, Southampton (gr. Mr. T. Hall), was 1st for four dishes of dessert Apples. Mrs. AUSTIN, Bishop's Waltham (gr. Mr. G. Barnes), secured a similar position with kitchen varieties.

In the vegetable section, Mr. ELLWOOD won Messrs. Toogood's special prize offered for six dishes of vegetables.

ULSTER HORTICULTURAL.

NOVEMBER 6, 7.—A Chrysanthemum show was held by this society in St. George's Market, Belfast, on these dates, and, despite the somewhat inclement weather, there was a good attendance of the public. This society is encouraging fruit growing in the North of Ireland. Lord Dudley has kindly presented a cup, value £30, for the best orchard of over two acres in extent; and Messrs. Gibson, jewellers, Belfast, have supplemented this with another trophy for the best orchard under two acres, in Ulster. The Dudley Cup has now been won outright by Mr. FELIX COYNE, Vernersbridge. Lord Aberdeen has kindly offered another cup in 1st place.

Plants.—The 1st prize for a group of Chrysanthemums was secured by JOHN FORGER, Esq., Edna Grana, Belfast (gr. Mr. J. M'Ilveen). 2nd, A. D. LEMON, Esq. (gr. Mr. H. Kirkpatrick). The best group of single Chrysanthemums was shown by J. BRADLEY, Esq., Knock (gr. Mr. J. Vance). A class was also provided for a group of miscellaneous stove and greenhouse plants, the premier honour for which was secured by FRANK WORKMAN, Esq., The Moat, Belfast (gr. Mr. Thomas Culbert). The Begonias Gloire de Lorraine and Turnford Hall, shown by Mr. A. F. Grubb (gr. to Col. FORDE SEAFORDE, Co. Down) in this class were the finest ever seen in Belfast.

Cut Blooms.—JOHN JAMIESON, Esq., St. Marnock, Dublin (gr. Mr. J. L. McKellar) secured the 1st prize for 20 varieties of Japanese Chrysanthemums, three blooms of each variety. His best examples were Duchess of Sutherland, Lord Ludlow, Mrs. A. H. Lee, and M. Gustave Henry. 2nd, Countess of CALEDON (gr. Mr. J. Small), among whose blooms were fine examples of W. R. Church and Mr. C. Beckett. The best 36 blooms of Japanese Chrysanthemums, in 12 varieties, were shown by THOS. H. TORRENS, Esq., Whiteabbey (gr. Mr. J. Robinson).

Col. SHARMAN CRAWFORD (gr. M. J. Whytock) led in the class for 24 Japanese blooms, three of each variety; and THOS. TORRENS, Esq., was 1st for 48 Japanese blooms against rather weaker competition than usually obtains at Belfast in this class.

Fruit and Vegetables.—The best table of fruits, measuring 8 feet by 4 feet, was shown by the Marquis of DOWNSHIRE (gr. Mr. T. Bradshaw); and the same exhibitor was also 1st for six bunches of Grapes, in not more than two of one variety. The premier collection of 24 dishes of Apples was shown by JOHN JAMIESON, Esq.

Among vegetables the best collection of 12 kinds was shown by Lord ALDENHAM, Elstree, Herts (gr. Mr. Beckett), who also secured many other 1st prizes for vegetables.

NURSERYMEN'S EXHIBITS.

Mr. HUGH DICKSON, Belmont, Belfast, showed a fine collection of stove and greenhouse plants; also an array of hardy fruits and a table of American Carnations.

Messrs. A. DICKSON & SONS, Newtownards, excelled in a table of hardy fruit, numbering 141 dishes. The same firm also put up a stand of floral emblems.

Messrs. FRANK SMITH & Co., High Street, Belfast, had a very pretty stand of floral devices.

Mr. MAGEE, Knock, Belfast, staged a splendid group of stove and greenhouse plants.

Messrs. HEATH, Cheltenham, showed American Carnations. *J. B. C.*

SOUTHEND-ON-SEA CHRYSANTHEMUM.

NOVEMBER 6, 7.—The Southend-on-Sea and District Horticultural Society held its annual exhibition of Chrysanthemums, fruits, and vegetables in the Kursaal on the foregoing dates in fine weather. The show, on the whole, was an improvement upon the Society's previous exhibitions, there being 30 entries more this than in any previous year, and the open and amateur classes were fairly well filled. Mr. R. MAY, Stroud Green, Rochford, was the most successful exhibitor in the open classes, taking six first and five second prizes, and two silver medals of the N.C.S., while Mr. H. E. CAMPKIN, Boscombe Road, Southend-on-Sea, was the most successful amateur exhibitor, securing seven first prizes and one of the N.C. Society's silver medals, as well as the special prize offered by Dr. G. F. Jones for the best bloom in the show, with a fine flower of Bessie Godfrey.

Groups of Chrysanthemums in pots were arranged by Messrs. GARDNER BROTHERS, York Road Nurseries, Mr. HANSOM, and Messrs. MARTIN RAY & SONS, Floral Nurseries, Southend, who took the prizes in the order in which their names appear. The prizes for a group of miscellaneous plants, arranged for effect, went to Mr. DAVEY, Leigh Nurseries, Leigh-on-Sea; Messrs. GARDNER BROTHERS, and Messrs. M. RAY & SONS in the order named.

Cut blooms were shown well in both the open and the amateur classes, the gentlemen whose names are given above being the most successful exhibitors in the respective classes, both staging large, even-sized, fresh blooms of F. S. Vallis, Duchess of Sutherland, Mrs. G. Mileham, Bessie Godfrey, Buttercup, &c.

FRUIT.

Mr G. F. SMITH, Prittlewell, Southend-on-Sea, was 1st for two bunches of white Grapes, showing Foster's Seedling in good condition. Mr. Eisdon (gr. to N. RUGG, Esq.), Hamlet Court, Westcliff-on-Sea, was 1st in the class for black Grapes, with good bunches of Black Alicante.

Mr R. MAY won in the class for six varieties of dessert Apples, showing even, clean, well-coloured fruits; 2nd, Mr. W. MEEKINGS; Mr. MURRELL, who was 3rd for dessert kinds, secured the 1st place in the corresponding class for six dishes of culinary Apples. Mr. W. A. Voss, Hope Cottage, Rayleigh, won the 1st prize for three dishes of dessert varieties of Apples, and Mr. A. GREEN had the best three dishes of kitchen varieties. Mr. EPPS was easily 1st in the class for six dishes of Pears, distinct, showing good fruits, and the Rev. J. O. REAY, Prittlewell, had the best three dishes of these fruits.

There were several entries in a class for a tray or basket of six varieties of vegetables. The exhibit shown by Mr. W. MEEKINGS was placed 1st; 2nd, Mr. R. MAY.

CROYDON CHRYSANTHEMUM.

NOVEMBER 6, 7.—Among the earlier shows around London, that held at Croydon on the 6th and 7th of this month served to indicate the condition of Chrysanthemum blooms and plants in the south. The flowers are smaller than usual, although the colouring, in many varieties, appears to be brighter than in seasons of the usual character.

The show was held in the Public Hall, George Street, a place admirably adapted for the holding of a flower show. We were pleased to note the complete abolition of the show board, and the substitution of tall vases in its place, to the greater effectiveness of the exhibits.

OPEN CLASSES.

Fifteen Incurveds and an equal number of Japanese varieties, distinct.—1st, Mr. Frank Bible (gr. to Prince HATZFELDT, Draycot Park, Chippenham), who showed of Incurveds, Buttercup, Margaret Brown, Mark Tourle, Le Peyron, Lady Isabel, C. H. Curtis, Godfrey's Eclipse, Hilda George, Amber Gem, Mrs. Hall, Mme. Denyer, G. W. Mathew, and F. Frierslien. The Japanese varieties included Waldeck Rosseau, Mme. Radaelli, W. Jinks, G. Vallis, Marquis Venosta, Mildred Ware, Algernon Davis, W. Hetherington, and General Hutton. Every bloom was well developed, and of fine form.

Twenty blooms, not fewer than four distinct varieties.—Mr. F. BIBLE was again 1st, with three blooms of A. F. Miller, 1 Beatrice May, 1 Bessie Godfrey, 5 President Viger, 4 of F. S. Vallis, 1 of Algernon Davis, 2 of R. F. Vallis, and 2 Mrs. Knox, all of them very fine blooms. 2nd, Mr. C. Lane (gr. to E. H. COLES, Esq., Burntwood, Caterham).

Ten Japanese blooms.—Mr. G. PREBBLE won the 1st prize, with Hy. Perkins, Mrs. G. Mileham, Mrs. F. W. Vallis, Mrs. A. H. Lee, and Lady Henderson. 2nd, Mr. G. Gooch (gr. to F. W. JONES, Esq., Worcester Lodge, Selhurst).

Ten blooms, Incurved, one or more varieties.—The winner of the 1st prize was Mr. G. EDWARDS, Windmill Cottages, Shirley, with middle-sized blooms of C. H. Curtis, Mrs. F. Judson, and Duchess of Fife. 2nd, Mr. C. Prebble (gr. to E. PRESTON, Esq., Shirleyhurst, Croydon), with Baron Hirsch, Duchess of Fife, Miss F. Southam, and Frank Hammond.

Some of the small competitions contained excellent blooms, as in the class for five Incurved blooms, in which Mr. G. EDWARDS was 1st with C. H. Curtis.

The same number of Japanese blooms (five) enabled Mr. BIBLE to come in 1st with White Venosta in perfection.

OPEN TO AMATEURS.

Mrs. N. WRIGHTSON, 55, Elgin Road, Croydon, won the 1st prize for ten Japanese blooms in not fewer than five distinct varieties, with large, well-developed blooms of, among others, Hy. Perkins and Mrs. C. Beckett. 2nd, Mr. C. R. CLARK, Neville Road, with Mrs. H. Weeks and Gustave Henry.

PLANTS AND GROUPS.

Plants of single-flowered varieties were numerously shown, and were of large-size bushes of 3-5 feet in height, abundantly flowered, and they

were employed in filling corners of the Hall, and masking bare walls, forming capital foils to the more formal arrangements.

BRISTOL CHRYSANTHEMUM

NOVEMBER 6, 7, 8.—The above society held its annual exhibition upon these dates in the Colston Hall, Bristol. As is invariably the case, the show was a grand one, though some of the classes for Chrysanthemums were not so well filled as in former years, but the quality of the blooms and the beauty of the groups left little to be desired. Fruit, especially Apples, was staged in capital condition. The Bristol Amateur Chrysanthemum Society held a successful show in connection with the older society. A most praiseworthy act of this society is the interest it takes in the gardening charities by arranging a stall for the sale of flowers, &c., for their benefit.

Groups.—A class was provided for a group of miscellaneous plants occupying an area of 12 feet by 8 feet. The best was shown by Mrs. H. St. VINCENT AMES, Cote House (gr. Mr. Bannester), who had Chrysanthemums, relieved with Palms, Codiæums (Crotons), Eulalias, &c., and edged with Ferns. J. B. BRAIN, Esq. (gr. Mr. J. Attwell) and Dr. R. C. W. EAGER were placed equal 2nd.

Only one competitor staged in a class for a group of Chrysanthemums occupying a floor space of 50 square feet—Mr. G. W. Harford (gr. to H. V. BARNARD, Esq.), whose plants carried large fresh blooms, and were chiefly of yellow varieties.

Cut Blooms.—In the important class for 36 Japanese blooms, the FROME FLOWER & FRUIT Co. secured the leading place for the third consecutive time, and thus become possessors of the Challenge Vase presented by the Colston Hall Co. The stand of blooms was composed of large, deep, fresh flowers of the varieties F. S. Vallis, Mrs. A. H. Lees, Mrs. Mease, Reginald Vallis, Mrs. W. Knox, &c. 2nd, Mr. DRAKE, Cathays, Cardiff, with somewhat smaller blooms.

Twelve Japanese blooms, distinct.—Mr. CARPENTER was again 1st with splendidly-grown flowers, including Mad. Marguerite de Mon, Mrs. A. T. Miller, Lady Harmsworth, &c. Dr. CROPPER again followed, but he reversed these positions in the class for twelve Japanese blooms in a class open only to amateurs and gentlemen's gardeners.

Chrysanthemums staged in vases were some of the best blooms in the show. The best six Japanese blooms of any variety were shown by the FROME FLOWER & FRUIT Co. The best half-dozen blooms of a white Japanese variety were shown by Mr. CARPENTER, the variety being Mrs. A. T. Miller. The FROME FLOWER & FRUIT Co. were again 1st for six blooms of a yellow variety, showing Mrs. W. Knox.

Twenty-four Incurved varieties.—Mr. DRAKE was the only exhibitor in this class, but he staged a beautiful set of large blooms, and was deservedly awarded the 1st prize. His leading blooms were Buttercup, S. W. Matthews, Lady Isabel, Mrs. F. Judson, Emblème Poitevin, and Mad. Ferlat.

FRUIT.

A. GIBBS, Esq., Tyntesfield, Bristol (gr. Mr. T. Wilkinson) staged the best collection of six varieties, having Muscat of Alexandria and Alicante Grapes, Golden Reinette Apple, Doyenné du Comice Pear, and Coe's Golden Drop Plum. 2nd, Mr. Strugnell (gr. to the Rt. Hon. W. LONG, Rood Ashton Park).

Mr. WILKINSON was also 1st for Muscat of Alexandria Grapes, and also for Black Alicante Grapes, amongst seven exhibitors. A class for Lady Downes brought five exhibitors, among whom Mr. WILKINSON was again to the fore, and he also had the best bunches of Mrs. Pince.

Apples.—The best six dishes of dessert varieties were shown by Mr. J. H. VIRGO; while Mr. BANNESTER led in the class for four dessert varieties. The best six dishes of culinary varieties amongst eight exhibitors were those shown by Mr. WOODMAN; and Mr. STRUGNELL had the best six dishes of Pears.

Vegetables.—Mr. BAKER won the principal prize offered by Messrs. Jas. Carter and Co. for six dishes; 2nd, Mr. STRUGNELL; and Mr. BENFIELD won in the class for prizes offered by Messrs. J. Garaway & Co.

NON-COMPETITIVE EXHIBITS.

These made a splendid addition to the show. A fine collection of Apples and Pears was staged by Messrs. BUNYARD & Co., Maidstone. Messrs. GARAWAY & Co., Clifton, Bristol, and Messrs. COOLING & SONS, of Bath, staged some fine fruit. Messrs. PARKER & SONS, Bristol, and Mrs. ROGERS arranged floral devices. Messrs. CYPHER & SON, Cheltenham, staged Orchids.

HEREFORD FRUIT AND CHRYSANTHEMUM.

NOVEMBER 7, 8.—This society's annual show, held in the Shire Hall, Hereford, on these dates, may be classed amongst the best of the society's exhibitions. For Apples, more than 50 classes were provided. Pears were fairly well shown, but not in such large quantities as at previous shows. Interesting and instructive were the exhibits in the classes for packed fruit, while farm roots, grain and hops were provided for in the schedule. Comparatively few classes were allotted to Chrysanthemums, and only two groups of these flowers were arranged.

FRUIT CLASSES.

The principal class for Apples was that for 50 dishes, arranged in an area of 70 square feet, with ornamental leaves for decoration. Among three exhibits, that staged by the KING'S ACRE NURSERY Co. was awarded the 1st prize, the fruits being clean and highly coloured; 2nd, Mr. WHITING, Credenhill, Hereford, who had an almost equally fine collection.

Mr. WOOLTON, Byford, Hereford, was successful in the class for 30 dishes of Apples, with splendid fruits of well-known varieties.

Twenty-four dishes of Apples, twelve culinary, twelve dessert. This class was only open to amateurs, but several good exhibits were staged, that from Mrs. BLASHILL, Bridge Sollars, being placed 1st. The most notable varieties were Emperor Alexander, Golden Noble, Lord Derby, Royal Jubilee, Mannington Pearmain, Allington Pippin, and Cox's Pippin, &c.

Twelve dishes of Apples.—This was another strongly-contested class, and in the leading collection, staged by Mr. J. LEE, Higher Bebington, some of the largest fruits in the show were to be found. They included Gascoyne's Seedling (perfectly green in colour), Gloria Mundi, Lord Derby, Lady Henniker, and Warner's King; 2nd, Rev. G. H. DEVONPORT, who also staged a splendid set.

Eight dishes of Apples, any market variety.—Mr. GRINROD, Whitfield Gardens, Hereford, set up splendid fruits of Warner's King, Stirling Castle, Newton Wonder, The Queen, Loddington Pippin, Lane's Prince Albert, &c., with which he secured chief honours.

Amongst the single dish classes for Apples were many of the best fruits in the show.

Pears.—Mr. Humphries, gardener to the Earl of CHESTERFIELD, Holme Lacy, was, as is usual, successful in the class for 24 dishes of these fruits, though he has staged better collections in some former years. Amongst his best examples were Doyenné du Comice, Beurré Diel, Pitmaston Duchess, Durondeau, and Doyenné d'Alençon.

Sir J. COTTERELL, Garnons, Hereford (gr. Mr. Fox), was placed 1st in the class for 12 varieties of Pears, having good, clean fruits of President d'Osmonville, Easter Beurré, Beurré de Jonghe, Doyenné du Comice, &c.; G. H. HADFIELD, Esq., Moraston, Ross (gr. Mr. Rick), who followed, showed almost equally good fruits of Glou Morceau, Durondeau, Beurré Hardy, Doyenné du Comice, &c.

Eight dishes of Pears.—The best fruits in this class were shown by Rev. G. H. DEVONPORT; 2nd, Mr. BLASHILL.

The best dish of Pears in the show was staged by Rev. H. DEVONPORT, the variety Doyenné du Comice. The best dessert Apples were Cox's Orange Pippin, staged by Messrs. GETTING C. NEWTON, and the best culinary Apples, Warner's King, staged by Mr. GRINROD.

VEGETABLES.

Mr. J. WILSON, Commercial Street, Hereford, offered prizes for a collection of 10 dishes of vegetables, which attracted six excellent collections. The best was shown by Mr. GRINROD, who had Celery, Parsnips, Autumn Giant Cauliflower, Potatos, selected Carrots, Beet, Onions, &c.; 2nd, Mr. J. Davis, gardener to W. C. KING, King Coxy.

CHRYSANTHEMUMS.

Twenty-four Japanese blooms.—A. N. FOSTER, Esq., Brockhampton Court (gr. Mr. H. Parrott), was the leading exhibitor in this class. He had good blooms of F. S. Vallis, Mrs. Bryant, George Lawrance, Walter Jinks, Godfrey's Pride, Bessie Godfrey, W. Duckham, &c.

Twelve Japanese blooms, four in vases.—The KING'S ACRE NURSERY Co. were placed 1st in this class, with large, highly-coloured examples of W. R. Church, F. S. Vallis, A. C. Doyle, and Mrs. J. E. Dunne.

GROUPS.

The winning group has already been referred to. It was arranged by the KING'S ACRE NURSERY Co., Hereford, and was composed of splendidly grown plants, possessed of large, fresh blooms, the colours being charmingly blended.

TORQUAY CHRYSANTHEMUM.

NOVEMBER 8.—This annual Chrysanthemum Show was held in the large hall of the Bath Saloons, Torquay, on the above date. The exhibition was a great success, entries being very numerous and the exhibits of high quality. Unfortunately, a persistently wet day prevented a large attendance. Perhaps the finest feature of the show was the winter-flowering Begonia Mrs. Heal, six pots of which took the 1st prize for Mrs. WREY in the class for Begonias. These plants were between 18 inches and 2 feet in height and breadth, and were covered with large deep-red flowers, being excellent specimens of culture. The silver challenge cup presented by Lady Albertha Lopes for the best group of Chrysanthemums was won by Mr. R. H. LEE, last year's winner; Mr. DUNDEE HOOPER followed. Specimen Chrysanthemum plants were admirably shown, Mrs. TOTTENHAM gaining two 1st prizes with well-grown and profusely-flowered plants, the same lady also won the special prize for six vases of cut Chrysanthemums, and the 1st prize for flowering table plants. In the open class for 36 Japanese blooms the 1st prize was awarded to Rev. T. SHEEPSHANKS for a fine stand in which Algernon Davies, Mrs. J. E. Dunne, Mme. Carnot, W. R. Church, F. S. Vallis, and General Hutton were particularly good. In the class for 12 Japanese blooms Rev. T. SHEEPSHANKS again secured the 1st prize.

Fruit of good quality was staged.

NURSERYMEN'S EXHIBITS.

These filled three sides of the hall, and made a bright setting to the flowers and plants in the competitive classes. Messrs. R. VEITCH & SON, Exeter, had a representative collection of berry-bearing plants and autumnal foliage. A collection of Tree Carnations, large blooms of Japanese Chrysanthemums, and a varied assortment of Apples. The DEVON ROSARY, Torquay, showed pot Chrysanthemums, many greenhouse plants, Crotons, Ferns, Palms, and Pandanus, while they had a fine collection of Apples. Messrs. F. C. SMALE & SON, Torquay, exhibited miscellaneous flowering plants: Messrs. BURRIDGE & SONS, Paignton, flowering and foliage plants. Messrs. ALLWARD had single Chrysanthemums and winter-flowering Begonias interspersed with Palms and Ferns.

CARDIFF CHRYSANTHEMUM.

NOVEMBER 7, 8.—The 20th annual show held in connection with the Cardiff Chrysanthemum Society took place in the Park Hall, Cardiff, on the foregoing dates. Although the entries this year were not so numerous as on many former occasions, the quality of the blooms shown was (notwithstanding the rather unfavourable weather experienced during the past few weeks) well up to the usual high standard. From all but the financial standpoint, the exhibition was a great success.

CUT BLOOMS.

In the open class, Mr. G. W. DRAKE, nurseryman, Cathays, Cardiff, won the 1st prize and challenge cup for a collection of eight vases of specimen blooms of eight distinct varieties of Japanese Chrysanthemums, each vase containing three blooms of one variety. The varieties—all of first-class quality—were: Madame Paolo Radaelli, Duchess of Sutherland, Valerie Greenham, President Viger, F. S. Vallis, Reginald Vallis, Chrysanthemiste, Montigny, and Bessie

Godfrey. As this is the third time the present winner has secured the cup, it now becomes his own property. Mrs. WILLIAMS, Bryn Glas, Newport (gr. Mr. J. Duff), the winner of the cup last year, was 2nd.

For 24 incurved blooms of not fewer than 12 varieties, Mr. GEO. DRAKE was placed first, some of his best blooms being Buttercup, G. W. Matthews, Duchess of Fife, Emblème Poitevin, Nellie S. Threlfall, and W. Pascoe. The 2nd prize went to W. PITT, Esq., Abergavenny (gr. Mr. H. Townsend), who also won the 1st prize for a collection of 12 blooms, distinct varieties, of Japanese, among which were Duchess of Sutherland, Mrs. G. Mileham, Chrysanthemiste Montigny, and Mr. H. Pitt.

In the amateurs' class A. T. STEPHENS, Esq., Sully (gr. Mr. J. Graham), was the winner of the 1st prize and a silver cup for a collection of 24 Japanese blooms in not fewer than 18 varieties. Some of the most striking varieties were Marquise V. Venosta, W. A. Etherington, Mrs. G. Mileham, and Madame Rivol. The Marquis of BUTE, Cardiff Castle (gr. Mr. H. Farmer), was 2nd.

The Marquis of BUTE was placed 1st for the best stand of 12 Japanese blooms in not fewer than six varieties. A silver medal was also awarded to this exhibit as being the best in its class.

F. PRIMAVASIE, Esq., Cardiff (gr. Mr. Webber), secured the 1st place for 12 blooms (any kind) in four varieties, three of each, President Viger, F. S. Vallis, Mad. P. Radaelli, were three of the best. Miss TALBOT, Margam (gr. Mr. Milner), was placed 2nd in this class, but won the 1st prize for six vases of cut bloom in six distinct varieties.

PLANTS.

More groups were staged this year than usual. Unfortunately, either the Chrysanthemum plant as now grown does not lend itself to artistic grouping, or gardeners are afraid to detract from the appearance of the individual blooms by adopting a novel mode of arrangement. As a consequence, groups of Chrysanthemums, as shown at exhibitions, are nothing other than uniform outlines faced with blooms, all the groups having the appearance of having been cast in one common mould. Even where choice foliage plants are introduced, the groups are allowed to remain too massive and uniform in character. The groups on the present occasion were no exception to the rule.

Mr. WILLIAMS, nurseryman, Cardiff, was awarded the 1st prize and a silver cup for a group of Chrysanthemums and foliage plants, arranged for effect in a space of 60 feet square. This competition was open to all comers, but the above was the only entry. Eulahias, Cocos Weddelliana, and different varieties of Crotons were the foliage plants used to lighten up the group.

The principal prize-winners for specimen bush plants (Chrysanthemums) were Messrs. W. TRESEDER, F. CARTRIGHT, G. NURSE, and Dr. WALLACE, all of Cardiff.

FRUIT.

The Apples and Pears were exceedingly good, the effects of the fine summer being evident in the highly-coloured fruits.

H. PITT, Esq., Abergavenny, was 1st for a collection of dessert fruit, distinct. These were Cox's Orange Pippin and Blenheim Pippin Apples, Pitmaston Duchess Pear, Taunton Hero Melon, and Coe's Golden Drop Plum; 2nd, Mr. THEO. THOMAS, Aberdare.

For a collection of culinary Apples, six dishes distinct, Mr. W. J. HOCKEY, Jetton, received the 1st prize.

Sir J. GUNN, Cardiff (gr. Mr. A. Dobbs), won the 1st prize and a silver cup for a collection of fruit, consisting of four dishes of culinary Apples, four dishes of dessert Apples, two dishes dessert Pears, and two dishes of culinary Pears. The dessert Apples shown were Blenheim Pippin, Cox's Orange Pippin, Allington Pippin, and King of the Pippins. The culinary sorts were Lord Derby, Peasgood's Nonsuch, Warner's King, and Gascoyne's Scarlet. The dessert Pears were Doyenné du Comice and Pitmaston Duchess.

MISCELLANEOUS EXHIBITS.

Mr. W. TRESEDER, nurseryman, Cardiff, carried off several 1st prizes for bouquets, sprays, wreaths, &c., and he was also awarded a silver medal for a remarkably fine collection of Dahlias. Messrs. CYPHER, Cheltenham, were awarded a gold medal for a fine display of Orchids, and Mr. BASHAM, Bassaleg, received a similar award for a choice collection of hardy fruit.

Certificates of Merit were voted to Messrs. CLIBRAN & SON for a collection of cut blooms of some of the newer varieties of Chrysanthemums; to the HEREFORD GRADING COMPANY for an exhibit of fruit, graded and packed in boxes ready for sending by rail; and to Messrs. S. TRESEDER & SON, nurserymen, Cardiff, for a beautiful collection of Tea Roses grown in the open.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM.

NOVEMBER 7, 8.—This society brought together a very attractive exhibition in the Town Hall, Wandsworth, on the above dates. It is one of the oldest, as well as the most enthusiastic, of the suburban societies, the recent display being the twenty-ninth annual show it has held in the district.

The exhibition under notice was greatly enhanced by a magnificent group of choice foliage plants and Orchids in flower from the nurseries of Messrs. JAMES VEITCH & SONS. The group was similar to that shown by the same firm two days earlier at the Royal Horticultural Hall, Westminster, and contained the same handsome plant of Coccoloba pubescens, and pretty specimens of Codiæum, &c. Messrs. J. PEED & SONS, Roupell Park Nurseries, West Norwood, exhibited a collection of Apples and Pears; Mr. ROBERT NEAL, Trinity Road, Wandsworth, a group of miscellaneous plants; and other honorary exhibits were made by Mr. J. H. POLLOCK, Florist, Wandsworth; Messrs. FORDHAM & Co., Wandsworth (Palms, 12 feet high); and Messrs. MALTWOOD & SONS, Putney.

In the competitive classes there was great interest in that for a collection of Chrysanthemums shown in pots on a space of 10 feet by 5 feet. The 1st prize exhibit from Mr. R. Bradford (gr. to L. H. BROWN, Esq., Roehampton) was of the usual semi-circular, banked style, but, apart from its formality, the quality of the flowers it included deserved the highest praise. A smaller class of the same type was reserved for amateurs not employing a regular gardener, and in this competition a very creditable exhibit gained the 1st prize for Mr. T. P. YARHAM, 62, Mexfield Road, Wandsworth. Mr. J. Prentice (gr. to J. D. CHARRINGTON, Esq., Roehampton had the best group of miscellaneous plants, and the best cut Chrysanthemum blooms of Incurved varieties. The best Japanese blooms were grown by Mr. A. Smith (gr. to Madame STUART, The Convent, Roehampton), his exhibits in the classes for twenty-four cut blooms shown on boards, of 12 cut blooms, also on boards, and eight vases, each containing three blooms of a distinct variety, being particularly noticeable.

The best exhibits of single flowers were made by Mr. D. Anderson (gr. to the Dowager Countess of KINTORE, Wimbledon Park), who won most of the prizes for Chrysanthemum plants shown as specimens. Of "single-handed" gardeners who showed Chrysanthemums, the most successful was Mr. J. Dark (gr. to JAS. HOOKER, Esq., Putney).

The President, Sir J. W. LANCASTER, Putney Hill (gr. Mr. F. H. Goddard), showed admirable "table" plants; and Begonias were exhibited well by Mr. R. S. Barnett (gr. to P. MORTIMER, Esq., Wimbledon Park).

There were also very attractive exhibits of berried plants, bouquets, &c., Apples, Pears, Grapes, and vegetables, making altogether, as we have observed already, a very pretty exhibition. The hon. secretary is Mr. J. F. McLeod, and the acting secretary Mr. J. Reynolds, 53, Medfield Street, Roehampton.

COLCHESTER CHRYSANTHEMUM AND FRUIT.

NOVEMBER 8.—The autumn show of this society was held on this date, when excellent exhibits of Chrysanthemums, fruit, vegetables, and floral decorations were seen. The Chrysanthemums were equal to any seen at the society's shows of past years, and for a large group of these plants with foliage plants intermixed, and Ferns, Major-General LARPENT, of London (gr. Mr. J. Claydon) was an easy 1st prize winner with a splendid group. A class was also provided for a smaller group, and the prizes for these were awarded to Messrs. R. B. BEARD, W. LEGGET, and Major KEMBLE in the order named.

Major-General LARPENT had the best twelve plants of Chrysanthemums, the best six, the best Japanese, and the best plant of an Incurved variety.

Cut blooms.—The important class for twenty-four Japanese blooms saw C. S. MONTEFIORE, Esq., Stisted Hall (gr. Mr. B. Rogers), to the fore with splendid flowers that possessed great depth, and were richly coloured. The same exhibitor was also 1st for twelve Japanese blooms.

W. E. EYRES, Esq., Braintree (gr. Mr. J. Dodget), staged the best stand of Incurveds.

General LARPENT had the best Pompons in bunches, and also the best single varieties.

The Mayor of Colchester offered prizes for six vases of Chrysanthemums. Nearly two dozen competitors were seen, C. S. MONTEFIORE, Esq., winning, followed by Mr. STEPHENSON.

Fruit occupied much space, and the hardy fruit was excellent. Mr. MONTEFIORE was 1st for black Grapes. Rev. R. CHILTON had the best six dishes of dessert Apples, and the same exhibitor had the best six dishes of Pears.

Vegetables formed a special feature of the show, and the collections occupied much space, and were remarkable for their good quality.

STIRLING CHRYSANTHEMUM.

NOVEMBER 8, 9.—On these dates, the 17th annual show was held in the Albert Hall, Stirling. Compared with former years, the entries were limited in number; this, however, was compensated for by the good quality and the admirable arrangement of the exhibits to hand.

The principal class for cut blooms was that for eight vases, with three blooms in each in eight varieties. Mr. LUNT, Keir Gardens, Dunblane, secured the premier award (Hon. President's Cup) with clean, well-finished blooms of good size, Mrs. A. T. Miller, Reginald Vallis, Algernon Davies, and Miss Oliver Miller being most prominent in a capital lot.

The Corporation Cup for four vases, three blooms in each, was won by Mr. T. BAIRD, Alloa.

While specimen plants of Japanese varieties were not up to the usual standard, the 6-inch pot plants were again a feature of the show. Pompons were good, and "singles" better than any ever seen at a previous exhibition.

The usual entry was made of Roman Hyacinths, Primula sinensis, P. obconica, Begonia, Gloire de Lorraine, Lily of the Valley, Zonal Pelargoniums, Ferns and foliage plants.

Excellent Grapes came from Mr. LUNT and Mr. J. WALDIE, Dollarbeg; magnificent Pears from Mr. RITCHIE, Polmaise; and Apples from Mr. BOSWELL, Stirling. Good examples were seen of Apples (dessert), King of the Pippins, Ribston Pippin, Blenheim Pippin, Worcester Pearmain, Cox's Orange Pippin, and Ochiltree, a local variety. Culinary: Ecklinville Seedling, Lord Suffield, Warner's King, Stirling Castle, and Bismarck.

Vegetables were a meritorious display, Messrs. J. WALDIE, J. OGILVIE, M. CARRIGHAN, and BOSWELL showing well-grown produce.

Honorary exhibits came from Messrs. DRUMMOND & SONS, JOHN CRAIG, Mrs. TASKER, Stirling, a vase filled with 27 varieties of outdoor Chrysanthemums, and an exhibit of Carrots from A. ROBERTSON, Gorgunnock.

DEVON & EXETER HORTICULTURAL.

NOVEMBER 9.—The 24th exhibition of this society, held in the Victoria Hall, Exeter, on this date, was one of the best for many years past. The exhibits were principally Chrysanthemums and fruits, the competition in many of the fruit classes being very keen. In Chrysanthemums some remarkably fine blooms were shown in the amateurs' classes.

In the class for a group of Chrysanthemums relieved with foliage plants, W. BROCK, Esq. (gr. Mr. W. Rowland) was the only exhibitor and he was awarded the 1st prize. The best table decorated with Chrysanthemums, with any kind of foliage added, was shown by Miss KINGDON, of Taddyforde. Cyclamen, Poinsettias, Violets, and Begonia Gloire de Lorraine were well shown by Mr. MARK FARRANT in a class for plants in pots.

Thirty Japanese blooms, in ten distinct varieties.—H. TOWNSEND, Esq., Exeter (gr. Mr. Phillips) was awarded the 1st prize for a fine lot of blooms, the best being Margaret de Mans, Bessie Godfrey, Alice Byron, and Godfrey's Pride. 2nd, Mr. W. BROCK.

A collection of cut blooms.—A class was provided for a collection of cut blooms of the various sections of Chrysanthemums, the examples to include not fewer than six out of the ten enumerated in the N.C.S. catalogue. Two competitors staged, the judges awarding the 1st prize to Mr. W. BROCK, and the 2nd to Mr. C. M. COLLINGWOOD, Exeter. In the opinion of some persons, these awards should have been reversed.

Twenty-four Japanese blooms, in not fewer than eighteen distinct varieties.—Rev. T. SHEEPSHANKS, Chudleigh (gr. Mr. Dunkley), won the premier place with a splendid lot of flowers, including a specimen of Madame Carnot, to which was awarded the prize offered for the best bloom in the show. To this exhibit was also awarded the silver medal for the best exhibit staged by a professional gardener.

Eighteen Japanese blooms, and not fewer than twelve distinct varieties in the collection.—These had to be shown in vases, three blooms in a vase. The 1st prize was won by J. QUICK, Esq. (gr. Mr. F. Perret), and he was followed by Col. GUNDRY, Broadhembury (gr. Mr. Shackleton). Here, again, a frequently expressed opinion was that the awards should have been transposed.

Twelve Japanese blooms, distinct. First honours in this class were taken by Mr. W. NIX, an amateur, whose exhibit was also awarded the National Chrysanthemum Society's certificate for general excellence.

Mr. J. R. GULSON had the best six blooms of a white variety (Mrs. J. Lewis); Mr. J. QUICK, the best six blooms of a yellow variety (F. S. Vallis). Mr. GULSON was also 1st for six blooms of any other colour than white or yellow.

Mr. C. M. COLLINGWOOD was 1st for six Incurved blooms; Mr. C. HAM, Exeter, who was 2nd, was awarded a medal for the best Incurved bloom in the show.

FRUIT CLASSES.

Sir DUDLEY DUCKWORTH KING, Wear House (gr. Mr. S. Baker), had the best Grapes, his varieties being Gros Colmar and Black Alicante.

Competition was exceedingly keen in a class for 24 Apples—12 dessert and 12 culinary varieties. The 1st prize was won by B. H. HILL, Esq. (gr. Mr. G. Lock). 2nd, Sir JOHN FERGUSON DAVIE, Creedy Park (gr. Mr. Seward), whose exhibit was little inferior to the 1st prize collection. Mr. J. F. G. BANNATYNE, Haldon House (gr. Mr. T. Ellicott) was 1st for six varieties of dessert kinds; and Mr. BANNATYNE was 1st for six varieties of culinary Apples, distinct. In both the foregoing classes there were 10 competitors. The single dish classes were also keenly contested.

Mr. B. H. HILL, Newcombes, showed the best nine dishes of Pears—six dessert and three culinary kinds. The 1st prize for a single specimen Pear of any variety was won by Mr. G. R. P. PERRIAM, of Exmouth, with an enormous fruit of Beurré Diel, which scaled 31 oz.!

Non-competitive exhibits were of unusual excellence, and were contributed by Messrs. Robert Veitch & Son, of the Royal Nurseries, Exeter; Messrs. Sutton & Sons, Reading; Messrs. Geo. Bunyard & Co., Maidstone; Mr. W. J. Godfrey, Exmouth; Mr. W. J. Coombes, Exeter; Messrs. Jarman & Co., Chard; and Messrs. Sanders & Biss, Exeter. *A. H.*

BIRMINGHAM & MIDLAND COUNTIES CHRYSANTHEMUM, FRUIT AND HORTICULTURAL.

NOVEMBER 13, 14, 15.—The annual exhibition of this well-established and progressive society was held in the spacious Bingley Hall, the biggest in Birmingham, on the above dates, and was a pronounced success, showing a decided improvement on previous exhibitions of the society, particularly so over that held a year ago.

This year's schedule has been revised. The old-fashioned method of showing Chrysanthemums in tubes on boards is not now recognised by this society, greater prominence and encouragement being given to the much more effective manner of displaying the blooms in vases. The number of varieties in the "vase" classes has been reduced, together with the number of flowers in each vase, which are now three instead of five, yet notwithstanding the smaller number of flowers required, the prize money has been increased, and, judging from the greater number of entries (nearly four times more than those recorded last year), the committee has reason to be satisfied with the change.

Thus, in a class for eight varieties, five blooms of each variety, the first prize last year was £5 10s., but this has been raised to £6, and was offered for 18 blooms in six varieties.

The principal new class was one for Chrysanthemum blooms arranged with cut foliage and foliage plants, the 1st prize including a silver Challenge Shield. Four competitors entered, and their exhibits all differed in design, but were all in excellent taste.

The schedule was divided into 127 classes—15 more than last year—and comprised classes for groups and specimen plants of Chrysanthemums, cut flowers, miscellaneous foliage and flowering plants, exotic and hardy fruit, and vegetables, for which a sum of about £50 was offered. Some of the foremost vegetable growers in the country exhibit at Birmingham each November.

This year a change was made in the arrangement of the exhibits, and, instead of unsightly subjects meeting the visitor immediately on entering the hall, choice groups of Chrysanthemums were to be seen, with floral devices, &c., beyond. So great was the demand for space in the body of the hall that it was found necessary to place the table decorations—always a feature at Birmingham—in the side galleries.

Apples were shown in great quantity, variety, and excellent condition.

It was decided to give 5 per cent. of the takings at the doors to the Birmingham General Hospital.

GROUPS.

In the principal class, for a group of Chrysanthemum plants, the 1st prize consisted of a silver Challenge Cup and £10. The best group, in which quality of bloom, variety, and general effect were the essential points, was staged by Messrs. W. SANFORD & Co., Hall Green, Birmingham. The plants carried heavy, well-finished blooms, principally of Japanese varieties, and the exhibit was beautifully arranged with foliage plants. For the 2nd and 3rd positions there was but little to choose between the groups staged by Messrs. J. RANDALL & SONS, Hatfield Nursery, Shirley, and Mr. A. Cryer (gr. to J. A. KENRICK, Esq., Berrow Court, Edgbaston). Both exhibitors adopted the same style of arrangement, but the judges gave the awards in the order named.

As the Cup has been won twice by Messrs. SANFORD & Co., it now becomes their property.

In a similar but smaller class than the last-named, Mr. J. AUSTIN, Sparkbrook, beat three competitors. His collection consisted largely of Japanese and single-flowered varieties, artistically arranged with bamboos, grasses, &c. 2nd, A. CLARKE, Esq., Edgbaston (gr. Mr. J. Eason).

Another group class was that for a collection of decorative varieties to be shown as grown. Messrs. W. SANFORD & Co., Hall Green, carried off the leading prize of £4 with a pleasing exhibit. 2nd, Mr. C. H. HERBERT, Acocks Green.

SPECIMEN PLANTS.

The best exhibits of six large flowering varieties of Chrysanthemums (Japanese included); the best six Japanese (dissimilar varieties); the best large flowering plant (Japanese excluded); and one of a Japanese variety were staged by F. MARTINEAU, Esq., West Hill, Edgbaston (gr. Mr. O. Brasier); J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer) being 2nd in these classes, but he was first in the class for three Japanese Chrysanthemums distinct.

CUT BLOOMS.

Great interest was centred in the new class provided for cut blooms of any variety, arranged on floor space measuring 20 feet by 12 feet. Cut foliage and foliage plants were admissible, and no restriction was made as to vases or stands.

Four prizes were offered, and divided as follows:—1st, £15 and a silver Challenge Shield, the latter to be held by the exhibitor during the ensuing year; 2nd, £10; 3rd, £7 10s.; 4th, £5.

The premier award was gained by Mr. H. J. JONES, Ryecroft Nurseries, Lewisham, whose principal flowers were displayed on large tripods, that varied in height from about 5 feet 6 inches to 7 feet 6 inches, each being filled with large, shapely blooms, and a few sprays of autumn-tinted foliage. The groundwork consisted of an assortment of smaller flowers in ornamental jars and vases of different sizes, the whole being relieved with Codiæums, Ferns, &c.

Messrs. SANFORD & Co., Hall Green, Birmingham, were placed 2nd with a beautifully arranged collection of handsome flowers, the next in order of merit being Messrs. JAS. RANDALL & SONS, Shirley, Birmingham.

Vase classes.—Blooms shown in vases were unusually numerous, and of good quality. Some of the finest blooms in these classes were shown by Lt.-Col. BEECH, Coventry (gr. Mr. E. J. Brooks). The Dowager Lady HINDLIP, Hadzor, Droitwich (gr. Mr. C. Crooks); and Mr. R. BARNES, Malvern.

Eighteen Japanese blooms.—The schedule required six distinct varieties on stems 18 inches in length. The 1st prize was secured by Lt.-Col. BEECH (gr. Mr. E. J. Brooks), who had magnificent blooms of the varieties Henry Perkins, Mrs W. Knox, F. S. Vallis, Walter Jinks, President Viger, and Mrs. A. T. Miller, the last-named being one of the best flowers in the show. 2nd, Sir A. MUNTZ, M.P., Rugby (gr. Mr. H. Blakeway), with a very fine lot; 3rd, Mr. W. IGGULDEN, Frome.

Twelve Japanese blooms.—This class was for four dissimilar varieties, three blooms of each variety. The 1st prize fell to Lt.-Col. BEECH (gr. Mr. E. J. Brooks), who was also 1st for two Japanese varieties, three blooms of each, M. FIRTH, Esq., Leicester (gr. Mr. F. J. Clark), being 2nd in the former, and the Dowager Lady HINDLIP, Hadzor, Droitwich (gr. Mr. C. Crooks), 2nd in the latter class.

Pink variety.—The best vase of any pink-coloured variety came from the last-named exhibitor, who had lovely examples of Olive Miller; 2nd, Mr. W. IGGULDEN, Frome, with handsome blooms of Mrs. Barkley.

Single flowers.—Mr. R. BARNES, Malvern, staged four varieties of single Chrysanthemums, and well deserved the first award. He was also placed 1st for the best half-dozen decorative varieties.

INCURVED VARIETIES.

The best four Incurved flowers came from A. JAMES, Esq., Rugby (gr. Mr. A. Chandler). T. W. PIGGOTT, Esq., Moseley (gr. Mr. R. Bullock), also had four varieties, and succeeded in beating all competitors resident within four miles of the centre of Birmingham.

A great many prizes were also awarded to local exhibitors.

Reports of Societies continued on p. xiv.

Obituary.

THE LATE ROBERT PINCE GLENDINNING.

ROBERT PINCE GLENDINNING.—By the death, on the 9th inst., at his residence, Merton Road, Wimbledon, of Mr. R. P. Glendinning, there has passed away a worthy horticulturist who was widely known and greatly respected throughout the British Isles, and whose death, which terminated a long period of intense suffering, will be regretted by many friends. Mr. Glendinning came of a good gardening stock. He was born in Exeter

on November 22, 1840, and was the third son of Mr. Robert Glendinning, who, in the middle of the last century, was a nurseryman of some repute at Chiswick, and who, singular to relate, also died on November 9. Leaving Chiswick some 35 years ago, Mr. Glendinning went for a period to the then great Edinburgh nurseries of Messrs. Peter Lawson & Sons, and afterwards was for several years with the late Mr. B. S. Williams at Holloway. Subsequently he went as manager to the West Coates Nursery of Messrs. Downie & Laird, and next of Messrs. R. B. Laird & Sons, Limited, and eight years afterwards, on the death of Mr. B. S. Williams, returned to Holloway as general manager, a position from which he retired several years ago. A man of tall stature and commanding presence, combined with a kindly, gentle nature and unfailing courtesy, Mr. Glendinning was "always a gentleman," and enjoyed the regard and esteem of all who knew him.

ENQUIRIES AND REPLIES.

DIRECTORY OF FRENCH GARDENERS.—On p. 332 a correspondent asked for French and German Directories. There are: *Annuaire Belge de l'Horticulture, Annuaire Général Horticole, Annuaire International d'Horticulture*, by Lehmann: 1 German, 2 Foreign, *Annuaire des primeuristes* and *Almanach des Jardiniers*, any of which can be got from the Librairie Horticole, 84 bis, Rue de Grenelle, Paris. *C. Harman Payne.* [For Germany see Thalacker's *Adressbuch*, published at Leipzig—Gohlis.—ED.]

TRUFFLES.—*T. Z.* would be glad if some reader could inform him of an instance where truffle cultivation is attempted in this country, and where he would be likely to obtain spores or "stock" in any form for planting.

ANSWERS TO CORRESPONDENTS.

BOOKS: *Anxious Inquirer.* The first you mention is out of date though still useful for reference. The second and third are more valuable, but you must ask a second-hand bookseller to tell you their market value. We have no means of knowing.

CABBAGE LEAF DISEASE: *F. G. B.* Your Cabbage-leaves are badly infested with Sphærella brassicicola, associated with which is a little of the Black mould, Alternaria Brassicæ. It is not uncommon (see Dr. Cooke's *Fungoid Pests of Cultivated Plants*, p. 82) upon Cabbage-leaves, but it is seldom so bad a pest as in the specimens you send. You state that the disease has appeared from year to year. Evidently dead leaves on the ground in previous years have filled the soil with spores which germinate in the spring and infest the young plants. All diseased leaves should be collected and burned, the soil disinfected, and no Cabbages or Cauliflowers should be planted on the same site for two or three years. You must use strong measures to clear the soil of the fungus spores before you can hope to grow healthy plants in the same ground again. Healthy plants in other parts of the garden should be syringed with fungicide, to prevent the disease attacking them.

CARNATIONS DISEASED: *A. H. H.* The plants are badly affected with the Carnation disease, caused by a fungus Helminthosporium. Your better plan will be to burn the diseased stock, and to afterwards thoroughly clear the house in which they have been grown with a weak solution of carbolic acid and warm water. Spraying with potassium sulphide (liver of sulphur) is said to arrest the spread of the fungus, but it blackens the paint.

COLLUS THYRSOIDEUS: *H. C. L.* The appearances are consistent with too much moisture from drip or some other cause. We find neither fungus nor insect. See p. 332 last week.

COPPER SULPHATE: *J. McC.* If you are likely to use a very large quantity of the liquid as a "wash," it will be safer to cover the Box edging beforehand.

GARDENERS IN BOTHY: *S. J. M.* We believe that it is only the head gardener who is considered by law to be a domestic servant. The employer is not bound to pay the doctor's bill for attending a servant, unless the doctor was summoned at the employer's instance.

GRUBS ON SAXIFRAGA UMBROSA: *S. S. H.* The grubs are weevils. Trap them with pieces of Carrots, Potatos, Turnips, or such-like vegetables. Next spring, plant the Saxifrage (London Pride) in a fresh site.

INSECTS ON EPIDENDRUMS: *T. C., Norwood.* The specimens, all of which are imperfect, appear to be young Porcellis scaber, probably the commonest English wood-louse.

IRISES: *B. L.* There need be no fear of failure being brought about through the early planting of such bulbous Irises as those named in your letter, and the end of September is a good time for such an operation. There is danger, however, in planting these species insufficiently deep. If the bulbs are 4 inches deep they will not take much harm, and if not so deep as this a covering of cocoa-nut fibre refuse will meet the case, or light soil even, as the growth will spear through quite well. We have passed through a summer and early autumn of exceptional heat, and the warm condition of the soil, coupled with almost continuous sun-heat till quite recently, have caused not a few freshly planted subjects to start very promptly into growth. You cannot have anything better than quite dry silver-sand for storing the bulbs of Iris Tingitana in after lifting. Place a layer of sand in a shallow box, then the bulbs, and add a further layer of sand. Place the box on a shelf in a well-ventilated outhouse or shed, or a greenhouse will do quite well. We have kept the bulbs quite well in a flower pot placed in such conditions. This species makes much of its growth during the early autumn, therefore early planting is desirable, selecting a warm and favoured position in which to insert the bulbs 5 inches deep, employing much sand about the bulbs and in the soil around them.

LANDSCAPE GARDENER: *J. E. H.* Providing you have an aptitude for landscape gardening, you will do well to commence by seeking employment where you may partake in some such work as the alteration and laying-out of grounds. Afterwards you might enter some nursery, most nurseries having a landscape department. This would, in a measure, fit you for the service of some firm who make landscape gardening a speciality. You will require a knowledge of geometry, other branches of art will also be of service. You should study mensuration, also land surveying, levelling, &c., of which you would probably get an insight in your practical work. Plan drawing and reading, are also important qualifications in the profession. You will need a knowledge of many and varied subjects to fit you for the work of landscape gardening, all of which will never make you a master of the craft unless you possess a taste and an inclination for this branch of gardening. "Landscape gardeners are not made, they are born."

MANGO: *J. S.* Obtain Mr. Woodrow's book on "The Mango," which treats of the culture and varieties of this tropical fruit. Price, 1s., from our publishing department.

MAY-FLOWERING TULIPS: *Select.* The following is a list of varieties with their colours, suitable for planting in an open border for the purpose of furnishing flowers for cutting:—Bouton d'Or (rich gold), Bronze King, Caledonia (orange-scarlet), Coronation-Scarlet (vermilion-scarlet), flava (lemon-yellow), fulgens (vermilion-crimson), Gesneriana spatulata (rich crimson-scarlet), Inglescombe Pink, Inglescombe Scarlet, La merveille (salmon-rose), macrospila (crimson-scarlet, fragrant), The Fawn (rosy-fawn), Mauriana (scarlet and gold), Picotee (white), Dream (soft heliotrope to grey), General Kohler (deep crimson), Leonardo da Vinci (blackish maroon), Mrs. Krelage (soft rose), Nora Ware (silver lilac), White Queen, Rev. H. Ewbank (heliotrope), and Professor Rauwenhoff (cherry-rose with white base).

MUSHROOMS: *E. F. C.* The two large Agarics are the Wood Mushroom, Agaricus sylvaticus, and they may be eaten, but they are not equal in quality to some other species. On the Continent they are mostly regarded as doubtful. The small specimens are the Fairy Ring Champignon Marasmius oreades. The other appears to be a species of Flammula, but it was in too bad a condition when received to properly determine its name.

MYRTLE: *Constant Reader.* We think there would be no danger in removing the plant at the present time, providing the operation is performed carefully, and after the roots have been well soaked with water. Keep as much soil to the roots as possible.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *Zola.* Apples: 1, King of the Pippins; 2, Reinette du Caux (Syn. Dutch Mignonne); 3, American Mother. Pears: 1, Holmer; 2, Bon Chrêtien Fondant; 3, Knight's Monarch.—*T. H. B.* 1, American Mother, 2, Old Gilliflower (not Cornish); 3, Rymer; 4, The Queen; 6 and 7 are both Beurré Diel. One is better grown and somewhat earlier than the other, which accounts for their difference in appearance.—*J. M. L.* Swan's Egg. 1 and 2, rotten; 3, Royal Somerset; 4, Lemon Reinette.

NAMES OF PLANTS: *E. A. H.* 1, Cupressus pisifera, var. filifera; 2, Arbutus Unedo; 3, Cotoneaster Simonsi; 4, Andromeda floribunda.—*M. M.* Cotoneaster affinis.—*J. W.* Rhodotypos kerrioides, Japan.—*Cambria.* 1, Diervilla rosea; 2 and 3, both forms of Veronica cupressoides (see fig. in *Gardeners' Chronicle*, January 7, 1888, p. 20).—*L. H.* Aster ericoides (type).—*Roath Park.* 1, Cupressus torulosa; 2, Crepis sibirica.—*F. L.* Sequoia sempervirens, the red-wood of California.—*F. C.* We cannot undertake to name varieties of Ivies; send them to some grower who has a collection.—*T. E.* 1, Promenæa stapeloides; 2, Aspasia lunata; 3, Odontoglossum crinitum.—*J. S.* 1, Pteris cretica albolineata. 2, Adiantum affine, Asplenium bulbiferum, 4, Pteris cretica cristata; 5, Pteris tremula, 6, Pteris longifolia.—*J. T.* 1, Anthurium Andreanum atrosanguineum; 2, Anthurium Andreanum delicatum; 3, Vanda tricolor.—*G. W. S.* Abies Pinsapo, Spanish Silver Fir.

THUYA DOLABRATA: *Cambria.* It is somewhat late to insert cuttings of Conifers in November, as it is better for these to become well callused before winter. However, with suitable provision, in the shape of a cold frame and some good porous soil, you will meet with a certain amount of success even at this late season. Be careful to prevent any excess of moisture in the frame, and ventilate in the morning to allow the excess of atmospheric moisture to escape. You would meet with greater success if a little bottom heat were provided in the frame. An article on the propagation of plants, including Conifers, is unavoidably crowded out this week.

TO KEEP WALNUTS: *A. S.* Why not treat them in the same manner as is usual in respect to Filberts. Make a layer of nuts and then place over them a layer of salt, repeating the process as often as necessary. The salt will prevent any mould, and at the same time keep the nuts in an agreeably moist condition.

VINE LEAVES WITH EXTRA COLOUR: *G. C., Bangor.* The attractive colour is not due to the presence of disease, but the unusual weather during October may have had something to do with it. Probably the soil contains an unusual amount of potash.

WORMS IN LAWNS: *R. A. F.* (1) Dissolve half an ounce of corrosive sublimate (POISON) in 15 gallons of water, and apply it over the lawn, and when the worms come to the surface sweep them up. If fowls eat them they will be poisoned. (2) If you mix a peck of freshly-made quicklime in 40 gallons of water, allowing it to stand until clear, and then apply the liquid from a rose watering-pot, it will serve to bring the worms to the surface. (3) You can obtain from Messrs. Cooper, Taber & Co., Ltd., 90 and 92, Southwark Street, London, S.E., a preparation which is known as "Chinese Worm Soap," which we have proved to be very valuable for the purpose, and easy of application.

THE LONGEVITY OF SEEDS.

THIS is an interesting and much discussed subject. Certainly, as M. Paul Becquerel remarks in a recent number of the *Comptes Rendus*, the longevity of seeds varies not merely with the species but in different individuals of the same species, as it is dependent on a great number of external and internal factors to which the seed is subject, and according to how and where it is stored.

The temperature and hygrometric condition of the atmosphere, light, the depth at which the seed is buried in the ground, bacteria, and the degree of permeability of the teguments of the seed, the nature of its nutritive reserves, and its degree of dryness, are among the causes which directly act on the vitality of the embryo. Many observers have studied the question and have dealt with isolated cases, but the only general work, and that containing the most numerous and exact facts, is still that of Alphonse de Candolle. In 1840 he sowed seeds of 368 species which he had himself gathered and kept in packets, sheltered from damp and light for fourteen years. He found that, of these 368 species, only 17 retained their germinating power, and these but feebly. The species belonged to three families: Malvaceæ five out of ten, Leguminosæ nine out of forty-five, Labiatæ one out of thirty*.

Thanks to the kindness of M. Costantin, "professeur de culture" at the Museum, and to the assistance of M. Caille, "chef du service de la Grainetérie," who placed at M. Becquerel's disposal all the oldest seeds the date of the arrival of which at the laboratory was exactly known, he was able to carry on De Candolle's work.

The experiments were made with nearly 550 species belonging to 30 of the most important families of Monocotyledons and Dicotyledons, the seeds of which had been gathered from 25 to 135 years previously. The seeds of each species, usually to the minimum number of ten, were carefully soaked in sterilised water, then partly decorticated when their coats appeared too impermeable. Thus prepared they were placed on damp, aseptic, moistened cotton wool, in a vessel covered with a sheet of glass, which was kept in a stove at a steady temperature of 28deg. C.= 83deg. F. Under these conditions 18 species out of the thirty of Leguminosæ were raised. In the genus Nelumbium three species germinated, viz., Nelumbium codophyllum, ripened in 1850; N. asperifolium, ripened in 1858; and N. speciosum, ripened in 1888.†

Of Malvaceæ fifteen species were raised: Lavatera, pseudo-Olbia, dating from 1842, and one out of fourteen species of Labiatæ, viz., Stachys nepetæfolia, the seeds of which had been stored since 1829.

Many seeds are enumerated which did not germinate at all.

Certain seeds are often described by various observers as being capable of preserving, when in the soil, their faculty of germination for many years, and even for several centuries. The fact of their sudden appearance in certain localities where they have never before been seen, after changes of soil, cutting down woods, or the drying or filling up of ponds, is not sufficient to justify this supposition.

Changes in the conditions of the surroundings and an infinite multitude of influences, such as transport by means of water, wind, birds, animals, and men, offer far more likely explanations of this sudden appearance of certain species. And this seems the more likely since examination of old seed kept in packets protected from light, water, cold, and fungus moulds (as is not often the case under natural conditions) shows us that, owing to the extreme permeability of their skin, the oxydation of their nutritive reserves, and the disorganisation of the embryo, they have lost all possibility of living.

The only seeds which have been proved to preserve their germinating power for more than 80 years are those of Acacia bicapsularis, Cytisus biflorus, and Leucæna leucocephala, which are protected by a thick skin and possess reserves little subject to oxydation.

Experiments made with an apparatus described in the *Comptes Rendus*, 1904, p. 1347, enabled M. Becquerel to ascertain the important biological fact that in these seeds impermeability of all the parts of the skin to the gases of the atmosphere has been realised naturally in a manner as perfect as if it had been induced artificially by drying in a vacuum by the aid of caustic baryta and heat.‡

Consequently, we have here an example of life remaining dormant for more than 80 years, all gaseous interchanges between these seeds and the atmosphere having been completely interrupted.

If an embryo enclosed within a coating hermetically closed has respired, it must have done so imperceptibly, with the expenditure of an infinitesimal quantity of gas since, at the end of so long a time, it has not yet used up all the oxygen that it must have contained inside its cells.§

---

* Alph. de Candolle, *Sur la durée relative de la faculté de germer.* (Ann. Sc. Nat. Serie III., t. vi., p. 383).

† M. Y. Poisson caused the seeds of Nelumbium luteum gathered in 1848 to germinate in 1902.

‡ In experiments on the skins of seeds described before the Paris Academy of Science in 1905 Joseph Gola demonstrated that in nature, seeds with impermeable coats which do not swell even in water are extremely frequent in Leguminosæ and Malvaceæ.

§ If in this paper no mention is made of the famous case of the longevity of seed from Cæsar's granaries, Mérovingian tombs, and those of the Pharaohs, it is, says M. Becquerel, because De Candolle, Decaisne, and more recently Gain, working with authentic specimens, have shown the baseless nature of these legends.

ROCK-GARDENS.

(Continued from page 304.)

THE ROCKY DEFILE.

Another type of rock-garden that offers many advantages to the cultivator, but which cannot be considered an aid to the garden landscape is that modelled on the lines of a rocky defile or mountain entourage. This type has several essential characteristics. It must be self-contained, lead from one place to another, or describe a circuit, and its walls should be high enough to shut out such parts of the garden proper as would clash with the rocky scenery it exhibits.

The visitor to such a rockery should be unable to see anything but rocks, rock-plants, soil and the pathway, and the sky above him as he passes through it. Such trees as would appear above the rock strata must not be dominant, but of the nature of scrub, dwarf and branch forms of popular Conifers, &c.—the tallest in the far background will accentuate the rift or defile all the more if their boles are not seen. One can suggest as a model for such a rock-garden some rapid stream that has carved its way through soft rock for centuries—its course varied by the hardness of the stone in places—and in others the recesses in the rock forming low and shallow caverns will suggest water erosion. Such a watercourse becomes our pathway—its banks our rocky defile, with certain modifications. In common with most garden scenes, a change of vista is desirable at every turn, hence one may fittingly trace the course of our rocky defile in serpentine form so that every bend gives one a full view of every plant and stone placed immediately beyond such a bend.

If the site is quite flat, and possessed of no natural undulations, however slight, an easy way of varying its surface presents itself, and, incidentally, some justification for the existence of stone in natural strata is secured.

Assuming that a wide cutting of any length and shape, but not less than 9 feet deep, is decided upon, one should not begin excavating at either end, but at the centre, digging there 9 feet from the top crust and wheeling the soil to form low banks at both ends, working, in fact, from the natural level at the ends to a 9-foot pit at the centre, sloping the cutting gradually to the centre. The soil placed on either bank at the ends serves two purposes. It does away with the need of steps—never a desirable feature—and it allows of a "natural" stratum of stone being formed at the natural level of the soil, and which would crop up from beneath the soil

so deposited. The low banks of soil at the rockery extremities will make excellent beds for shrubs and low trees, that will hide the junction of the rockery with the garden proper and give the designer much-needed height of vegetation at each entrance, thus preventing any possibility of his rocky formations appearing to be where one never finds them in nature—above the surface of the soil of a dead level. One can suggest that no rock formation should be visible from outside, that every stone laid should appear to be part of a natural formation. Big stones placed on end may serve as milestones or as guides to traffic, but they cannot be considered in their proper position when placed pile upon pile at the entrances to rock gardens as a kind of advertisement of similar vagaries to be found inside the portals they literally form. The shape of our cutting may vary according to taste or circumstance; it may be a simple defile with shelving sides; it may be a rift with precipitous walls in places, leading to one or more open amphitheatres of rock-scenery, or one may dig recesses into the banks, and huge bluffs may project to the pathway itself; it may have a bog bed at its centre, or recessed into its banks; it may have a waterfall or drip-pool, but there should be some observance of natural laws in providing such features. One never sees a waterfall coursing over a mountain's summit, and yet one has seen a waterfall coursing over the highest boulder in a rockery, the only source of which could have been a brick wall 20 yards distant!

Wherever there is a bluff projecting to the rockery pathway there must be a recessed rock bed on the opposite side to match it in essential features, and wherever there is a bog bed let it be where a bog should be, lower than the pathway itself, and at the lowest part of the rockery. I have already considered the entrance to a rockery should be of tree and shrub and not of boulders, and will now describe the rocky defile

AS IT SHOULD APPEAR,

instead of attempting to build it with a pen.

Its entrance is flanked by low mounds covered with trees and shrubs of a dwarf character, and no suggestion of a rock garden is apparent till these are left behind. The first rocky formation occurs at the ground level, just projecting from the banks on both sides—a low, trailing series of boulders only, showing the uppermost stratum of the formation; the farther one goes down the defile the higher the formation rises, till at the centre bold masses of stones rose 9 or 10 feet high, big rifts in the formations occur in which groups of dwarf Conifers, Cotoneasters, Rosas, and other trailing plants form a tangle, the trees in the background lending an impression of distance to the vista. All around one are rocks in natural strata, poised in similar form to those described in the previous chapter on the out-crop rockery; "torrents" of soil and shale covered with plants skirt the large boulders, smaller stones out-crop from these "torrents" and every dominant rift and fissure the formation shows on one side has its counterpart on the other. No sign of the garden proper is to be seen, and the 9-foot cutting is only traceable where the sides are nearly perpendicular; the sloping and terraced banks receding here and there suggest twice their actual height. There are no piles of bare stones on end, every stone serves a purpose in holding up soil above it, and throughout the whole design there is uniformity of stratification, but the greatest superficial variety of form. There are rocky cracks for every Sempervivum, a fissure in which to root and a face of stone to cover for every plant that delights to drape a boulder, spacious chair-like recesses above and below the eye level for the colony of low-growing herb and shrub are there. No grand boulders dominate the scene and impress one with their magnitude, but there are giant bluff formed of smaller boulders bedded into the steeper banks that give massiveness to the scene in sufficient measure, their gaping seams offering the happiest conditions of life for hosts of Alpine plants.

Such then is a brief description of the rocky defile as it appears to me. Nothing in the nature of a wall or a series of steps is possible if one disposes the rocks in the freest possible way. If the designer keeps the natural formation of the rock well maintained throughout it does not matter how much he varies the surface, nor how widely dissevered are the prominent boulders one from the other, provided there is ample trace of rock formation behind the interspaces. A prevailing failing in rock-building is the use of too much stone in massive blocks without regard to its formation; such blocks offer no aid to the cultivator—he wants the greatest diversity of surface, the greatest variety of "habitat," and above all things he wants degrees of moisture varying from the sunny crevice to the peat bog, and the means of maintaining the requisite moisture supply from natural sources.

PLANTING

may be done during the building or immediately after the rockery is finished. All plants of easy growth and which will form part of the general rock-scheme should be planted first, all the carpeters, the rock shrubs, trees, bulbs, and other kinds that grow in ordinary soil and require no especial condition or care, but reserve the planting of difficult Alpines for several months. It may, and often does, happen that the carefully-prepared rift destined to receive Ramondias dries out too quickly, and that there is moisture oozing from the crevices prepared for some woolly Alpine—no one can correctly estimate how moisture will percolate in newly-moved soil and among newly-laid stones, but after several months have elapsed the rockery will have settled and positions for this or that plant will suggest themselves as ideal from the cultivator's and the artist's points of view. The true Alpine is a highly individualised plant; it can stand much buffeting by winds, it will starve for a long period without dying, but moisture at the wrong time, or in excess, or in the wrong place troubles it as nothing else can. Every soil-pocket the rockery contains should slope outwards to promote surface drainage, or should have a shelving base to promote drainage there. *G. P. Mallett.*

(To be continued.)

NEW PLANTS.

BESCHORNERIA PUBESCENS, BERGER.*

THE genus Beschorneria was founded in 1848 by Kunth on a plant previously described by the same author as Fourcroya tubiflora. Kunth says that his new genus is intermediate between Fourcroya and the sub-genus Littæa of Agave. However, it is more nearly related to Fourcroya, and there are even species of Fourcroya which have exactly the same appearance, when in leaf only. When in flower the differences between the two genera are readily perceived. Fourcroyas have campanulate, patent sepals and petals of an ovoid or elliptic shape, and short, very thickened filaments, whereas the flowers of Beschorneria are tubular, the segments being much longer and narrower, and the filaments thin and slender, and only very slightly thickened below the middle. Fourcroyas are larger plants, the inflorescence generally branched as in Agave, and without large bracts. In most cases they produce a large quantity of little bulbils instead of capsules, or even instead of flowers. Beschornerias, on the contrary, have shorter inflorescences with large, vividly-coloured bracts and rachids, and never produce bulbils.

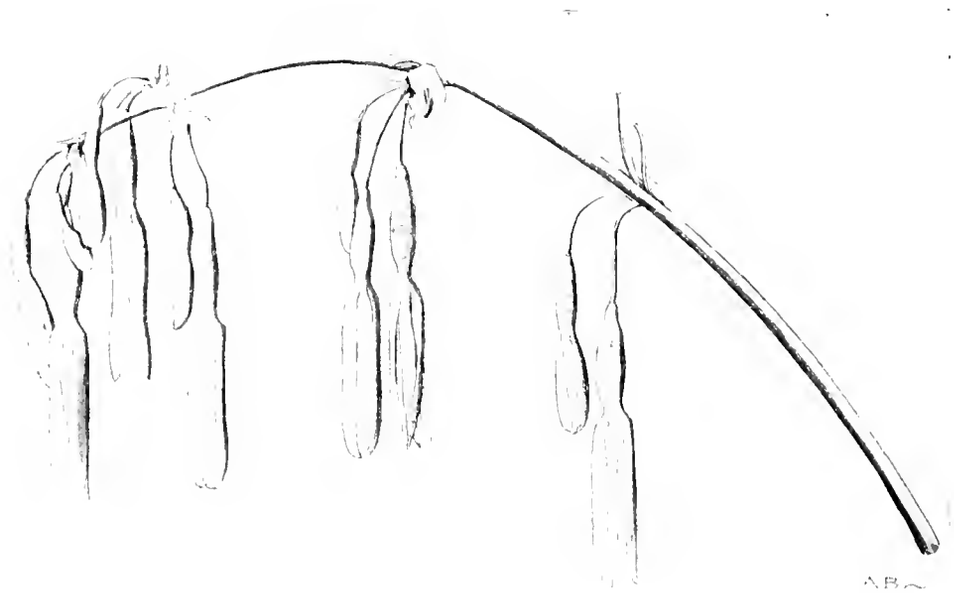

FIG. 138.—PART OF INFLORESCENCE OF BESCHORNERIA PUBESCENS: COLOUR OF FLOWERS GREEN, FADING TO YELLOW.

Baker describes, in his Handbook of Amaryllidaceous Plants, p. 161-162, five Beschornerias: B. tubiflora, Kunth (*Bot. Mag.*, 4,642), Toneliana, Jacobi (*Bot. Mag.*, 6,091), yuccoides, Hooker (*Bot. Mag.*, 5,203), bracteata, Jacobi (*Bot. Mag.*, 6,641), and Decosteriana, Baker (*Bot. Mag.*, 6,768). A sixth species was added by Sir Joseph Hooker in *Bot. Mag.*, 7,779, as B. Wrightii, named in honour of Mr. C. H. Wright. Besides these there exist some names left without any description by Lieut.-General Jacobi. Baker mentions in his handbook a B. superba, and in the *Kew*

* BESCHORNERIA PUBESCENS, *Berger, n. sp.* – Acaulis, multiceps. Folia 60 cm. longa et 5 cm. lata, lineari-lanceolata, longe acuminata, crasse carinata, subtus apicem versus aspera, glauca, ad margines aspere et minute denticulata. Pedunculus pro genere parvus, in paniculam 6-8 ramosam, 1·20-1·50 m. altus, basi vix 2 cm. diam., vacue bracteatus, laete ruber, glaber; bracteæ deltoideo-lanceolatæ, acuminatæ, glabræ, infimæ 8-10 cm. longæ, superiores minores; flores 3-4 ex fasciculo; pedicelli 2-4 cm. longi, glabri, nutantes; flores omnino pubescentes, virides, demum lutescentes; ovarium 25 mm. longum, conico-cylindratum; perianthii segmenta conniventia, linearia, limbo paullum patula, interiora latiora glabra, medio ad nervum tantum puberula; filamenta albida, basi leviter incrassata, antheræ 12 mm. longæ, vix vel brevissime exsertæ.—Mexico?—Culta in Horto Mortolensi, florunt mens. Maii & Junio, 1906.

Bulletin, 1892, p. 7, a B. viridiflora, which he had seen at La Mortola. Both these species are nothing but the B. yuccoides, Hooker, with the difference that these plants, having been cultivated in the open ground, were more vigorous than those grown in pots under glass. There also exists in gardens a B. argyrophylla, which, according to W. Watson, is identical with B. Decosteriana, Baker. Another plant has been cultivated since the end of last century under the name of B. californica. This is again a *nomen nudum*: I cannot find it recorded in any paper or book.

The species of Beschorneria are very closely related to each other, and even when in flower are not easily distinguished one from the other.

There has lately been a species in flower at La Mortola, which cannot be identified with any of those already described. It differs, firstly, in its pubescent flowers, whilst all the others are throughout glabrous, with the exception of B. Wrightii, Hooker, fil., with which, however, our little plant is not identical. This undescribed plant, which I call Beschorneria pubescens, is rather small; the leaves are 60cm. long and 5cm. broad, glaucous, rather stiff and fleshy along the mid-rib, underneath nearly smooth, and only rough near the tip, the margins finely but sharply denticulate. The inflorescence is 1.20 to 1.50m. high, rather slender, the bright red scape measuring 1½ to 2cm. in diameter, with about 6 to 8 erecto-patent branches. The flowers are fascicled in the axils of ovate bracts, green fading to yellow; pedicels slender, glabrous, 2 to 4cm. long; ovary 25mm. long, segments 38mm. long, both densely pubescent.

Beschornerias are attractive on account of their general appearance, which combines both vigour and grace; of their vivid red peduncles and bracts, the flowers themselves being green, and in fading turning to paler tints. They flower with us generally in April to May, and begin to ripen their capsules in July; this B. pubescens is later; it flowers from May to June.

After the flowering is over, the peduncle being strictly terminal, the rosettes begin to branch. The Beschornerias now in cultivation are very likely all descendants from the seeds introduced by Roezl in 1857. They are natives of Mexico; whether there be really a species in California, I do not know, though it seems possible. *Alwin Berger, La Mortola.*

IRISH GARDENS.

In the *Kew Bulletin* Mr. W. Watson has published the following notes of a visit paid to Ireland in the month of June last, when with Mr. Moore, of Glasnevin, he made a tour of some of the best Irish gardens.

Our special object, writes Mr. Watson, was to ascertain what had been done in the direction of establishing reputedly tender trees, shrubs, and perennial plants in the more favoured parts of the island. Both Mr. Moore and myself are fairly well acquainted with the gardens of South Cornwall and South Wales, where the climatic conditions are similar to those of the south and west of Ireland. We were therefore in a position to make comparisons and offer suggestions with regard to what might be tried in Ireland. The things we saw, however, far surpassed our most sanguine expectations. Ireland is favoured with a climate and, in many parts, a soil most suitable to gardening; and fortunately a number of people who are in a position to do so are making good use of their gardens and estates by devoting them to what may be termed experimental horticulture.

During the whole fortnight (the latter half of June) it rained daily, usually in the morning, the afternoons being hot and sunny. The vigour and healthy look of plants of all kinds under these conditions were delightful to behold. It might reasonably be said with regard to Irish gardening that the tools most needed are the saw, pruning hook, and knife. Generally the plants grow too fast for the gardener, and where plants are set at ordinary distances apart this has its disadvantages. The opinion formed after a fortnight's rapid visit to Ireland in June may not be worth much, but I have no hesitation in saying that of all the countries I have seen Ireland is as well provided by nature with conditions favourable to high-class land cultures—including agriculture, horticulture, and forestry—as the best. In the opinion of competent judges long resident in Ireland, the great need is intelligent labour; but so long as America and other countries hold out tempting inducements in the shape of better conditions of employment to the Irish workers, the best of them will go. If the most were made of the land by employing upon it the best of its people—and there are no better gardeners than Irishmen when they are allowed to use their intelligence—Ireland would soon become the richest instead of, as it is now, the poorest division of the United Kingdom.

Glasnevin

is to Ireland what Kew is to England. The collection of plants cultivated there is remarkably rich, in some departments the richest I know, whilst their condition is most satisfactory. The zeal of the late and present keepers in collecting, growing, and encouraging others to grow plants of all kinds has no doubt largely contributed to the spread of a taste for gardening in Ireland. This influence is now being turned to account by the Irish Board of Agriculture in the promotion of fruit and vegetable culture, Mr. Moore having the control of a training college where gardeners are taught the best methods of cultivation for the best kinds of fruit and vegetable, and then sent to different stations in the country, where model gardens are formed under Mr. Moore's superintendence. The men are trained gardeners before they enter the college, and in return for good work they are well paid all the time they are there. In this practical way a knowledge of high-class horticulture is being distributed over the country, and if this is only backed up by capital on the one hand and an intelligent treatment of the workers on the other, the effort cannot fail to have far-reaching results. During the time of my visit to the college a party of Scotch farmers were being shown round by Mr. Houston, the horticultural science instructor, who is also editor of an excellent little monthly journal devoted to Irish gardening. Agriculture is also assisted in the Glasnevin Botanic Gardens by the cultivation of plots of agricultural plants of all kinds, including grasses, plants yielding dyes, oils, fibres, tobacco, &c. Each plot bears a label showing name and time of sowing. There is also a garden of herbs and other economic plants.

Before leaving Glasnevin, note must be made of the "lions" of the collection, such as Nepenthes Rajah, a grand plant over 20 years old; Gleichenias, the largest specimens I have ever seen; Eulophiella peetersiana, a giant with leaves 4 feet long and 6 inches across; the fine specimens of Palms and Cycads; the extensive and well-grown collection of Orchids; the superb water-gardening, where Nymphæas are magnificent; Alpine plants and hardy Ferns, all in splendid health. Certainly the national botanic garden of Ireland is one of its most valuable assets.

Castlewellan.

The Earl of Annesley has made his garden famous throughout Europe. It is the best proof that Ireland is a great gardeners' country that in the lifetime of one man a hillside should have been turned into a grand "gallery" of trees and shrubs, in which giant specimens of many kinds of Coniferæ, looking at least a century old, of many kinds of New Zealand, Chilian, Californian, Himalayan, and South European trees and shrubs in the ruddest health, all testify to the genial character of the climate, the richness of the soil, and the sagacity of the proprietor. A full account of this garden, with photo-illustrations of some of the specimen plants, was recently published by the Earl of Annesley. As an indication of what may be found there I may mention the following:—Trees morindoides, a grand specimen tree, unique in Europe; Fagus cliffortiana; Cornus florida, a big bush in flower; Fejoia sellowiana, happy as a privet; Restio subverticellatus, three years outside and looking quite happy; Acer Hookeri; Cordyline indivisa, true, a grand plant with leaves 6 inches across; Lomatia ferruginea, a beautiful Protead, well set with flower buds and since figured for the *Botanical Magazine*. There was the usual display of Olearias, Trichospidarias, Azalea indica, Himalayan Rhododendrons, &c.

Kilmacurragh.

The garden of Mr. Thomas Acton is the most interesting in Ireland. Here there is little evidence of keep, but there has been much judgment in the planting, and generally things look happy. The soil appears to be deep and rich, and there is plenty of water. The great feature at the time of our visit was a tree of Embothrium coccineum in full bloom—it was 35 feet high with a spread of 30 feet, the trunk 15 inches through, and covered with flowers: this was planted as a baby about 30 years ago by Mr. Acton. Desfontainea spinosa, 12 feet through; Drimys Winteri, 30 feet high, in full bloom; Magnolia Campbelli, 25 feet high; Trichospidaria lanceolata Crinodendron hookerianum, 18 feet high, 10 feet through, the branches weighed down by the flowers—I never saw such a plant; Swammerdamia Antennaria, 10 feet high, 15 feet through, covered with flowers; and the Himalayan Rhododendrons—many finer than the finest in Cornwall—R. Keysii (9 feet), R. Delavayi (8 feet), R. decorum (10 feet), R. lacteum (6 feet), R. Royleï (12 feet), R. argenteum (18 feet), and many others—not thin bushes, but fat, mostly wider than high, and in grand health. It was worth the journey to Ireland to see R. Falconeri there—such a bush—18 feet high and 21 feet through, with six main branches each over 6 inches in diameter; it bore the remains of hundreds of flower-heads, and was in the midst of making new growth. I noted also the following (the figures in each case indicate height and spread of branches):—Podocarpus chilina, 22 feet; Saxegothea conspicua, 15 feet by 12 feet; Athrotaxis selaginoides, 34 feet; A. laxifolia, 20 feet; A. imbricata, 15 feet; Cupressus lusitanica, with a trunk 3 feet in diameter and a wide-spreading Oak-like head; Prumnopitys elegans, 25 feet; Podocarpus nubigenus, 20 feet; Libocedrus tetragona, 12 feet; Pinus aristata, 12 feet; Fagus Moorei, 14 feet; F. Cunninghamii, with a trunk 15 inches through, 40 feet high; Olea intermedia, a large tree; Cunninghamia sinensis, 25 feet; Laurelia aromatica, planted 30 years ago, now 40 feet high and growing with great vigour; Ilex latifolia, 12 feet; Myrtus Luma, 15 feet by 15 feet; Fuchsia excorticata, 15 feet; Senecio Greyi, 4 feet by 10 feet, a magnificent mass of yellow flowers. Ceratonia Siliqua, a big bush, has stood out for 30 years. The commoner trees are well represented. I noted Cupressus lawsoniana, 80 feet high; Abies Pindrow, 50 feet; and there is a grand avenue of Silver Firs leading up to the house. Mr. Acton, now an octogenarian, has been his own gardener all his life.

The only nursery we visited was that of Mr. T. Smith in the town of Newry. This is one of the most interesting gardens in Ireland. The collection is quite botanical in comprehensiveness; I doubt if there is another commercial collection of hardy plants like it anywhere. Not only for Ireland, but for England, the Continent, and even America this nursery is the

"shop" for the choice and rare among hardy plants. The proprietor, an Englishman, trained in the Chelsea nursery of Messrs. J. Veitch and Sons, is a keen collector and cultivator, and his knowledge of plants is quite exceptional. I found many plants there that were not in the Kew collection. The prominent features at the time of our visit were the Verbascums, large beds of them in full flower; Anchusa italica grandiflora, Saxifraga pyramidalis, Incarvillea Delavayi by the thousand, the racemes 2 feet high and the flowers enormous; Primulas, Dianthuses, Delphiniums, Helianthemums, and Roses. We spent the greater part of a day in the nursery before proceeding with Mr. Smith to Narrow Water, where there is a fine garden and collection of plants formed by the proprietor, Captain Hall.

Rodgersias, Gunneras, Nymphæas, Mimulus, Ourisia coccinea, Orchis foliosa, Japanese Iris, Myosotidium nobile, Parochetus communis, Gentians, Senecio macrophylla, and many others were very happily provided for. The stream sides were richly clothed with Ferns and other suitable plants.

(To be continued.)

THE GENUS ARAUCARIA.

Of the eight species of this genus in cultivation, the A. Cookii depicted at fig. 139 is one of the most handsome. The view shows the top of a plant growing in the Temperate House, Royal Gardens, Kew, and was taken from the gallery at a height of 30 feet. The plant usually produces a crop of cones every alternate year,

FIG. 139.—ARAUCARIA COOKII IN THE TEMPERATE HOUSE, KEW. *Photo E. J. Wallis.*

which, when fully developed, are from 2½ to 4 inches in length, and 2 to 3 inches in width. At the present time there are two beautiful and symmetrical specimens over 40 feet in height in the same house. The habit of the plant is distinct from all others, being columnar, this, together with its graceful habit, gives it quite a distinctive character, even when associated with other Conifers. It was introduced over half a century ago from New Caledonia—where it is said to reach a height of 200 feet—but is still far from common in gardens.

All the species are of great decorative value, while several of them are also valuable timber trees. Unfortunately, with the exception of the "Monkey Puzzle" (A. imbricata), they are all too tender for general culture in the open in this country. The "Bunya-Bunya" (A. Bidwillii) and the "Moreton-Bay Pine" (A. Cunninghamii) have been tried with moderate success in some of the milder parts of England.

The species readily adapt themselves, however, to pot-culture, and form useful subjects for the decoration of ball-rooms and also for vases when in the young state. The species most generally used for this purpose is the "Norfolk Island Pine" (A. excelsa). What is not generally known in regard to the thousands of plants of this species raised every year for market supply is that practically all of them are raised from cuttings. It is well known that seedlings of this plant are of extremely rapid growth, the internodes between each tier of branches being often 15 to 18 inches distant in a vigorous plant, and the plants soon become too tall for ordinary purposes. Plants raised from cuttings, on the contrary, form sturdy, little specimens, with successive tiers of branches at intervals of 2 to 4 inches, and retain this habit until they are several years of age.

Several varieties of A. excelsa are in cultivation, the best of these being the one known as "Göldieana," a variety from New Caledonia, and differing from the type in having much larger leaves and heavier habit.

There is a fine old specimen of the type of this species excelsa in the Temperate House, which is considerably over 100 years old, and is still a healthy, well-furnished specimen. The plant has long reached the roof, and has to be frequently topped in order to keep it within bounds. Its present height is 50 feet, and its diameter is 28 feet.

A. Balansæ is a native of New Caledonia, and is occasionally met with in gardens under the name of A. elegans. It possesses a loose, strag-

gling habit with age, with long, drooping branches, but when young is light and elegant. The Bunya-Bunya (A. Bidwillii) previously mentioned, is the giant of the genus. Its habit reminds one somewhat of that of A. imbricata, but it is much heavier, and more dense in all parts. There are two immense plants of this species at Kew in the Temperate House towering right up to the roof over 50 feet in height. These plants were raised from seed received at Kew in 1846.

Another species which has reached large dimensions in this house is A. Cunninghamii, also over 50 feet in height. This plant is one of the original ones introduced by Allan Cunningham in 1826. There is a considerable difference between juvenile and adult plants of this species, so much so that many take them to be entirely distinct species. In the juvenile stage the plant is possessed of long, slender

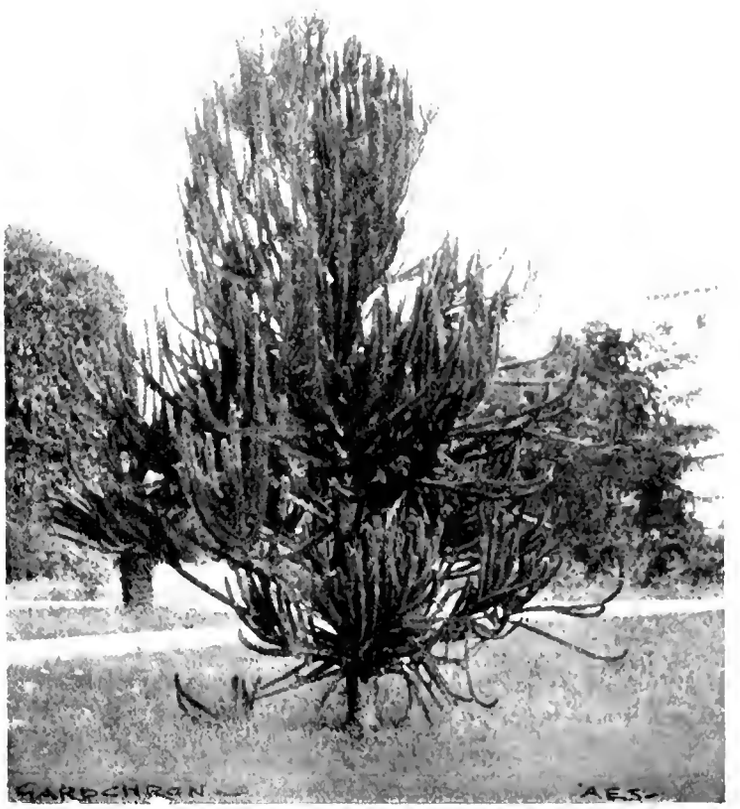

FIG. 140.—ARAUCARIA EXCELSA "GOLDIEANA" IN A PALERMO GARDEN.

foliage, and an extremely dense habit, while in the adult stage the leaves are short and the habit much more straggling.

A. Rulei is the gem of the genus, and is a rare plant in cultivation. The branches are rigid and horizontal, the branchlets being more or less pendulous. The leaves are densely arranged on the growths, about one inch in length, and of a deep rich green colour. A fine healthy specimen of this plant is to be seen in the Temperate House, planted out in a large bed in association with other plants.

Of the two South American species, the common Monkey Puzzle or Chilian Pine (A. imbricata) is well known to most gardeners. It thrives fairly well in most localities, but requires a well-sheltered position. The wood is of a somewhat brittle character, and the plant is apt to be greatly disfigured by rough winds or heavy snows. It is a fairly common plant in the mountain districts of Southern Chili. Abundance of moisture both at the roots and in the atmosphere is what the plant requires. Nowhere have I seen this plant in finer condition than on the Island of Fota, the property of Lord Barrymore, in the South of Ireland, where a number of huge specimens are to be seen, which produce abundance of good seeds most years. The seeds possess an agreeable nutty flavour, and are used for dessert in some parts of South America.

A. brasiliana is a native of the mountains of South Brazil, where it forms a tree from 50 to 100 feet high. It has little to recommend it, as compared with the preceding species. When young it possesses a loose, straggling habit, with few branches and long internodes. In the adult stage the plant loses all its lower branches, the trunk being terminated with a few long pendulous branches. Several varieties are in cultivation, the most decorative of which is the one known as "Sabiana," the foliage of which is of a pale, glaucous-blue colour. *C. T. Ruthe.*

[We reproduce a photograph kindly sent us by Mr. Sprenger, showing a specimen of A. excelsa "Goldieana" (fig. 140) growing in a Palermo garden.—ED.]

THE PROPAGATOR.

THE season has arrived when the cultivator must greatly curtail the propagation of garden plants for a few months, both as regards indoor and out-of-door subjects. The few, whose propagation may yet be forwarded, but not completed, will be mentioned in this article. Taking hardy plants first, the following may be raised in the open air: Vitis (Ampelopsis) quinquefolia; Alnus, in very moist soil but not always readily; Buxus, from short cuttings planted in the shade; Cornus, most species and varieties, excepting C. mascula, which is difficult to root; Coronilla Emerus, Eleagnus argenteus, E. fuscus, E. umbellatus and E. orientalis, Euonymus sempervirens and E. verrucosus, Hedera, Hippophae rhamnoides, Kerria japonica, Ligustrum vulgare, Lonicera, Periploca græca, Ribes, Salix, Sambucus, many of the Spiræas, Staphylea, Syringa, Viburnum opulus, &c. Most of these trees and shrubs do not suffer from the effects of frost, excepting in the more northern part of these islands, and cuttings do not, therefore, require to be inserted till the spring. The propagating beds should consist of sweet-smelling soil, rich in vegetable mould, and very sandy; and be formed in a warm position, sheltered from cold winds. As cuttings, the wood should be of the previous year's growth in the case of some of them, and the points of the shoots in others, and their length from 9 inches to 1 foot, cut squarely across below a bud. Not more than two buds should show above the ground level; and, in order to have each hole no deeper than is necessary, dibbers of various lengths should be used, the holes made perpendicular, and the cuttings very carefully inserted. The distance apart at which the cuttings may stand will vary from 3 to 5 inches for moderate growing plants, and from 6 to 12 inches for those of larger growth. The cuttings must be made quite firm in the soil.

Conifers.—Some species of coniferous plants can be raised from cuttings, although few of them make an erect tree-like growth unless leading shoots are selected for the purpose. More especially is this the case in Abies, Araucaria, Taxus, Torreya, Tsuga, and some of the Podocarpus which can only be raised from cuttings by taking the leader from seedling plants. The seedling plant puts forth shoots which have a tendency to grow erect on the removal of the leader, and these may also be employed as cuttings. Some of such mother plants should be kept for furnishing cuttings and scions for grafting. Many of the Mexican Pines develop from the stem, towards the base, small shoots which seldom develop, and these make good cuttings and root readily. I may name Pinus ayacahuite, P. cembroides, P. Gordoniana, P. Teocote, P. patula, P. Montezuma, &c.

The two most favourable seasons for taking and making cuttings are the spring, when growth begins, and from September to November, when it ceases. When the mother plant can be placed under glass, the propagating period may extend from September to February and March. Having cut the base of the cuttings smooth, and removed the needles (leaves) so far as the cuttings will enter the soil, place one cutting in a small pot, or several together, in small "cutting" pans provided with good drainage, and stand them in the propagating house having a warmth of 50° to 60° Fahr., with a bell glass over them. It is best to place them singly in small pots, the young plants having very brittle roots, which run great risks of being broken when the rooted cuttings are separated. When potted singly the plants should be returned to the bell glass in order to expedite the rooting process. Taxus and Sequoia may be rooted under *cloches* and bell glasses in the open border, in the shade, affording them protection against frost.

Seeing that Conifers take a long time to form roots, in every case the cuttings must be taken out of the soil once in two months and afforded fresh soil and pots, for the high temperature of the propagating house, water, and the confined air under the bell glasses set up decomposition of the soil, which is more hurtful than beneficial to the cuttings. A certain sign of decomposition in the soil is the black colour of the callus.

Besides the species of Conifers named above that may be grown from cuttings, there are also Athrotaxis, from well-ripened wood; Cephalotaxus, Chamæcyparis ericoides, Cryptomeria

(but this never makes a strong plant), Cunninghamia sinensis, if cuttings are taken from the base of the plant, for these make erect-growing plants, but side shoots never do so. Dacrydium is propagated readily from cuttings; D. elatum always remains weak, and does not live long. Dammara australis roots readily, but it is only erect in habit when a leader is chosen as the cutting; Fitzroya roots readily, as likewise does Libocedrus, but not so L. Doniana. Cuttings of Picea, taken from any part of the tree, make erect plants. Ginkgo (Salisburia) will grow from notched, ripe wood, placed in peat, in a shady northern aspect. Sciadopitys should be managed similarly to Athrotaxis. Of Taxus, only T. baccata fastigiata makes upright growth; Thujopsis will make roots as cuttings, and Sequoia gigantea will, if the mother plant is allowed to grow under glass till the month of June, afford cuttings which, if taken in the soft stage, form roots readily under a bell glass placed on the north side of a wall. When a callus has been formed, place them in fresh soil and stand them in the propagating house and they will form roots in a few weeks.

Roses, Camellias, and Aucubas may be side grafted during this month; the Camellias should be kept in a close case in moderate warmth. Ixoras of choice varieties may be grafted in heat on the commoner ones. Indian Azaleas on A. phœnicea, Arabias on A. trifoliata, a species which is readily propagated from cuttings, and lastly, Epiphyllum varieties on Cactus, Pereskia, Euphorbia canariensis and E. erosa. *F. M.*

NOTICES OF BOOKS.

WOBURN EXPERIMENTAL FRUIT FARM. Sixth Report. By His Grace the Duke of Bedford and Mr Spencer Pickering, F.R.S. (Eyre & Spottiswoode. Price 4s.)

At a time when there is quite a deluge of reports, chiefly in the form of circulars, calling attention to experiments designed for trade purposes, although often the object is as far as possible concealed, it is pleasant to meet such an honest and full report as this. As we read and re-read its pages in the light of both science and practice we became more and more interested and instructed and less inclined to be critical.

Although some of the statements may upset our preconceived ideas, we recognise the impartial, truth-seeking work which has dictated them. To select a few of the more important items: The authors call attention to the confusion which has so long existed in various works and leaflets on spraying, respecting caustic soda and caustic potash, and the carbonates, also as to such commercial terms as pearlash, potashes and the like. They indicate very clearly that very extensive experiments prove that caustic soda is the best, as well as the cheapest, to use, and in showing this they have done a most valuable work. There is, however, in this connection one small item that we would notice. Caustic potash, if used, would ultimately pass to the soil in a carbonated condition, and would become an available, and valuable, plant-food in many soils. Hence in discussing the economics of the subject, a small item should be allowed in favour of potash, but even then the difference in price shown by the authors would not merely be made up, so that it seems that after everything possible has been said the balance is decidedly in favour of caustic soda, and fruit-growers will do well to note this.

Experiments were made with ordinary paraffin emulsions, and it was found that scale-eggs, which were specially dealt with, were effectually destroyed when either the percentage of the paraffin or soap reached a high value, which value was, however, shown to be highly dangerous to the well-being or even the life, of the tree. It was found "that an emulsion which by itself was too weak to have much effect on the scale, would, with the addition of 2 per cent. of caustic soda, cause a complete destruction of the eggs. The proportion of paraffin used in this emulsion was 6 per cent. by volume and the soap need not exceed 0·5 per cent." Full directions for making are given, and also the prices of materials. The comparatively new insecticide lead arsenate, is dealt with, and growers are advised to obtain it ready made in the form of paste, instead of trying to make it for themselves. Ordinary Bordeaux Mixture (provided it be properly compounded) can be used mixed with it, without appreciable chemical interaction, and thus a combined insecticide and fungicide is produced.

Methods for removing moss and lichen are indicated. We notice, with pleasure, that attention is drawn to the fact that unhealthy conditions, improper care and the like, predispose to a weakly state and a much greater liability to pests and disease. Cultivators who have a thoroughly practical knowledge of the difficulties of getting workmen to do exactly as required, when one's own attention is for a time otherwise engaged, will greatly appreciate the significance of such a statement as: "In spraying a tree in the ordinary way, some parts must necessarily receive an overdose whilst others may be hardly wetted, and the results would be liable to much uncertainty in consequence."

It may be mentioned that the experiments included both laboratory and field work.

There are some valuable notes on "Silver Leaf," a disease which is causing considerable loss among the solter-wooded stone fruit trees. The disease is held to be due to the saprophytic fungus, Stereum purpureum, and the experiments indicate that the disease is chiefly air borne, and that it enters the tree mostly where there is an exposed part of the stem, and preventive measures are suggested. Among these are the burning of all affected trees or branches; the avoidance of bruising as far as possible, the use of tar to cut surfaces, or even a weak solution of carbolic acid for the pruning instrument. It may be argued that the methods of inoculation employed in this set of experiments are open to objection. Pieces of infected bark, the size of pins' heads, were taken, and these presumably may, although it is not likely, have contained something, not yet identified, and which might have something to do with the trouble. Our own experience of this disease has induced us to think that unhealthy conditions greatly predispose particular plants to the disease, as we have especially noticed it in soil where fruit trees had been planted on the site of an old wood, and the soil not having been trenched, there was a large number of rotting woody roots in the ground. It may, however, have happened in this instance that there was a deficiency of plant-food, as there was obvious indications of a deficiency of potash and an excess of nitrogen in the natural plants growing around, and chemical analysis showed the same peculiarity.

Fruit growers are urged to co-operate with the authors in investigating this disease, and we hope all of our readers who have the opportunity will help as far as they possibly can.

A boon would be conferred upon fruit growers generally if a short, popularly written pamphlet, containing the essential facts, were available in a very cheap form.

The Week's Work.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq. Cleveley, Allerton, Liverpool.

Chrysanthemums.—As these plants pass out of flower, any variety that is not intended to be grown another year should be at once discarded, retaining only those which are required for purposes of propagation. These latter should be placed in a position near to the glass exposed to the full light and abundant air. The best cuttings are those prepared from firm and short-jointed growths. If therefore the cuttings have already been drawn up weakly, through the plants having been placed thickly together, thin out the weakly growths to a limited number, that those retained may acquire more vigour. Sometimes certain varieties are shy in producing growths for supplying cuttings. Such plants should be encouraged by removing from them some of the surface soil, and by affording them a top dressing of good loam, leaf mould and sand, with an addition of a little dried fowl manure passed through a fine sieve. If these materials be well mixed together, they will form such a top-dressing as will encourage root action and the production of growths for use as cuttings in due time. Such shy varieties will succeed better if placed in an atmospheric temperature of not less than 60 degrees. It is a mistake to cut down the stems very close to the soil; for the roots, being suddenly deprived of the means whereby the moisture is taken from them, very often die, and the loss of a good variety may be the result. If 1 foot or 18 inches of the stem is left, a few shoots will quickly show themselves, and the roots will continue active. Secure from the present time onwards any good medium-strong cuttings of large-flowered varieties that appear. There are many methods of rooting the cuttings. We find here that by placing a propagating box or frame in one of the fruit houses in which the trees are now dormant, every condition is secured that is necessary for the cuttings to root easily, whether they are inserted in pots or not. They can be examined, and ventilation afforded even in the worst weather; whereas the contrary is the case if the cuttings are in exposed pits or frames, which would have to be protected from frosts.

Mignonette.—Plants for flowering in spring should be kept close to the glass, and an abundance of air admitted on all favourable occasions. The plants should not be fed with manures at this season, but after the commencement of the new year, when the roots will again become active, a little feeding will be an advantage. At this season the plants have a tendency to show flower, which should be pinched out, stopping the shoots evenly. The chief condition necessary for success in growing good Mignonette is to encourage the roots to the surface. Water must be supplied with great care, as Mignonette is most impatient of an excess in winter.

General Remarks.—Spray Marguerites occasionally (with quassia or some other disagreeable insecticide), which will help to keep the leaves free from the eggs of the Marguerite fly, and consequently from the mining grub also. Calceolarias, Cinerarias, and Pelargoniums should be given similar attention.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Some ornamental garden hedges.—There is such a wonderful diversity in the plants that can be employed to form ornamental hedges that there exists no excuse for lack of variety in these, whether they serve as boundary fences, shelters, or merely as divisions in the flower garden. First and foremost amongst hedges are those of the Holly and Yew. Their only fault is slowness of growth. They both thrive best in a soil which is rich and inclined to be heavy. Perhaps April is the best time in which to plant the Holly and the Yew, but the present is a good time to prepare the ground by trenching and manuring. When once established the Yew should be clipped in September and the Holly in April. When the Yew is used as a boundary fence it should be remembered that the leaves and berries are poisonous to cattle.

Thuya gigantea (*Lobii*) *and Cupressus macrocarpa* both make fine evergreen hedges; they grow quickly, and are not fastidious in regard to soil and situation.

Beech and Hornbeam.—An admirable hedge is formed by planting Beech and Hornbeam in combination, and the fact that they retain their withered leaves throughout the winter enhances their value as hedge plants, as they thereby afford shelter almost to the same extent as an evergreen.

Roses.—For the formation of flowering hedges Roses are pre-eminently suited. Nothing is more delightful than a hedge of Sweet Briar. It is always a source of pleasure and enjoyment. From the first breaking of the buds in early spring, its scented leaves diffuse the air throughout the summer with a delicious fragrance that hardly wanes until they fall in autumn. The delicate bloom of early summer, too, is followed in the winter months by the fruit, which is a pleasing adornment to the garden. In addition to the hedge of the common Sweet Briar is that formed with the Lady Penzance hybrids; but in planting a hedge of them care must be exercised to select varieties alike in vigour of growth, as some differ considerably. Of other Roses, a bold imposing hedge (if such is desired) could be obtained by planting strong-growing kinds similar to the "Tea Rambler," "Hélène," "Trier," "The Dawson," "Psyche," and "Madame d'Arbley" 3 feet apart in a row, and, after cutting the plants hard back the first year of planting, permitting them to grow afterwards untrammelled with further pruning.

Fuchsias, especially F. Riccartoni and F. gracilis, make beautiful hedges, and are much used in this way in the south and south-west of England. The former is particularly hardy, and

does well without protection even in Scotland. Both of these Fuchsias will root very readily from cuttings inserted in winter.

Escallonia macrantha.—This lovely flowering shrub adapts itself to hedge-making in the south and south-west. Its dark glossy foliage and pretty red flowers are strikingly handsome when the hedge attains to a height of 5 or 6 feet.

Many flowering shrubs, such as Lilac, Philadelphus, Weigela, Spiræa, Leycesteria, Viburnum, Osmanthus, and Olearia, can all be utilised either individually or in combination to produce an effective hedge when it does not necessarily need to be one maintained in a strictly trim and kempt condition.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Epiphronitis Veitchii is a lovely hybrid from Sophronitis grandiflora, and grows well in pots placed on a shelf near to the roof glass of the intermediate house. The plants are now growing freely, and young shoots are pushing out from the old flower stems. These small pieces, as soon as they begin to push forth roots, may be cut off with a portion of the stem attached, and potted in small pots, using sphagnum-moss, with some small crocks mixed with it. In a short time they will make nice flowering plants.

Epidendrum prismatocarpum.—Plants of this species that are growing freely and require more root room should be repotted at once in pots of large size for their roots to ramble in, and as a medium employ peat and sphagnum-moss properly drained. From this time and until the growths are finished afford plenty of water, but afterwards only just sufficient to keep the roots alive: the pseudo-bulbs will take no harm if they shrivel slightly. Through the winter keep the plants in a light position at the cooler end of the East Indian house.

Angræcum distichum.—In a shady position in the same house this plant and A. pectinatum grow freely, and both are now in bloom. They thrive luxuriantly in well-drained Orchid pans with only sphagnum-moss to root into.

Intermediate house.—The yellow Oncidium cheirophorum, now opening its blooms, is deservedly a favourite among Orchid amateurs. The plant should be elevated well up to the roof of the house; a little sun at this period will do it good. Water should be sparingly afforded at all times, and especially after the flowers fade, or the small pseudo-bulbs and leaves will rapidly decay. Plants of Cochlioda vulcanica, with their elegant spikes of rose-coloured flowers, are charming at this season. It is quite a cool-house species, requiring a light, well-ventilated position and plenty of water at all seasons. The same treatment will suit its congeneric species C. rosea, C. Noetzliana and C. sanguinea.

The Pleiones that have ripened their pseudo-bulbs may now be placed in the intermediate or Cattleya house to flower, and if care be taken that no water is allowed to fall upon the flowers they will keep fresh for a considerable period. Immediately the flowers fade the plants should be repotted into well-drained, shallow pans or pots, and a potting material composed of fibrous loam, peat, and sphagnum-moss in equal parts, mixing moderate quantities of small crocks and coarse silver sand to ensure porosity. After repotting, suspend or otherwise elevate the plants near to the roof glass of the Cattleya or intermediate house, and for a few weeks afterwards little or no water will be necessary. Later, however, water must be applied copiously whenever the surface of the soil is dry, and it may be supplemented with liquid manure to be applied about once a week. The best varieties are Pleione maculata, P. lagenaria, P. Wallichiana, and P. Reichenbachiana. The flowers are easily gathered by giving them a gentle pull, when the stem will readily part from the centre of the young "breaks," and will be much longer than when cut. The cooler varieties as C. humilis and C. Hookeriana have done growing and shed their foliage. Keep them in the Odontoglossum house, and afford them a light sprinkling overhead occasionally just to prevent the pseudo-bulbs from shrivelling. These species usually bloom in January or February.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Pot Strawberries.—Although a little frost would do no harm, it is as well to get the plants plunged in their winter quarters before severe weather sets in. Some cultivators plunge the pots in ashes out in the open, and others stack them on their sides. The latter method is not at all a good practice, for the plants become too dry at the roots and the foliage withers, besides which the plants are liable to be badly injured in severe weather. The best and safest plan is to plunge the plants in fresh leaves, packing them firmly between the pots, in cold frames. If very heavy rains come, lights can be put over them, removing these each day, when it becomes fine. Some of the plumpest and most forward crowns should be selected for the earliest batch. These can be merely stood in a cold frame until the house is got in readiness for their reception. The cooler the plants are kept, the more readily will they afterwards respond to the influences of heat and moisture.

Vines.—After such a favourable season the vines will now be perfectly matured, and abundant ventilation should be employed to cause the plants to go to rest. Late Grapes, if still hanging, should be cut with as much wood as possible, and be placed in bottles in the fruit-room. A few pieces of charcoal put in the water are beneficial. The Grapes will keep in as perfect condition as they would if left upon the vines. When the Grapes have all been cut the work of cleaning the vines can be pushed forward, and any renovation of the borders that may be necessary can be commenced. Where there are interior and exterior borders it is desirable to renew only one border in one season, and by this practice next season's crop will not be injured. In order to keep the roots as near the surface of possible, carefully remove, with a fork, the top soil down to the roots and replace this with some sweet loam, wood-ashes, lime scraps and chemical vine manure. In the following season the front of the external border may be treated in a similar manner. By careful attention to this matter each year, the surface roots will greatly extend, and they will be of much benefit to the crop. Push forward the pruning and cleansing of early and late permanent vines, so that they may obtain a little rest before forcing is commenced. Should the wood show any signs of bleeding, a little styptic may be applied to the cut parts, which will remedy the evil.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Seakale.—The roots may now be lifted, and the best selected for forcing purposes. Only those rows required for growing out of doors need be left longer in the ground, and these will be covered up later on. In trimming the roots, select all the straight thongs for storing away ready for planting in the spring. By lifting the roots thus early, the ground may afterwards be prepared for the next crop, which is an advantage. Keep a succession of plants in the forcing pit, remembering that small and frequent batches are best.

Rhubarb.—Where there are no arrangements for forcing Rhubarb indoors, the roots can be forced where they grow by placing over the crowns some barrels or earthenware pots made for the purpose. Cover these barrels or pots deeply with hot manure, which should be again covered with long litter to prevent the heat escaping quickly. All varieties of Rhubarb are not equally suited for forcing, especially so early in the winter. Some of them refuse to grow at all. Hawk's Champagne is still one of the best, together with The Sutton, both of these varieties are of grand colour and quality, and may be forced easily.

Laying down broccoli.—It is very necessary this season to lay down this crop in order to protect it from severe weather. A few of the late varieties, of which Model and Late Queen are types, need not be dealt with first, for these are capable of withstanding severe weather. The appearance of the plants generally is a good indication of the care required to protect them. They have made unusually succulent growth, and have grown until very late in the season. Lay them down with their heads towards the north, and let the stems be well protected with soil, which is generally the first part of the plant to suffer from exposure. Early Broccoli are doing splendidly, and fine "heads" have been cut, but to have these at their best they must be looked over daily, for they soon spoil.

Early Peas.—Where there is house accommodation for growing this crop, a start may now be made. Sow the seeds in 4-inch pots, five or six seeds being quite sufficient for each pot. The soil should be used in a fairly moist condition, that no watering may be necessary before the seeds germinate. An excess of water just now would be fatal to seeds. Place the pots in an atmospheric temperature of 50°, and as soon as the seedlings are well through the soil, put the pots in a position near to the glass. This crop does equally well whether grown in pots, 8 or 9 inches in diameter, or in boxes, of any convenient length and width. Suitable dwarf-growing varieties are Chelsea Gem and Green Gem. Early Giant is a first-rate variety, growing 3 feet high, and may be sown later. Peas will not stand coddling at any stage of their growth, therefore much heat must not be applied to them. Young Pea plants, when well rooted, may be transplanted readily, and it seems to have the effect of dwarfing the growth, while not interfering with their cropping properties.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Cherries should now be planted. Well-drained loamy soil, with plenty of old mortar rubbish or lime incorporated, is the best for these trees. Plant firmly and in dry weather. Cordon-trained trees should be planted 2 feet apart, fan-shape trees 15 to 20 feet, and bush trees and pyramids 9 to 12 feet. Cherries may be pruned and trained at once.

Pruning.—Whenever the weather is mild and favourable for pruning Apple and Pear trees, get as much done as is possible. Bush trees must be looked over carefully in order that they may be thinned regularly and that no part of the bush may remain overcrowded. In those of Apple and Pear that were "summer pruned" there will be no long growths to cut out. Trees or bushes that have grown to the size required, and must be kept so, will need to be pruned back to two or three buds on the new upright or vertical shoots, and the side or middle branches should be treated similarly, cutting to a bud which points outwards. Where several shoots have arisen from one shoot, they should be thinned out severely. Such trees need to be root-pruned occasionally to restore the balance between root and branches. Try to obtain a regular crop over the tree rather than a dozen Apples or Pears in a cluster, for under these latter conditions the fruits will not be of good size or colour. On old trees that have clusters of shoots or spurs, which have grown long and infertile, take off one lot entirely and thin out every other spur. This will help in a year or two to rejuvenate the tree. Especially will this be the case if the roots have been given the attention recommended for them in former articles. The pruned spurs will break thickly at the base in the spring, and they must be thinned out to about three shoots as soon as it can be seen which are the strongest.

Trees growing against walls will require similar treatment. When the pruning has been done and the trees cleansed, they may be either nailed or tied. All old ties should be removed, as there may be insects lurking in them. Following the work of training the trees, a thin layer of the border may with advantage be taken away, in case any grubs of caterpillars are hibernating in it. Afterwards a slight dressing of lime and basic slag may be afforded, and over this a dressing of new soil, or failing this a layer of ashes. Ashes form an agreeable substance for walking on. The border within the root area should not be dug with a spade, especially after root-pruning has been done. If any insects can be detected, cleanse the trees thoroughly, and as a stimulant to the bark and as a general cleanser, spray them with the XL-All winter wash. This will be found to destroy all moss, lichen, eggs, &c., of insects which may have been deposited in the crevices of the bark or wall. If this be used at, say, 3 lbs. to 35 gallons of water, it will be found very efficacious. This wash, unlike most others, is non-poisonous. In cases of bad attack of American blight, see that every portion is washed from the branches. In bad cases this work should be done again in the new year.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, Nov. 24—Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—41·4°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, November* 21 (6 P.M.): Max. 57°; Min. 43°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November* 22 (10 A.M.): Bar., 30·3°; Temp., 59°; *Weather*—Bright.

PROVINCES.—*Wednesday, November* 21 (6 P.M.): Max. 57° S.W. Ireland; Min. 44° Scotland, east coast.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Roses, Plants, Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY to FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY—
Choice duplicate and other Orchids from the Park Lodge Collection, at Park Lodge, Ilkham, by Protheroe & Morris, at 12.30.

WEDNESDAY—
Cases of Japanese Lilies, received direct at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.
Azaleas, Palms and plants, Roses, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

FRIDAY—
Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Horticultural Affairs.

The meeting of the Royal Horticultural Society on Tuesday last was indeed a memorable one, and it was particularly gratifying to those who have in the past, in season and out of season, advocated both the erection of a central hall for the use of horticulturists, and the establishment of a research station in the garden of the Society. The utility of the hall was amply demonstrated not only by the fortnightly exhibition, of which notice is given in another column, but by a succession of meetings which occupied the Fellows, or some of them, continuously from morning till evening, and which dealt with matters of great importance not only to Fellows of the Society, but to horticulture generally. It was, indeed, satisfactory to see our oft-expressed desire for the establishment of a suitable horticultural institute so well fulfilled. Whilst many co-operated to bring about these results, we are not likely to forget that it is to Baron Sir Henry Schroeder, in particular, that we owe the existence of the hall, whilst for the garden at Wisley we are under corresponding obligations to Sir Thomas Hanbury.

Reverting to Tuesday's proceedings, there were, first of all, the ordinary meetings of the council and of the several committees, Floral, Fruit, Orchid and Scientific, to which we need not in this place make further allusion. There were, in addition, other meetings to which attention may be directed—taking them, as it were, in chronological order.

Researches at Wisley—The Currant-bud mite.

At the three o'clock general meeting of Fellows, Mr. Massee made the welcome announcement that the building of a research laboratory at Wisley had been commenced, and that real progress had already been made in those scientific and technical investigations we have so long yearned for, as promising, in the future, results of greater importance to gardening than the mere holding of exhibitions and distribution of awards, valuable as those proceedings undoubtedly are.

Mr. Massee, in his incisive manner, detailed the results of the experiments and observations made up to this time at Wisley, premising that owing to the absence at present of a laboratory, the subjects selected for investigation were such that most of the work could be conducted in the field. The disease of Black Currants known as "big-bud," &c., was first selected. A series of experiments proved that the mite causing the mischief never voluntarily left the bush on which it was parasitic, and, further, that the only period of time it was exposed on the bush was the time occupied in walking from the old-infested bud to a fresh one on the same branch. These discoveries explained why attempts to eradicate this pest have, up to the present, proved abortive. The infected buds were not removed before some of the mites had migrated to new buds; and as the mite never feeds outside a bud, spraying with an insectide proved comparatively useless, only killing those mites that happened to be in the act of migrating, even if it did that. The mites do not fly, but are said to be conveyed by birds; this, however, could not be actually demonstrated, but it was definitely proved that the mites were conveyed by insects, as many as seven mites having been found on the body of a ladybird. They have also been found on aphides. In view of the above habits of the mite, it appeared obvious that a certain method of preventing migration from old to new buds would consist in covering the branch with some sticky substance not easily removed by rain. Friends were asked to carry out this idea, the choice of the material being left to themselves. At Wisley, where a supply of badly diseased Black Currant bushes was available, some had the diseased buds coated with vaseline; in other experiments the branches were smeared with cart-grease. In both experiments, extending over two years, not a single diseased bud has been discovered since the experiments were conducted. In one instance, a batch of bushes were brushed over with thinned gas tar, this also completely checked the disease. On a large scale, a compound of fish oil and resin, coarse palm oil, or cart-grease would prove efficient, and as the diseased buds are covered by the sticky compound, the mites cannot escape, hence the danger of being conveyed to other bushes by outside agents is obviated. Bushes should be treated in January, and, if necessary, again in April. If the work is thoroughly done, the pest will be eradicated. The bushes experimented upon at Wisley still remain, and can be examined by anyone interested.

A "big-bud" caused by a mite is also very common on the Hazel, and the popular opinion is that the mite from the Black Currant can attack the Hazel and vice versâ. A series of experiments proved this idea to be unfounded. Certain other investigations that were completed were also briefly described. Finally, an appeal for the preparation of a "Wild Fauna and Flora of the Gardens" was made.

To have detected a means of combating this terrible enemy of the Black Currant is a result of no mean importance. Mr. Massee and the Society may be warmly congratulated on the success of the experiment, which will, we hope, be repeated and confirmed by other observers. In the meantime, we may point out that this highly important practical result has been obtained by a careful study of the life history and ways of life of the creature which inflicts so much damage on our plantations, and not by any mere rule of thumb proceedings, such as have been so often tried and found wanting.

Prevention of Corruption Act.

Whilst Mr. Massee was discoursing on a subject of so much practical importance, and whilst the Scientific Committee was in session subsequently for an hour, another meeting was in progress throughout the whole time, which affects nurserymen and gardeners very nearly. Rarely, if ever, have we seen so large and representative an assemblage of nurserymen before. The object of their gathering, presided over by Mr. T. A. H. Rivers, was to consider the course of action to be taken in consequence of the passing of the Prevention of Corruption Bill, which will come into operation on January 1. We have already published the text of the Bill (Oct. 20, p. 279), and we have inserted various letters from correspondents viewing the matter from different standpoints. Many more letters have reached us which it will now not be necessary to print, at least in their entirety, but we should like to remove one misapprehension, under which some of our correspondents appear to suffer, and to point out to them that the provisions of the Bill do not affect gardeners and nurserymen only, but apply to all trades and employments. The provisions of the Bill are very stringent, but as they only apply to practices which can be proved to be "secret and corrupt," we do not see that the man who has a clear conscience need trouble himself much about the matter. The Horticultural Trades Association, under whose auspices the meeting was held, had secured the opinion of a counsel learned in the law, who answered the questions put to him in a very definite manner, pointing out that the slightest infringement of the law might lead to distressing results. Some of the instances cited were, intrinsically, so trivial that we imagine the legal maxim "de minimis non curat lex" would, in practice, be found to apply. Still, behind all are the great principles of right and wrong which we must all act on as best we can. The matter was debated at great length, and ultimately the Press was furnished by the Honorary Secretary with the following authoritative statement:—

"Under the auspices of the Horticultural Trades Association of Great Britain and Ireland, a largely attended meeting, at which some seventy of the principal firms in the horticultural trades were represented, was held in one of the committee rooms of the R.H.S. Hall in Vincent Square to consider the position created by the Prevention of Corruption Act, which is to come into operation

on January 1 of next year. After full discussion of the situation and a carefully prepared and exhaustive statement of the legal aspects of the question had been laid before the meeting, supported by the opinion of an eminent King's Counsel, from which it appeared that the Act in question would include the horticultural trades, it was decided to loyally accept the position as defined by the Act, and to avoid anything which might in any way appear to transgress its provisions."

British Gardeners' Association.

This meeting of the trade affords a good illustration of the advantages of co-operation and combination. We trust the illustration will not be lost on the British Gardeners' Association, whose Council held an ordinary meeting on the same day in the same building. The nurserymen have the means of helping themselves in a much more efficient manner than have the gardeners. We heartily trust that the Association of which we are now speaking will do for the whole body of gardeners what the trade association is doing for its members. They stand in need of co-operation and mutual assistance much more than the nurserymen. Hitherto they have been isolated and with no power of common action. Now they have a chance of raising their professional status and furthering their individual interests in a way they never had before. In their turn, employers will have the benefit of some guarantee of the fitness of the gardener which they have never previously had, and they will soon see the necessity for increasing the remuneration of their gardeners, now often much underpaid in proportion to the qualifications and responsibilities imposed upon them. In too many cases the remuneration to a trained gardener is less than that accorded to other employees from whom much less is expected.

The Benevolent Institution.

Even this does not exhaust the list of meetings held on Tuesday at the Royal Horticultural Hall. In addition to those mentioned, the claims of the necessitous gardeners were considered at a meeting of the committee of the "Gardeners' Benevolent." Truly, the gardener loomed large on Tuesday last!

Country Life in Normandy, &c.

In the evening a fit sequel to the day's proceedings was found in the dinner of the Horticultural Club, when Mr. T. W. Sanders gave an interesting address on some of the conditions of country life in Normandy, Holland, and Sweden. Mr. Sanders visited Normandy three years ago with members of the British Dairy Farmers' Association, and he described in appreciative terms the generally good cultivation observed in the Normandy orchards, and the "luscious" cider obtainable there. Mistletoe was growing in every orchard, and the common Laburnum vulgare was so exceedingly common that at first it was thought to be flowering Gorse. The details observed in the great creameries, where the process of butter-making was in progress, and the insanitary conditions under which the celebrated Camembert cheese is manufactured were not such as to increase an Englishman's appreciation for the finished products. In Normandy, however, there are excellent examples of the benefits arising from co-operation, and although Mr. R. P. Kerr, Mr. Collingridge, and other subsequent speakers were not disposed to consider good cultivation a general characteristic of the orchards there, they admitted many useful lessons could be learned by English visitors to that country.

Mr. Bunyard related a few facts respecting Messrs. Bulmer's cider industry at Hereford, from which it appeared that this firm is importing this season four thousand tons of Apples from Normandy for the manufacture of cider.

Mr. Sanders had a different story to tell relative to Holland, where cleanliness and sanitation appear to be almost worshipped by all. He spoke of the wonderful amount of produce obtained from the land owing to the intensive cultivation practised by the Dutch, and of the large amount of cheese, butter, bacon, and mutton, in addition to much market-garden produce, that is annually exported from Holland to this country.

During the present season the British Dairy Farmers' Association visited Sweden as guests of the Swedish Government. The party travelled 3,000 miles through that country, and at Stockholm they were so far north that it was possible to see to read the newspaper all through the night. Very few home gardens were observed throughout Sweden, these few being in the district of Gothenberg. Fruit-cultivation is not practised extensively, but it is becoming more general, and English varieties of Apples are found to succeed best. Potato cultivation is being increased enormously, and the bulk of the tubers will be used for making Potato spirit for use in Swedish punch. Two of the highest nobility in Sweden are Scotsmen, Count Douglas and Count Hamilton, and the visitors noticed that in Sweden "Ayrshire cows and Scotsmen were doing well." Much stress was laid upon the encouragement given by the Swedish Government to farmers wishing to purchase land, and to the development of agricultural industries generally, and the thorough system adopted in the Government trial grounds for the improvement of Wheat is certainly worth emulating.

The trend of the evening's discussion was upon the value of co-operation amongst producers and the need for more sympathetic assistance from the Government. Mr. C. E. Shea, who presided, offered the congratulations of those present to Mr. Sanders on the honour recently conferred on him by the King of Sweden.

OUR SUPPLEMENTARY ILLUSTRATION.—Thunbergia mysorensis is a stove climber better known under the name of Hexacentris. It has long, slender branches, bearing opposite oblong lanceolate remotely and slightly toothed glabrous leaves. The flowers are in pendulous racemes irregular in shape, with an upper and a lower lip, yellow with a deep red border. It is an old plant in gardens, but still not so often met with as might be expected from its attractive appearance. It may be either planted in the border in the stove, or be grown in a large pot. The latter system of culture is preferable, as being a free-rooting subject, the soil in which it is grown can be more easily renewed in a pot. Plants can be had in bloom at almost any season during the year, but they flower best in the winter and early spring months on well-ripened growths produced in the preceding year. A plant will also flower on the current season's growth, without any previous rest, during the late summer and autumn, but to effect this it must be grown in a structure in which a maximum amount of light is obtained, and under drier conditions than are usually afforded stove plants. The plant should be subjected to drier conditions, both at the roots and in the atmosphere in which it is growing, when ripening its wood. Young growths of the current year will readily form roots in the spring if inserted singly in small pots in a compost of two-thirds sandy loam, and one-third sand. They should be taken with a portion of the older wood at the base, and be kept at a temperature of 70° Fahr. in a propagating frame. By the beginning or the middle of May they will be ready for lifting into 6-inch pots. When the plants have attained a foot in height, the tops should be pinched to induce a growth of several strong shoots: each of which should be trained around sticks placed for the purpose. A temperature of 60° at night-time and 20° higher during the day will suit the requirements of the plants. They should be syringed overhead once a day, and should not be allowed to become scorched by the sun's rays. By the middle of July they should receive a further shift into 9-inch pots. They should be gradually hardened for the winter, and the syringing discontinued at the beginning of September. A winter temperature of 50° to 55° will be found sufficient, and very little water must be given. About the middle or end of February shift them into 16 to 18-inch pots, or plant them in the border, and endeavour to procure strong, robust growths for the following season's flowering, and when the flowering spikes appear, stimulate the plant with a little liquid manure, which should be applied twice a week. Do not syringe the plants when they are in their flowering stage.

LEGACY TO THE ROYAL GARDENERS' BENEVOLENT INSTITUTION.—In the will of MRS. SAM LEWIS-HILL, which has just been made public, the Gardeners' Royal Benevolent Institution has been left a legacy of £1,000.

LEGACIES TO GARDENERS.—MRS. SAM LEWIS-HILL'S will also directs that certain furniture and the cup and prizes won by him whilst in her service, and also a sum of £2,000, be given to her gardener, Hammond. MRS. LEWIS-HILL also left £5 to each of the gardeners employed in Grosvenor Square Gardens. By the will of MISS MARY ISABELLA CARVER, which was proved on Tuesday last, it was directed that a legacy of £1,000 should be given to "her faithful gardener," and she also left an annuity of £30 to her late gardener. We have often thought that the claims of gardeners upon the consideration of their employers were not always sufficiently realised, therefore these instances to the contrary are the more gratifying.

SWEDISH HONOUR TO MR. T. W. SANDERS.—In connection with a visit paid to Sweden during the present season by representatives of British Agriculture and Dairy Farming, MR. T. W. SANDERS, F.L.S., founder of the National Amateur Gardeners' Association, has been appointed by the King of Sweden a Knight of the first class of the Royal Order of Wasa. MR. SANDERS organised the party and acted as its Chairman whilst in Sweden. We congratulate our colleague on the high honour conferred upon him.

CATTLEYA LEDA.—The plant recorded in the *Gardeners' Chronicle*, November 10, Supp., p. iv., was entered before Committee in error, as the name had been used before for a cross between C. Percivaliana and C. aurea. The correct name is Cattleya Cleopatra (superba × aurea).

MORMODES BUCCINATOR THEIOCHLORUM.—This is the variety recorded on p. iv., Supp., in *Gardeners' Chronicle*, November 10, without the varietal name. It entailed research to correct the error in the entry of the name.

ROSES FOR THE IRISH INTERNATIONAL EXHIBITION.—The promised gift of 10,000 plants of Rosa Hermosa by Sir JAMES BLYTH for planting in the grounds of the Irish International Exhibition should do much to popularise this pretty, free-flowering, pink coloured Rose. Unfortunately the limited run of the exhibition (May to October, 1907), with the comparatively late planting, contingent on the present transition state of the ground, which must ensue, is not exactly favourable to the plants. With regard to the former, however, the donor has generously promised to do all that is possible in the way of sending vigorous plants, whilst the horticultural department of the exhibition will, doubtless, do its part in order to overcome the evil of late planting which, under the circumstances, must more or less obtain.

BULLETIN DE LA SOCIETE FRANCAISE D'HORTICULTURE DE LONDRES.—The recently issued part of this journal contains an excellent portrait of PETER BARR and a sympathetic account of his career from the pen of Mr. SCHNEIDER. The proceedings of the society make very interesting reading, and the criticisms on our method of arranging flower shows are well founded in themselves, but do not sufficiently take into account the circumstances that prevent a more artistic and beautiful system of grouping. The main object is to show well-grown and interesting plants. Quite as good a general effect could be produced by commoner materials if time and space permitted.

THE WHITE CURRANT.—Mr. H. MAURER, of Jena, sends us a beautiful photo-lithograph of a long-clustered white Currant which has hitherto, he says, been erroneously known in England as the "cut-leaved white." The variety possesses two great advantages, the one being the extraordinary strength of its growth, the second the very unusual length of the bunches of fruit. These peculiarities have remained unchanged during eight years of culture in rich and somewhat damp soil.

THE OLDEST CAMELLIA TREE IN EUROPE is to be found at Caserta in the park belonging to the King of Italy. The tree, it is said, was planted in 1760, and was the first example of the Camellia which produced seeds in Europe.

FRUIT CROPS AND BIRDS.—Mr. CECIL HOOPER puts the following questions and will be glad to receive replies to any or all of them: 1, Have you seen any wild bird eating slugs? 2, Or any bird other than the song thrush eating snails? 3, What birds besides the house sparrow do you consider should be decreased in number? 4, Have you observed any of the following pests eaten by birds, and by which bird: looper caterpillar of winter moth, lackey moth, ermine moth, bud moth caterpillars? 5, Larvæ of sawfly? magpie moth on Gooseberries and Red Currant? 6, Scale on Apple, Gooseberry or Currant? 7, Aphis on Red or Black Currant, Plum, Damson, Cherry, Apple; 8, woolly aphis and Apple sucker? Remarks as to their food; birds and insects injurious to buds, fruits, etc.:—Birds. 1, house sparrow; 2, bullfinch; 3, blackbird; 4, missel thrush; 5, song thrush; 6, chaffinch; 7, greenfinch; 8, rook; 9, jay; 10, wood pigeon; 11, blue tit; 12, black cap; 13, nettle creeper and other warblers; 14, robin; 15, wren; 16, cuckoo; 17, pied wagtail: other birds injuring fruit or beneficial to the grower. Mr. HOOPER'S address is Shoreham, Kent.

A NORTH STAFFORDSHIRE APPLE.—Mr. WALLIS, late of Keele Gardens, Staffordshire, has sent us some fruits of an Apple named Beebench, which he included in his list of the best six dessert Apples for his locality, when contributing to our census taken in 1904. It is evidently a local variety, cultivated at Woore, where Mr. WALLIS now resides, and in neighbouring parishes, where it is valued for its free cropping qualities and pleasantly flavoured fruits. The fruits are from small to average size, somewhat conical in shape, and the skin green to yellow, excepting some patches just around the stalk and a very few minute dots over the entire fruit. The stalk is only one quarter of an inch long, very slender, and it is inserted in a very perfectly formed funnel-shaped cavity from which the stalk scarcely emerges. The eye is small, with closed segments and set in a very slight depression, the sides of which are very inconspicuously furrowed. The flesh is white, soft, juicy and refreshing, but possesses comparatively little flavour. The sample is not equal to our best dessert Apples in the southern counties, but if Beebench were grown in Kent, Sussex, Surrey, or Berkshire, its fruits would probably be much improved, for north Staffordshire is not a good Apple district, and the experiment might therefore be worth the trial. The fruits are at their best in the middle of the month of October.

VIOLET LA FRANCE.—We have received some unusually fine flowers of this variety from Mr. W. HONESS, Cobham Park Gardens, Surrey, who states that it has succeeded so well in those gardens for several years past that the variety Princess of Wales has been discarded in its favour. The habit of La France, writes Mr. HONESS, is very compact and free-flowering, the flowers, which are borne on a self-supporting stem, are quite as large in size and deeper in colour (purple) than those of Princess of Wales. When growing side by side with Princess of Wales, La France has shown itself to possess a more hardy constitution.

THE ACTION OF PLANTS ON A PHOTOGRAPHIC PLATE IN THE DARK.—In a communication to the Royal Society, and subsequently to this journal (Nov. 26, 1904, p. 370, figs. 165 & 166), Dr. RUSSELL showed that wood has the property of acting in the dark on a photographic plate placed in proximity to it. In a further communication to the Royal Society, Dr. RUSSELL shows that leaves, seeds, roots, bulbs, and, with a few exceptions, all vegetable substances, act in a similar way. The plants, as it were, store up sunshine, whose presence is revealed by the photographic plate. But starch, cellulose, gum, sugar, pith, and pollen (mostly plant-products rather than parts of the plant) are without this property. It appears that seeds in their dormant state are devoid of all power of acting on a photographic plate, but as soon as growth commences this power appears. Flowers and their parts, always excepting the pollen, no matter what their colour, have this property.

Publications Received.—The first volume of the *Trees of Great Britain and Ireland*, by H. J. Elwes, F.R.S., and Augustine Henry (privately printed), has been issued and will demand full notice at an early date.—*First Steps in Gardening*, and *Pictorial Practical Potato-Growing*, both by Walter Wright and E. J. Castle (Cassell & Co.).—*Landschaftliche Gartengestaltung*, by Camillo Karl Schneider (Carl Scholze, Leipsic).

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE BRITISH GARDENERS' ASSOCIATION.—It is a relief to what may be termed the progressive section—a very small one, I fear—of the B.G.A. to find that its highly-respected chairman of council, Mr. Divers, is dead against any mixing of amateur with professional gardeners. What a simple, long-suffering, good-natured fellow the average gardener is. Not content with a working day of anything between 10 and 16 hours, with a Sunday now and then thrown in, he must needs spend a portion of his winter evenings in improving himself, not at billiards or bridge, but as a gardener. And he is so unselfish as to invite the tinker and tailor and candlestick maker to come and learn also. There is no harm in their coming, except when they make unreasonable claims and pretensions, and even then the good-natured gardener often puts up with it. When our B.G.A. is strong enough it will easily clear its temple of all these undesirables. I have more than once been troubled by these tinkers, &c., when addressing a meeting of what I thought were all professional gardeners. If these gardeners' societies would only set themselves to seriously consider the question that at present most concerns them, they would find it more profitable than discussions on how to grow Grapes and Cabbages, and they would then no longer be troubled by the tinkers, &c. The question for them is the British Gardeners' Association, which was started for the purpose of organising professional gardeners, for what? In the "plea" put forward by some of the present council of the B.G.A., namely, Messrs. Divers, Pearson, Curtis, Weathers, and a few others, including myself, it was stated that the association would register gardeners, regulate their wages and working hours, control journeymen and apprentices, protect their interests—in short, look after them generally. These are questions for professional gardeners only, to be dealt with only by combination and co-operation. "Mutual protection and assistance" was our aim, and much work was done and progress made "on that ticket." There was opposition, of course; there always is when movements of this kind are set going. The short-sighted and selfish among gardeners, the sweater and narrow-sighted among employers, protested, the one saying that they would do as they liked, the other that gardeners got as much as they were worth. Some raised the cry of "horrid trade unionism," of the principles of which it was evident they knew nothing. Still, the association grew, the commotion it caused proving a help rather than a hindrance. Its promoters ran some risk, as those who endeavour to right a wrong generally do, notwithstanding that the cause was a just one, the remedies proposed honest and lawful, and everything was above board. If it were possible to unite professional gardeners into a trade union, no effort should be spared to accomplish this. There are, however, difficulties in the way. At the same time, there is not the smallest chance of this or any other gardeners' association doing anything that will "promote the interests of the profession and all who belong to it," unless it is organised on lines approximating as nearly as possible to those of the trade union. A year or two ago one dared not even hint this; now, however, the workmen's combinations are encouraged and admired, even by the lawyers and the prophets. For this reason some of us are disappointed to find that the B.G.A. has dropped into the somewhat undignified position of an employment registry office, and apparently nothing else. This is nothing less than a perversion of the objects for which the movement was started, and, as one who took an active part in its inauguration, I protest against it. Surely it would be better if the effort were to improve the conditions of the gardener in his present situation than to encourage him to believe that they would be better in his next place. We are greatly in need of an organisation that will do for gardeners what other combinations of workers have done, and continue to do, for themselves. The man who is not of our profession, however worthy he may otherwise be, must look elsewhere for help. Gardening can be made a profession or trade only by the gardeners themselves, and no one can deny that a start was made that would have led up to this had there been no departure from the lines laid down in our "Prospectus." We need this organisation to promote and protect the interests of professional gardeners; to be even aggressive on their behalf when necessary; to show by its attitude and operations that in the movement now going on everywhere for the betterment of the conditions of the worker the men who have adopted professional gardening as a calling shall not be left behind. *W. Watson.*

RE-NAMING OF CARNATIONS.—In my letter (p. 328) I said if rose-pink Enchantress is no better than Mrs. Omwake it should not be called rose-pink Enchantress, as Mrs. Omwake is slightly pencilled, and not a clear pink. I am glad to hear that the rose-pink Enchantress is so perfect, and there was evidently no occasion for *New Yorker* to

hint in his first letter that the exhibitor of Mrs. Omwake had re-named the rose-pink Enchantress, for, with his own words, this is "the finest rose-pink Carnation existing as yet." I only classed Mrs. Omwake and Helen M. Gould together as both being sports of Enchantress, which no doubt they are. Possibly Helen M. Gould may not look quite so much of a winner when we see it in England. For if *New Yorker* is a New Yorker [He has returned to America.—ED.] he is, no doubt, aware that New York is further South than Naples, and that consequently there is considerably more bright sunshine round New York at this time of the year than anywhere in England, and for that reason I am afraid we shall never be able to grow Carnations so well during the winter as the Americans do. It may be foolish of English growers to buy from stocks they know nothing about, but I am afraid there are very few able to examine the stocks before buying novelties. As regards my stock of Enchantress, I do not think I will change it, as *New Yorker* suggests, for even if among 15,000 I get 12 sports, most of them only parts of a plant, it is quite good enough for me. Whether I can fix these sports or not, I do not know, for I have not troubled to try. *C. Engelmann, Saffron Walden.*

FLOWERS IN SEASON.—I send samples of early-flowering Chrysanthemums from the open border, also flowers of Salvia azurea grandiflora from outdoors. The weather has been favourable and dry. We had 38° of frost on October 14, which slightly damaged the Dahlias and Salvia splendens. At the present time Hollyhocks are at their best from seed sown in a cold frame in December, 1905. Schizostylis coccinea is in full beauty. A large plant of Datura sanguinea, in a sheltered corner, is most effective with its large pendulous orange-coloured trumpets. A large plant of Genista racemosa, which has stood two winters in the open, is now in full flower. Salvia azurea grandiflora is a great success here as a late autumn flower, standing rain well. Pentstemon Newbury Gem is still beautiful in the beds, as is also Nicotiana sylvestris and Calceolaria amplexicaulis. Cobœa scandens on rough Larch poles is fresh and vigorous. Last year a plant of this, which covered a portion of an old Pear tree on a south wall, bore numerous seed pods which ripened seed in February, after remaining on the plant the whole winter. *F. Strat, Andwell, Wigtonshire, November 14.* [The flowers included a large number of Chrysanthemums, ranging from white to yellow in various shades, and from lilac to ruddy brown. Among the latter Mr. W. Holmes was the most remarkable, and Soleil d'Octobre among the yellows. But the number and variety of kinds were too great to allow us to do more than say that the consignment was a very noteworthy one. The blue of the Salvia is very valuable at this season.—ED.]

CHRYSANTHEMUM BLOOMS AT EXHIBITIONS (see p. 342).—Mr. Molyneux now contemns the very means by which he attained fame. How many have in the past decried the craze for big show blooms and so far with little effect! When the Swanmore giant commences to deal these blooms fierce blows of condemnation, then must the end of the craze be at hand. There are many readers of the *Gardeners' Chronicle* who welcome this useful and desirable crusade. *A. D.*

CULTURE OF CELERIAC.—The Celeriac, referred to by the Editor on p. 341, was the produce of seeds sown in a gentle heat early in February last. As soon as the seedlings were large enough to handle they were pricked off into boxes, and these boxes were placed near to the glass, it being most important that the plants should be prevented from becoming drawn, a condition which would be fatal to success. As growth advanced, the plants were gradually hardened off previous to being pricked out into a cold frame. Subsequently they were planted at 18 inches apart, in shallow drills, drawn at the same distance apart on a south border. From that time the outer leaves were kept pulled off at intervals of about three weeks, and this was continued all through the growing season. The plants were frequently flooded with water, and these waterings were alternated with copious supplies of liquid manure obtained from the stables. *W. Honess, Cobham Park Gardens, Cobham.*

ARAUJIA SERICIFERA (PHYSIANTHUS ALBENS).—I am of opinion this plant is hardier than it is generally considered to be. A plant exposed on the balcony at Norton Barracks, Worcester, all through last winter was uninjured. A small specimen planted out of doors in these gardens last spring grew to a height of 12 feet, although it failed to flower. In these gardens is also a fine batch of plants raised from seeds sown last May, some of the best being now 4 feet in height. Perhaps some reader who is acquainted with this fine plant will briefly state its cultural requirements. It scarcely seems a wall plant, but has more the habit of the Hop (it entwines itself in the reverse direction to the Hop), and I would suggest its being trained to a pole, or old tree, such as one would afford Polygonum Baldschuanicum. *Louis C. Williams, Old Colwall Gardens, Malvern.*

WILLOWS (see pp. 327 and 337).—I believe it is Salix alba that is most in demand, and is of the greatest value for making into cricket bats. As a rule, planters when increasing their stock do not rely so much on small cuttings, but adopt quite the contrary practice. Large, clean growths, fully 18 to 20 feet in height, and from 10 to 12 inches in circumference, taken from pollarded trees, are what they usually plant. They first drive a stake into the ground 2 to 3 feet deep, the stake is afterwards levered out and the butt end of the willows dropped into the holes and made tight. These pieces should be made secure against winds, which would otherwise cause them to sway about, and if the weather proves dry, as was the case last summer, a few good soakings of water should be applied at intervals and, if necessary, the soil should again be made firm round the stems. It may be interesting to those intending to plant if it is stated that these huge, clean sets may be bought and planted for the small sum of about 1s. per set, the price varying a little, according to the quantity required. Certain firms undertake to do this kind of work. *H. Markham, Wretham Park, Bamt.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 20. The usual fortnightly meeting of the Committees was held on Tuesday last in the Vincent Square Hall, Westminster, and there were several other events also during the course of the day that together kept everyone busy. See p. 356.

The FLORAL COMMITTEE recommended seven Awards of Merit to varieties of Chrysanthemums. The ORCHID COMMITTEE's awards to new plants included two First-Class Certificates and two Awards of Merit.

The FRUIT AND VEGETABLE COMMITTEE did not make an award to a novelty on this occasion.

In the afternoon Mr. Geo. Massee gave a lecture on "Researches at Wisley." See p. 356.

Floral Committee.

Present: W. Marshall, Esq., Chairman, and Messrs. Geo. Nicholson, T. W. Turner, Jno. Green, C. R. Fielder, G. Reuthe, Jas. Hudson, R. Hooper Pearson, W. Howe, R. W. Wallace, Chas. Jeffries, C. E. Pearson, C. Dixon, J. T. Bennett-Poe, Jas. Douglas, W. Cuthbertson, H. J. Jones, W. P. Thomson, E. H. Jenkins, W. J. James, C. E. Shea, R. Wilson Ker, R. C. Notcutt, Jas. Walker, C. J. Salter, C. T. Druery, Chas. Blick, H. J. Cutbush, and J. Jennings.

Mrs. STEWART MACKENZIE, Seaforth, Lydhurst, Hayward's Heath (gr. Mr. A. Smith), displayed a number of plants of Begonia Gloire de Lorraine and the white Turnford Hall variety. All the plants were perfect specimens, each being crowded with flowers, and exhibiting excellent culture, including three very large baskets of the pink variety that were suspended from iron standards. (Silver Gilt Banksian Medal.)

Another very handsome batch of these Begonias was shown by the Hon. WALTER ROTHSCHILD, Tring Park, Tring (gr. Mr. Dyer). The group, which occupied a considerable space, was composed of both the white and the pink varieties, the latter forming a broad band around a batch of the white-flowered variety. They were all well-grown specimens. (Silver Flora Medal.)

F. M. HAMPDEN TURNER, Esq., Rooksnest, Godstone (gr. Mr. Wm. Penton), showed nine pyramidal trained plants of Begonia Gloire de Lorraine, and a number of Zonal Pelargoniums, with cerise and pink-coloured flowers.

Messrs. H. CANNELL & SONS, Swanley, Kent, displayed vases of Zonal Pelargoniums of new and choice varieties. We noticed several of recent introduction—Bowood (a pleasing shade of crimson), Lady Folkestone (blush pink), Madresfield (rich purple), Helen Countess of Radnor (cerise), Kingswood (scarlet, with a white "eye"), Warley (a mottled variety, shades of orange and white), &c. Messrs. CANNELL also displayed Chrysanthemum blooms, among which were many pretty single varieties. Innovation is a "single" of the best form, the florets being a shade of red. (Silver Flora Medal.)

E. H. BROWN, Esq., Roehampton, Surrey (gr. Mr. Bradford), exhibited a pleasing group of indoor flowering and foliage plants arranged in the form of a semi-circle. (Silver Flora Medal.)

Mr. H. B. MAY, Dysons Lane Nurseries, Upper Edmonton, staged Veronicas, Begonias, and Bouvardias, also nicely berried plants of Solanum capsicastrum, the whole being interspersed with small, hardy Ferns. (Silver Banksian Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, exhibited a number of greenhouse plants, a batch of Acacias in about twenty-five varieties, and some very fine Carnations in vases. A plant of Bilbergia muscosa was shown in flower, and there were several specimens of Grevillea Preissi also in flower.

Messrs. CRAGG, HARRISON, CRAGG & Co., Merrivale Nurseries, Heston, Middlesex, filled a large table with single Chrysanthemums, many of which were of their own raising. We noticed Lady Brooks (a good crimson flower), Sylvia (bronze), G. W. Forbes (a large red flower with a paler reverse), Miss Irene Cragg (white), &c. (Silver Flora Medal.)

Lord ALDENHAM, Aldenham House, Elstree (gr. Mr. Ed. Beckett), showed a very pleasing exhibit of decorative and single Chrysanthemums, among which we noticed many old favourites Ladysmith, Mary Anderson, Stella (white), Golden Star (deep yellow), &c. Thirza Cherry is a variety with narrow-fluted or quilled florets. (Silver Banksian Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, showed some of the latest varieties among the various types of Chrysanthemums—Japanese, decorative, single, &c. The variety Annie Hamilton is a large white Japanese flower with narrow and recurving florets.

Mr. NORMAN DAVIS, Framfield, Sussex, exhibited some large specimen blooms of Japanese Chrysanthemums of such choice kinds as Mad. Paolo Radaelli, Miss Hinckling, Marquis V. Venosta, Algernon Davis, Mad. R. Oberthur, &c., all in the best exhibition style. Several vases of single varieties found a place in the display.

Mr. D. FAIRWEATHER, Bifrons, Canterbury, Kent, showed several vases of single Chrysanthemums and three new Japanese varieties.

E. SALMON, Esq., Norbury Park, Dorking (gr. Mr. Geo. Kent), also displayed a collection of pretty single Chrysanthemums.

Mr. H. J. JONES, Ryecroft Nurseries, Lewisham, showed a group of plants of the white market Chrysanthemum Money-Maker.

Messrs. WM. CUTBUSH & SON, Highgate, London, N., exhibited a very large group of ornamental shrubs and Conifers—Box, Rhododendron, Privet, Euonymus, Hollies, Laurustinus, Cytisus, Andromeda japonica and other similar plants in great variety and excellent condition. (Silver-Gilt Flora Medal.)

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed small shrubs and trees in pots—Ivies, Aucubas, Eleagnus, Euonymus, Osmanthus, &c.

Messrs. BARR & SONS, King Street, Covent Garden, W.C.; Mr. G. REUTHE, Keston, Kent; and Messrs. JOHN PEED & SON, West Norwood, displayed hardy and rock-garden plants.

J. F. HOOPER, Esq., Snowdenham Hall, Guildford (gr. Mr. A. J. Ivy), showed a batch of Cyclamen plants, the first seen in the hall this season. (Bronze Flora Medal.)

Messrs. JAMES VEITCH & SONS, Ltd., King's Road, Chelsea, showed a number of well-flowered plants of winter-flowering Begonias, a batch of plants of Jacobinia chrysostephana, and a row of the taller-growing J. coccinea at the back.

Messrs. JOHN JEFFRIES & SON, Royal Nurseries, Cirencester, displayed a group of ornamental Conifers. Many of the best varieties of Junipers, Yews, Cedars, Picea, &c., were included, with Retinosporas, &c. Cupressus Lawsoniana lutescens Stewarti

has the ends of the recurving branches tipped with a gold colour, Abies Veitchii, Picea concolor, Picea pungens glauca var. Kosteriana and Cryptomeria elegans were among the more handsome examples displayed. (Silver Banksian Medal.)

AWARDS OF MERIT—CHRYSANTHEMUMS.

Chrysanthemum Mrs. Sidney Fox.—A large pink-coloured Japanese, of regular colouring as shown. Of large size and greater breadth than depth. Shown by Mr. D. FAIRWEATHER, Bifrons, Canterbury.

C. Edith Harling.—A single variety, flowers yellow. Shown by Messrs. W. WELLS & Co.

C. Mlle. G. Rivol.—A yellow sport from Mad. P. Radaelli (Japanese Incurved). Shown by Messrs. WELLS & Co.

C. Mad. R. Oberthur (Japanese).—A very large, white flower, already cultivated in many collections. Shown by Mr. NORMAN DAVIS, Framfield Nurseries, Sussex.

C. H. Haun.—A very large Incurved flower of reddish colour, with bronze to buff reverse. Shown by Mr. W. SEWARD, The Beeches, Hanwell.

C. Mersthum White. This is a good white single flower of several rows of florets, but of excellent, circular form. The flowers are 3 inches across, and the florets are stiff and regular. The five upper buds on several of the shoots developed almost on a level plane. Shown by Messrs. W. WELLS & Co., Ltd.

C. Miss H. Hampson.—A first-class single decorative variety, flowers pure white. If little disbudding is done, the flowers come freely and develop perfectly for 1 foot down from the top bud, and most of them are in flower at the same time. Shown by Lord ALDENHAM.

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair; and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, Francis Wellesley, W. A. Bilney, W. Boxall, H. Little, G. F. Moore, R. G. Thwaites, A. A. McBean, F. M. Ogilvie, H. T. Pitt, W. Cobb, A. Dye, J. Charlesworth, E. J. Thorne, W. H. Young, H. G. Alexander, H. A. Tracy, J. Wilson Potter, C. J. Lucas, and W. Bolton.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, staged a very fine group, principally of hybrids. In the centre were a number of the showy Lælio-Cattleya luminosa, other fine Lælio-Cattleyas being arranged around them. At each end were magnificent plants of Cattleya Fabia with eight to nine richly-coloured flowers on each, and among others of special merit were Cattleya labiata "Mrs. J. Bradshaw," a fine white flower with a slight shade of pink on the lip, and C. l. Reedleyensis, also a white variety. A good selection of Cypripediums were included. (Silver-Gilt Flora Medal.)

Messrs. JAS. CYPHER & SONS, Cheltenham, staged a fine group in which the Cypripediums were the leading feature. Among them were a very fine series of varieties of C. insigne, which included the remarkable variety Oddity; a number of yellow forms, C. l. Sanderæ being represented by six fine plants. The varieties Gulbotense, Cobhamum, Harefield Hall, Sunray, ornatum and a remarkable form of the Bohnhofianum class were also noted. Of hybrid Cypripediums, there was great variety, also Lælio-Cattleya Clive, and some other hybrid Lælio-Cattleyas, &c. (Silver-Gilt Flora Medal.)

Messrs. SANDER & SON, St. Albans, staged an effective group, the centre of attraction in which was a magnificent Cypripedium, supposed to be a form of C. Rolfeæ, but which the committee decided was a form of C. F. K. Sander, and very close to the original which was so much admired when shown October 18, 1904, when a First Class Certificate was given, a similar award being now voted for the variety King Haakon (see Awards). Other specially remarkable things in the group were Cattleya Hardyana picturata, with delicately-tinted pale rose flowers netted and mottled with white and with fine ruby purple lip with two light patches on the sides; C. insigne D. S. Brown, of fine form, and C. insigne Hodgkinsoni, a distinct light variety, the feathered light reddish-purple lines in the dorsal sepal changing to a pale lilac shade on the white apical half; Lælio-Cattleya exoniensis cærulea, white with slaty-blue front to the lip; good L.-C. luminosa Millard Bleuana, and a number of good Cypripediums, &c. (Silver Flora Medal.)

Messrs. HUGH LOW & Co., Enfield, staged a group among the C. labiata, in which were three white forms, viz., Gilmouriæ, Reedleyensis, and Amesiana. The group also contained a good selection of Cypripediums, including a fine C. Niobe with nine flowers, and C. Arthurianum with seven. (Bronze Banksian Medal.)

J. GURNEY FOWLER, Esq., Glebelands, South Woodford, showed Cypripedium insigne Glebelandsense, a large and finely-coloured flower of the Chantmi class, C. insigne J. Davis, a large form of a yellowish tint, the suface being polished and the upper half of the dorsal sepal white, the lower half bearing some spotted brown lines, and C. Madame Jules Hye.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), again showed the noble Cypripedium Germaine Opoix, Westfield variety, which was awarded a First Class Certificate at the last meeting, and which now secured the First Diploma, the second going to Mr. Wellesley's finely-coloured C. Baron Schroder punctatum. Mr. Wellesley also showed Lælio-Cattleya Mrs. W. J. Dickson (C. Gaskelliana × L.-C. Wellsiana), a good flower with white sepals and petals tinged with rose and bright ruby-purple front to the lip, and Cypripedium Arthurianum giganteum.

G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr. Mr. Page), sent the pretty white, rose-spotted Cypripedium Nandii and C. Leeanum var. corona (see Awards).

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. J. Hudson), sent Vanda cærulea albescens, a white variety with a pale blue shade on the lip.

H. S. GOODSON, Esq., Putney (gr. Mr. Day), showed Cypripedium Fairlawn and C. Miss Annie Goodson.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. Alexander), showed Cattleya labiata Amesiana in grand form with five fine pure white flowers with pale pink lip on one spike and C. fulvescens superba.

Messrs. J. W. MOORE, Ltd., Rawdon, Leeds, staged a group of Cypripediums which included C. insigne Harefield Hall in fine condition, and other varieties of C. insigne, C. Milo, C. Watsonianum, Lælio-Cattleya Statteriana, Cattleya Clarkii, &c.

M. CHAS. MARON, Brunoy, France, sent a very fine white Cattleya labiata with a faint pink tint on the lip, and two C. Fabia alba.

M. MEERTENS, Mont St. Amand, Ghent, showed a selection of Cypripediums and a white Cattleya labiata.

The Hon. WALTER ROTHSCHILD, M.P., Tring Park, Tring (gr. Mr. Dye), sent Cattleya Germania inversa (Schofieldiana × Hardyana) with very attractive cream-white flowers tinged and veined with rose, the showy labellum being dark ruby-red. The finely-grown plant had three flowers.

From the ROYAL HORTICULTURAL SOCIETY'S GARDENS, Wisley, Mr. Wright showed four forms of Cypripedium Euryades. It is noteworthy that Orchids will receive attention at Wisley and that spare specimens will be welcomed.

W. M. APPLETON, Esq., Weston-super-Mare, sent Cypripedium insigne Appletonianum, a very finely-formed and richly-coloured variety; and C. Elsie (Charlesworthii × villosum).

J. BRADSHAW, Esq., The Grange, Southgate (gr. Mr. Whitelegge), showed the beautiful Odontoglossum amabile Charlesworthii with flowers of fine form suffused with rose-pink and spotted on the inner parts of the segments with red-brown.

AWARDS—ORCHIDS.

FIRST-CLASS CERTIFICATE.

Cypripedium F. K. Sander variety King Haakon (Annie Measures × bellatulum) from Messrs. SANDER & SONS, St. Albans. A near approach to the fine type which was illustrated in the *Gardeners' Chronicle*, October 29, 1904, p. 307, which is its best recommendation. The chief differences are in the spotting of some parts of the flower and in the rather longer and more pointed petals. The flower is of the largest of its class and wax-like in substance, creamy-white with heavy lines of chocolate-purple spots on the upper sepal and petal, and smaller rose-purple spots on the lip. [The council did not confirm this award, on account of the too close similarity of the flower to the original form previously certificated.]

Cattleya Fabia Goodsoni from H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day). One of the finest-coloured Cattleyas, either species or varieties, the sepals and petals being of a rich magenta rose, the lip glowing velvety crimson with gold lines at the base. The splendid specimen had two spikes of five and four flowers respectively.

AWARD OF MERIT.

Cypripedium Leeanum "Corona" from G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr. Mr. Page). A very distinct form, with the broad, white dorsal sepal of thick substance in some degree resembling that of the unique C. L. J. Gurney Fowler. The base of the fine white dorsal sepal is yellow-green with some purple lines, the broad petals and lip yellow tinged with purple.

Cypripedium Stephanos (Pollettianum × cenanthum superbum) from The Rev. J. C. B. FLETCHER, Mundham Vicarage, Chichester. A very distinct and pretty hybrid with a resemblance to some of the unspotted forms of C. Euryades. Upper sepal white with a green base and some feathered purple lines; petals and lip yellow, heavily tinged with brownish-purple.

DIPLOMA AWARDS.

CYPRIPEDIUM FAIRRIEANUM.—*First Diploma* to Cypripedium Fairrieanum dark variety, from Messrs. SANDER & SONS.

CYPRIPEDIUM FAIRRIEANUM HYBRIDS.—*First Diploma* to Cypripedium Germaine Opoix Westfield variety from FRANCIS WELLESLEY, Esq. (gr. Mr. Hopkins). The noble variety which secured a First-Class Certificate at the last meeting (see *Gardeners' Chronicle* Supp., November 10, p. iv.). The last and best of a small batch raised by Monsieur Opoix in the gardens of the Luxembourg Palace between C. Madame Cofinet and C. Fairrieanum. A model flower of fine proportions and attractive colour.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., chairman; and Messrs. J. Cheal, W. Bates, S. Mortimer, A. Dean, G. Kelf, A. R. Allan, Ed. Beckett, W. Pope, R. Lye, H. J. Wright, H. Markham, H. Parr, J. Davis, Jno. Basham, Jno. Lyne, G. Reynolds, J. Willard, F. D. Tuckett, J. Jaques, Chas. Foster, Owen Thomas, and W. Poupart.

Mrs. HENDERSON, Sedgwick Park, Horsham (gr. Mr. C. Maddell), showed some splendid Apples, principally dessert varieties. The collection, which embraced 40 dishes, was remarkable for the high colour of the fruits. (Silver-Gilt Knightian Medal.)

E. G. WYTHES, Esq., Bickley Park, Bickley, Kent, showed several dishes of Apples gathered from very old trees; a plate of Discovery Potatos, and three kinds of Onions, grown in unmanured soil, and a very fine dish of Doyenné du Comice Pears.

Messrs. GEO. MASSEY & SONS, 17, Market Place, Spalding, showed 50 baskets of Potatos, all clear-skinned, evenly matched tubers of new and popular varieties. (Bronze Banksian Medal.)

Messrs. DOBBIE & Co., Rothesay and Marks Tey, showed their Victoria Kale, one of the best kinds of this hardy green vegetable, and which has already received an Award of Merit from the Fruit and Vegetable Committee after trial in the Society's old gardens at Chiswick.

CHELMSFORD AND DISTRICT CHRYSANTHEMUM

NOVEMBER 6, 7.—The annual exhibition of the above society was held on these dates in the Corn Exchange, Chelmsford, and proved to be one of the best the society has ever held. The entries were in excess of previous years and the quality of the exhibits was of a high standard. Unfortunately the weather was unfavourable.

In the class for a large group of Chrysanthemums the 1st prize was a silver Cup, given by Captain Cruickshank, and this was won by H. C. WELLS, Esq., Broomfield Lodge, Mrs. W. GRAY, Phœnix House, being 2nd.

In the smaller group class, ABRAHAM JACKSON, Esq., Great Baddow, led, and he was closely followed by Rev. Canon HULTON, Boreham, Mrs. C. H. GRAY being 3rd.

Mr. P. LINN, Great Baddow, was the winner of the Amateur's Cup, presented by Temple Cowell, Esq.

A prominent feature of the show was a group of single Chrysanthemums, arranged the full length of the platform, and exhibited by Mr. C. J. SIMPSON, St. John's Nursery, Chelmsford.

The principal prize winners in the open classes for cut blooms were H. C. WELLS Esq., Messrs. SALTMARSH & SON, Mr. C. J. SIMPSON, Mrs. W. GRAY, Mr. H. HICKS, and Rev. Canon HULTON: while in the amateurs' classes, Mr. J. FALCONER, Mr. P. WISEMAN, Mr. W J. WARREN, Mr. P. LINN, and E. C. PAGE were successful exhibitors.

Floral decorations made a grand show. Exhibits of fruit and vegetables were exceptionally good. Mr. W. SEABROOK, and Messrs. SALTMARSH & SON both showed good produce. *C. J. S.*

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 11.—*Committee present:* Messrs. E. Ashworth (chairman), R. Ashworth, Thorp, Cowan, Sander, Rogers, Stevens, Warburton, Leemann, Smith, Ashton, Williamson, Parker, Weathers (hon. sec.).

There was a capital display of plants at this meeting, and a few good things were selected by the Committee for award.

Groups of Orchids were exhibited by W. THOMPSON, Esq., Stone, H. J. BROMILOW, Esq., Rainhill, G. W. JESSOP, Esq., Rawdon, and WALTER LAVERTON, Esq., Nantwich, for which Silver Medals were awarded. Mr. D. MCLEOD was awarded a Bronze Medal.

S. GRATRIX, Esq., Whalley Range (gr. Mr. Cypher) exhibited a good form of Cattleya × Hardyana var. alba, Gratrix's var., which gained a First Class Certificate; Cypripedium × Leoniæ, Gratrix's var., was given an Award of Merit.

Messrs. STANLEY & Co., Southgate, London, N., gained an Award of Merit for the pretty natural hybrid Odontoglossum × Huyvierianum, the parents of which are O. cordatum × O. nebulosum. Cattleya × Fabia var. alba, C. labiata var. pardina, and several other distinct plants were shown by the same firm.

W. FARRER, Esq., Carnforth (gr. Mr. Proudlock), exhibited Cypripedium × Leyburnense and C. × Chapmani var. magnificum. G. W. JESSOP, Esq., Rawdon, Leeds (gr. Mr. Wilkinson), was given a Botanical Certificate for Cirrhopetalum Medusæ. A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), obtained First Class Certificates for Lælio-Cattleya × Decia and Cypripedium × Germaine Opoix, two handsome Orchids, particularly the former. E. ROGERSON, Esq., Didsbury (gr. Mr. Price), exhibited a distinct variety of Cypripedium × Actæus. *P. W.*

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 13, 14.—The Guildhall was again used to accommodate the autumn exhibition of this society, held on these dates. The display was much the best of the series, and one of the most complete exhibitions seen this season. The quality of the cut blooms was of a high standard of excellence, especially in the Incurved section. Decorative varieties in sprays arranged in vases were a distinct feature. Fruit and vegetables, too, were of the best quality.

CUT BLOOMS.

The principal class was for 36 Japanese blooms. Four exhibitors competed. The Dowager Lady ASHBURTON, Melchet Court, Romsey (gr. Mr. G. Hall), was successful, having especially fine examples of F. S. Vallis, Mrs. J. E. Dunne, Princess Mafalda, Mrs. W. Knox, J. H. Silsbury, John Cumberland, Bessie Godfrey, and Marquise V. Venosta. Sir C. SWINFEN EADY, Oatlands Lodge, Weybridge (gr. J. Lock), was a good second.

Twenty-four Japanese blooms in not fewer than eighteen varieties.—The premier award was made in favour of E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson), among six contestants, with a very fine exhibit of well-known varieties; 2nd, J. B. TAYLOR, Esq., Sherfield Manor, Basingstoke (gr. Mr. J. Wasley), with but little inferior blooms.

Twelve Japanese blooms.—In this class four competed, the best exhibit being that shown by W. H. MYERS, Esq., Swanmore House, Bishop's Waltham (gr. Mr. G. Ellwood), and he was followed by M. HODGSON, Esq., Morton House, Kingsworthy, Winchester (gr. Mr. A. J. Marsh). In the class for six Japanese varieties, staged in vases, five growers competed. Mr. G. HALL staged exceedingly fine blooms, and secured the premier award quite easily.

Any white Japanese variety.—Mr. ELLWOOD staged the best five blooms, having the variety Mad. R. Oberthur in fine form.

Incurved varieties were not numerous, but they were of high quality. In the class for 36 blooms in not fewer than 24 varieties, P. RALLI, Esq., Ashstead Park, Epsom (gr. Mr. J. Hunt), was an easy 1st with large, perfectly-formed blooms, quite the best seen this season. Mr. A. J. MARSH was 1st for 24 Incurved blooms with a thoroughly representative set.

Single-flowered varieties, arranged in vases, made a fine display. In the class for six bunches of these flowers, not disbudded, there were seven exhibits. A. J. RALLI, Esq., Twyford Lodge, Winchester (gr. Mr. J. Hughes), was successful with high-class blooms on long sprays.

Mr. A. E. TAYLOR, 3, Hillside Terrace, Winchester, was 1st in a similar class for decorative varieties.

Plants were not equal to those shown in former years. For a group arranged for effect in a space of 8 feet by 7 feet, there were four competitors, Lord NORTHBROOK, Stratton Park, Winchester (gr. Mr. E. Henderson), being placed 1st. Col. F. A. DICKENS, Edge Hill, Winchester (gr. Mr. G. Adams), was 1st for a group of Chrysanthemums suitable for conservatory decoration, as he also was for plants of white and yellow varieties.

Classes for floral decorations created much interest. The most tastefully-arranged dinner table—Orchids excluded—was decorated by Mrs. W. B. CANNON, Shirley, Southampton.

Non-competitive exhibits were staged by Messrs. E. HILLIER & SONS, Winchester, who had a collection of Apples of leading sorts. Mr. ELLWOOD had a collection of highly-coloured Apples interspersed with fruiting branches of Euonymus europeus. Messrs. B. LADHAMS & Co., Shirley, staged Carnations and autumn-tinted leaves.

BIRMINGHAM & MIDLAND COUNTIES CHRYSANTHEMUM, FRUIT AND HORTICULTURAL.

(Concluded from page 347.)

NOVEMBER 13, 14, 15.

PLANTS.

Primulas.—J. A. KENRICK, Esq., Bellow Court, Edgbaston (gr. Mr. A. Cryer), won four first prizes and one second for these, and one first prize for specimen Palms. The handsomest tree Fern came from A. HUGHES, Esq., Knowle (gr. Mr. T. Parry). The Rev. H. BUCKSTON, Derby (gr. Mr. A. Shambrook), was placed first in a class for twelve Cyclamen, and W. S. POWER, Esq., Derby, took the lead for six Cyclamen in the amateur classes.

CUT FLOWERS.

Only two competitors entered in a new class for Carnations to be shown on table space of 10 feet by 4 feet. 1st, Mr. S. MORTIMER, Farnham, Surrey, with a prettily arranged group; 2nd, Messrs. JAS. RANDALL & SONS, Shirley, Birmingham. The first prize of £1 for the best bouquet of Chrysanthemums was well won by E. DARBY, Esq., Selly Oak, Birmingham, who relied upon bronze-tinted flowers.

Epergnes of Flowers.—The first award in this class went to Miss DAVIS, Pershore, who used Orchids and Chrysanthemums; 2nd, W. F. BENNETT, Esq., Coventry, whose flowers were confined to Orchids.

Basket of Autumn-tinted Foliage and Berries.—Eight baskets were staged, and the one that pleased the judges most came from Mr. T. JONES, of Ruabon; 2nd, Mr. C. THOMAS, Handsworth.

TABLE DECORATIONS.

Twenty-eight tables, each 8 feet by 4 feet, decorated with Chrysanthemums, Ferns, and foliage were placed in the side galleries, and although no originality in the arrangement of the flowers could be observed, a number of them were pretty, and the judges had a rather difficult task in awarding the first prize of £3, offered by Mr. J. Duller, Birmingham. 1st, H. NORMANSELL, Esq., Edgbaston; 2nd, Miss L. BASTOCK, Moseley; 3rd, Miss DAVIS, Pershore.

FRUIT.

The first prize for a collection of British-grown fruit to occupy space not exceeding 40 square feet was won by the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), who had well-shouldered and finely finished bunches of Muscat of Alexandria and Black Alicante Grapes, highly coloured Cox's Pomona, Blenheim Pippin, and King of the Pippin Apples, and a good dish of Pitmaston Duchess Pears; 2nd, J. W. FLEMING, Esq., Romsey (gr. Mr. W. Mitchell).

For a collection of British-grown hardy fruit arranged on a table 12 feet by 8 feet there were only three competitors, compared with seven last year, and the judges experienced little difficulty in awarding the silver challenge cup given by Sir John Holder, Bart., and £5 to the Earl of CHESTERFIELD, Home Lacey, Hereford (gr. Mr. W. Humphries), whose collection included beautiful dishes of Peasgood's Nonsuch, The Queen, Chatley's Kernel, and Cox's Pomona Apples. Of Pears Pitmaston Duchess, Beurré Bosc and Beurré Diel were the best.

GRAPES.

For six bunches in not fewer than three varieties (open), the Earl of HARRINGTON (gr. Mr. J. H. Goodacre) obtained the 1st prize; 2nd, J. W. FLEMING, Esq., (gr. Mr. W. Mitchell).

The best three bunches of black Grapes came from STUDLEY COLLEGE, Warwickshire; 2nd, Lord BAGOT (gr. Mr. T. Bannerman).

The Earl of HARRINGTON (gr. Mr. J. H. Goodacre) staged the best three bunches of Muscat of Alexandria Grapes; J. W. FLEMING, Esq. (gr. Mr. W. Mitchell), being 2nd.

In a class for white Grapes (Muscats excluded) the Rt. Hon. T. F. HALSEY, Hemel Hempstead (gr. Mr. H. Folkes), beat his only opponent, F. MARTINEAU, Esq., Edgbaston (gr. Mr. G. Brasier).

APPLES AND PEARS.

The best six dishes of culinary and the best six dishes of dessert Apples came from Lord ALDENHAM, Elstree (gr. Mr. E. Beckett). The Earl of HARRINGTON (gr. Mr. J. H. Goodacre) was to the fore with eight dishes of Pears, and W. MAYNARD, Esq., Ledbury (gr. Mr. W. E. Hyde), exhibited the best four dishes of Pears.

VEGETABLES.

Although competition in the collections of vegetables was not so keen as in previous years, the produce shown was of a high order of merit.

For a collection of nine distinct kinds of vegetables, for which liberal prizes were offered by Messrs Sutton & Sons, Reading, there were nine competitors. 1st, Lord ALDENHAM, Elstree (gr. Mr. E. Beckett), with a superb lot.

Messrs. Webb & Sons, Stourbridge, offered four prizes for collections of eight distinct kinds, but only five exhibits were staged. 1st, G. J. EVESON, Esq., Knowle (gr. Mr. T. J. Griffiths), with a very even lot, in which Onions, Tomatos and Leeks stood out prominently.

Messrs. R. Smith & Co.'s prizes were offered for nine distinct kinds, and brought three competitors only. 1st, T. H. PUGH, Esq., Newtown.

For Mr. R. Sydenham's Silver Challenge Cup, offered to the exhibitor who gained the greatest number of points in certain classes, two competitors tied, *viz.*, Mr. H. Folkes (gr. to the Hon. T. F. HALSEY, Hemel Hempstead) and Mr. R. A. HORSPOOL, of Ruabon, with 36 points each. As each of these exhibitors had won the cup twice before, Mr. Sydenham decided to give a cup of equal value to each competitor.

A similar difficulty arose in connection with the local Challenge Bowl, two exhibitors being bracketed with 34 points apiece. In this case it was decided to count each as a win, and if either wins it a third time it will become his absolute property. The winners on this occasion were Mr. E. DEAKIN, Hay Mills, and Mr W. PICKARD, Acock's Green.

Prizes were offered by Messrs. W. H. Simpson & Sons, Edgbaston, and by Messrs. Thomson & Co., Birmingham, for single dishes of vegetables.

HONORARY EXHIBITS.

Messrs. CLIBRANS, Altrincham, staged a collection of Chrysanthemums and a few dishes of hardy fruit. (Silver Medal.)

Messrs. POPE & SON, King's Norton, exhibited brightly-coloured Conifers and other shrubs, in the centre of which was a handsome plant, about 14 feet high, of Cupressus macrocarpa lutea. (Silver Medal.)

Messrs. WEBB & SONS, Stourbridge, sent a large collection of Potatos and plants of Begonia Gloire de Lorraine. (Large Gold Medal.)

Messrs. SUTTON & SONS, Reading, showed a collection of vegetables comprising Tomatos, French Beans, Onions, Celery, Carrots, &c. (Large Gold Medal.)

Messrs. R. SMITH & Co., Worcester, had a large batch of Hollies, Skimmias, richly-coloured Aucubas, and two excellent plants of Picea Parryana glauca. (Small Gold Medal.) The same firm also received a Silver Medal for 100 dishes of Apples and Pears.

The finest collection of hardy Conifers and ornamental shrubs came from Messrs. JOHN WATERER & SONS, Bagshot, Surrey, who had handsome standard and bush Hollies, also Retinosporas, Thujas, Gold and Silver Yews, a splendid plant of Berberis nepalensis (B. Bealei), and Osmanthus myrtifolius in flower. (Large Gold Medal.)

Messrs. H. J. & A. HUGHES, Water Orton, sent flowering plants and floral devices. (Silver-Gilt Medal.)

From the LADY WARWICK COLLEGE, Studley, Warwickshire, came Chrysanthemums, Grapes, bottled fruit, and jellies. (Silver Medal.)

Mr. R. W. GREEN, Wisbech, showed 55 varieties of Potatos. (Silver Medal.)

Messrs. HEWITT & Co., Solihull, contributed a nicely-arranged group of Conifers, edged with golden-leaved Privet. (Silver Medal.) They also showed Carnations and Chrysanthemums, for which a Bronze Medal was awarded.

Messrs. JAMES RANDALL & SONS, Shirley, showed bouquets, baskets and vases of flowers, together with plants in flower, and foliage plants. (Silver Medal.)

Messrs. SNEYD & Co., Hall Green, Birmingham, put up a pretty group of Chrysanthemums, containing splendid flowers of the different sections. (Silver Medal.)

An exhibit of educational value came from Mr. J. CRAIG, Experimental Gardens, Droitwich, who staged upwards of 50 varieties of Apples and a number of excellent bunches of Gamay Noir Grape grown out-of-doors. Seven boxes of Lane's Prince Albert Apples were displayed to show the effects of certain kinds of manures and different methods of pruning. The best and heaviest fruits were gathered from trees treated with stable manure and inorganic chemical manure, and the lightest crops from trees manured with stable manure only. (Small Gold Medal.)

Messrs. RICE BROS., Olton, arranged a pleasing exhibit of Alpine plants and cut Chrysanthemums. (Silver Medal.)

Messrs. THOMSON & Co., Sparkhill, Birmingham, put up a densely-packed group of Chrysanthemums. (Silver Medal.)

Mr. W. J. GODFREY, Exmouth, showed a collection of Chrysanthemums, in which were very good blooms of Mrs. R. Luxton, Admiral Beresford, and Gladiator. (Small Gold Medal.)

A similar award went to Mr. NORMAN DAVIS, Framfield, Sussex, who staged upwards of 40 large, well-finished flowers of Japanese Chrysanthemums.

The finest collection of floral designs came from Messrs. GUNN & SONS, of Olton, whose exhibit displayed great artistic merit. (Large Gold Medal.) Messrs. GUNN also had a group of Decorative Chrysanthemums, for which a Silver-Gilt Medal was awarded.

An assortment of floral designs came from Messrs. PERKINS & SONS, Coventry, but they were not so numerous or so effective as those from the last-named exhibitors. (Large Gold Medal.)

Mr. E. BUCKEN, King's Heath, made a very creditable display with 50 dishes of Apples. (Silver Medal.)

From Messrs. HEATH & SON, Cheltenham, came a bright group of Carnations and Orchids, and a collection of uncommon New Zealand shrubs. (Silver Medal.)

Mr. WILLIAM SYDENHAM, Tamworth, showed a meritorious collection of single and border Chrysanthemums. (Silver Medal.)

The only exhibit of Cyclamen "not for competition" came from the Rev. H. BUCKSTON, Derby (gr. Mr. A. Shambrook). The plants were well grown and carried good flowers. (Silver Medal.)

Miss THOMPSON, Handsworth, staged a large collection of uncommon Cactaceous plants. (Silver Medal.)

Messrs. YATES, Birmingham, showed a collection of well-grown vegetables. (Large Gold Medal.)

Messrs. W. B. ROWE & SON, Worcester, exhibited 70 dishes of hardy fruits. (Silver-Gilt Medal.)

Messrs. PEWTRESS BROS., Hereford, sent a collection of Apples. (Silver Medal.)

The finest non-competitive exhibit of Apples came from the KING'S ACRE NURSERIES, LTD., Hereford, who had magnificent fruits of Blenheim Pippin, Boxhill Pippin, Golden Noble, James Grieve, Court Pendu Plat, and Peasgood's Nonsuch. (Large Gold Medal.)

Bronze Medals were awarded to Mr. J. E. KNIGHT, Wolverhampton, for hardy shrubs and flowers; Messrs. JAS. SIMPSON & SON, Harborne, for variegated Conifers and other shrubs; Mr. VINCENT SLADE, Torquay, for Zonal Pelargoniums; and to the undermentioned firms for Chrysanthemums: Mr. H. J. JONES, Lewisham; Messrs. CHEAL & Co., Acock's Green; Messrs. J. PEED & SON, West Norwood; The VINERIES, LTD., Acock's Green; Mr. H. WOOLMAN, Tyseley, Birmingham; and Mr. J. S. EARP, Tamworth.

[Owing to a printer's error last week the sum offered in prizes was stated to be £50. It should have read £450. ED.]

WOOLTON AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 14.—The eighth annual exhibition of this society was held in the Church Hall, Woolton, on this date. The exhibits in every class quite maintained the high standard of excellence seen in former exhibitions of this society.

The Silver Challenge Cup given by Mrs. F. H. Gossage, as a prize in the premier class of 24 Japanese blooms, was awarded to Sir. WM. H. TATE, Bart. (gr. Mr. George Haigh), the 2nd prize being secured by ALFD. HOOD, Esq. (gr. Mr. John Hall). In the classes for 18 Japanese blooms and for 18 Incurved varieties F. H. GOSSAGE, Esq. (gr. Mr. Joseph Storey) secured the 1st prize; THOS. CLARKE, Esq. (gr. Mr. Jas. Clarke, being 2nd in the former class, and Mrs. COPE (gr. T. Carling) 2nd for the Incurved varieties.

To Sir WM. H. TATE, Bart., was awarded the 1st prize for the collection of cut Chrysanthemums arranged for effect. F. H. GOSSAGE, Esq., being placed 2nd; 3rd, Sir JOHN J. BRUNNER, Bart., M.P. (gr. Jas. Wilson). The last-named exhibit staged a magnificent group of single varieties, and secured 1st honours, with F. H. GOSSAGE, Esq., and Sir WM. H. TATE, Bart., following very closely. In the classes for trained plants P. W. BARR, Esq. (gr. Mr. T. Keightley) captured four 1st and three 2nd prizes in the seven open classes.

Two bunches each of black and white Grapes shown by HAROLD CUNNINGHAM, Esq. (gr. Mr. Wm. Wilson), were really first-class produce. With other kinds of fruit Col. R. IRELAND-BLACKBURNE (gr. Mr. Geo. Hammond) was, as is usual at these shows, well to the fore. The exhibits of vegetables were, in the opinion of most persons, the best ever shown at Woolton.

H. D. Shoosmith, Hon. Sec.

SOUTH SHIELDS AND NORTHERN COUNTIES CHRYSANTHEMUM.

NOVEMBER 14, 15.—This society held its annual exhibition on these dates, and the show was again a success. No fewer than seven silver cups were offered, as well as much money in prizes. Japanese blooms were very good, but the Incurveds were exceptionally fine, being the best ever shown at South Shields.

Cut blooms.—In the leading class for 36 Japanese blooms in not fewer than 18 varieties, Mr. G. E. Thomas (gr. to the Marquis of RIPON, Studley Royal) was 1st with a stand containing fine blooms of the best varieties; 2nd, Mr. G. CROOKS, Droitwich.

In the class for 18 Japanese blooms, Mr. HARDCASTLE was placed 1st with a fine lot of blooms, being followed by Mr. T. PATTISON, Tunstall Manor. Mr. HARDCASTLE was also successful in the class for 12 Japanese blooms in distinct varieties, and also for three Japanese blooms of a white variety. The prize for the premier Japanese bloom was awarded to Mr. CROOKS for a fine specimen of F. S. Vallis.

Incurved flowers were, as stated, far above the average. Mr. C. JENNINGS (gr. to Mr. F. W. JAMESON, North Ferriby), won the silver cup offered by Mr. Alex Purvis for 24 blooms of not fewer than 12 varieties. Mr. CROOKS was awarded the 2nd prize for a fine collection. Mr. JENNINGS was also successful in the class for 12 Incurved blooms.

Mr. J. SUMMERS carried off the principal prizes in the decorative classes. The chief prize-winners in the classes for plants and groups of plants were Messrs. T. Reay, T. Pattison, N. Mothersole, E. J. Baser, and J. W. Foster. *C. O.*

CHESTER PAXTON.

NOVEMBER 14, 15.—The 18th annual exhibition of this society was held at the Town Hall, Chester, on these dates, when the entries exceeded those of any previous year. In the hardy fruit classes nearly 300 more dishes were entered than last year, which was a record one. Through the liberality of Mrs. MacGillicuddy, another class for a mixed group was this year added to the Chrysanthemum section, for which this lady also offered a silver salver. Mr. Stubbs (late gardener to Major MacGillicuddy, and now in the service of Mr. F. B. SUMMERS, Bache Hall) carried off not only this prize, but the first prize in the other two group classes, thereby capturing the two old challenge cups and the new silver salver.

In the classes for black and for white Grapes, Mr. J. SAUNDERSON, Bodnant, took first honours. The entries in the classes for dessert Apples were very numerous. Messrs. CLIBRANS, Altrincham, were awarded the society's Gold Medal for an exhibit of Chrysanthemum blooms, including several new varieties. Messrs. DICKSONS', Ltd., Chester, were awarded a Silver Medal for collections of Potatos and of flowering plants; Messrs. MCHATTIE & Co., Chester, gained the society's Bronze Medal for a collection of Apples and another of flowering plants. The Duke of WESTMINSTER, Eaton (gr. Mr. N. F. Barnes), staged a collection of Apples, for which he was awarded the society's special large Bronze Medal.

NEWPORT (MON.) CHRYSANTHEMUM.

NOVEMBER 15.—The 18th annual show of this society was held in the Gymnasium, Newport, on this date, and, though some of the classes were not so well filled as at some previous exhibitions, the building contained a creditable display of flowers and fruits. Groups of plants were especially good; Apples were shown well, the non-competitive collection of Apples and Pears staged by Mr. J. BASHAM, Fair Oak Nursery, Bassaleg, being of a high standard of quality.

Groups of Chrysanthemums.—In the open class for a group arranged with ornamental leaved plants, and occupying an area of 50 square feet, two bright displays were arranged, the best being staged by Messrs. G. WILLIAMS & SONS, Cardiff; 2nd, R. T. MANN, Esq. (gr. Mr. J. Wiggins).

In the smaller class, open only to gentlemen's gardeners and amateurs for a group of Chrysanthemums measuring 40 square feet, a challenge bowl, value 8 guineas, and £2 was offered as the 1st prize. Mr. R. Long (gr. to W. F. DAWSON, Esq.), won easily with splendidly grown and well-arranged plants, having blooms, many of them equal to the best staged in the cut bloom classes. The only other exhibitor in this class was H. LE BRASSEUR, Esq.

PLANTS.

The best group of miscellaneous plants was shown by Col. C. T. WALLACE (gr. Mr. Powell); 2nd, H. OAKLEY, Esq. (gr. Mr. F. Wood), Chepstow.

Mr. R. FRY showed the best three plants of bush-trained Chrysanthemums, while C. F. COLBORNE, Esq. (gr. Mr. Harris), was the only exhibitor of three pyramid-trained plants, having well-flowered specimens of Pride of Madford, Daisy, and Souvenir de Petite Amie. Mr. HARRIS was also 1st for three bush plants of single varieties. Mr. POWELL won in the class for three Orchids, and also for six plants suitable for the decoration of a dinner table.

CUT BLOOMS.

Twenty-four Japanese blooms.—The 1st prize in this class included a challenge bowl, valued

at 10 guineas. Two exhibitors competed with blooms of almost equal merit, but Mr. PITT, Brecon Road Nursery, Abergavenny, had the best coloured blooms, and was awarded the 1st honours. He staged President Viger, Bessie Godfrey, Mrs. Beckett, Mad. R. Oberthur, Mr. Louis Remy, Mrs. Williams, Duchess of Sutherland, Montigny, W. R. Church, Mrs. Bryant, Mrs. Dalton, Mrs. Vallis, Henry Pitt; 2nd, Mr. DUFF.

Twelve Japanese blooms.—The 1st prize was secured by Mr. F. S. Daniels, gardener to F. PHILLIPS, Esq., for good deep blooms of the varieties Mrs. J. Dunn, Duchess of Sutherland, W. Duckham, Mrs. Vallis, F. S. Vallis, Lady Conyers, &c. Messrs. G. WILLIAMS & SONS were awarded the 2nd prize, and Mr. PITT the 3rd prize.

Incurved varieties.—A class was provided for six Incurved Chrysanthemums. Mr. PITT secured the 1st prize with examples of Lady Isabel, C. H. Curtis, Louisa Giles, Mrs. W. C. Egan, Hanwell Glory, C. N. S. Threlfall; 2nd, Mr. F. WOOD.

Vase Classes.—There was very close competition in the class for 18 Japanese blooms in six vases, and very little difference obtained between three exhibits. Mr. R. LONG was placed 1st, however, with handsome blooms of Mrs. Vallis, Bessie Godfrey, F. S. Vallis, Mrs. J. Lewis, &c.

Mr. F. W. FRANCES, Somerton, won in the class for three vases containing Japanese varieties; 2nd, Mr. W. G. PARKS, Clontarf; and Mr. R. FRY had the best six vases of single varieties.

FRUIT.

A class was provided for six dishes of Apples, the prizes being offered by Mr. Basham. Mr. DUFF took the lead in a strong competition with clean, large fruits; 2nd, Mr. POWELL. Mr. R. LONG had the best two dishes of Pears, and Mr. J. Green (gr. to F. L. DAVIES, Esq.), the best two bunches of Black Grapes in Black Alicante.

NON-COMPETITIVE EXHIBITS.

Mr. BASHAM, Fair Oak Nursery, staged a fine collection of Apples and Pears. Messrs. CASE & SON, Cardiff, showed wreaths, bouquets, &c. Miss A. M. HARDING, Newport, exhibited Carnations, Roses, Chrysanthemums, &c.

BARNSLEY CHRYSANTHEMUM.

NOVEMBER 15, 16.—The 20th exhibition of this society was held on these dates, when the exhibits seen were better than ever. The event is a great social one for Barnsley, and this year had for its president the Mayor of the town.

In the open classes the Incurved varieties were specially good. Vegetables were a splendid show, but fruits were hardly up to the standard.

W. H. BASS, Esq., Burton-on-Trent (gr. Mr. R. Nisbet), was the principal prize-winner in the classes for Japanese and Incurved varieties, other successful competitors being A. S. WILSON, Esq., Cottingham, near Hull (gr. Mr. H. Willcocks), and Countess of ROSS, Womersley Park, Yorkshire (gr. Mr. A. Brook).

EDINBURGH CHRYSANTHEMUM.

NOVEMBER 15, 16 and 17.—The annual exhibition of the above society held in the Waverley Market on these dates was quite equal to any of the fine displays previously held at Edinburgh. The number of entries in the cut bloom section was well up to the average of former years, and exceeded in the Decorative classes. The quality of the Japanese blooms seen has never been surpassed at these shows, and they were certainly superior to anything seen elsewhere this year. All the blooms were arranged in vases, and as many as 22 classes were provided, the prizes offered being exceptionally large. Plants were but a moderate show. Grapes of good quality were seen, but the exhibits of hardy fruit and vegetables were but mediocre in quality. As is usual, the management was of the best, although the show was the first held since the new secretary, Mr. A. D. Richardson, was appointed.

OPEN CLASSES.

Cut blooms.—The principal class for Japanese varieties, and in which the leading prize included a piece of plate value £20, offered by the City of Edinburgh Council, was for 15 vases of distinct varieties, three blooms in each vase. Six growers competed, and furnished a magnificent display. Mr. T. Lunt (gr. to Captain STIRLING, Keir, Dunblane) won easily with one of the finest sets of blooms seen this year. The varieties were: F. S. Vallis, Mrs. F. W. Vallis, Mrs. W. Knox, Mrs. G. Mileham, Mad. P. Radaelli, Reginald Vallis, Marquise V. Venosta, Jumbo, Miss O. Miller, Henry Stowe, Bessie Godfrey, Algernon Davis, Lady Conyers, J. H. Silsbury, and Mad. Cadbury. The blooms were judged by points, and of a possible 180 points this exhibit was awarded 140. Mr. D. NICCOLL, Rossie, Forgandenny, followed with 118 points. He had exceptionally fine blooms of J. H. Silsbury, Lady Conyers, Reginald Vallis, and F. S. Vallis. 3rd, Mr. JAMES MARTIN, Winchcombe, Glos.

Twenty-four Japanese blooms, distinct.—The Scottish Challenge Cup class for 24 blooms of Japanese varieties was an important one. Twelve exhibitors competed. Mr. A. Hutton (gr. to G. KEITH, Esq., Usan House, Montrose) was awarded the 1st prize, which included £10 in money. He showed excellent examples of the varieties Lady Conyers, J. H. Silsbury, Mrs. W. Knox, F. S. Vallis, Mad. Cadbury, Miss Olive Miller, &c. 2nd, Mr. J. STEWART, Dunkeld House, with a meritorious exhibit.

For the Queen Alexandra prize of £10 in the class for eight vases of Japanese blooms in not fewer than six varieties, four exhibitors competed. Mr. J. FRASER, Kilravock, Edinburgh, was awarded the prize for an average exhibit. The exhibit shown by Mr. A. STENHOUSE, Edinburgh, was placed 2nd.

Eighteen Japanese blooms, distinct.—This class was for six varieties, three blooms of each variety. Nine exhibits were seen, the best being those shown by Mr. R. WHANNELL, The Drum, Gilmerton. 2nd, Mr. J. ADAMS, St. Clement's, Forfar.

Six Japanese blooms of one variety.—This class elicited keen competition, which resulted in Mr. MARTIN winning among ten contestants with fine blooms of F. S. Vallis. One of these flowers was adjudged the premier bloom in the show. It measured 9 inches in width and as many in depth. Mr. LUNT was awarded the 2nd prize for the same variety.

Mr. LUNT had the best exhibit of 12 varieties in four vases, having large, well-coloured examples of popular varieties.

In a class for four varieties Mr. J. FRASER, Shandon, won the 1st prize easily, being followed by Mr. J. WALDIE, Dollarbeg.

Incurved varieties.—These flowers are never of great excellence at Edinburgh. Mr. MARTIN won with examples of moderate quality in the two classes provided for Incurved varieties.

Single varieties.—These charming flowers formed a fine display, as they are always given much prominence in this exhibition. In the class for three vases of distinct varieties nine competed, Mr. A. KNIGHT, Brayton Castle, Carlisle, having the premier exhibit, staging good quality blooms of Edith Pagram, its bronze sport, and Miss Annie Holden. 2nd, Mr. J. HAY.

A class was also included in the schedule for four vases of partially disbudded single varieties, three sprays of each variety to a vase. Competition was exceptionally keen, with the result that Mr. J. HAY's exhibit was adjudged the best, Mr. W. ARMSTRONG, Musselburgh, being awarded the 2nd prize.

In a class for three varieties of single Chrysanthemums in which quality and decorative effect were to be the first considerations, there was a commendable display. Mr. GALLOWAY, Gosford, won the 1st prize amongst 13 competitors.

No fewer than 17 exhibits were seen in the class for one vase of a single variety, disbudded, and arranged for effect, with any foliage. Mr. D. KIDD, Carberry Towers, won the premier prize, with medium-sized blooms of J. H. Silsbury, intermixed with leaves of Prunus Pissardii, Oaks, and trails of Ampelopsis; 2nd, Mr. A. KNIGHT.

AMATEUR CLASSES.

Amateurs staged cut blooms numerously and well. Dr. MAXWELL DAWSON, Buckhaven, won in the class for four vases of large Japanese varieties with creditable specimens of well-known sorts.

Plants were of fair quality, but they were mainly much too large, stiffly trained, and were lacking in foliage. Mr. W. MICHIE, Boroughfield, Edinburgh, was placed 1st for plants. Mr. W. PULMAN had the best specimens of four Japanese varieties, among which Mrs. Greenfield, Swanley Giant, and Nellie Pockett were fairly well represented. Mr. J. FRASER won in the class for Japanese varieties grown in 6-inch pots. He showed very large plants that were carrying from 10 to 16 blooms each. Mr. MICHIE won a like position for Pompon varieties, with extremely well-flowered plants.

Epergnes and bouquets of Chrysanthemums were numerous and good.

HONORARY EXHIBITS.

A Gold Medal was awarded to Messrs. SUTTON & SONS, Reading, for 106 dishes of high quality Potatos. A Silver-gilt Medal was awarded to Messrs. DOBBIE & Co., Rothesay, for a collection of Turnips and Potatos. Silver Medals were awarded Messrs. W. THOMSON & SONS, Cloverfords, for Grapes; Messrs. W. WELLS & Co., Merstham, Surrey, for Chrysanthemums; Messrs. JAMES DICKSON & SONS, Edinburgh, for a collection of Apples.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

NOVEMBER 15, 16, 17.—In the worst possible weather, the above society held its annual Chrysanthemum show in the Botanical Garden on these dates. There was a magnificent display of plants and blooms, not a small feature being a collection of two thousand plants in pots grown in the Botanical Gardens. Mr. JAMES BROWN showed the best nine large-flowered Chrysanthemum plants in pots, and he also won the 1st prize for a group of Chrysanthemums arranged with suitable foliage plants. Mr. GOSSAGE had the best Incurved blooms in the two important classes for these flowers, and he was 2nd to Mr. F. S. VALLIS in the class for 36 Japanese blooms, but he was again 1st for 36 miscellaneous blooms of Chrysanthemums. Mr. VALLIS had the best 18 Japanese blooms in not fewer than nine varieties, and the best 12 Japanese blooms of distinct varieties. In the class for 18 blooms, to include 24 Japanese and 24 Incurved varieties, Mr. C. MAYER won.

BRADFORD CHRYSANTHEMUM.

NOVEMBER 16, 17.—This society's exhibition was held on these dates in the St. George's Hall. The exhibition, which was the twentieth of the series, made a brilliant spectacle. The entries were slightly more numerous than last year.

In the premier class for 24 Japanese blooms, Mr. A. Chandler (gr. to Mr. ARTHUR JAMES, Rugby) was awarded the first prize. A Silver Challenge Cup used to accompany this award, but two years ago Mr. Chandler won this outright, and last year he took 2nd place after Mr. W. Iggulden, of Frome. Mr. Chandler's varieties included F. S. Vallis, W. Jinks, Bessie Godfrey, Valerie Greenham, Mrs. E. Crossley, Henry Stowe, and Algernon Davis. The finest specimen plant in the exhibition was an example of F. S. Vallis, shown by Mr. L. SHEARMAN, of Undercliffe Cemetery. The Incurved varieties were not so strongly represented as the Japanese, but they were of exceptional quality.

One of the features of the show was the collection of single Chrysanthemums in vases. Mr. J. Howland (gr. to Mr. T. ARTON, Rawdon) carried off premier honours in the class for bouquets, and the most tasteful basket of Chrysanthemums was adjudged to be that of Mr. E. Mudgley (gr. to Mr. R. L. FOSTER, Queensbury). Mr. S. Nutter (gr. to Mr. W. BARRON, Bingley) obtained the 1st prize in the class for groups, and Mr. JOHN BROOKE, Bradford, was the winner in the class for baskets of autumn foliage. Only two exhibitors were seen in the group class. Mr. LEONARD SHEARMAN (Chrysanthemums) and Mr. R. EICHEL, of Bingley (miscellaneous plants), and their compositions were regarded as worthy of the 1st prizes in their respective classes.

BLACKBURN CHRYSANTHEMUM.

NOVEMBER 16, 17.—The 11th annual show of Chrysanthemums, Orchids, fruits, &c., promoted by the above society, was held in the Town Hall on these dates, and whilst there was a slight decrease in certain sections, on the whole the success gained in previous years was well maintained.

In the class open to growers within a radius of 18 miles around Blackburn for a group of Chrysanthemum plants, a silver challenge cup

was presented by Mr. J. Wilcock, J.P., Wilmar Lodge, Blackburn. This was won by Captain FIELDEN, Witton Park (gr. H. Boyd); 2nd, A. SHUTT, Mieus Road, Blackburn (gr. F. Watts); 3rd, T. MITCHELL-ECCLES, J.P., Quarry Bank, Blackburn (gr. John Pimlott).

In the cut bloom classes, that for 24 Japanese blooms in not fewer than 18 varieties, the 1st prize for which included the silver challenge cup presented by Mr. J. Rutherford, M.P., Blackburn, Mr. J. WILCOCK, J.P., Wilmar Lodge, Blackburn (gr. H. Bradburn), won.

Mr. J. WILCOCK, Wilmar Lodge, Blackburn, won in the class for 24 Chrysanthemum blooms, 12 Japanese and 12 Incurved (distinct varieties), for the silver challenge cup presented by Mr. Henry Lewis, Blackburn, for six Japanese blooms of a white variety, for six Japanese blooms of a yellow variety, and for six Japanese blooms of any other colour than white or yellow. Six Chrysanthemum blooms (Incurved): 1st, Mrs. JOHN TAYLOR. The best Japanese bloom in the show was F. S. Vallis, and the best Incurved bloom in the show was Mad. Fariet, both of which were shown by Mr. J. WILCOCK.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 19.—A meeting of the Executive Committee was held at Carr's Restaurant, Strand, on the above date, when Mr. T. Bevan presided.

After the minutes were disposed of the Chairman referred to the loss the society had sustained by the death of its treasurer, Mr. A. Taylor. A vote of condolence with the widow and family was passed unanimously. Pending the appointment of a new treasurer, it was resolved that the chairman be empowered to sign all cheques, the office not to be filled up until the next annual meeting.

Mr. Hawes and Mr. Moorman were appointed stewards to act at the forthcoming December show. It was resolved that the usual Floral Committee dinner take place at the end of the season. Ten ordinary members and one fellow were elected.

A meeting of the Floral Committee of this society was held on November 19, when the following varieties received First Class Certificates:—

Mrs. Thomas Fox (Single).—A very fine shade of yellow.

Mrs. Sidney Fox (Japanese) (see p. 360).—These two varieties were shown by Mrs. FAIRWEATHER, Bifrons, Canterbury.

Miss E. Partridge (Single).—Pink with a prominent yellow disc.

Merstham White (Single) (see p. 360).

Galatea (Single).—Pink with a white zone around the yellow disc.

Edith Harding (Single) (see p. 359).

Annie Hamilton (Japanese).—A large white flower with long narrow florets.

Mdlle. G. Ricol (Japanese) (see p. 360).—The last six varieties were from Messrs. W. WELLS & Co., Merstham, Surrey.

Distinction (Japanese).—A large incurving flower of a bronzy buff shade. Shown by Mr. H. J. JONES, Lewisham.

Crown of Gold (Single).—A deep bronze or old gold shaded flower, the florets of good substance. Shown by Mr. INGRAM, Weybridge.

Kathie (Single).—Bright reddish crimson. Shown by Messrs. J. PEED & Son, West Norwood.

H. Hann (Incurved) (see p. 360). Shown by Mr. SEWARD, Hanwell.

Obituary.

GREENWOOD PIM, ESQ., M.A., F.L.S., who passed away at his residence, Easton Lodge, Monkstown, co. Dublin, on November 14, was regarded as the best living authority in Ireland on fungi. The deceased gentleman, born at Monkstown in 1851, went through his collegiate course in Trinity College, Dublin, with distinction, graduating as gold medallist in natural science, and for many years was actively connected with scientific circles in Dublin; notably, as a member of the council of the Royal Irish Academy, the science section of the council of the Royal Dublin Society, and he was also on the council of the Royal Horticultural Society of Ireland. As a cultivator Mr. Pim's favourite flowers were Irises and Water Lilies, and a novel feature was to be found in his garden by the introduction of climbing and rambling Roses to the support afforded by Thorns and other trees. Mr. Pim was, probably, best known as a very successful amateur photographer and manipulator of lantern slides, his camera being chiefly devoted to plants. Mr. Pim was an occasional correspondent of this journal.

A. TAYLOR.—The respected treasurer of the National Chrysanthemum Society died suddenly on the 12th inst., after hurrying to catch a railway train. Mr. Taylor was an amateur cultivator and exhibitor of Chrysanthemums.

R. G. FLETCHER.—We regret also to learn of the death, on the 19th inst., of Mr. R. G. Fletcher, a well-known Orchidist at Mount Harry, Brighton.

ENQUIRIES AND REPLIES.

KEEPING FLOWER BEDS FREE FROM TREE ROOTS.—Has any reader had experience with creosote retuse for preventing tree roots from entering into flower beds near large trees? [What about the flower roots?] *W. H. C.*

ENQUIRY.—Will any reader be so good as to give full particulars as to Pineapple cultivation in the Azores; *i.e.*, the method of cultivation, temperature, varieties, number exported during the season, and the average prices realised. *Pineapple.*

ANSWERS TO CORRESPONDENTS.

ADDRESS: *J. McC.* We have no means of knowing the address of the lecturer. Write to the Secretary, Cheshire County Technical Education Committee, Chester.

APPLE TREES AND THE POLLINATION OF THE FLOWERS: *F. L.* Mixed planting is of the utmost importance. No one variety should be planted in extensive blocks. Bees would hardly answer the same purpose as mixing the varieties of trees, but we would recommend you to have the bees in addition to mixing your varieties. Mr. George Woodward, of the Barham Court Estate Gardens, Maidstone, has planted several varieties even in the same row, and the results have been most satisfactory. About one hundred of his trees represent the varieties. Cox's Orange Pippin, Stone's, Warner's King, Tower of Glams, Ecklinville Seedling, Lane's Prince Albert, and Golden Spire. You should plant about 20 trees of four varieties, selected from those already mentioned, and distribute them over the whole area to be planted.

CABBAGE LEAF-SPOT: *J. D. C.* This is caused by a fungus, Phyllosticta brassicæ, but it is not a serious disease. See Cooke's *Fungoid Pests*, p. 79.

CUSTARD APPLES: *J. S.* These are the fruits of a subtropical tree, Anona Cherimolia, found in the region of Ecuador and parts of Peru. The best varieties are almost seedless and are grafted on two year stocks raised from seeds. Oranges should be grafted in the early spring. See note on the Culture of Oranges at Sawbridgeworth in our issue for March 24, 1906, p. 187.

DRESSING FOR VINES: *J. F.* Take one part coal tar, nine parts clay, and two parts flowers of sulphur. Dry the clay and powder it so that it may be passed through a fine sieve. Mix these together adding sufficient boiling water to make it of the consistency of paint. Apply it to the vine rods by means of a partially worn-out paint-brush, stirring the mixture occasionally during the process of application. Your trouble being caused chiefly by mealy bug, you may elect to follow Mr. Newstead's recommendation and dress the rods with kerosene emulsion which he has stated in his book upon scale insects to be much more effective against this bug than any clay mixture.

ELECTRICITY IN PLANT CULTURE: *William Pettie.*—We can add nothing to what has already been published. See an article on the subject by Mr. B. H. Thwaite, in our issue for September 8, 1906, p. 180.

GABOON WOOD FOR PICTURE FRAMING: *C. P.* The wood is almost certainly that of a species of Diospyros, perhaps D. Dendo, but in the absence of leaves and flowers it is impossible to satisfactorily determine the species.

MAHONIA FRUITS: *S. A.* We do not think these can be poisonous.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *A. H.* 1, Well's Sweet; 2, Hollandbury.—*James Weaver.* [Please send us your address.] A poor specimen of Cox's Orange Pippin, a fairly good bearer in most seasons. Considering your several questions, we think Blenheim Pippin is the best variety.—*J. C. Wheeler.* Welford Park Nonsuch.—*E. P.* 1, Lady Henniker; 2, Queen Caroline; 3, Hanwell Souring; 4, King of the Pippins.—*Nocl.* 1, Newton Wonder; 2, Baumann's Red Winter Reinette; 3, Cellini; 4, Stirling Castle; 5, Gilliflower, not Cornish Gilliflower.—*Russet, Chichester.* 1, Cheshunt Pippin; 2, Lamb Abbey Pearmain; 3, Melon; 4, Old Nonsuch; 5, Winter Queening; 6, Waltham Abbey Seedling.—*Pinehurst.* 1, Nine Square Pippin; 2, not recognised, a local variety; 3, White Whorle.—*F. L.* 1, Is rightly named Derbyshire Crab. It was exhibited at the Apple Congress in 1884, and was then considered worthless. This would account for it not being found in any nurseryman's catalogue of fruits; 2, Newtown Pippin; 3, Lodgemore Nonpareil; 4, White Nonpareil.—*Ponica.* 1, Wadhurst Pippin; 2, Powell's Nonpareil; 3, Lord Derby; 4, French Crab; 5, Marie Louise; 7, British Queen. A "pot" is two bushels.—*F. S.* Winter Hawthornden.—*T. S.* Hambledon Deux Ans.

NAMES OF PLANTS: *W. G. S.* Eulophia pulchra.—*F. S.* Phlomis fruticosa.—*P. D. W.* Clematis brachiata. *J. S. C.* Pernettya mucronata—the white-fruited form.—*W. H. S.* 1, Canarina Campanula, a native of the Canary Isles; 2, Similax; 3, Muehlenbeckia complexa; 4, Gesnera tubiflora; 5, Asparagus plumosus.—*W. L.* Cypripedium Charlesworthii. We have seen a similar variety with enlarged and coloured lower sepals.—*C. E. A.* All ordinary varieties of Odontoglossum crispum as at present shown. The spotted one may develop better features.—*J. M. C. B.* Cymbidium ensifolium and Lycopodium dichotomum.

PSEUDOTSUGA DOUGLASII: *J. Stewart.* March is the best time to sow seeds of the Douglas Fir. They may be sown in drills, or broadcast on beds slightly raised in the open air and covered with fine soil. No protection is necessary unless the position selected is very cold and draughty, in which case a board, rising 4 inches to 6 inches above the ground level, may be placed round the bed.

TENANCY: *J. A.* Your better plan will be to consult a solicitor. See articles on the subject in our issue for October 27, and the two following numbers.

TOMATO ROOTS: *B. T. A.* The nodules on the roots are caused by eelworms. Clear out the old soil in which the plants have been grown, and sterilise it by baking, or convey it to a distant part of the garden and bury it. Thoroughly cleanse the house in which they have been grown, with carbolic acid in warm water, and spray the soil with a rose-red solution of permanganate of potash (Condy's fluid). Dress the land intended for pasture with bone manure or some other phosphatic fertiliser.

COMMUNICATIONS RECEIVED.—H. J. E.—Mrs. F. C. C.—W. J. T.—H. E. S., Guernsey, with thanks—T. C.—F. M.—Dr. K., Berlin—F. R. B.—L. A.—G. M.—C. E. P.—H. M. W.—J. R. T.—A. D.—C. H.—J. B. D.—R. C.—H. R.—C. THE AURICULA IN WINTER.

AT certain seasons of the year even enthusiastic amateurs become to a limited extent rather careless of their favourite plants, and I fear this applies as much to the Auricula as to any other plant. Autumn, about the time of the fall of the leaf, when

"Boughs are daily rifted by the gusty thieves,
And the book of nature getteth short of leaves,"

is also the time of the year when there is fear of the Auricula being forgotten. The choice Alpine varieties in the open border become covered with drifted wet leaves, at a time when the plants themselves are rapidly losing their outer leaves. The drifted leaves are the best shelter for enemies of the plants, such as slugs and the leather-coated grubs, for they can feast on the succulent young leaves of the plants unperceived. Amateurs who value their Auriculas should see to it that not only are the leaves that have drifted round the plants removed, but all dead and decaying Auricula leaves also, and these should be carefully detached at their base, for if portions of decayed leaves are left they may cause decay. Some persons, amongst them gardeners of much experience, advise leaving such leaves as have fallen from trees and accumulated around plants, as they protect the plants from frost. My own experience is that it is a haphazard and uncertain kind of protection for most garden plants, and cannot be tolerated by Auriculas.

Auriculas of the Alpine section are being more extensively cultivated as garden plants, and they are exceedingly interesting and have a charming effect if planted in groups in the front row of a border of herbaceous plants or in a well-placed part of the rock garden. Three or even as many as a dozen plants of one variety may be made to form a group, and they will be capable of increasing in size and profusion of bloom year by year if a slight surface dressing of a compost of equal parts decayed manure and loam is placed around them in March each season. They do not thrive so well in light sandy soil, preferring rather an unctuous loam having some holding capacity; in the case of light shallow soils it is better to dig out a few spadefuls and replace this with a compost of decayed, turfy, yellow loam, to which may be added a fourth part of decayed manure. This can be obtained easily in most gardens, as there is, or ought to be, a constant supply of it in every potting shed. A little sand and leaf-mould may be added if the loam is very clayey or "heavy," as such is apt to tear open in cracks during dry summer weather, damaging the roots of the plants and otherwise injuring them. I am sure no amateur will think these minor details superfluous, and I am always in a mood to impress upon young gardeners the great importance of minor details in the cultivation of plants. Every successful cultivator will bear me out in the assertion that no success worth the name was ever obtained except by careful attention to all these minute details. There must also be a love for the work, and on this point I may have the Editor's permission to quote from Ruskin: "When you are fairly at work, what is the motive that tells upon every touch of it? If being a landscape painter, it is love of trees and hills that moves you; if, being a figure painter, it is love of human beauty and human soul that moves you; if, being a flower or animal painter, it is love and wonder and delight in petal and in limb that moves you, then the spirit is upon you, and the earth is yours and the fulness thereof. But it, on the other hand, it is petty self-complacency in your own skill, trust in precepts and laws, hope for academical or popular approbation, or avarice of wealth it is quite possible that by steady industry, or even by fortunate chance, you may win the applause, the position, the fortune you desire; but one touch of true art you will never lay on canvas or on stone as long as you live."

Let young gardeners ponder these words. They must have a love for their work; and in truth I do not know any work that appeals to the affections so much as does gardening and the culture of lovely flowers.

Besides the Auriculas which are cultivated in the open garden there are those in pots and frames requiring attention; these appeal in the greater measure to the fancier. He cannot trust his choicest favourites to the storms of winter. They are protected in glass frames during that inclement season, but even so they demand careful attention. The outer leaves decay quite as freely on the plants under glass as on those in the open border. The rain has been falling freely lately, the ground is sodden all round the frames, and no ray of sunshine has been visible for some time. Under conditions such as these there is much danger of the plants decaying at the neck or in the centre, and if decay once sets in there is little chance of saving the plant, and none of its ever forming a good specimen.

During the autumn trusses of bloom are thrown up, and an inexperienced cultivator may break off the succulent stem in order that the autumn bloom may not exhaust the plant and prevent it from developing a good truss of bloom next year. Probably the part of the stem left may immediately decay, and in this state it cannot be removed at the base, and may rot down and so destroy the plant. The flower-buds only should be removed, and in this state the stem will remain green until it gradually dries up and can readily be pulled out. Plenty of ventilation is needed during late autumn and winter, as the plants are in their resting period; the lights may be drawn off whenever the weather is favourable, and as the outer leaves decay they should be removed. It is recommended that the frames containing the plants be placed in a light and moderately exposed position. The plants require very little water at this season, but it is a grave error to allow the soil to become dusty dry. I am often asked—"How often should the plants be watered? To such a question as this it is impossible to give a direct reply. At present the plants may need water once in a week or once in 10 or 12 days. I can only advise that the soil should be kept well on the dry side, and when watering is necessary that it should be done early in the day.

The culture of the Auricula was perhaps better understood amongst amateurs 50 years ago than it is now, except that the growers at that day recommended the use of an over-rich compost, which gave a richness of colour to the foliage for the time, but which caused the old plants to die afterwards, although they would certainly be replaced by off-sets. We have also a very much better selection of varieties now than was possible then. There are some who fancy that the old varieties of 50 years ago were of superior merit; but from the point of view of the old florists, and their standard of excellence, which is still retained in the Royal Horticultural Society's "Rules for Judging," the modern flowers excel on all points. There is an excellent paper in *The Floricultural Cabinet*, October, 1855, headed "Remarks on the Auricula bloom of 1855." The varieties are very numerous, and as they were the best in existence at the time they would be esteemed accordingly. There are 15 green-edged varieties described, most of them severely criticised. Leigh's Colonel Taylor was stated to be the best. I still grow it, but it is never good enough to exhibit as a green edge: the pips are angular and the paste thin. Page's Champion and Booth's Freedom were also stated to be very fine. I have grown both, but they have now disappeared from my collection. There were 14 grey-edged varieties, but Lancashire Hero and Ringleader are the only two that are now in cultivation. They are both good when in their best dress.

George Lightbody was in cultivation at the time, but the writer did not mention it. When well grown it is still the best grey-edged Auricula. In white-edged varieties 13 were described, and I still cultivate two of them, True Briton and Favourite (Taylor's), but they do not find a place in the best collections.

Of "selfs" there were 15 varieties, but they have all been dropped except Othello. In Alpines it was stated that there had been no improvement for many years: Conspicua, Fair Rosamond, and Victoria are all the writer could name, and they do not admit of comparison with modern varieties.

Of the true green-edged varieties, the best six now in cultivation are: Abbe Liszt, Abraham Barker, Dr. Hardy, Mrs. Henwood, Rev. F. D. Horner, and Shirley Hibberd.

Grey edges.—George Rudd, George Lightbody, Lancashire Hero, Marmion, Mabel and Richard Headley.

White edges.—Acme, Conservative, Mrs. Dodwell, Heather Bell, Rachel, and Wild Swan.

Selfs.—Black Bess, Gerald, Favourite, Mrs. Potts, Heroine, and Ruby.

Alpine Auriculas.—Dean Hole, Duke of York, Firefly, Ganymede, General Buller, J. F. Kew, Melanie, Mrs. Harry Turner, Mrs. Martin Smith, Rosy Morn, The Bride, Teviot Dale, Thetis, Uranie, and Ziska.

There are many others which have been exhibited and obtained Awards of Merit and First-Class Certificates from various societies National and Royal. Some of them may be superior to those I have named, and some probably are of uncertain merit, and will not maintain their first promise. It is of little use giving the names of varieties of Auriculas until they can be obtained through the usual trade channels. *J. Douglas.*

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM INSIGNE SANDERÆ AT WILDERSPOOL

OUR correspondent, Mr. de Barri Crawshay, in his descriptive note on p. 317, respecting Mr. William Bolton's Orchids at Wilderspool, near Warrington, referred to Cypripedium insigne Sanderæ as being in extraordinary vigour, and said that the plants grew like Tradescantia under a damp stage. He also said the house containing 500 of these plants must be an extraordinary sight when in flower. At fig. 141 we reproduce a photograph of the plants taken since Mr. Crawshay's note was penned, from which it will be clearly seen that his prediction has been fully justified.

ODONTOGLOSSUM LONDESBOROUGHIANUM

FLOWERS of this very distinct species are sent by Mr. H. Haddon, gr. to J. J. Neale, Esq., Lanwood, Penarth. O. Londesboroughianum was first imported from Mexico, and flowered with Lord Londesborough in 1876. In habit and in the bright yellow of its flowers it more nearly resembles an Oncidium than an Odontoglossum, in which genus O. Cervantesii is the nearest. It has creeping rhizomes, with pseudo-bulbs at intervals of 2 to 3 inches. The scapes are ascending, and often over 2 feet in length, the upper third bearing showy flowers, the nearly equal sepals and petals being yellow, closely lined with bars of chocolate-brown colour. The lip has a broad reniform blade of a bright yellow tint, the base having a few reddish spots.

Few plants have troubled gardeners to grow successfully more than this, and the cultural note which Mr. Haddon sends may be useful to some. He writes: "The plant of Odontoglossum Londesboroughianum has a spike of 18 flowers. It has been growing in a basket hanging from the roof of the cool, intermediate house quite close to a ventilator, which has been open night and day during summer. I also left a pane of glass on each side of the ridge above it almost unshaded, the middles of the panes being but slightly dulled. I gave the plant plenty of water during its season of growth, and syringed it in the morning and afternoon of bright days. Last autumn I watered it freely until the leaves turned yellow and dropped off, after which it had a long rest, without any water whatever, and the pseudo-bulbs kept quite plump until growth began again and water was given." This note gives the two points, the neglect of the observance of which generally result in failure, viz., the keeping of the plant in a well-ventilated situation, and the withholding of water after the leaves turn yellow and drop off, which is a sure indication that active growth is completed and a dry rest required.

CATTLEYA LABIATA, PELORIATE.

A THREE-FLOWERED inflorescence of a very effective abnormal form of Cattleya labiata is sent me by Mr. Richard Nisbet, Byrkley Gardens, Burton-on-Trent. The flowers were of the usual colour, but the upper sepals are petaloid, wavy at the edge, broad and slightly stalked. The petals are scarcely wider than the sepals, and there are three lips, the middle one being normal and the two lateral ones made up of the sepals with half a labellum added to each, the upper side being expanded and crimped, as is the normal labellum, and with a similar yellow base, and the lower half formed like the true sepal. The column, which is in the middle, is of the usual form and not straightened as is frequently the case in abnormal flowers of this class.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDEES.

WITH an apology for its lateness the August issue of this useful work came to hand, descriptions and coloured illustrations of the following plants being given:—

Cattleya lueddemanniana.—An interesting hybrid raised by M. Peeters, of Brussels, between C. Bowringiana and C. Schilleriana, the latter species, as in all cases where it has been used, showing strongly in the form of the flowers, which are dark reddish-purple, with a yellow disc to the lip.

Cypripedium Mme. Blanche (bellatulum × barbatum) Peeters. The flowers are white, with a yellow tint in the middle of the dorsal sepal, petals and lip. The dorsal sepal is tinged and striped with purple, the petals being spotted with the same colour.

Cypripedium Phœbe (spicerianum × bellatulum). The flowers are white, tinged with green, the dorsal sepals and petals bearing dotted purple lines, the lip being tinged with purple. Both these Cypripediums were illustrated from M. Peeters' specimens.

Cymbidium insigne Sanderi.—The pretty species introduced from Annam, and illustrated in the *Gardeners' Chronicle* (February 25, 1905, page 115). Flowers white, tinged and striped with rose colour.

Dendrobium cupidatum.—The pretty old species, with rose-tinted flowers, the greater part of the lip being yellow, and which first flowered in the Westonbirt collection in 1850.

Dendrobium Ainsworthii.—Habit of D. macrophyllum. The flowers are white, with a tinge of yellow on the sepals and lip, which has purple markings in the centre. An illustration and description were given in the *Gardeners' Chronicle* for February 9, 1901, page 86. The plant now figured bloomed with Baron von Furstenberg.

Epidendrum glumibracteatum.—Allied to E. clavatum, *Bot. Reg.*, t. 1870. The flower-stalk and ovary are 2 inches in length, bracts half as long, sepals and petals green, lip white. Flowered by Baron von Furstenburg, and identified at Kew.

Eulophia Guineensis var. purpurata.—A pretty variety from the Congo, with rose-tinted flowers.

Lælia majalis.—The well-known rose-coloured Mexican species. Flowered with M. Van de Putte, Melrelbeke-Gand.

Listrostachys pelucida.—The West African species usually called Angræcum pellucidum in gardens. The flowers are produced in pendent racemes. They are nearly white at first, and changing to the tawny hue shown in the illustration. Flowered by Baron von Furstenburg.

Odontoglossum Insleayi.—Introduced by the late Mr. Barker, of Birmingham, in 1838, through Ross, who collected for him in Mexico, and since that time it has been a very familiar species in gardens.

Odontoglossum Lambeauianum ×.—The fine hybrid raised by M. A. A. Peeters between O. crispum var. and O. Rolfeæ ardentissimum, two varieties of which were illustrated in the *Gardeners' Chronicle* in 1905 (November 4, page 324, and December 23, page 434, var. exquisitum). It is one of the best hybrid Odontoglossums. The flowers are white, tinged with purple, and heavily blotched with dark purplish-red.

Oncidium suave.—A very old Mexican species, with brown sepals and petals tipped with yellow, and yellow lip with reddish crest.

The Chronique Orchidéenne, which accompanies the illustrations, publishes a report of the Orchid meeting in the Brussels Botanic Gardens on July 15, including the Odontoglossum caligiosum, shown at the Royal Horticultural Society on July 17 last, and reported in the *Gardeners' Chronicle* (July 21, page 56), the parentage being recorded as O. Weltoni × O. Pescatorei. Oncidium Weltoni is an obsolete synonym of Miltonia Warscewiczii, and when the plant was shown at the Royal Horticultural Society the exhibitor suggested the parentage Miltonia Warscewiczii × Odontoglossum Pescatorei. But the test of the R.H.S. paintings was applied, and it was found to be almost identical with a variety of Odontoglossum Vuylstekei. The exhibitor then entered the plant as O. caligiosum (cristatum × Pescatorei).

Oncidium Carthagmense album was also shown at the Royal Horticultural Society, but the honorary secretary pronounced it to have no affinity with O. carthaginense, but was in fact O. stramineum Lindl. (*Bot. Reg.*, 1840, t. 11; *Bot. Mag.*, t. 6254), which was one of the first Orchids collected by Hartweg for the Royal Horticultural Society in Mexico in 1837. It is a pretty species, which would probably be more successfully grown in gardens if cultivated in a cool house. *J. O'B.*

POLYGALA MYRTIFOLIA VAR. GRANDIFLORA.

THERE was published in the *Die Garten Welt* for September 29 a note on the genus Polygala from the pen of Mr. H. Riebe, of the Royal Gardens, Kew, together with an illustration of a plant of the above species, grown as a standard at Kew. The species is a native of South Africa, and is one of the most beautiful of the genus, the plant reaching a height of 4 to 6 feet. The plant reached Kew under the name of P. grandiflora, and it is cultivated there as a half standard, in which form its good appearance is increased. The plant flowers in the months of April and May. The flowers are of a bright violet tint, darker as regards the keel, and these appear in short clusters at the extremities of the shoots, although in consequence of the simultaneous growth of the new shoots they do not appear so to do. Leaves light green in colour, with very short stalks, and longish, oval. *E. M.*

THE ROSARY.

BUD GRAFTING INSTEAD OF BUDDING OF ROSES.

WHEN one considers that the sap does not rise in the bark or rind of the stem, as has been erroneously supposed, but in the wood just beneath it, and that in bud-grafting the eye or bud comes into direct contact with the wood, it is readily understood why bud-grafting is so successful in most instances; the losses do not amount to more than 5 per cent. The operation is more quickly carried out than budding; the bud runs no risk of injury as by pushing it into place in budding. In the case of failures, there are no ugly scars and every stem can be grafted, whether the bark will "run" or not. The operation consists in making a slanting incision in the stem or branch, and then with a second cut removing the rind and a very little of the wood. In this cut the bud is placed, after cutting to fit it exactly. That done, another cut can be made on the opposite side of the stem, and a second bud inserted at the same height. Both buds are now bound in with bast or worsted, beginning at the bottom, the short end laid on the stem or shoot, and the longer end used to encircle the buds, binding fairly tightly immediately below and above the bud. The buds being now bound in, the short end and the longer remaining end of the bast can be tied in a knot. This kind of Rose grafting is making its way, and taking the place of budding in many parts of the continent, even among old Rose cultivators. *F. M.*

AN ITALIAN GARDENER'S MODE OF STRIKING CUTTINGS OF ROSES.

A USEFUL note on the above subject is supplied by Herrn Karl Mader, director of the Agricultural School at St. Michele, in the Tyrol. In the course of a student's journey to Piedmont the gardens of Carboni Giovanni that are situated in the vicinity of Alba were visited. The gardener at this establishment directed the attention of his visitors to his method of propagating Roses that are not readily rooted by any other means. In the month of July, tin funnel-shaped cases of small size are slipped over selected shoots, after first ringing the rind at the point from which roots are desired, the cases being then filled with soil mixed with moss, which mixture is kept in a moist state. The method in principle is the same as that which gardeners adopt with Dracænas, Crotons, &c. A callus soon forms and roots follow, the cutting being ready to plant out or place in a pot in the month of September. *Oesterreichische Gart a Zeitung.*

CULTURAL NOTES FOR DECEMBER.

ALL arrears of planting should now be brought to a close, providing the ground is in a fit state. In town and suburban gardens, where smoke and fogs prevail, the planting can be left until March, which will be just before vegetation becomes active again. Standard Briars recently planted should be carefully examined, and if any are loose in the soil the soil should be well trodden about their roots. All standard Briars should, if possible, be planted before Christmas, and the surface of the ground about them be well mulched, for if they are planted before the New Year commences fewer are lost than when planted in the spring. The Manetti, Seedling Briar, and Multiflora stocks can, if other work is pressing, be "heeled in" carefully and be planted during the spring, as, having many fibrous roots, there is not much risk of their failure. All classes of Roses may still be planted with the exception of the tender kinds of Noisettes, Teas, hybrid Teas, and Chinas; but in planting all Roses the nature of the soil and the climate of the district must be taken into account. Established ground plants, with much crowded head growths, should have a portion of the current year's wood well thinned out to the old wood. This admits light and air to the tree without impairing its vitality. This rule will apply to most of the hardy climbers, including hardy perennials, hardy Chinas, and ramblers. The remainder of the established pot Roses outside that have finished flowering can now be brought under glass and be kept under cool conditions and rather dry at their roots for another month, but soon after Christmas they should be re-potted. The plants that were potted in October will now be best placed under cover, either in a cold frame or in a light, well-ventilated house. A portion of the batch can now be pruned, the stronger growing varieties to about a third, and the weaker to about half of the current year's growth. Always prune to an outward pointing, but to keep the middle of the plant as open as is possible and to prevent a crowded central growth of shoots. It is not too late, providing the wood is well ripened and the buds are dormant, to plant some more cuttings outside in the same manner as advised for October, choosing moderately strong growths from about 8 inches in length. Although rather late in the season, 35 to 40 per cent. of the cuttings of the hardier kinds can be depended upon to root. Cuttings of the Manetti, de la Grifferaie, and Briar stocks can still be planted, with a fair measure of success in rooting, especially if the weather remains mild. All materials for protection, such as straw and dried fern, should be in readiness, so that if sharp weather prevails, they will be ready for protecting the "head" of the tree which may be done by affording a loose covering of the material and by placing some over the soil about the roots. Plants on walls can be protected by a mat or two nailed to the wall; especially should this protection be afforded to tender varieties. *J. Z. G.*

(For text see page 366.)

NOTICES OF BOOKS.

TEXT-BOOK OF FUNGI. By George Massee. (Duckworth & Co.)

The portly text-book of Botany which served past generations of students, is now rapidly giving place to a series of smaller works each devoted to some special branch. The "Text-Book of Fungi" will fill a gap in the series, and is therefore welcome. The translation of De Bary's "Anatomy and Biology of the Fungi" has hitherto been the principal work in English, but it has never been a popular book for earlier studies. This new "Text-Book" is in part a re-statement of old facts, but the author has woven into it the results of his own active labours as an investigator, as well as all the prominent discoveries of recent years by other workers. It was no light task to select the best out of the enormous literature dealing with the fungi, but Mr. Massee has succeeded in producing a book of a size and price (6s.) within reach of all, and which, at the same time, gives a clear, concise, and orderly account of all the aspects of fungus-life. The "Text-Book" is divided into three sections, the first dealing with form, structure, and life-history, the second with pathology, and the third with the classification of the fungi. The book is not intended to include a complete description and the method of identifying all species of fungi native to Britain; for that branch Mr. Massee has already written a most useful "British Fungus Flora." Nor do plant-diseases and their cure fall within the scope of this book, although it contains a considerable amount of general information on this topic. Confusion may be avoided by pointing out that the "Text-Book of Fungi" is distinct from the "Text-Book of Plant-Diseases" published by Mr. Massee in 1899, the two books are companion volumes issued by the same publisher.

The introduction reveals the fact that the author is disturbed by certain "cytologists" who have recently invaded the domain of fungi in a somewhat noisy manner. Mr. Massee has been led to defend the labours of the systematist, but this is surely unnecessary, for the first essential in the study of plants is to have careful descriptions of their characters, and as much information as possible regarding their habitat; the number of new fungi which are still being discovered in Britain is a sure sign that good systematists are essential.

The morphology, physiology, and biology of the fungi are dealt with in chapters relating to the cell, anatomy, &c., a method which greatly facilitates reference. A list of papers utilised by the author is given at the end of each division, and these lists will serve as a useful guide to the literature, although they are by no means exhaustive. The great advance of knowledge regarding the minute structure of the fungi is evident on comparing this, the latest book, with De Bary's work. Some statements are, however, made in a way likely to cause confusion, one sentence which purports to explain the turgidity of the cell (p. 19) is a case in point. It is to be regretted that in dealing with the formation of spores and modes of reproduction, the author has not used a more exact nomenclature as regards the terms "spores" and "conidia"; for example, "the conidiophore consists of a single, erect, non-septate hypha, bearing a single sporangium at its apex." The word "gonidia," used by many English writers, is, so far as we can see, not once used in the book; if the author prefers "conidia," a statement to this effect with a reference in the index would save confusion to the student accustomed to the earlier term. It is quite true that Brefeld, one great authority, differs in his use of the word spore from those who regard the spore as the product of the sexual generation, and it is not easy for an author to pronounce an opinion. Yet one essential of a "Text-Book" is clearness, and a definite English standard of nomenclature would find many followers.

The excellent account of recent work on sexual reproduction of the fungi is opportune at the present time, and the summaries on methods of spore and conidial dispersal are so interesting that one feels tempted to wish the author had made them longer. The divisions which deal with the mineral food of fungi, the effect of light, temperature, and other agents, the colours and chemistry of the fungi, and other topics appear at first sight fragmentary, but the fault is not the author's, for his summaries give about as much information as is known at the present time.

The biologic forms of fungi are explained in a clear manner, especially the work in this direction done by Mr. E. S. Salmon. "Personal Views on Phylogeny" is a statement of the author's views on a complex problem; the argument is not altogether convincing, the sequence is indifferently expressed, and altogether it is rather difficult to ascertain what the author's views really are.

The section of the book on Pathology gives a brief account of the evolution of parasitism amongst fungi, and of the effects on the plants attacked. The origin of Potato disease from diseased tubers is an important topic dealt with at some length, and one on which Mr. Massee has recently conducted interesting investigations. An article on Legislation and Disease is given, which originally appeared in the *Gardeners' Chronicle* (December, 1905, and January, 1906).

The section devoted to classification of fungi is the best in this book. A preliminary table shows the systematic arrangement in a way which is easily grasped. Keys are supplied for distinguishing the chief genera of each order, sub-order, and, in some cases, the family. The short, concise descriptions of important fungi are excellent, and in many cases are accompanied by illustrations. The numerous figures are a feature of this book, and will be appreciated by all readers. The book nominally has 141 "figures," but the actual number of illustrations is much larger, since many of the figures are plates with as many as eight or ten separate drawings. Several photographs have been reproduced with success. The majority of the illustrations are reprints from the "Text-Book of Diseases," and two plates from that book showing *Sclerotinia* are included, although the genus finds no place in the classification given. Thirty-five illustrations are repeated, and in one case (Figs. 6 and 87) two different synonyms of *Tilletia tritici* are used. In the text we also notice that the Potato disease is placed in the genus *Phytophthora* in one place, and in *Phomopsis* in another. Several printer's errors were noticed; for example: "conidia . . . germinate once" (p. 103) should surely be "at once"; there is a misspelling in the title near foot of p. 51 (azygospore is meant).

Oversights of this kind are almost inevitable in the first edition of a book, but that the "Text-Book of Fungi" will live through many editions we may confidently forecast.

The "Text-Book of Fungi" is an important addition to our literature, and it ought to find a place on the shelves not merely of the fungologist, but also of everyone who studies botany. Students preparing for the National Diploma for Agriculture or university examinations will find the book especially useful and up-to-date in those general principles, which it is so important they should grasp clearly.

A CONCISE HANDBOOK OF GARDEN SHRUBS. By H. M. Gwyn Lewis. (Methuen & Co., 3s. 6d. net.)

This is an alphabetical list of hardy and half-hardy shrubs that are grown in British gardens, with occasional cultural details. Trees like the Ailanthus and the Tulip tree are included as well as shrubs, to which we should raise no objection, but we are puzzled when we find Abutilon vitifolium described as a climber suitable for walls, and not to be regarded as hardy anywhere. We saw a big bush of it lately in Dover, where it is grown in the open without protection. We are surprised also to find Aristolochia elegans included among hardy garden shrubs. In spite of a few eccentricities of this kind, and the omission of some of the newest introductions, such as Davidia and Olearia Gunniana, this is a useful little book to be commended to growers of shrubs, the more so as it comprises a copious index, and for a book of this kind it is very free from errors. The exceedingly brilliant autumnal colouration of Pyrus arbutifolia should have been mentioned.

IRISH GARDENS.

(Concluded from page 352.)

DARREEN.

This is the Irish home of the Marquis of Lansdowne, who adds to his great political reputation that of being a keen amateur gardener and an excellent landlord. His garden of some 30 acres is on the south side of Kenmare River, and here, as in other gardens that we saw, the conditions favour the cultivation in the open air of what are known as sub-tropical plants. The most striking features of the garden are magnificent masses of Indian Bamboos and gigantic coniferous trees. I have never seen Abies Nordmanniana so perfect and luxuriant as at Darreen. Gaultheria Shallon was 8 feet high, Griselinia littoralis planted in 1882 was 30 feet high, Veronica Traversii 15 feet, Acacia dealbata 50 feet, Eucalyptus Globulus 80 feet, Azara microphylla 25 feet, Olearia Forsteri 20 feet by 20 feet, Euphorbia mellifera 10 feet through, Erica arborea 10 feet, Myrtus Luma 20 feet, Ilex crenata 15 feet by 15 feet, Leptospermum lanigerum 15 feet; enormous plants of Cordyline, one measured had a stem 3 feet in circumference; Kalmias like Portugal laurels; Leptospermums like Privets; Metake Bamboo 12 feet high, and Falconer's Bamboo 25 feet high, 40 feet spread, with 1,000 canes, all in flower—a marvellous sight.

ROSSDOHAN.

This is also on Kenmare River, and is the property of Dr. Heard. It is practically an island, and some 20 years ago was almost waste land, with scarcely a tree upon it. By planting first shelter trees and then many kinds of Australian, New Zealand, Himalayan, and Californian trees and shrubs it has been turned into a jungle of exotic vegetation. Simon's Bamboo 15 yards across, Aralia Maximowiczii 20 feet high, Acacia decurrens 30 feet, A. melanoxylon 20 feet, A. falcata 30 feet, Eucalyptus urnigera 40 feet, Olea europæa 15 feet, Melaleuca hypericifolia 10 feet, Cassinia longifolia 15 feet, Hakea saligna with a 12-inch stem, Agonis marginata, great shrubs; Brugmansia sanguinea, Pittosporums, Escallonias, Kunzeas, Ozothamnus, Callistemons, Boronias, Camellias, Daphne indica and Asparagus plumosus. These are a few of the plants noted as being successes in Dr. Heard's garden. It is clear that, with shelter from the strong sea winds, a very large number of plants from sub-tropical regions may be grown on the south-west side of Ireland. We were unable to get to the garden of Lord Dunraven, at Garrish, but we were informed that it is of similar character to those of Lord Lansdowne and Dr. Heard.

FOTA.

This, the seat of Lord Barrymore, is famous for its garden, the noblest in Ireland, and one of the most delightful in the world. I saw it 15 years ago, and was astonished by the change that had taken place in so short a time. Truly, plants grow rampantly in Ireland. Fota is a place of trees, especially Conifers. An evergreen Oak, with a trunk nearly 7 feet through, a cork-barked Tulip-tree, and groves of Cordyline and Yucca gloriosa near the entrance give the

note for the whole place. All Falconer's Bamboos have flowered, and there are hundreds here, the children of those which flowered at Fota 30 years ago. A list of the big trees in this garden would be longer than space will permit. The special things that may be mentioned are Fagus Cunninghamii, 50 feet; Embothrium coccineum, 30 feet by 30 feet; Benthamia fragifera, 40 feet by 50 feet; Berberis nepalensis, 12 feet by 20 feet; Pittosporum Mayi, 40 feet; Ilex latifolia, 40 feet; Genista racemosa, 12 feet; Eriobotrya japonica, a grand old tree; Acacia dealbata, a tree; Clianthus puniceus, 30 feet through; Dasylirion longifolium; Asparagus retrofractus, a great mass against a wall; Phœnix senegalensis, two big specimens outside for 12 years. The great trees of Pinus Ayacahuite, P. insignis, P. Montezumæ, Picea Morinda, P. Alcockiana, Abies grandis, A. numidica, A. bracteata, A. religiosa, A. Webbiana, A. cephalonica, Tsuga Brunoniana, and Cryptomeria are grand to see, and the groves of Bamboos, Phormiums, Cordylines, Chamærops, Aralias, &c., are noble. Water gardening is a special feature, and in swampy situations there are many kinds of flowering and foliage plants that love moisture.

BELGROVE.

A few miles from Fota is Mr. Gumbleton's garden, the home of many rare and interesting plants, the proprietor being a very keen collector and tester of plants of all kinds. Mr. Gumbleton knows more about garden-plants than any amateur that I have ever met, and his knowledge has full play in his own garden. We were unfortunate in having to see the garden on a pouring wet day. Some of the plants noted were Anemone Fanninii, a mass 6 feet through, the peltate leaves 2 feet high and 15 inches across, and the scape 6 feet: I had never seen this plant so good, although Kew introduced it about 15 years ago. Olearia insignis against a wall bore nine flowers; Freylinia cestroides, 10 feet; Daphniphyllum glaucescens, 18 feet by 18 feet; Pterostyrax hispida, a tree draped with its lovely white flowers; Plagianthus Lyallii, Xanthoceras sorbifolia, Buddleia Colvillei, Eucryphia pinnatifolia, E. cordata, Romneya Coulteri, Escallonia langleyensis ×, Veronica Hectori, and V. Lindsayi were seen in fine condition. Mr. Gumbleton also makes a speciality of Begonias, Pelargoniums, Disas, and, of course, herbaceous plants.

ST. ANNS.

The stately home of Lord Ardilaun is more like an English nobleman's residence than any that I saw in Ireland; and this is true of the garden also. The keep of the place is good, the collections of plants are comprehensive and well cared for, and there is an air of cultivation wherever one looks. Lady Ardilaun is a keen gardener, and loves to experiment with plants of doubtful hardiness, providing shelter fences and hurdles for those supposed to need it until they are well established. Buddleia Colvillei, a bush 12 feet high, was in flower; also big bushes of Cassia corymbosa, Carpenteria californica, and Pentstemon coccineum. Roses and Carnations are splendidly grown there.

ASHBOURNE.

Mr. Beamish has formed here a delightful garden, which in a few years will most likely be much talked about. It is partly on a steep slope, with the bare rocks showing here and there, a situation that lends itself to rock gardening, and Mr. Beamish has made the most of it. The whole garden is well conceived, and the construction of the rockery is most picturesque. Plants grow exceptionally well there, and, as the proprietor spares neither money nor pains to secure the best, his garden is sure to prosper.—*W. Watson, in Kew Bulletin, 1906.*

A MODEL BOTHY.

FIG. 142 represents a view of the new bothy recently constructed in the Rt. Hon. Lord Rothschild's gardens at Tring Park, Tring. It is a very ornamental structure, and the timber from which the massive Oak pillars and other heavy woodwork in the front was fashioned, was furnished by trees grown at Tring. On the ground floor is a spacious kitchen fitted with all necessary appliances on a very liberal scale; a large and airy dining-room, a fine sitting-room and reading-room [which are both very comfortably carpeted and furnished], and lavatories and storage accommodation. On the upper floor a corridor runs from end to end of the building, with lavatories and bath-rooms at either end. Ten spacious bed-rooms are provided, and at one end, quite shut off from the rest of the building, and with a separate entrance, is an isolation sick-ward with bed accommodation, nurse's quarters, bath-room, &c. The whole building is lighted by electric light and is heated by the large Treatham boilers recently erected, which also heats the whole of the plant houses and offices. In addition to the comforts supplied in the building itself, the young men have free use of perhaps the finest private horticultural and botanical library in existence, and which the Hon. Walter Rothschild has had arranged near to the bothy.

FIG. 142.—THE NEW BOTHY AT TRING PARK GARDENS.

THE BOARD OF AGRICULTURE AND THE AMERICAN GOOSEBERRY-MILDEW.

In recent numbers of this journal* I have drawn attention to the imminent danger of the introduction into England of a very destructive fungus disease of Gooseberries, viz., the American Gooseberry-mildew. I have so recently described the serious nature of this disease that it is not necessary to deal with this point; it may be just mentioned here that it is solely on account of the ravages caused by this mildew that growers in the United States have been forced to abandon the cultivation on a commercial scale of the European Gooseberry. On November 10 I recorded the discovery of the disease in an English nursery on standard Gooseberries on Ribes aureum stocks imported from the Continent. I have now to report that I have met with an extensive outbreak of the disease on about 20 acres of Gooseberries in a commercial plantation in Worcestershire.

It is impossible to exaggerate the gravity of the situation. Gooseberry growers now stand face to face with an extensive outbreak of the disease in this country. If the disease is allowed to spread, the whole Gooseberry crop of the country is imperilled. As legislation alone can deal with the sources of danger, it is a question of the greatest moment to ask what steps the Board of Agriculture intend to take in order to stop the introduction of the disease elsewhere and to stamp it out in the affected districts before it assumes epidemic proportions.

It is quite clear from the resolutions urging the Government to take immediate legislative action, recently passed by the National Fruit-growers' Federation, the Mid and East-Kent Chambers of Agriculture at Maidstone and at Canterbury, the Horticultural Trades' Association, the Worcestershire Chamber of Agriculture, the Fruit-growers' and Market Gardeners' Associations at Evesham and Pershore, the Herefordshire Fruit-growers' Association, and at the recent Conference of Fruit-growers held at Wye College, that both the trade and fruit-growers earnestly desire, in face of the imminent danger, the temporary prohibition of all importation of Gooseberry bushes and of plants of Ribes aureum.

On November 15 Mr. Laurence Hardy, M.P., called attention to the matter by a question in the House of Commons. The Board of Agriculture gave the following reply: "We were informed last month that the disease in question had been discovered in Worcestershire this summer, but we have no information as to its discovery in imported stocks in the last few days. The Board have no power to prohibit the importation or to order the destruction of diseased stocks, and it is not practicable to introduce legislation on the subject during the present session. A leaflet on the subject has been in circulation for some years, and several thousand copies have been distributed during the present year. The Board are now in communication with the Customs with a view of obtaining the necessary information to enable them to warn importers against purchasing Gooseberry bushes from countries where the disease is prevalent."

I should like now to comment upon the statements made in the above answer.

First, as to the supposed outbreak of the disease in Worcestershire here referred to. This case, I have ascertained on enquiry from the Board, was founded on an error. Curiously enough, however, an outbreak has, as a matter of fact, taken place in Worcestershire. On November 17 I was lecturing on the disease at Worcester, and, in consequence of information which was given to me after the lecture, I visited some plantations of Gooseberries in an outlying district, and there discovered an outbreak on about 20 acres of Gooseberries. The varieties affected were Leveller, Berry's Early Kent, Whinham's Industry, and Lancashire Lad. In one field acre of Leveller the bushes were so badly infested that practically all the young shoots were coated over at their tips with the brown spawn of the mildew containing the winter spores. It was in this part of the plantation that the fungus last season had affected the fruit, which had to be picked over before being marketed. On searching the rest of the plantations I found the disease scattered over about 20 acres, being bad on the bushes of Lancashire Lad and Berry's Early Kent, and less so on Whinham's Industry. The owner fortunately realises the seriousness of the case, and that half measures are of no use in dealing with an epidemic fungus disease such as the present. He has promised to grub up and burn over half an acre of the worst diseased bushes, to cut back as severely as possible the young wood in the rest of the plantations, and to spray the bushes carefully next spring with the fungicide recommended. From enquiries made in Evesham and the district, I ascertained on reliable authority that it has been, and still is, the custom of some firms of nurserymen to import occasionally Gooseberry bushes from the Continent; there is little doubt, therefore, that the disease has been introduced into Worcestershire in this way.

Next with regard to the question of the Board not being aware of the discovery of the disease on imported stocks, one can only deplore that the Board has no sub-department whose work it would be to understand the purport of recent resolutions sent to the Board. In this instance a resolution from the Conference of Fruit-growers held at Wye College, "calling upon the Board of Agriculture (in view of the discovery of the disease in England) to take immediate steps to prevent the importation of infected trees by the prohibition of the imports of Ribes Grossularia and of Ribes aureum" had been sent to the Board a week before the above statement was made in the House of Commons.

As to the Board having no power at present to stop this importation of diseased stock, it is of course for this very reason that immediate legislation is necessary.

Then, as to the leaflet on the subject which "has been in circulation for some years," and of which "several thousand copies have been distributed during the present year." What do we find? In a leaflet devoted to the harmless European mildew, a short paragraph, inserted in 1901, in which the bare statement is made that "the American Gooseberry-mildew was met with in considerable abundance in Co. Antrim, Ireland, during the summer of 1900." No word is mentioned that the disease is a highly infectious and recently-introduced one, nor any warning given as to the sources of danger. The case would be similar if we supposed that a highly-infectious and epidemic disease of animals, recently introduced into this country, had been dealt with by a short paragraph in a leaflet on some comparatively harmless disease. It is deplorable if the Board thinks that any good whatever can be done by the issue and distribution of such a leaflet.

Finally, with regard to the warning of importers "against purchasing Gooseberry bushes from countries where the disease is prevalent," such a course is utterly useless. In the first place, the disease is spreading so rapidly on the Continent that it is not safe to say that any country there is free. Secondly, with the system of interchange of stock that is current among Continental firms of nurserymen, it is impossible to trace the *original* source of imported plants. To take a case in point. The standard Gooseberries on which I found the American Gooseberry-mildew in an English nursery were imported from a firm in France. Now the disease has not been reported as occurring in France. Either the disease does occur there, however, or the standards were obtained from a nursery in some country, such as Germany, where the disease is known to occur.

On reading this reply given by the Board, I must say that I thought no more discouraging or disheartening answer could have been given; it showed that neither the seriousness nor the imminence of the danger was realised, and also a total unpreparedness for dealing with it. It is obvious that until fruit-growers can obtain from the Government at a special sub-department of the Board of Agriculture to deal with matters connected with the fruit industry, their interests will never be adequately looked after. I was present last Friday week at an interview given by the President of the Board of Agriculture to the National Fruit-growers' Federation. As a result of this interview, Major Boscawen is consulting with Col. Long as to the possibility of bringing in at once, as an emergency measure, a Bill to deal with the American Gooseberry-mildew. We were assured by Lord Carrington that the Board of Agriculture would regard such a Bill sympathetically.

The case stands thus. We know now that the disease is actually being introduced into this country in two ways: on imported standard Gooseberries on Ribes aureum stocks, and on imported Gooseberry bushes. The first outbreak in a commercial plantation, imperilling 20 acres, has already occurred. It is obvious that to temporise in the matter will now be fatal. Legislation alone can deal with the danger at its source, and unless the Board of Agriculture immediately introduces or actively supports a Bill prohibiting this importation, the disease will certainly spread beyond remedy or control over the whole country, as at the present time it is spreading in certain countries on the Continent where it was introduced in a similar way. I would warn earnestly all growers who are planting up Gooseberries this winter of the necessity of obtaining their stock from a firm of repute, who can give a guarantee that the plants have been raised in England. *E. S. Salmon, F.L.S., Hon. F.R.H.S., Mycologist to the South-Eastern Agricultural College, Wye, Kent.*

November 3 and 10, 1906.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Temperatures.—During the winter months the night temperatures must be reduced, and should be maintained as follow: East Indian house, 60° to 65°; Cattleya house, 55° to 60°; Mexican and intermediate house, about 55°; and the Odontoglossum house, 45° to 50°. Whenever sharp frosts, or cold, piercing winds prevail, entailing much fire heat to maintain the requisite temperatures, observe as near as is possible the lower temperatures given above, but when the external air is mild and genial, the higher ones should be maintained. During very cold nights, and when much artificial heat is being circulated in the pipes, its injurious effects can be somewhat counteracted by the admission of a little fresh air through the lower ventilators. In order to safely reduce the amount of fire heat in the houses, it is a good plan to cover the lower part of the roof with some kind of thick protective material. At Burford, ordinary garden mats are used for this purpose, several being sewn together with string. They are easily rolled along the roof, and can be made secure with strong cord, and where the lattice-wood blinds remain on the houses, they also are used for the same purpose, and are let down over the mats. The day temperatures should be maintained at the higher figures, and the atmospheric conditions should be regulated in accordance with the rise and fall of the outside temperature. The extra warmth obtained from the sun's rays in winter is always beneficial, providing the atmospheric conditions in the house are regulated accordingly.

Watering.—The quantity of water afforded the roots of Orchids generally, and the degree of damping of the floors, stages, &c., should now be less than hitherto; much will depend in these respects upon the position and construction of the houses, for those which are situated at high altitudes will need more damping than those built on lower ground, because the air moves more freely about the former and thus carries away more moisture. For instance, at Burford, which is situated in a very low position, and is partially surrounded with lofty trees and high hills, it is found unnecessary to damp the Cattleya house for several months in winter, the usual watering of the plants furnishing all the moisture that is required. In the East Indian house, in which a considerable amount of fire heat is used, the paths, &c., should be damped both during the morning and the afternoon, and the ground beneath the hot-water pipes and out-of-the-way corners should be thoroughly wetted. The intermediate and Odontoglossum houses will also require light dampings once or twice a day, according to the state of the weather outside. The Mexican house, which contains such plants as Lælia anceps, also Vanda cærulea, V. Amesiana, Barkerias, Odontoglossum Oiosmum, &c., will require but little atmospheric moisture under any circumstances until spring commences. Plenty of fresh air is

what these plants require, and this should be admitted liberally whenever practicable. Immediately the deciduous trees outside have shed their leaves, and especially if the weather continues mild, advantage should be taken to cleanse the houses inside and out, so that light may be freely admitted to the plants. At the same time the collection of plants may be rearranged on the stagings, and the plants carefully examined for insect pests, and their foliage sponged with tepid rain-water. If thrips, &c., have been troublesome, the houses should be vaporised on two successive evenings, after which they will not require fumigating again for several months.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq. Cleveley, Allerton, Liverpool.

The Tying and Training of Plants.—Winter is the best and most convenient season for the carrying out of work of this kind. If the interior of the plant houses has been thoroughly cleaned, attention should now be given to training or shaping any plants intended to be grown on as specimens, either for exhibition or otherwise. However good in health a plant may appear, its beauty may be marred by unskilled training. Plants of this description are often seen in the exhibition tent, and if exhibitors only realised how many points they lose in competition by an irregular system of training, more attention would be given to this item in plant cultivation. There is also much satisfaction to be had from a well-grown, evenly-balanced plant even when the specimen is not in flower. Nothing can be in worse taste, or a greater eyesore, than a house containing deformed plants. Many of the most handsome stove plants are climbers or trailers, and require the support of a trellis of some kind to enable them to display their flowers to the best advantage, and for this purpose the balloon-shaped trellis is perhaps best. When galvanised wire is the material used for making trellises, it should receive a coat of paint, as the acid contained in the galvanised metal acts very injuriously on plants in contact with it. To overtrain a plant is objectionable, and once it has been put into shape, the outline should be maintained in a free manner, so that the growth and flowers may develop in a natural way. This especially applies to Azaleas, which should not be tied in too closely. Gardenias, Ixoras, Francisceas, Chironias, Bouvardias, Statices, and Ericas will require a few neat stakes to keep them in shape, but do not use more than are necessary. Let all stakes that are for training or supporting plants be painted of a light green colour, using a little varnish in the paint, as this preserves the stakes. In growing soft-wooded plants, such as Fuchsias, Pelargoniums, and Begonias, timely attention to stopping becomes necessary when they are quite young, and the foundation of the plants is being laid for future development.

General Remarks.—Bulbs or tubers in store, such as those of Caladiums, Gloxinias, Begonias, Gloxinias, and Achimenes should be examined at least every fortnight, and any that are unsound should be removed, to save others from contamination. Open the ventilators of pits and frames on all favourable occasions, taking care always to prevent cold draughts. All kinds of potting material should be put under cover, and not left exposed until actually required. The exercise of such forethought will be amply repaid.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Orchard House Trees.—Early varieties of Peaches and Nectarines in pots should now be placed indoors, but the structure must be freely ventilated both by night and by day. Cherry trees in pots should be treated in the same manner. Pot trees of Apples, Pears, and Plums should now be placed in a sheltered position outside, and their pots should be plunged in ashes, so that the frost may not break them. Should the weather be severe, a good covering of long litter or of leaves placed over the pots will preserve the roots from injury. The roots of newly potted trees should now be ramifying in the fresh compost, and must be kept in a suitable condition of moisture, and on no account must the soil become soddened.

Cucumbers.—The recent exceedingly mild weather has been in favour of these plants, and has enabled the pits in which they are growing to be maintained at a night temperature of 67° without excessive fire heat, which would be conducive to the development of red-spider and other insect pests. Allow a little ventilation whenever the weather is favourable, and if only for half an hour it will benefit the plants. The foliage should now be kept a little drier, but sufficient atmospheric moisture must be supplied by frequently damping all available spaces in the house. Strong, healthy plants will show abundance of fruits, which should be thinned to about one to a node. Give the plants frequent top-dressings, in small quantities, of rough leaf soil, a little loam, and old Mushroom bed manure. Keep a sharp look-out for fly and red-spider, and vaporise the structure on their first appearance. Two gentle fumigations, the one at night-time, and the other the first thing in the morning, are much better than one excessive dose. If the same plants are required to be grown until the beginning of next required to be grown until the beginning of next year, their lateral growths should be encouraged to develop, and their roots be kept near to the surface of the soil and in a healthy condition. There is no better stimulant for Cucumber plants at this season of the year than warm, weak liquid-manure, given once or twice a week. Cover the pits with mats on very cold nights, for this will assist in maintaining a suitable temperature without undue fire heat.

Vine Eyes.—When the vines are pruned, some of the ripest pieces of wood should be selected, tied in bundles, and labelled, for future "eyes" for propagation in the spring. The bundles should be heeled in under a north wall during the winter.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

General work.—During wet weather much needful work can be done, such as the cutting of stakes to a suitable size and length and sharpening the ends, afterwards tying them in bundles, and creosoting the points. If stakes intended for permanent use are treated with creosote, they will last several years longer than they would if not so treated. Large labels needed for the fruit tree quarters may be sharpened, painted, and the names written upon them. Labels that can be conveniently seen from the paths are necessary for Strawberry and Gooseberry plantations, and they should therefore be made about 18 inches to 2 feet in length. Cuttings of Gooseberries and Currants and the like may be made neatly during such weather. The cuttings may be made 10 inches or one foot long, and all the lower buds should be taken away, leaving only about three on the apex. The cuttings should be tied up in bundles and labelled with the number and variety, and laid in again for the time being in a box or in the border. Soils for various purposes may be mixed up in a shed; shreds can be cut into convenient lengths, remembering to keep them very narrow. Tools should be sharpened and oiled, bearing in mind that all tools should be kept in as perfect a condition as possible, in order that the work performed by them may be of the best description.

Manuring of Fruit Trees.—Some soils require much more manure than others. Large crops of superior fruits can only be obtained by a judicious application of the proper manures. Farmyard manures must always form the staple manure, and chemical manures should be regarded as auxiliaries. Potash constitutes a large proportion of the ashes of fruit trees; nitrates, phosphates, and lime must also be present in the soil, if the best results are to be obtained. Farmyard manure supplies all of these, with the exception of lime, in greater or less quantities. In conjunction with farmyard manure, muriate of potash may be used with good effect at the rate of 5lb. to a pole, or not less than 8 cwt. per acre. Phosphoric acid should be supplied in the form of superphosphate, or bone meal, or basic slag. Either of these substances may be used in the same proportion. Lime should be applied at about every three years. No manure is necessary until the trees commence to bear fruit. If the land has been well broken up, young maiden trees often grow too vigorously, and it is necessary to lift them to check growth. Farmyard manure may be supplied as a top-dressing at any time with good effects, more especially perhaps on high ground. Some fruit trees in a plantation several acres in extent, planted about 10 years ago in a low-lying situation, are smaller now than when they were planted, and many have died. Planting should be done on high ground.

Trees.—These should be sprayed several times with sulphide of potassium (1 ounce to 3 gallons of water) (avoiding the paint), and all leaves, prunings, &c., should be collected and burnt.

Prevention of pests.—Collect all leaves and prunings from fruit trees and burn them. Do not, under any pretence, allow them to be dug into the soil, as this would perpetuate many diseases and insect pests.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Broad Beans may safely be sown now if it is desired to have an early "dish" a little in advance of those sown in the open early in the spring. Unlike Peas, they are not easily damaged by frost, or by wet weather, their chief enemy being slugs, which are apt to eat them after they have germinated. Sow the seeds in lines, drawn at 2 feet apart in the usual way, on a fairly dry border facing to the south. If space can be spared in an unheated frame, seeds may also be sown in one or two boxes, with a view to planting them out in January or early in February. An early "dish" long in advance of those resulting from entirely outside culture can be secured by this means. Improved Windsor is a good variety to sow at the present time.

Early Carrots.—As soon as a suitable hotbed can be made, the first sowing should be got in. After the material has well settled down, cover this with good soil to a depth of 12 inches, and make it moderately firm. Sow the seeds broadcast, and gently water them in. Do not cover the seeds more than ¼ of an inch deep. Keep the frame slightly tilted in order for the excessive heat or moisture to escape. Choose a small rooting variety for sowing at this date, Sutton's Intermediate Forcing being one of the best. The root is quite round in shape, has a small core, and matures quickly. Arrangements should be made for making successional sowings.

Hotbeds.—There will be much use for hotbeds from the present time onwards. Potato tubers will require planting soon, also all seasonable varieties of salading. Many people depreciate almost all kinds of forced vegetables, but poor quality in these is very often due to the grower neglecting to afford sufficient air when the vegetables approach full growth. Forced vegetables can be made to compare favourably with those grown outside if this important matter is given sufficient attention, but not otherwise.

Draining.—Few gardens are well drained. If any drains require renewing or repairing, this work should be commenced, so that the disturbed soil may settle again before spring. A depth of 3 feet 6 inches should be regarded as the minimum for placing new drains. Kitchen gardens, unlike farms, are cultivated to a great depth, therefore the drains should be deep. Kitchen gardens composed of clay soils should always be well drained, not only to take away excessive wet, but because the soil being drier will also be warmer. The number of drains necessary will depend upon the nature of the soil, and the gardener is extremely fortunate who has a garden sufficiently drained by nature, and yet possesses a sufficient depth of soil to suit his crops.

The gathering of vegetables is sometimes left to someone who does not understand the best methods of doing the work, and the produce is therefore seriously depreciated. It is profitable to have this work done by someone who has been well trained to the work, and who will think well of what he is doing. As an illustration of what is meant, I may say that a lad in gathering Brussels Sprouts will probably strip large and small sprouts from top to bottom of a stem at one time, which can never boil suitably together, and part probably has to be discarded by the cook. Had he thought more about his work, he would have gathered them all of one size, thus the loss would have been saved.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR DECEMBER.

SATURDAY, DECEMBER 1—
Soc. Franc. d'Hort. de Londres meet.
German Gard. Soc. meet.

TUESDAY, DECEMBER 4—
Winter Flowering Carnation Society's first Exh. at Roy. Botanic Gardens, Regent's Park.
Exh. of Colonial-grown fruit at Roy. Hort. Soc. Hall, Westminster.
Nat. Amateur Gard. Assoc. meet.

WEDNESDAY, DECEMBER 5—
Nat. Chrys. Soc. Mid-Winter Exh. at the Crystal Palace (2 days).

THURSDAY, DECEMBER 6—
Ann. meet. of Nat. Sweet Pea Soc. at Hotel Windsor at 3 p.m.
Meeting of the Brit. Gard. Assoc. at Wesleyan School-room, Evelyn Road, Richmond, 7.30 p.m.

SATURDAY, DECEMBER 8—Dutch Gard. Soc. meet.

MONDAY, DECEMBER 10—
Unit. Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, DECEMBER 11—
Roy. Hort. Soc. Comms. meet.

WEDNESDAY, DECEMBER 12—
Nat. Chrys. Soc. Exh. of Market Chrys. in the Foreign Flower Market, Covent Garden.

THURSDAY, DECEMBER 13—
Nat. Potato Soc. Exh. at Roy. Hort. Hall, Westminster (2 days).
Manchester and North of England Orchid Soc. meets.

SATURDAY, DECEMBER 15—German Gard. Soc. meet.

TUESDAY, DECEMBER 25—*Christmas Day* (Quarter Day).

SATURDAY, DECEMBER 29—Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—41·4°.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, November* 28 (6 P.M.): Max. 54°, Min. 43°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November* 29 (10 A.M.): Bar., 30·1; Temp., 55°; *Weather*—Overcast.
PROVINCES.—*Wednesday, November* 28 (6 P.M.): Max. 54° S.W. Ireland; Min. 45° Scotland, north.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Roses, Plants, Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY TO FRIDAY—
Dutch Bulbs, Azaleas, Rhododendrons, Roses, Fruit Trees, Border Plants and Perennials, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 11.

WEDNESDAY—
Dutch Bulbs in variety, Hardy Border and Herbaceous Plants, at 11; 5,000 Roses in variety, at 3 and 5; Azaleas, Palms, Plants, &c., at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Odontoglossum Crispum, Lælia majalis, and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Our Trees. This is a book* to the publication of which we have been looking forward with much interest, nor have our anticipations been disappointed. We know the special qualifications for their task possessed by the authors as travellers, as naturalists, and as foresters. We know something of the care and labour that have been bestowed by them on the preparation of the book, and we have every reason to believe that any omissions and corrections that may be needed will be supplied in subsequent volumes. The work is dedicated to the King, and is furnished with a preface by Sir William Thiselton-Dyer. Since the publication of Loudon's Arboretum in 1838 many treatises of more or less value have been issued, but none of such encyclopædic importance as Loudon's great work. In that book the details given are, if anything, too copious, and not sufficient discrimination was exercised in thinning out matters of comparatively little permanent interest. Still, it must always remain a colossal monument of the authors' industry and research. Since Loudon's time we have learnt much as to the conditions under which trees flourish in this country. Many species unknown to Loudon have been introduced; at the same time, many that he mentioned have disappeared, or are not to be found out of arboreta such as those at Kew and Edinburgh. The disappearance of certain forms may be accounted for partly by reason of unfavourable conditions of climate or soil, partly from the change in taste on the part of planters. Trees of interest or beauty or both have been neglected in favour of Orchids or herbaceous plants, or of plants yielding "cut flowers" for decorative purposes. As a consequence, the nurserymen do not care to cumber their grounds with stock that is not saleable, or which can only be disposed of slowly and in such small quantities as not to be remunerative. The renewed interest in forestry is likely to bring about a change, and the planters of the immediate future will not only interest themselves in the older and well-tried trees, but will anxiously seek for information about such trees as the Japanese and the West American Larches, the Giant Thuya, the Nordmann Spruce, and other trees of more recent introduction, which are not only ornamental, but more or less promising as timber trees. Such information they will get in the present volume, and, as it is the work of practical planters as well as men of botanical eminence, the information is not only trustworthy, but peculiarly appropriate.

"The object of the work," we are told, "is to give a complete account of all the trees which grow naturally or are cultivated in Great Britain, and which have attained or seem likely to attain a size which justifies their being looked on as timber trees, but does not include those which are naturally of shrubby or bushy habits. . . . After having seen the trees of every country in Europe, of nearly all the States of North America, of Canada, Japan, China, West Siberia and Chile, we confidently assert that these islands contain a greater number of fine trees from the temperate regions of the world than any other country. Descriptions of the best examples of all these and of interesting woods and plantations will be a prominent feature of the book. We have the special qualification that we have seen with our own eyes and studied on the spot, both at home and abroad, most of the trees, descriptions of which will be included in the book."

During the last five years one or other of the authors has visited nearly every place in England, Scotland, Wales, and Ireland where large and rare trees are to be found. Dr. Henry, in particular, has visited many places in Ireland not generally known. No particular order is followed in the text; thus we find Fagus immediately preceding Ailanthus, and that is immediately followed by Sophora. The following volumes will doubtless contain an orderly classification, and an index which will render consultation easy. Of course certain genera occupy much more attention than others, but each genus is dealt with on the same plan. First we have a description of the botanical characteristics of the genus. Then, as in the case of Fagus (the northern Beeches), an analytical key to the species is given, founded, unfortunately but necessarily, on characters which are not available by the home planter, but can only be studied in the herbarium or in the native forests. An account of the American Beech F. ferruginea is supplied. This is a species almost unknown here, but Mr. Elwes was able to collect information about it from his own investigations in America. The Caucasian Beech, F. orientalis, and the Japanese Beeches, F. japonica and F. Sieboldi, are still less known. A similar remark applies to the Beeches of China. The European Beech (F. sylvatica) is, of course, treated at considerable length, more than twenty pages being devoted to it. The varieties are mentioned, and their history detailed with copious notes and references. Many of these varieties are purely seedling variations, and from the same bag of seed Beeches of various colours and form may be obtained, so that a visit to a good nursery and an inspection of the nursery rows are necessary for the planter who desires to obtain specially distinct varieties. After the description of these varieties comes an account of the former and of the present distribution of the tree in Britain, from which it is clear that the Beech is an aboriginal inhabitant of these islands. Its occurrence in other European countries is noted, and the way in which it has, in past ages, alternated with the Pine at one time and with the Oak at another, during periods roughly corresponding in Denmark with the ages of stone, or bronze, and of iron.

After these remarks on the geographical distribution of the Beech follow details relating to the cultivation of the tree. The occurrence of seedling Beeches in great numbers strikes every observer. What becomes of them is not always so obvious. The authors furnish a solution by showing that the seedlings are often destroyed by spring frosts, or by drought in hot summers, to say nothing of rabbits, pheasants, and wood pigeons.

It will surprise some to learn that the Beech woods of Buckinghamshire no longer suffice, and that the chair-makers of Wycombe find it cheaper to import American Birch than to buy the locally-grown timber. To remedy this, Mr. Elwes counsels the raising of Ash from seed, and to fill up the vacant spaces with Larch, which, when mixed with Beech, usually keeps healthy and grows to a larger size than it does alone. No deciduous tree is better adapted as a nurse for Oak and other trees, hence it is recommended to grow Beech for coppice and to cut it in fifteen or twenty years. The formation of Beech avenues is next alluded to, and some of the famous avenues, such as that at Savernake, are noticed. Then follow references to some of the famous specimen trees scattered throughout the country, such as those at Knole, Ashridge, Newbattle, and elsewhere.

A short account of the Beech coccus follows. If taken in hand sufficiently early, scrubbing with petroleum emulsion is efficacious, but this cannot be done on a large scale nor even on a large tree. The last paragraph on the Beech has reference to the timber and its economic value, but little or

* "The Trees of Great Britain and Ireland," by H. J. Elwes, F.R.S., and Augustine Henry, M.A., Edinburgh (privately printed). Vol. i., 4to, pp. 200, tab. 60. To be [illegible] Mr. R. Edwards, Colesborne, Cheltenham.

nothing is said as to the appearance and microscopical structure of the wood, which is a rather important omission, although reference is made to Stone's Timbers of commerce, where the subject is alluded to.

From what we have said some idea may be obtained of the method adopted by the authors in dealing with their subject. We should greatly like to comment on some of the many trees, accounts of which are included in this volume, but we must, perforce, refrain. We can only add that those interested in trees will find the book most attractive to read and most valuable to consult.

It remains to speak of the illustrations—there is none in the text, but some sixty quarto plates form an atlas to the first volume. They are mostly autotype reproductions from photographs of remarkable specimens. Naturally, they vary in merit, as any one who has had anything to do with photographs of trees and knows the difficulty of securing satisfactory portraits will at once acknowledge. It is unfortunate that representations of the same trees in different seasons could not be given. The picture of the Newbattle Beech, for instance, loses in effectiveness by the absence of a portrait showing it when covered with foliage. The illustrations of seedlings are scarcely adequate, but the outline drawings of the buds of the various species of Pyrus will be very useful. The illustration of a group of Araucarias on plate 20, which, by the way, like one or two others, is misplaced, is very striking, and may be usefully compared with the views of the tree in its native forests as given on plates 17 and 18. From these latter we gather that, judged from an ornamental point of view, we have already had the best decorative effects that we are likely to get from this tree, and that we must not be disappointed if the fine specimens we still have will sooner or later degenerate. But perhaps the most interesting illustrations are those showing the trees in their native countries, as, for instance, in the case of the Araucarias just mentioned, the Servian Spruce (Picea Omorika), Brewer's Spruce, the Japanese yews, the Cryptomeria forests, the singular outgrowths from the stem of the Ginkgo in Japan, the Cypress swamps of North Carolina and others. With this notice, all inadequate as it is, we must leave the consideration of this volume. We have said quite enough to commend it to the notice of our readers, and to ensure its appreciation by tree lovers and arboriculturists. The work will, it is expected, be completed in four more volumes.

OUR SUPPLEMENTARY ILLUSTRATION.—The collection of succulents at Kew is one of its richest possessions. It is accommodated in a house 200 feet long, 30 feet high, and 20 feet wide, with a brick stage extending all round the sides, and floor-level gravel beds in the centre. With few exceptions, all the plants are grown in pots, an arrangement which for convenience has its advantages, but the plants would certainly look better and grow more vigorously if they were planted out. The house was built in 1854. Fifty years later, that is in 1904, it was reconstructed, a lighter roof with a lantern replacing the heavy flat roof, which had served fairly well during summer, but was too obstructive to direct sunlight in winter. The present structure is a house of pleasing lines, and that it is an improvement from a horticultural point of view is abundantly proved by the healthier growth of the plants since the alteration was made. The hot-water pipes in this house are so arranged that there is a stove temperature at the north end and a greenhouse temperature at the south. The view shown in our supplementary illustration is from the middle of the house, looking north. In this portion the largest of the Cacti, Euphorbias, and Aloes are displayed. The southern half is occupied by the Agaves, Dasylirions, Furcræas, and Xanthorrhœas, with a big specimen opposite the door of the giant Iris Robinsoniana from Lord Howe's Island. Succulent plants are not in great favour with English plant-growers, although they have many good points to recommend them, as was observed by the young lady who fell against the hedgehog-looking Echinocactus shown in the left-hand corner of the picture! The Kew collection has been strengthened from time to time, first by a selection from the WILSON SAUNDERS collection; then by the purchase of many of the late Mr. PEACOCK's plants; more recently still by the purchase of a portion of Mr. COOPER's collection when he left Redhill, and only a few weeks ago by the purchase of some choice, well-grown plants from Mr. JUSTUS CORDEROY, of Didcot.

ROYAL HORTICULTURAL SOCIETY.—A show of Colonial Grown Fruit and Vegetables will be held in the society's hall, Vincent Square, S.W., on Tuesday, December 4, 1 to 6 p.m., and Wednesday, December 5, 10 a.m. to 6 p.m. A lecture on the "West Indian Lime, its cultivation, uses, &c.," will be given by Mr. ARCHIBALD BROOKS, of Dominica, at 3 p.m.

BRITISH GARDENERS' ASSOCIATION.—We are informed that with a view to forming a branch of this Association at Richmond, Surrey, a meeting has been arranged to take place in the Wesleyan School room, Evelyn Road, Richmond, on Thursday, December 6, when an address will be given by the Hon. Secretary, Mr. J. WEATHERS. The hall is within five minutes' walk of the Railway Station, to which there are trains from Kingston, Staines, Feltham, Putney, Barnes, Gunnersbury, &c. Omnibuses from Ealing and Brentford pass the building. All professional gardeners in the neighbourhood should make an effort to be present. It is hoped to have the services of Councillor COOK, Hon. Secretary of the Richmond Horticultural Society, as Chairman. The meeting will commence at 7.30 p.m. The local Hon. Secretary *pro. tem.* is Mr. R. SIMPSON, 21, Alexandra Road, Richmond.

——— At the last meeting of the Executive Council eight new members were elected, bringing the total up to 960. One candidate was rejected.

WINTER CARNATIONS.—We are asked to remind readers that the first annual show of the Winter-Flowering Carnation Society will be held on Tuesday next in the Royal Botanic Gardens, Regent's Park.

THE ROYAL BOTANIC SOCIETY is experiencing a crisis similar to that through which the R.H.S. passed some years ago. We all know by whose munificence and by whose persistent exertions the situation was reversed, and we all know how successful was the change of policy inaugurated when the Society had to leave South Kensington. We have not forgotten, nor are we likely to forget, the intense interest which was felt by horticulturists of all degrees and of all shades of opinion in the Proceedings of the Society. This was due to the splendid record of the Society. Even in its darkest days the interests of horticulture were by no means neglected. Comparatively few horticulturists concern themselves about the Botanic, in spite of its attractive garden and other features. The reason is obvious. It has done little to justify its name, and it relies so much on entertainments for the amusement and recreation of its Fellows, and so comparatively little on the promotion of horticulture, still less for the advancement of botany. The interests of its Fellows as individuals have been considered rather than the advancement of the science and of the art it was established to promote. We do not overlook the exceptions, but they are too inconsiderable to invalidate the general truth of our statement. A general meeting of the Fellows was held on the 22nd ult., when a "heated discussion" took place. The council brought forward certain proposals, and, as we learn from *The Times* report, 46 voted in favour, 67 against them. Speeches "of a heated and recriminatory character were made, but ultimately the Chairman said he had no doubt the council would appoint a sub-committee to confer with three of the Fellows."

POTATO LEAF-CURL.—According to the November number of the *Journal of the Board of Agriculture* the details relating to the life-history of "leaf-curl" have now been worked out. A point of great practical importance in connection with this research is the discovery that "leaf-curl" in Potatos and the "black-stripe" or "black rot" in Tomatos are due to the same fungus, Macrosporium solani (Cooke). This discovery not only eliminates one supposed parasitic entity, Macrosporium tomato (Cooke), but will also tend to check the spread of the disease, as hitherto it was not known that soil infected by producing a crop of diseased Potatos was capable of infecting Tomatos and *vice versa*.

NATIONAL ROSE SOCIETY.—The thirtieth annual general meeting of the National Rose Society will take place at the Westminster Palace Hotel, Victoria Street, Westminster, on Thursday, December 6, at 3.30 p.m. A meeting of the general committee will be held immediately after the annual general meeting to elect the General Purposes Committee for the ensuing year. The thirtieth annual dinner will take place at the Westminster Palace Hotel, Victoria Street, Westminster, on Thursday, December 6, at 5.30 p.m., the President in the chair. Members and their friends, including ladies, are invited to attend this annual gathering of Rosarians.

NATIONAL SWEET PEA SOCIETY.—The annual general meeting will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, S.W., at 3 p.m., on Thursday, December 6.

CHRYSANTHEMUM SHOW AT EDINBURGH.—In addition to the medals awarded to honorary exhibitors, as stated on page 363 of our last issue, Mr. JOHN DOWNIE now informs us that he received a Silver Gilt Medal for a group of Conifers, and Mr. DAVID W. THOMSON, Murrayfield Nurseries, Edinburgh, was awarded a Gold Medal for a collection of 380 dishes of Apples. These Apples had been cultivated in 15 districts of England, Scotland and Ireland.

CACTUS DAHLIAS AS GARDEN FLOWERS.—At a meeting of the Committee of the National Dahlia Society held last week, an arrangement was agreed to with the Royal Horticultural Society to have a trial of true Cactus Dahlias next year at Wisley, for the sole purpose of testing the merits of diverse varieties, especially those sent for trial, as regards their garden decorative qualities. The arrangement includes the making of awards to the most suitable varieties by a Joint Committee of twelve members of the Floral Committee and the National Dahlia Society respectively, during the month of September next. There is more room for improvement as garden-decorative plants, in the Cactus Dahlia Section, than in any others. Generally the plants grow too tall, the flowers have weak stems, and are apt to be too much hidden by foliage. Hitherto these Dahlias have been too much regarded as show flowers only, now some effort is at last to be made to create a garden decorative section. Pompon cactus forms will be included in the trial.

FIRST STEPS IN GARDENING.—By WALTER P. WRIGHT and EDWARD J. CASTLE (CASSELL & Co., LTD., London, Paris, New York, and Melbourne). We have here two experienced horticulturists "showing beginners how to succeed with many of the most popular flowers, fruits and garden crops." Indeed, if the novice fails after reading this book it will be his own fault, for the necessary information is plainly put and illustrated with clear photographs. Bulbs, Roses, and other favourite flowers, indoors and out, vegetables, fruit, herbs; all these receive consideration in a series of short, practical essays. The authors claim that "nature is made the teacher," and certainly it was wisely done to explain the why and wherefore of the various operations recommended, and to refer, though briefly, to the functions of roots, leaves and other parts of plants and their several requirements. The illustrations are numerous and useful, so that the book is one of the best of its class.

CHECKING STRAWBERRY DISEASES.—In a recent number of *The Journal of the Board of Agriculture* useful instructions are given for checking certain diseases in Strawberries. For leaf spot (Sphaerella fragariae) it is advised that:—Bordeaux mixture, half the normal strength, should be used on the first indication of the disease. This is important, as when the fruit is set, spraying must cease. As the fungus forms its fruit on the decayed leaves, these should be removed, and the most effective method is by burning. In the autumn sprinkle a thin layer of straw over the entire bed and set it on fire; by such means not only all diseased leaves, but also spores lying on the ground, are destroyed. This may at first sight appear to be a drastic method; nevertheless, experience has proved it to be highly successful, and followed by a luxuriant growth of healthy and vigorous foliage.

———Strawberry Mildew (Sphaerotheca castagnei, Lev.).—During recent years Strawberry growers have experienced serious loss, due to the presence of a fungus which completely covers the ripe fruit with a dense white mildew. Although usually only noticed by the grower on the fruit, the fungus generally occurs first on the under surface of the leaves, where it is not so conspicuous as when growing on the fruit, yet it is only during the early appearance of the fungus on the leaves that remedial measures can be applied with any hope of success, as spraying must cease after the fruit is set. Bordeaux mixture, half the normal strength, may be used, or the foliage should be thoroughly sprinkled when damp with a mixture of one part of quicklime and two parts of flowers of sulphur. Great care should be taken to cover the under surface of the leaves, and the soil should also be treated. As the Strawberry fungus is the same as the one causing Hop mildew, care should be taken to prevent the disease passing from one plant to the other.

NEW ZEALAND INTERNATIONAL EXHIBITION.—This exhibition promises to be one of the largest and most successful ever held in any of our Colonies. The exhibition buildings have been erected adjoining the prosperous Cathedral city of Christchurch in the provincial district of Canterbury. The exhibition by itself is well worthy of a visit, and, in addition, the tourist will have the opportunity of visiting the many scenic and other attractions of the islands of New Zealand with its great Alpine ranges and wonderful thermal springs. Anyone, therefore, in this country intending to be away during the winter and enjoy the brighter skies and more genial temperature of the New Zealand summer, should ask the High Commissioner for New Zealand (13, Victoria Street, London), for further particulars of the exhibition and the country in which it is being held.

DENDROBIUM CHRYSANTHUM.

A VERY fine specimen of Dendrobium chrysanthum, having 1,016 well-developed flowers, is shown at fig. 143, the photograph having been sent us by J. E. Riley, Esq., Arden Hall, Accrington (gr. Mr. R. Hutchinson). The plant has 38 pseudo-bulbs, the largest being 5 feet 4 inches long, and it bore 73 flowers. It is growing in an ordinary plant-stove, suspended from the roof, in a basket 22 inches in width. Above the plant are Stephanotis floribunda and Allamandas for affording shade, and in the same house there are other Dendrobiums, Cattleyas, Cypripediums, Coelogynes, &c. On the front stage there are Codiæums, Cordylines, Caladiums, Palms, and Ferns all succeeding well.

FIG. 143.—DENDROBIUM CHRYSANTHUM WITH MORE THAN A THOUSAND FLOWERS.

NURSERY NOTES.

WINTER-FLOWERING BEGONIAS AT MESSRS. JAS. VEITCH AND SONS.

STANDING recently in one of the excellent plant-houses in the Feltham Nurseries of this firm, it seemed passing strange that the winter-flowering section of Begonias could still be considered in some gardens a section of plants difficult of cultivation. Immediately in front of us were several hundreds of plants of the variety Winter Cheer, and there was not an indifferent plant amongst them. They were growing in 4½-inch or 54-size pots, were nearly, or quite, 18 inches in height, and all were flowering strongly and profusely. Each plant appeared to have all the leaves it ever possessed still in the best possible condition, thick in texture, and deep green in colour. The semi-double flowers of reddish carmine colour crowned the erect growths in a manner that is conducive to an excellent effect when the plants are thus grouped together. The pretty little Agatha, which resulted from a cross between Begonia socotrana and the tuberous-rooted "Moonlight," was flowering freely in the same house. In general effect this variety is somewhat suggestive of a dwarf-growing type of Gloire de Lorraine, but the flowers are more persistent, and the plant has certain other good characteristics which are not possessed by Gloire de Lorraine, popular though this latter variety undoubtedly is with most cultivators. Agatha compacta is of even dwarfer habit, and was flowering abundantly in 3-inch pots. The variety John Heal was the first of these hybrids raised, and, though it is not equal to the later hybrids, it was regarded at that time as a first-class acquisition. The plants are dwarf-growing, and flower very well in 3-inch pots, the blooms being single. Ensign has an erect, bold habit, which is similar to that of Winter Cheer, but the flowers are of a light shade of rose. Winter Perfection is a double-flowered variety of a shade of pink, and Julius is certainly one of the most attractive. Its flowers are exactly the shade of pink so familiar in Nerium Oleander. The plants were growing in pots 4½ inches in diameter, and the plants themselves were rather less than 1 foot in height. Mrs. Heal may be described as the brightest in colour of these Begonias, being red, but of a rather different shade than Winter Cheer. The flowers are single, and the variety blooms rather earlier than some of the others. Amongst the earliest of all may be men-

tioned Ideala and Success, which have been exhibited many times this season, but are now past. Sunray has smaller, rather deeper-coloured flowers than Winter Cheer. The greatest novelty of the varieties already named is Elatior, which gained an Award of Merit from the R.H.S. Floral Committee on Oct. 27, 1906, in the present season. It is a semi-double flowered variety, of rosy carmine colour, somewhat dwarf in growth, and slender in habit. Plants in 3-inch pots were flowering satisfactorily. Flatior has not yet been distributed. An unnamed seedling attracted our attention, not so much by reason of its habit of growth or superiority in flowering, but owing to the flowers being of a shade of orange colour. The plant has rather coarse foliage, and the flowers might be of better quality, but it possesses a colour that previously was unrepresented in these hybrids. There is no colour we can call to mind that is more effective in winter than rich orange, and it may easily be imagined how welcome in these dull, cheerless days a group of Begonias would be were the flowers of a rich shade of this colour. The seedling, therefore, in Mr. John Heal's hands may be of great value for use as a parent in future crosses.

We have left until last any mention of the species B. socotrana, one of the parents of all these most useful hybrids. It is regarded with much appreciation even in the present day, and when the plants have attained to a good size its single, mauve-coloured flowers are very effective. This brings us back again to the question of cultivation. Gardeners seem sometimes to forget the nature of the parentage of these hybrids, and the result is that they are less successful with them than they could wish. Begonia socotrana is wholly fibrous-rooted, but it was crossed with varieties of the tuberous-rooted section. The hybrids, therefore, are neither one nor the other, but an admixture of both. This circumstance needs to be remembered at all stages of the plant's growth, and it should especially be given consideration as bearing upon the water supply. The hybrids do not require so much water as tuberous-rooted varieties, nor will they flourish if such a supply is imposed upon them. As we looked upon the batch of Winter Cheer, Mr. Heal informed us that those magnificent plants were but cuttings early in the summer of the present year. This skilled cultivator, who, having been the means of bringing the hybrids into existence, has a first-hand knowledge of their requirements, assured us that, where failure is now experienced, in nine times out of ten it is due to excessive waterings. The plants make part of their growth in autumn, and they flower in winter, when transpiration and evaporation is of very limited degree; therefore, with their succulent foliage, they have no need for the free root-waterings that are necessary for tuberous-rooted Begonias when flowering in the height of summer. We emphasize this point in order that those cultivators who have had some difficulty in growing these Begonias may at least try the effect of so simple a remedy. After the flowering period is passed the plants are kept in an atmospheric temperature similar to that of a warm greenhouse, and abundance of air is afforded when the conditions out of doors will allow. The roots will be kept moderately dry, being afforded water once a week or so, according to the weather. The culture is directed to getting the tuber to swell properly and to mature fully, for which purpose it is necessary to keep the leaves healthy and green as long as practicable. The young growths, when large enough, in April or May, will be removed from the axils of the leaves, and used as cuttings for the increase of stock, and at the beginning of the month of June the plants will be cut down to about 2 inches from the base.

VARIOUS PLANTS IN OTHER HOUSES.

There are numerous glasshouses, and most of them are 100 feet long and 12 feet wide, all of them possessing span roofs. There are some structures larger than these, such as the Carnation house, which is 100 feet long and 18½ feet wide, divided into two compartments; the Rhododendron house, which was transported from Chelsea, and the Vineries, which are 120 feet long and 23 feet 6 inches wide, each being divided into two divisions.

We have alluded to the Carnation house, and have only to add in respect to it that the structure is full at the present time of well-grown plants of the "tree" and Souvenir de la Malmaison sections, which are succeeding well under the care of Mr. Weeks, who has had charge of the soft-wooded plants for many years past.

The Lapagerias are now cultivated at Feltham, and there are many plants in pots suitable for moving and, in addition, stock plants with their growths layered into a large bed. The varieties are the well-known L. alba and the Nash Court variety of L. rubra, which is kept true by the system of layering. Many of the Hippeastrums are planted out in beds, whilst

FIG. 144.—NARCISSUS VIRIDIFLORUS.

others are in pots. There are hundreds of seedlings in a very young state now growing three together in a pot.

In a more advanced stage of growth, numerous Streptocarpus were observed in another house. Messrs. Veitch's strain is now, said Mr. Heal, fixed in respect to colour, it being possible for the purchaser to obtain seeds that will produce flowers of the particular colour he desires.

There were good batches of Gesneria exoniensis, with the richly-coloured hairy leaves characteristic of the species, and which will soon produce their brilliant orange-coloured flowers; Eupatorium vernale, Clianthus, Boronia megastigma, Primula × Kewensis, Corydalis thalictrifolia, Echium Wildpretti, Cheiranthus × Kewensis (an extremely sweetly-scented Wallflower that flowers well in winter and early spring in pots); Jacobinia coccinea, and the equally desirable J. chrysostephana (yellow); Kalanchoe flammea, and other hybrids growing in 5-inch pots, the plants being at the present time about 1 foot in height; Senecio auriculatissimus, Cinerarias in batches of distinct types, including the variety exhibited under the name "Antique Rose"; Gerberas, which at the present time are being kept somewhat dry at the roots; an excellent collection of Nerines; and other miscellaneous plants in houses and in the numerous frames and pits, but which we are unable to mention individually.

The vineries contained a fine stock of young pot vines ready for delivery, and in other fruit houses there were collections of Fig trees, Oranges, &c.

THE OUT-OF-DOORS DEPARTMENT.

The principal feature out-of-doors is that consisting of the collection of fruit trees covering about 40 acres of land. Some young Apple trees that had been lifted and were lying upon the land were extraordinary for the amount of fibrous roots they possessed. They well illustrated the good effects of frequent transplantation. Most kinds of fruit trees were included in the plantations, and we need only remark upon the good appearance they had, and upon the unusually fine batches of pot trees for orchard-house cultivation, and of trained trees for cultivation against walls and trellises.

Some standard Mulberry trees of good size were an uncommon feature. Of trees and shrubs there are large quantities, especially fine being the young trees of the common Yew. One hundred thousand Seakale plants are grown here for sale each year.

In every department of this Middlesex nursery the good culture so long associated with the name of this firm was observable, but it should be remembered that Messrs. Veitch have other extensive nurseries at Langley, Buckinghamshire, and Coombe Wood, Surrey.

NARCISSUS VIRIDIFLORUS.

THIS is a species differing from all its relatives by the narrow green segments of its perianth. It is a native of Southern Spain and the opposite African coast, and is cherished as a curiosity by plant-lovers, though we expect the Narcissus Committee would not have a good word for so inconspicuous a member of the Daffodil genus. It is figured in the late Mr. Burbidge's book on the Narcissus, and was exhibited lately at the R.H.S. by Messrs. Barr and Mr. Reuthe.

LAW NOTE.

LEGISLATION FOR NURSERYMEN.

AS so many nurserymen are approaching members of both the Upper and Lower Houses of Parliament with a view to enlisting their sympathy with the movement to extend the benefits of the Agricultural Holdings Acts to land cultivated by nurserymen, seedsmen, and florists for the purpose of their business, the writer has been at some pains to ascertain what objections have hitherto been urged against the movement, and for this purpose he has spent some hours in the House of Commons discussing the matter with various members of Parliament. Want of space forbids any lengthy reference to the subject, but the following are the points which should be emphasised in seeking to gain adherence to the movement in question:—(1) There is no doubt that, presumably by oversight, an invidious distinction at the present time apparently exists between the legal position of market-gardeners and nurserymen. The law officers of the Crown have already given their opinion to this effect. (2) Although market-gardeners have enjoyed the benefits of the Acts for the past 23 years, nurserymen have hitherto made no movement on their own behalf, simply because they erroneously believed until a few weeks ago that they were on an equal footing with market-gardeners. (3) The extension of the benefits in

question to nurserymen would not enable the latter to bring enormous claims against their landlord in respect of growing stock left behind at the end of their tenancy. The Market-Gardeners' Compensation Act only gives compensation, so far as growing stock is concerned, for the planting of standard or other fruit trees and fruit bushes *permanently* set out, and the planting of Strawberry plants, or Asparagus, Rhubarb, and other vegetable crops which continue productive for two or more years. Even if there were any room for doubt on the subject, which is not the case, any objection of this kind could be effectually safeguarded by the insertion of a clause to the effect that the amount of compensation payable to nurserymen in respect of growing stock should not exceed a small fixed sum per acre. (4) The real benefits which nurserymen would secure by being brought within the Agricultural Holdings Acts would be found in compensation for such matters as drainage or irrigation works, manuring, arbitration, one year's notice to quit in the case of yearly tenants (instead of six months' notice, as at present), and compensation for erection, enlargement, or alteration of brick buildings. (5) It is true that nurserymen have a common law right to remove the wood and glass portions of their greenhouses, as well as the right to remove their growing stock, but this right gives them no protection in respect of the other matters mentioned. Even if they are given the benefit of the Acts, the nurseryman will still be a heavy loser if, for instance, he has to quit at Midsummer. (6) It is true that many of the large nurserymen own the freehold of their own land, but there are hundreds of others, especially the smaller class, who, for one reason or another, are unable to secure the absolute ownership of their land. (7) The proposed amendment of the law will not affect questions of taxation. Nurserymen are already put on an equal footing with market-gardeners under the Public Health Act, 1875, and the Agricultural Rates Act, 1896. (8) Nurserymen are already under heavy liabilities in respect of workmen's compensation, since the Act of 1900 expressly states that "agriculture" shall include "horticulture." It is gratifying to note that there are already many sympathisers with the movement, and it will be seen from the above list of objections that no argument has yet been urged against the proposals which cannot easily be refuted by an explanation of the true position of matters. *H. Morgan Veitch.*

PREVENTION OF CORRUPTION ACT.

The Horticultural Trades Association has, as we have already mentioned, recently taken the opinion of a King's Counsel as to the bearing of this Act on the subject of discounts and commissions. The full text of the Act was published in our number for Oct. 20, 1906, p. 279, and we now publish the substance of the questions put to the Counsel and an abstract of his replies.

Counsel was requested to advise:—

1. Whether the giving to a gardener
   (*a*) of a sum equivalent to 5 per cent. upon the amount of the account, or
   (*b*) of an ordinary Christmas gift, if the gift had no relative connection with the amount of his employer's account, or
   (*c*) entertainment or hospitality on the occasion of visits to nurseries, refreshments at show stands, &c.,

would be held to be "corrupt"—i.e., would the smallness of the gift have any bearing upon the question of corruption?

2. Would the offer to a gardener, while still in a situation, of financial assistance in the future event of his losing it and being out of employment be "corrupt"?

3. If the employer is aware of the gift to his employee, would this protect the giver?

4. Would an intimation in the catalogues issued by the nurserymen or seedsmen and circulated among the employers of gardeners to the effect that, "In accordance with long-established custom we shall continue to present gardeners with a commission on our sales unless we are informed that such is contrary to your wishes" be desirable, and would such a statement protect the giver?

5. If the employer is not aware of the gift, but there is a general custom among nurserymen to give these discounts or commissions to gardeners, would this protect the giver?

6. Counsel is requested to advise the association generally what attitude they should adopt, and what advice they should give their members having regard to the existing custom of giving commissions, now that Act has passed.

Summary of Replies.

1. (*a*) In my opinion a gift to a gardener of a sum representing a percentage on the amount of his employer's account would be held to be a "corrupt giving" within the meaning of the Act, whether the amount is the customary 5 per cent. more or less. It would, in my view, fall within the class of acts which the statute was intended to discourage and prohibit.

   (*b, c*) A Christmas gift may, I think, be given if the amount is so small that it could not be intended to operate as an inducement to the servant to assist in obtaining further orders, and in the same way hospitality might be shown if it was reasonable to suppose that the same thing would have been done if no such relation existed between the parties. If the expenditure involved in either case—and especially the Christmas gift—were such that the recipient, having regard to his circumstances, would be tempted to regard it as a payment, it would be within the mischief which the Act was intended to stop. The gift of anything more than a nominal sum would be imprudent and, I think, improper.

2. I think that it would.

3. The knowledge of the employer would prevent the gift being "corrupt," but the employer should be made personally acquainted with all the facts by the giver in writing.

4. This would not be enough unless it could be proved that the information was actually brought to the employer's notice.

5. It certainly would not, in my opinion. The Act was intended to stop commissions, which may, in some cases, be constantly if not invariably paid, and to put an end to the usage.

6. I can only suggest that the association should advise their members to wholly discontinue the practice, and to be careful to do nothing which could influence a gardener to assist in obtaining orders unless full information is given to the employer.

[We must add that, though in this journal we are concerned with nurserymen and gardeners only, yet the law applies equally to all other trades and employments. We are informed, though not officially, that an association is being formed with the chairman of the London Chamber of Commerce as one of its members to take immediate action in support of the new Act.]

TRADE NOTICE.

We are informed that Mr. Daniel G. Purdie, after 17 years' connection with the firm of Messrs. Smith & Simons, has commenced business as a seed merchant at 6, Waterloo Street, Glasgow.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

British Gardeners' Association.—Mr. Watson with the toothache under ordinary circumstances would be deserving of commiseration, but not so when his irritation induces him to dub the whole army of amateurs, many of whom are good gardeners and excellent gentlemen, "tinkers and tailors." For an official of the Board of Works [Agriculture—Ed.] to voice in public such mischievous nonsense is, to say the least of it, very bad taste. A good many of us know that there are gardeners and employers who pull together in the most sympathetic manner, discussing methods and working towards a common end; there are of course others. Gardening is not like anything else and cannot be run on trades-union lines. A garden is a necessary adjunct to the dwelling, and often it is a hobby, the owner knowing just how much he can afford to spend upon that hobby, but when he learns that the mischievous agitator is going to make it cost a third or a half more, he will drop it and his gardener must look for a place on the B.G.A's, register which Mr. Watson pretends to despise. The successful gardener must be born, he can't be made, and unless the instinct is born in him, he can't be successful. Such a man knows little of hours and thinks less. When he has become a half-past five man the slug and the other enemies will have good times. I remember having some correspondence upon this subject, when the movement was first set going, and was told in reply to some of my strictures that it was going to succeed, and would have a following, to which I said that no doubt it would, and the following would include all those aspiring young men, all of whom could be found any evening with their hands washed, their jackets on, and the handle of the door in their hand, waiting for the bell to ring. *T. Smith, Newry.*

——— When Mr. Watson, the cultural chief of the finest garden in the world, champions the cause of the professional gardener, one may be sure he has good reason for doing so. For many years past gardeners from all parts of the kingdom—indeed, from all parts of the world—have passed through his hands, and many of them now occupy leading positions in the horticultural world, at home and abroad. He is therefore in a position to speak with some authority on matters affecting gardeners and their welfare. It is, of course, true—everyone admits the fact—that gardeners, as a class, are the most patient, the most hard-worked, and the worst paid body of workers in the kingdom. I have often wondered how it is that some men in public positions will often vote, with both hands up, in favour of a minimum wage of 30s. a week (to be paid out of the rates) to street-cleaners for about 40 hours a week, and then, in private, to offer a skilled gardener 20s. or less per week of 80 or 100 hours to look after their fruit, floral, and vegetable treasures. And, in addition, perhaps the gardener's wife will be expected to attend to the gate or the wash-tub without any extra remuneration—unless a cottage can be regarded as such. These things take place every day, but the question is, how are they to be stopped? The evils from which gardeners suffer are not new. They are the growth of generations, and are considered to be irremediable, even by some gardeners who ought to know better. But improvement cannot be affected in a moment. It must come about gradually and rationally, one improvement succeeding another, in the same way as a florist's flower is brought to perfection after patient years of work and waiting. The first step towards the improvement of the gardener's prospects and position was taken by the establishment of the British Gardeners' Association, in which Mr. Watson took the leading part. Another step in the right direction would be the exclusion of the tinker, the tailor, the candlestick maker, the coachman, the painter, the old policemen, and other unqualified individuals from assuming the ancient and honourable title of "gardener." Such men delude the employer, and by their inability and ignorance of gardening, bring discredit on the true gardener, who, as Mr. Watson says, is "a simple, long-suffering, good-natured fellow," because he has hitherto allowed these interlopers free access to his preserves without a protest. While I agree in the main with Mr. Watson's views, I regret not being in accord with him that "trade-

unionism would be likely to prove a panacea for righting the wrongs of the gardener. I do not for one moment think that trade-union methods will be the most useful medicine for the gardeners' complaint. The B.G.A. is, I believe, working on the right lines, and shows no inclination to "bolt," as Dr. Masters said. While devoting its energies to the improvement of the professional gardeners' prospects, it has no desire to quarrel with employers who are disposed to be friendly, and to recognise that the trained gardener is a man worthy of better wages and working conditions. The objects of the Association are set forth in the rules adopted at the last annual meeting, and are such that I cannot conceive any gardener or employer taking exception to them. At the present time there are about 970 members in the Association, and if those gardeners who are still outside the professional fold would only exhibit a little more *esprit de corps*, and not sit on the fence so long, the B.G.A. would soon become an organisation—free from the drawbacks of trade-unionism—that would be blessed, not only by professional gardeners, but by all those who were willing to employ and remunerate them in accordance with their experience and ability. *J. Weathers, Hon. Secretary B.G.A., Isleworth, November 20.* [We cannot admit any discussion in these columns as to the merits or demerits of trade unionism in general. We believe the introduction of the more objectionable features of trade unionism would be most detrimental to the prospects of the association.—ED.]

THE BLACK CURRANT MITE.—Mr. Massee is to be congratulated on the result of his researches upon the Black Currant mite (see page 356). It would be interesting to note what the effects of smearing the bark on the branches of the bushes would have on the general health of the bushes. Perhaps Mr. Massee will kindly give us this information as following the results of his experiments. Up to the present time great care has been exercised by practical men not to rub or brush oil or grease on the bark of trees or bushes. For instance, bands of some material are placed round the trunks of Apple trees, and over these some sticky matter is smeared for the purpose of trapping the female winter moth as she crawls up the stem. These bands are placed on the trunks of the trees to prevent the sticky, greasy matter from touching the bark, as it is thought it would be injurious to the trees. This is generally advised not only in this instance, but also in others when treating stems or branches of trees with oil or greasy matter, for the purpose of combating insect and fungi attacks. One interesting circumstance in connection with the Black Currant mite attack came under my notice a short time ago. In a cottage garden on the banks of the Ouse, a few miles north-west of York, are quantities of Black Currant bushes, about half of which on one side of the garden are badly infested with mites, the other half on the opposite side are uninfested, there appears to be a dividing line between the infested and uninfested bushes. The river Ouse at this part overflows its banks during floods. The half of this cottage garden where the uninfested bushes are, is sometimes under water during floods. The bushes are submerged at different depths. In that part of the garden where the water does not reach during flood, the bushes are infested. Some useful experiments might be conducted in districts where the land is sometimes flooded, and where the water when at full height will only reach a short way up the bushes. *Alfred Gaut, Leeds.*

CHRYSANTHEMUMS AT THE CRYSTAL PALACE.—I do not think Mr. Molyneux is quite right in stating (see p. 342) that there is less enthusiasm displayed over the classes for large Japanese blooms. 'Tis true there was less competition this season, but I have good reasons for believing that several growers were too early with their blooms, and did not care to risk the expense of exhibiting when they had not a reasonably good chance of being amongst the prize winners. Probably the Crystal Palace is a difficult place for most exhibitors to get to. Ninety-five per cent. of the visitors present on the first day were gardeners. If the N.C.S. were to hold its exhibitions at the R.H.S. Hall, Westminster, the attendance would probably be trebled, and a large number of ladies and gentlemen would attend which would be to the advantage of the society's funds. Much might be done to make the N.C.S. show more attractive than it is, by providing extra classes for blooms on long stems. Few gardeners can afford to cut 60 blooms for one particular class, but a class for half that number, under the same conditions as required in the large class, would, I think, be well filled. With regard to blooms staged on boards, I cannot see how these can be "swept away out of the show," as the chairman of the committee said he should like to see done. What are to become of the Holmes Memorial Challenge Cups if ever this drastic and absurd treatment is meted out to blooms shown on boards? If the chairman had to take 100 blooms on long stems to various shows in the huge boxes required to contain them, I think he would, after one experience, be glad to modify his statement. Most gardeners that exhibit have to consider expenses, and few employers care to pay heavy expenses on non-successful exhibits. When there are over a dozen competitors in a class, six prizes ought to be given, viz., 1st to 6th. This would stimulate the non-successful to try again. The Anemone and Reflexed flowers should be shown in vases, having a class for, say, 12 vases, distinct varieties, 3 blooms in each vase; very small boxes would be required to contain these flowers. It is the Japanese blooms that need such large boxes which necessitates an assistant as well as the exhibitor to travel with the blooms. Mr. Molyneux is correct in criticising the judgment in the classes he mentioned. Such errors need not be wondered at, for the N.C.S. has no guide for its judges. As the classes for 48, 24, and the 12 Japanese blooms distinct are very difficult ones to judge, I suggest that these three particular classes should be judged last, so that the judges would feel that they had plenty of time at their disposal. Then perhaps there would be time for the first and second prize lots in each of the three classes to be pointed. The points awarded each bloom need not necessarily be put on the cards for public inspection. Five points might be allowed as a maximum, thus: size three, colour one, freshness one. At least 6 inches space should be allowed between each exhibit instead of as is generally the case, placing each stand close against another, making it difficult for visitors to examine properly, and adding confusion in judging. The tabling on which the exhibits are staged could easily be marked off as all the stands are of equal size. The competition in the "Grape" classes is always poor, and if two bunches instead of three of each variety were required more exhibits would be staged. At the recent R.H.S. fruit show two bunches of each variety only were required. *A. J., Essex.*

HYACINTHS FOR BEDS AND GROUPS. For the planting of beds and groups in the open air, it may not be amiss to call attention to some remarks on this subject appearing in *Moller's Deutsche Gartner Zeitung* for October 27, by Messrs. Gt. van Waveren and Kruyff, of Sassenheim, Holland, one of the most important firms of bulb growers. The best Hyacinth bulbs for out-of-door planting are those of middle size, the so-called "miniature size." In former times it used to be thought that the best for this purpose should be of large size, that is, bulbs four and five years old, which carried massive spikes of bloom, which on the whole afforded a very formal and stiff appearance. The miniature bulbs that are better liked to-day have a lighter, more graceful appearance, and it is a great advantage that the empty space caused by the failure of a bulb to grow healthily, is soon filled by the leaves and bloom of the adjacent bulbs. Moreover, the price of these smaller bulbs is proportionately cheaper—120-140 being planted on the square metre. The following varieties are those chiefly employed, blooming at the same time and being equal in growth: Cardinal Wiseman (light red), Gertrude (the same tint as the foregoing), Robert Steiger (carmine), Roi des Belges (dark red), Rose Amaranth (deep rose), Angenis Christina (pure white), Baroness van Tuyll (white), Grandeur a Merveille (pink and white), La Belle Blanchisseuse (pure white), La Franchise (creamy white), La Grandesse, L'Innocence, Madame Van der Hoop, and Pavillon Blanc (the four varieties pure white), Bleu Morant (dark blue), General Cornell'e (porcelain blue), Grand Maitre (light blue), King of the Blues (indigo), La Peyrouse (porcelain blue), Queen of the Blues (sky blue), Regulus (light blue), King of the Yellows (clear yellow), Yellow Hammer, and Sir Wm. Mansfield (violet). The following combinations go well together:—Roi des Belges (middle) and Yellow Hammer (outside); Gertrude (middle) and King of the Yellow (outside); La Peyrouse (middle) and King of the Yellows (outside); Queen of the Blues (middle) and Angenis Christina (outside); Rose Amaranth (middle) and King of the Blues (outside). Double-flowered Hyacinths give but little satisfaction, and rarely open their bells fully owing to cold weather and night frosts; the only exceptions being Princess Alexandra (deep pink), Princess Alice (white), and Blocksberg (blue). *F. M.*

GASTERIA × PETHAMENSIS. This old hybrid if not raised by, was sent out by, the late Mr. Masters, of Canterbury, and is still worthy of a place amongst Gasterias. Although there are many of the larger kinds, very grand and beautiful specimens, which produce flower spikes from 6 feet to 7 feet in height, G. Pethamensis produces a flower stem 2 feet 6 inches long and the plant is about 1 foot in height. It is, I think, rather a scarce plant, and it produces offsets very sparingly at intervals of some years. I find that many Gasterias and Haworthias lose their roots much like a bulb, and afterwards make new ones, probably yearly, especially the Haworthias. I consider both of them very beautiful, some with their pearl-like spots have a very pretty appearance and some are reticulated and tesselated, and the rather rare tesselata alba is most distinct. *J. C.*

LEONOTIS LEONURUS.—This South African plant has been a very handsome object in the garden. Its tubular flowers, 2 inches in length, are produced in whorls in the axils of the leaves on the upper portions of the shoots, four whorls being often carried on the same shoot, and are glowing orange-scarlet in colour. They were clothed with short hairs on the exterior. Thirty-five whorls brightly coloured at one time, and the most advanced, which measured over 14 inches in circumference, had more than a hundred flowers. Of the sixteen flower-bearing shoots the tallest was 5 feet in height. The leaves were 12 inches in length and three-quarters of an inch in breadth, light green in colour and deeply veined. The Leonotis was introduced in 1712, but was subsequently lost to cultivation, and reintroduced about 15 years ago. It is but little known, though it is to be met with in a few gardens in the south-west, where it flowers annually in September and October. It is one of the Labiates, and its flowers, in form and arrangement, resemble those of the Dead Nettle. It is easily propagated by cuttings of the short side shoots in the spring or summer. Should the month of October prove frostless, as it generally does in South Devon, the plant retains its beauty through the full four weeks. *S. W. Fitzherbert.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 20.—*Present*: Dr. M. T. Masters, F.R.S. (in the chair), Dr. M. C. Cooke, Messrs. Gussow, Saunders, Bennett-Poe, Bowles, Rolfe, Worsley, Worsdell, Gordon, Hooper, Massee, Douglas, Shea, Nicholson, and Chittenden (hon. secretary).

Spotting in Apples.—Mr. Gussow said: "The Apples brought before the committee on October 23 by Mr. WORSLEY showed externally a number of depressed spots. When cut, discolorations of the tissues corresponding to the external pits were noticeable; also a number of brownish spots distributed all over the cut surface. To the naked eye the appearance of the spots was spongy. The taste of the Apple was distinctly bitter. This injury renders the sale of the Apples impossible. The cause of the spots finds an explanation as follows: The injury is most prevalent in dry seasons, and confines itself generally to fruits with softish flesh. Those of a firm, hard flesh rarely show these spots. When in dry seasons the flow of organic materials necessary for the full development of the fruits is interrupted, several groups of cells will remain poor in reserve food, and much sooner become exhausted. This exhaustion manifests itself in a brownish discoloration of the tissues. The beginning of this injury evidently takes place in the early stages of the developing fruit. One generally finds the cell-tissues, when viewing them under the

microscope, of a corky nature, and filled with small colonies of starch granules, whilst in the healthy tissues the starch has been already transformed into sugar. The brown tissues are frequently torn. The explanation of this is simple. During the growth the normal tissues only develop, and when normally expanding the injured cells, which, on account of their dry and corky cell walls, have become inflexible, are torn. The manifestation of life is stopped in these cells, and the change of the starch granules into sugar cannot take place. The remedy for this injury is a supply of water to be repeated at intervals during the dry season. It has been found that when nitrogenous manure had been applied the Apples showed more signs of injury than without manure." Mr. G. MASSEE has also shown experimentally that the same kind of trouble may be caused by certain conditions working together during the ripening process. (See *Kew Bulletin*, August, 1906.) The trouble is due to a purely physiological cause, and is not induced by the attacks of either fungal or insect parasites.

Diseased Celery.—Mr. CHITTENDEN reported that the Celery from Colyton shown at the last meeting was attacked by the fungus Septoria petroselini var. apii, and the attack seemed to be a very bad one. The whole of the leaf, blade, and petiole, was covered with the brown spots which show where the fungus was growing, and upon each of these little black spots the "perithecia" of the fungus were abundant. Each perithecium contained large number of spores which were set free on wetting the leaf, and would easily be washed on to other leaves, where they would set up the disease afresh. All the diseased parts of the plants should be destroyed by burning, and a Celery crop should not be taken off the same soil next year. Spraying the plants at intervals of about a fortnight with ammoniacal solution of copper carbonate would probably prevent the recurrence of the disease in a succeeding year.

Diseased Violets.—Mr. CHITTENDEN also reported that he had found the fungus Ascochyta violae upon the Violets shown at the last meeting. This fungus is becoming more and more prevalent upon Violets, and the only plan when the disease has once gained a secure footing seems to be to burn the stock and start afresh on fresh soil.

Fruits of Magnolia.—Mr. W. H. DIVERS sent fruits with ripe seeds of Magnolia Lennei from the gardens, Belvoir Castle, Grantham. The seeds, which are of a bright pink colour and half as large as the seeds of French Beans, are set free by the bursting of the follicles, and hang for some time attached by the long slender funicle.

Fruit of Asclepias fruticosa.—Dr. MASTERS showed on behalf of Mr. HALES, of the Chelsea Physic Garden, the fruits of Asclepias fruticosa. These fruits are large bladdery-looking pods of a white colour, and contain numbers of brown seeds, each furnished with a tuft of silky white hairs at the apex.

Maize varieties.—Mr. S. B. DICKS, F.R.H.S., sent specimens of varieties of Maize grown in the gardens of Mr. C. L. ALLEN, of Long Island, U.S.A., as follows:—

1. A cob of the primitive (?) form, in which the grains are each covered with bracts about an inch to an inch and a half long.

2. A cob of Golden Pop Corn.

3. A cob found on a plant of Golden Pop Corn, but having black grains instead of the usual light-coloured ones; a variation not at all infrequent in Zea Mays.

4. Two cobs from a plant, the result of a natural hybridisation between the (Egyptian?) primitive form with long bracts and the Golden Pop Corn. Although these were picked from the same plant, there was considerable variation in the length of the bracts to be seen, one cob having the grains entirely hidden, while in another they were exposed.

Narcissus viridiflorus.—Messrs. BARR showed this interesting species of Narcissus wild in Morocco and Gibraltar, in flower, having a tall scape surmounted by two flowers having green segments. [See fig. 144, p. 375.]

Autumn-flowering Snowdrop. Mr. BOWLES showed a specimen of Snowdrop, one of many now in flower in his garden. It was apparently a variety of Galanthus plicatus, and it was thought had not previously been seen to flower in autumn in this country.

Bonatea Ugandae (Rolfe).—This Orchid, to which at the last meeting a botanical certificate was recommended, was commented upon by Dr. MASTERS, who drew attention to the remarkable form and size of the rostellum, the length of the caudicles of the pollinia which fitted into long tubes at the sides of the rostellum, and the length of the spur, which reached to between 5 inches and 6 inches.

Uncommon Orchids.—A species of Fleurothallis from R. I. MEASURES, Esq., and Oncidium Walnewa, Rolfe (Leiochilus pulchellus Cogniaux), from H. T. PITT, Esq., of Stamford Hill, were shown at this meeting, and will be further reported upon at the next meeting.

Cattleya Fly.—Mr. BOWLES showed pseudo-bulbs of newly-imported Cattleyas, which were badly infested with the larvæ of the Cattleya fly, Isosoma sp., a pest too well known on Cattleyas. Mr. BENNETT POE suggested that the only way of dealing with the trouble is to collect the affected pseudo-bulbs, which turn black, and burn them.

Change of Food by Birds.—Mr. HOOPER said he had recently met with some remarkable changes in the habits of birds so far as their food was concerned. He had heard from Cornwall of some Tomatos being attacked by blackbirds, but could not hear of Tomatos being injured by any other birds. Again, at Blairgowrie, rooks had been discovered eating Raspberries. Mr. HOOPER is collecting information regarding the food of particular birds that frequent fruit gardens, and will be glad to receive accounts of any exact observations made upon the subject.

Sempervivum Dying.—Mr. O'BRIEN sent a specimen of Sempervivum dead and dried up, one of several that had been affected by some disease. Mr. SAUNDERS will report upon it at the next meting.

YORK CHRYSANTHEMUM.

NOVEMBER 14, 15, 16. An excellent show—the 27th in succession—was held by the above society in the Exhibition Building on the foregoing dates. Nowhere are so many groups of plants displayed as at this autumn show. Cut blooms were fewer in numbers, except in the decorative classes, which were of the usual high standard of excellence. Hardy fruit was shown in less numbers than usual, but it was good in quality. Grapes were excellent. Exhibits of vegetables were numerous and good. Messrs. BACKHOUSE & SON, The Nurseries, York, were given a Gold Medal for a very fine floral display; and a Silver-Gilt Medal was awarded Messrs. W. CLIBRAN & SON for an exhibit of Chrysanthemums.

GROUPS OF PLANTS.

The leading class in this section was for a group of Chrysanthemums interspersed with foliage plants, and occupying an area of 100 square feet. Four competed, and among these Mr. L. Hanchant (gr. to the FREDERICKS HOTEL, Ltd., Harrogate) secured the 1st prize. Mr. G. COFTAM, Alma Gardens, Cottingham, Hull, was a good second.

Mr. J. W. HIELD, Front Street, Acomb, York, won the 1st prize in the class for a group of Chrysanthemums, among four contestants: W. TALBOT AGAR, Esq. (gr. Mr. W. Barnes), Brookfield, York, being awarded the 2nd.

The best group of miscellaneous plants arranged in the form of a pillar 17 feet in height and 6 feet in diameter at the base, was put up by Mr. W. Curtis (gr. to J. BLACKER, Esq., Thorpe Villas, Selby). A class was also provided for a pillar group of decorative Chrysanthemums and green foliage plants. Messrs. E. THEAKSTONE & SONS, The Nurseries, York, were easily 1st among five.

CUT BLOOMS.

The leading class was that for 36 Japanese blooms of distinct varieties. Mr. W. IGGULDEN, Frome, Somerset, secured the leading place with medium-sized, well-arranged blooms, which were not much superior to those shown by Lord LONDESBOROUGH, Market Weighton (gr. Mr. J. McPherson), which were awarded the 2nd prize. The last-named exhibitor won in the class for 18 Japanese blooms, distinct, Lord FAVERSHAM, Duncombe Park, Helmsley (gr. Mr. D. Williams), following; but Lord FAVERSHAM was 1st among five competitors for 12 Japanese blooms. Mr. McPHERSON, with exceedingly fine examples of Edith Smith, won in the class for six blooms of a white variety; and he also secured a similar award for half-a-dozen flowers of F. S. Vallis in the class for yellow flowers. J. H. Silsbury was remarkably well shown by Mr. WILLIAMS in the class for six blooms of any other colour than white or yellow.

Incurved varieties were of a high order of merit, and it was unfortunate there was not more competition. Mr. McPHERSON easily secured the leading prizes in the classes for 24, 12, and six varieties, with grandly developed examples.

Singles.—Mr. EVERARD had the best half-a-dozen sprays of single Chrysanthemums in such useful sorts as Roupell Beauty, Crimson King, Mrs. Parkinson and Miss Annie Holden.

SHEFFIELD CHRYSANTHEMUM.

NOVEMBER 16, 17.—The annual show of this society was held on these dates in the Corn Exchange. Competition was even greater than was seen last year, although this has not obtained in the majority of flower shows this season.

CUT FLOWERS.

The cut blooms formed the leading feature of the exhibition, and an important class was the Lord Mayor's Vase class. This was for eight vases of Japanese varieties, each vase to contain three blooms of one variety. Four growers competed, the best flowers being shown by Mr. W. G. DRAKE, Cathay's Terrace, Cardiff. Among his best examples were Chrysanthemum Montigny, Miss E. Thirkell, and Mme. P. Radaelli; 2nd, The Dowager Lady HINDLIP, Hadsor House, Droitwich (gr. Mr. C. Crooks).

Twenty-four Japanese blooms, distinct.—Mr. F. S. VALLIS, Bromham, Wilts, easily won the 1st prize among eight exhibitors with a set of full-sized, well-coloured examples of Magnificent, F. S. Vallis, Reginald Vallis, J. H. Silsbury, Mrs. W. Knox, &c. Mr. DRAKE followed with good but smaller flowers. Mr. VALLIS repeated his success in the class for 12 Japanese blooms.

Incurved varieties were remarkably well shown. In the important class for 24 blooms, Mr. DRAKE's flowers were much superior to those of all other competitors. He had large, well-finished examples of W. Biddle, Godfrey's Eclipse, Mme. B. Hankey, C. H. Curtis, Pantia Ralli, and Doris Rayner. F. W. JAMESON, Esq., Aston Hall, North Ferriby (gr. Mr. J. Jennings), was awarded the 2nd prize. Mr. DRAKE had also the best 12 Incurved blooms in the smaller class for that number of flowers. The one-time important section of the Incurved varieties—the "Rundle" family—is still provided for in the schedule at Sheffield, and the flowers are very pretty, arranged with their own foliage. A silver cup is offered for two blooms of each of the varieties Mrs. E. Rundle, George Glenny, and Mrs. Dixon. Mr. H. BRAMMER, Walkley Bank, secured the trophy with clear but somewhat small blooms; 2nd, Mr. W. FENWICK, Rueben Street, Park.

Pompones were well shown in bunches of six by S. R. FLOWERDAY, Esq. (gr. Mr. Topham).

Singles.—Seven exhibits were seen in a class for six vases of single Chrysanthemums, J. G. GRACE, Esq., Riverdale (gr. Mr. C. E. Abbott), winning with desirable bunches of unnamed varieties. The premier position in the class for affiliated societies was taken by the Nether Hallam Chrysanthemum Society.

GROUPS.

Prizes were offered for a group of miscellaneous plants arranged for effect in a space measuring 100 square feet. The premier prize of a silver cup and £5 was won by Alderman G. SENIOR (gr. Mr. T. C. Baker).

Non-competitive exhibits were numerous. Mr. H. J. JONES, Ryecroft Nurseries, Lewisham, had a fine exhibit of Japanese blooms, for which he was awarded a Gold Medal. Gold Medals were also awarded to Messrs. SEAGRAVE & Co., Sheffield, who had Chrysanthemum plants associated with foliage plants of other subjects. Messrs. FISHER, SON & SIBRAY, Handsworth Nurseries, Sheffield, for Hollies, Ivies, Conifers, &c. Messrs. ARTINDALE & SON, Sheffield, who exhibited floral decorations. Mr. W. G. GODFREY, Exmouth, staged Chrysanthemums and Zonal Pelargoniums, for which he received a Silver-Gilt Medal.

LEEDS PAXTON.

NOVEMBER 20, 21.—The eighteenth annual Chrysanthemum show of the above society was held in the Town Hall, Leeds, on these dates. The displays of cut blooms, fruit, and vegetables were a decided improvement on those of any previous exhibition held by this society. The show was opened by the Lord Mayor of Leeds.

Group classes.—The exhibits of groups generally were better than those seen last season. In the class for a miscellaneous group of plants occupying an area of 70 square feet, J. PICKERSGILL, Esq., Bardon Hill, Weetwood, Leeds (gr. Mr. J. Donoghue), secured the 1st prize for a prettily-arranged exhibit containing some splendid and well-grown Orchids. The best group of Chrysanthemums arranged in a space measuring 70 square feet was shown by Mr. L. HANCHANT, Hotel Majestic, Harrogate, and he was followed by O. B. SIMPSON, Esq., Adel, Leeds (gr. Mr. A. Lupton). Other prize winners in the group classes were T. WINN, Esq. (gr. Mr. H. Dennett), P. GREEN, Esq. (gr. Mr. T. Saunders), and J. PICKERSGILL, Esq. (gr. Mr. J. Donoghue). The last-named exhibitor displayed the best table among nine decorated with Begonias, Lily of the Valley, and cut foliage.

CUT BLOOMS.

The chief class was that for 36 blooms of Chrysanthemums, to include 18 Japanese and 18 Incurved varieties, and for which a challenge cup was offered. Mr. DRAKE, Cardiff, staged the premier collection, and he was followed by Mr. THORNTON, Lamb Hall.

In the local classes, for which a challenge cup was also offered, there were three remarkably good exhibits, and there was little to choose between the 1st and 2nd prize groups staged by JOSEPH BYLE, Esq., Asket Hill, Roundhey, Leeds (gr. Mr. C. Shaw), and JOSEPH PICKERSGILL, Esq., (gr. M. J. Donoghue) respectively. The first-named exhibitor was also successful in the principal local classes.

FRUIT AND VEGETABLES.

The best two bunches of Black Grapes were shown by Mr. O. PILLING, and the best two bunches of white by A. WILSON, Esq., Tranby Croft, Hull. In the classes for single dishes of Apples and Pears prominent prize winners were Messrs. D. WILLIAMS, O. PILLING, and CROSSFIELD.

The principal prize winners in the vegetable classes were Messrs. GROUNDWELL, O. PILLING, BAILEY, and SHAKLETON.

Many trade exhibits of excellent quality were staged. *J. F. D.*

ROYAL METEOROLOGICAL.

NOVEMBER 22.—At the meeting of the Royal Meteorological Society on this date, Mr. W. Marriott read a paper on "The abnormal weather of the past summer and some of its effects."

The principal features of the weather over the greater part of England—especially the south-east—were the high state of the barometer throughout the whole of the period, except a portion of August; the high temperature in July, August, and September; the great amount of sunshine; and the deficiency of rainfall. Over the south-eastern portion of England more than 900 hours of bright sunshine were recorded during the four months June to September; while at a few stations in the extreme south and on the east coast, over 1,000 hours were recorded. The sunshine was more than 200 hours above the average over the Thames basin and on the coasts of Lancashire and North Wales.

The most remarkable feature of the weather during the past summer was the exceptional heat wave which occurred between August 30 and September 3. The temperature rose above 90° over a large part of England on four consecutive days, viz., August 31-September 3. Mr. Marriott has not been able to find any previous record of readings over 90° for a similar period. The air was very clear, and brilliant sunshine prevailed over nearly the whole of the country. Another remarkable feature connected with this heat wave was the great dryness of the air; for on September 1 and 2, differences of 25° [?] were observed between the readings of the dry and wet bulb thermometers, and relative humidities below 30 per cent. were recorded at many inland places. Owing to the great heat, vegetable matter became very inflammable, and consequently there were more stack fires than usual, and extensive stretches of heather and gorse were also set on fire.

The author said that with the advent of the hot weather the death rate increased considerably, and he pointed out that when the mean maximum temperature for the week reached 72° the death rate at once began to rise. The increase of the death rate was made up almost entirely of infants under one year of age. This was shown to be due to the prevalence of infantile epidemic diarrhœa, which sets in when the mean maximum temperature for the week rises above 72°.

Attention was called to the effect which the high temperature had in turning milk sour, and in rendering it unfit for drinking purposes unless it had been first Pasteurised or sterilised. Not only was the ordinary milk a source of danger to infants during the hot weather, but the great use which is now made of tinned foods also tended to produce ptomaine poisoning and cause diarrhœa.

Owing to the drought, food for cattle was very deficient, and consequently there was a falling off in the milk supply of as much as 30 per cent.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 27. The annual dinner of the above society was held at the Holborn Restaurant on this date, under the chairmanship of C. E. Shea, Esq., president of the society. About 115 members and friends assembled, and included in the company were many ladies. Dinner was laid in the Royal Venetian Chamber, which was prettily decorated with flowers, plants, and fruits contributed by some of the supporters of the society. Among others present we noticed Messrs. C. Harman Payne, Thomas Bevan, J. H. Witty, Henry Cannell, H. J. Jones, D. B. Crane, Eric Such, E. Hawes, S. Mortimer, J. W. Moorman, G. Castelton, Bryan Wynne, W. Howe, &c.

After the usual loyal toasts had been duly honoured, the Chairman proposed the principal toast of the evening, "The National Chrysanthemum Society." He contrasted the Chrysanthemum of to-day with the flower at the time when the National Society was instituted, and he regarded the advance to be due in no small degree to the efforts of the parent society. This progress was greatly the result of competitive shows, and especially was this true in the case of the single varieties, which had lately found great favour with the public. Striving to be first brought out many good qualities in a person, and it was a healthy and ambitious bent to endeavour to excel in competition. The Chrysanthemum was essentially a poor man's flower, and it gave him great pleasure to attend the Chrysanthemum shows in the East End of London, and also to see the brightness the Chrysanthemum brought into the homes of the poor. He instanced the case of one exhibitor at the People's Palace, who informed the speaker that the money which he formerly spent in the publichouse was now devoted to purchasing new varieties of Chrysanthemums. He was proud of the *personnel* of the society, and congratulated the members on their admirable committee. He regretted the loss of their popular treasurer, the late Mr. A. Taylor, but he had confidence that, as the old members drop out, others will step forward to fill the gaps. He was impressed with the forward movement seen at the shows, and especially with the decorative aspect as distinguished from the mere competitive character of the exhibitions. They must cater for the multitude, and endeavour to attract the public with a beautiful display. He was especially pleased to notice in this direction that at some provincial shows, such as at Edinburgh and Birmingham, the show board had been entirely eliminated. However, they must "make haste slowly." The use of vases has two concurrent results: it limits the number of varieties shown and raises the cost of transit. By selecting the best 15 varieties only, much other beautiful material is lost to the shows, while the transit of flowers with long stems, &c., is a matter of expense and difficulty. At the recent autumn show he looked in vain for many old favourite flowers. Avalanche was absent, nor could he find a single example of Edwin Molyneux. He concluded by asking what would our country do without the Chrysanthemum, and what would the Chrysanthemum do without the National Society?

The President then proceeded to distribute the prizes to the successful exhibitors.

Mr. J. H. Witty proposed the toast of "The Donors of the Special Prizes." He pointed to the good example set them by their president in this matter, and regretted that, owing to its having now been won outright, the trophy presented by the Ichthemic Guano Co. was lost to the society, although the committee were hopeful of its being replaced.

Mr. J. A. Botham, assistant manager to the Crystal Palace Company, in replying to this toast, said that he regretted that his society had been unable to fulfil all their promises in the matter of special prizes, but it was due to the action of certain underwriters, who had pressed upon his company, but he was glad to say the Crystal Palace affairs had improved, and he saw better prospects for them in the future. The National Chrysanthemum Society would always be welcomed at the Palace at Sydenham.

Mr. T. Bevan, chairman of the General Committee, in replying to the toast of "The President, Vice-President, and Officers of the Society," appealed for increased support. They now hold four shows, but they have managed to pay their liabilities and accumulate a small reserve fund. The proposed *Year Book* was a new departure, and this they hoped to issue shortly. The committee were endeavouring to increase the value of the prizes offered at the society's great show during the coming year, in order to attract the best flowers. The society is now affiliated with over 130 other societies, which naturally look to the parent society to lead the way, and they must endeavour to have the best at their exhibitions.

Mr. Richard Witty, secretary, also replied.

The chairman vacated the chair at this stage of the proceedings, and Mr. Thos. Bevan was voted in his place.

Mr. Harman Payne, in proposing the "Affiliated Societies and Exhibitors," advocated the holding of a provincial show in connection with the affiliated societies.

Other speakers were Messrs. Henry Cannell, E. F. Hawes, R. B. Leech, W. Harrison, D. B. Crane, H. G. Cove, F. W. A. Scholl, and W. G. Bunn.

Obituary.

M. O. THOMAS, OF METZ.—We learn from the *Revue Horticole* of the death, on November 3, of this distinguished fruit-cultivator and pomologist. His *Guide Pratique de l'Amateur des Fruits* is a useful work of reference. M. Thomas was in his 63rd year.

MR. W. PARNELL.—We regret to learn, as these pages are passing through the press, of the death of Mr. W. Parnell, the outdoor foreman at Glasnevin. We shall give fuller particulars in our next issue.

ENQUIRIES AND REPLIES.

HEATH'S BOOK ON VIOLETS.—Can any reader inform me where Heath's Book on Violets can be procured? *Percy Alldis*

EVAPORATING FRUIT.—Can any reader tell me where I can obtain a stove, small size, for evaporating fruit? *W. Bailey.*

PLANT PORTRAITS.

PEAR DOYENNÉ GEORGES BOUCHE.—A seedling from Doyenné du Comice, but more prolific, and lasting till February and March. Puget-Gundon in *Revue Horticole*, November 1.

GORDONIA GRANDIS.—A Camellia-like evergreen shrub, described as having the foliage of the Laurel-Cherry and the large white flowers of a Cistus. *Revue Horticole*, November 16.

LOTOSOPS TOURNEFORTH.—A white-flowered species with much divided, spine-tipped leaves and dense covering of thread-like hairs like spider's webs. *Revue Horticole*, November 16.

ANCISTROPHYTUM.—A tropical African Cucurbit, flowering in the Brussels Botanic Garden. *Tribune Horticole*, November 17.

ANSWERS TO CORRESPONDENTS.

CHALLENGE TROPHY COMPETITION: *Interested.* Before offering a Challenge Trophy for competition over a number of years, a Committee should take every possible care to state the conditions of the competition so accurately and definitely that alterations will not be called for until the Trophy has been won outright by someone. When circumstances arise that make an alteration necessary the Committee should take into their confidence those exhibitors who have already competed for the Trophy, and if possible obtain their approval. We are speaking, of course, of cases in which it is possible for an exhibitor to acquire the Trophy as his own personal property, and who therefore, having won it once, may be considered to have a kind of vested interest in it. In cases where the Trophy is only held for one year and at the expiration of that time is returned to the Committee, the circumstances are quite different, because an entirely new competition is commenced each year.

CHRYSANTHEMUM LEAF MINER: *F. J. P.* The leaves are injured by the leaf miner. Preventive measures would include the spraying of the plants with quassia extract, or other distasteful liquid in order to prevent the females from depositing their eggs upon the leaves. Remove badly affected leaves and burn them. You will find a page illustration and a note of this pest in the *Calendar of Garden Operations*, to be obtained from our publisher, price 7½*d*., free by post.

CUCUMBER SPOT. *H. J. P.* The spores of all fungi are very minute, and it need excite no wonder how the disease entered your stock. You could easily convey the spores on your clothes, or it may have been carried by the wind. Spraying the plants with liver of sulphur, half ounce to two gallons of water, is the best treatment, but be careful of the paint, which is turned black by this substance. If your houses are empty cleanse them thoroughly, using a little carbolic acid in the water when you scrub the woodwork, &c.

CYANIDISING PLANT HOUSES: *Fotpanshire.* We have recently published much correspondence on this subject. On page 222, April 7, 1906, is given a figure of a simple apparatus for cyanidising plant structures, accompanied by a note on the subject by Mr. J. G. Blakey. Other articles on cyanidising will be found in our issues for February 10, 1906, p. 85, and March 3, 1906, p. 142.

DAMAGED PEACH TREES: *T. S. L.* You have not forwarded the tenancy agreement, the wording of which may materially affect the position. You state that the land was let as a nursery, but the facts you mention appear to imply that the land was used as a market garden. If you have read the recent legal articles in these columns, you will have observed that nurserymen and market gardeners are entitled at the end of their tenancy to remove even fruit trees in full bearing, provided they are really nursery trees, and not trees of such a size as to render it impossible for them to be dealt with in the way of trade. Similarly the tenant could have removed his greenhouses, and presumably he failed to do so either through ignorance or on account of some special agreement with you. If the land were used as a market-garden under such circumstances as to cause the Market-Gardeners' Compensation Act to apply, then the tenant would be entitled to recover from his landlord compensation for any fruit trees permanently set out which he may have left behind him. There are no facts mentioned in your letter which would enable the landlord to obtain redress from the tenant; in fact, unless there are special circumstances which you have not stated, it looks as though the tenant had not exercised his full rights, though his intentions may have been malicious.

FIGS: *J. L. W.* We cannot say whether the tree is attacked by the fungus disease (Cercospora) unless we receive specimens. You do not say whether the foliage is spotted or blotched. The falling of the "fruits" at the stage you mention would appear to indicate the presence of disease, or lack of fertilisation of the flowers, which of course grow in the receptacle we call "fruits."

FUNGUS: *G. J.* Your specimen is the Hard Puff Ball, Scleroderma bovista. It is not edible.

FUNGUS ON ELMS: *J. F. J.* The fungus is Nectria cinnabarina, a common species on dead and decaying timber, and one especially common on the Red Currant. The mycelium is often present in the tree much beyond the parts where the red conidial condition appears. Diseased branches should be cut off and burned, as should also rotten sticks lying on the ground. We suspect the trees were too large to be shifted without suffering serious check and are dying in consequence, the fungus being ever present and ready to assist in the work of destruction.

HORTICULTURAL LECTURER: *Enquirer.* We do not know that the Royal Horticultural Society's interesting gardens at Wisley offer facilities for the making of a good lecturer. Audiences in such a place would be, we imagine, very small and occasional. But the gardens contain a great variety of interesting plants, a knowledge of which would go a considerable way towards furnishing the experience a professional horticulturist must acquire, and we take it you must be a horticulturist first and a horticultural lecturer afterwards. We do not know what your present experience and knowledge of the principles which underlie horticultural practice amount to, nor to what particular branch of gardening you intend to devote your lectures. But if it is a County Council lectureship for which you are anxious to qualify yourself, out-of-doors gardening will be most important, particularly the cultivation of fruits, vegetables, salads, and such flowering plants as may be grown in cottagers' gardens. Fencing, hedge-making and cutting, draining, and all the operations pertaining to the cultivation of land should be studied, together with the means available for combating insect and fungus pests. In these circumstances we think if you go to Wisley you should make up your mind to learn as much as possible during your stay there. Make a change after the expiration of one year.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Gih.* Bleuheim Pippin. *D. R.* 1, Leon Leclerc de Laval; 2, Beurré Ananas; 3, Claygate Pearmain; 4, Harvey's Remette; 5, Mère de Ménage; 6, Malster. *I. H.* 1, Wealthy; 2, Cornish Aromatic; 3, Beurre Bachelier. *Eton.* The Pear was decayed. Apple, Wyken Pippin. *W. S.* We cannot name such tiny Apples. The Pear is Black Worcester. *J. C. W. & Son.* Hanwell Souring. *I. Dixon.* 1, Passe Colmar; 2, Knight's Monarch; 3, Blue Pearmain; 4, Scarlet Leadington; 5, Stirling Castle; 6, Baldwin; 7, Orange Pippin; 8, French Crab. *Pinehurst.* Baron de Mello.—*F. P.* Nanny Apple. *G. B.* 1, Gascoyne's Scarlet Seedling; 2, Harvey's Wiltshire Defiance; 3, Too poor to be named; 4, Bergamot d'Esperen. *W. D. S.* Golden Ducat. *W.* 1, Hanwell Souring; 2, Grange's Pearmain; 3, Belle Dubois; 4, Melon; 5, Pitmaston Nonpareil; 6, Aston Town. *E. C.* 1, Dumelow's Seedling (Wellington); 2, Remette du Canada; 3, Golden Harvey; 4, Margil; 5, a poor specimen of Cox's Orange Pippin.

NAMES OF PLANTS: *J. Smith.* 1, Nephrodium molle; 2, Scolopendrium vulgare cristatum; 3, Davallia dissecta; 4, Davallia canariensis; 5, Pteris serrulata; 6, Scolopendrium vulgare. *S. I. B.* Verbascum nigrum. *G. McG.* The leaves are those of Ginkgo biloba, or as it used to be called, Salisburia adiantifolia. The common name "Maidenhair tree" has been given the species owing to the cuneate or wedge-shaped leaves being similar in form to the pinnæ of Adiantum cuneatum. The species was introduced into this country from Northern China, and it is perfectly hardy. It belongs to the natural order Coniferæ.—*G. C. L.* You have mixed your labels. Your No. 2 is Libocedrus chilensis. Your No. 1 is either Cephalotaxus pedunculata or C. drupacea. We cannot tell which from the leaves only. It is certainly not C. Fortunei. *G. M. G.* 1, Euonymus europæus; 2, Leycesteria formosa; 3, Berberis empetrifolia; 4, Berberis Darwinii; 5, Azara microphylla. We wish every one would send as good specimens and as carefully labelled as you do.—*J. H. J.* Planera aquatica.—*H. M. C.* 1, Lupinus arboreus; 2, Juniperus communis; 3, Juniperus sabina variegata; 4, Skimmia japonica; 5, not recognised; 6, Spiræa Thunbergii.—*C. N., Co. Clavdon.* The upright form of Cupressus sempervirens.—*H. H.* Cypripedium insigne Maulei and Adiantum tenerum.—*T. A.* 1, Oncidium cheirophorum; 2, Oncidium pubes; 3, Stelis ophioglossoides; 4, Pleurothallis rubens; 5, Mormodes Buccinator.—*Nil Desperandum.* 1, Oncidium Papilio, but not fully developed; 2, Oncidium prætextum; 3, 3a, 3b, are all forms of Oncidium Forbesii; 4 and 4a, Oncidium tigrinum.—*G. D.* Panicum plicatum. *H. R.* 1 and 2, Codiæum (Croton) interruptum; 3, Codiæum angustifolium; 4, Sonerila Hendersoni; 5, Phyllanthus nivosus; 6, Hibiscus Cooperii.

PARADISE STOCK: *H. H.* This stock, like the Crab stock, is a variety of Pyrus malus (Apple), which has a dwarfing effect upon the varieties of Apple grafted upon it. It is possible that an equally dwarfing stock could be selected from seedling Crabs, and there are already several such varieties known as "Paradise."

POPLARS: *Constant Reader.* It will depend upon the position and conditions in which the trees are growing, and whether they are desired to be 45 feet or 55 feet high. If they offer no disagreeable obstruction, however, the better plan would be to cut them to the point at which they were pruned six years ago. You need not consider the capacity of the tree to support the growth which will result from the pruning, for the lower you prune, the more growth will the tree produce.

POTATO. *W. C. S.* The tuber is badly attacked with the "scab" disease. Add plenty of lime to the soil, mixing them well together.

SPRAYS OF CHRYSANTHEMUMS: *W. W.* The committee should have worded the schedule somewhat as follows: "Six vases of single Chrysanthemums, distinct, each vase to contain six sprays, and each spray to have not fewer than . . flowers. Or, if no thinning at all was to be insisted upon, the word 'disbudded' should have been inserted before the word 'sprays,' deleting the remaining part of the sentence." You will see that we have assumed that the committee intended to have unthinned, or only partially thinned exhibits, and we do this because they employed the word "spray," which in horticultural usage is generally intended to describe something other than a stem which has been thinned to one flower, or as, in the case of composite plants, to one "head" of flowers. We can sympathise with you in suffering the disqualification, because it is partly attributable to the somewhat indefinite manner in which the schedule was compiled. That readers may understand we will quote the wording as it appeared in the schedule: "Six vases of single Chrysanthemums, distinct, each to contain six sprays."

TURF FOR ANALYSIS: *W. D.* We do not undertake to analyse soil, but if you are a Fellow of the Royal Horticultural Society you can have it analysed for a small fee by the Society's consulting chemist, Dr A. Voelcker, 22, Tudor Street, London, E.C. The turf sent is a good sample. When using this for the cultivation of Grape-vines you should incorporate with it a little phosphatic and potash manures, such as bone manure and wood ashes. For stone fruits a little lime rubble will be an additional advantage. Work plenty of farmyard manure in the soil of the kitchen garden.

VINES: *Constant Reader.* You do not say whether the vines are growing indoors or out-of-doors. You should cut back the laterals to two or three buds on each. Dress the vines in the manner recommended to *J. F.* in this column in last week's issue.

COMMUNICATIONS RECEIVED.—D. W. T.—You will see the omission rectified in our present issue.—L. B., New York.—S. P. R. A., Antibes.—E. S. S.—Sir F. L.—Interested.—A. D. W.—J. J.—C. I. P.—M. J. S.—J. SCOTCH GARDENERS IN AMERICA.

IT is not long since we commented on the fact that, although many of the leading horticulturists of the United States are of British origin, yet that we heard comparatively little of them after they have left their old home.

So far as Scotsmen are concerned, the deficiency is supplied in a very interesting manner by Mr. Wallace, of the Florists' Exchange, who has contributed to the Scottish Horticultural Association the following details, which we are privileged to publish:—

WHAT SCOTSMEN HAVE DONE FOR HORTICULTURE IN AMERICA.

Commercial horticulture in the United States may be said to have had its beginning in the early years of the nineteenth century. There were, of course, long before that time, many excellent private gardens in the country, in which many exotic plants were grown, yet those gardens were isolated in proportion to the population.

Prior to, say, 1825, but little greenhouse glass was to be seen in this country used for the growing or forcing of plants. The best market for plants, flowers, and vegetables in those early days was found in Philadelphia, and to that city gardeners from the Old World were first attracted. Incidentally, it may be stated as significant that many of the men who then came to America in the capacity of private gardeners, after they had accumulated a little money, embarked in business in a commercial way; and the same remarks hold true to-day.

The growing of plants, flowers, and vegetables for profit, however, soon became very general, progressing with leaps and bounds until the breaking out of the Civil War in 1860, when the industry received a set-back which was felt for the next six or eight years. When the country again became tranquil, say about 1870, there were several thousand commercial plant and flower-growing establishments in the United States. Fifteen years later, in 1885, a writer going into statistics, estimated that 8,000,000 cut Roses reached New York market alone in that year, and that the aggregate number of Roses grown around Boston, Philadelphia, Cleveland, Chicago, Washington, and other places could not have been less than 24,000,000. The number of Carnation flowers grown was said to be at least 120,000,000. Furthermore, it was estimated that one-fourth as many Roses and Carnations were grown by private establishments. The amount of space occupied by flowering-plants and bulbs in the open air was estimated to aggregate at least 12,000 acres, in addition to several thousand acres used for seeds.

The latest statistics, those compiled by Dr. Galloway, of the Department of Agriculture at Washington, D.C., in 1900, show that there were at that time probably not fewer than 9,000 commercial florists' establishments in the United States, having a glass area of 22,500,000 square feet. The income to the producer was set down as averaging 50 cents for each square foot of glass, or $11,250,000; and double that amount when viewed from the standpoint of the retailer. It was estimated by Dr. Galloway that the retail value of cut flowers sold annually is $12,500,000; the estimated apportionment for this sum being, for Roses, $6,000,000; Carnations, $4,000,000; Violets, $750,000; Chrysanthemums, $500,000; miscellaneous flowers, including Lilies, &c., $1,250,000. The retail value of the plants sold is placed at $10,000,000.

To handle the business in its entirety requires probably an average of not less than one man for every 1,500 square feet of glass. Fifteen hundred square feet of glass per man may seem a low estimate, and such is the fact when considering commercial establishments of any size, says Mr. Galloway. The larger the area of glass, other things being equal, the more square feet one man can handle. As a matter of fact, some of the large Rose-growing establishments do not employ more than one man for each 10,000 square feet. The census of 1900 gives a total of 2,029 commercial nurseries—devoted to the growing of trees, shrubs, &c.—with a total acreage of 165,789, 82·9 per cent improved. The total value of the products was $10,086,136. In the same year the census shows that there were 2,421 seed farms in the United States, with sales of products valued at $826,019, from an area of 40,423¼ acres.

Large as is our own production, it was found necessary, or prudent, to import bulbs, trees, and plants, to the amount of $6,528,756 in the decade 1890-1900. Since these statistics were compiled, the number of plant and cut flower establishments has increased, and the glass area added to, probably to the extent of from 10 to 15 per cent. All this indicates a gratifyingly prosperous condition of the country, which is likely to remain some time, if no greater calamity befall us than the adoption of Andrew Carnegie's simplified spelling.

As may be readily imagined in a cosmopolitan country such as the United States, representatives of almost every European nationality are engaged in gardening, the Turk proving perhaps the only exception. While a number of older Americans also follow the florist's profession, it is one to which the younger "Yankees" do not seem to take, its demands being too exacting, and the dollars too slow in accumulating to suit the spirit of the age.

The restless, roaming character of the average Scot is proverbial, and that class designated gardeners has not escaped the national characteristic. It is but natural, therefore, that some of them should set their faces toward the West, the Land of the Free, where, as the poet puts it,

> "A man is a man
> If he's willing to toil,
> And the humblest may gather
> The fruits of the soil."

And speaking of toiling I am reminded of a passage written by the talented but irascible Cobbett (himself, by the way, at one time an American horticulturist, or at least, a horticulturist in America), as follows: "Scotchmen toil hard enough in Scotland, but when they go from home it is not to *work*, if you please. They are found in gardens, and especially in gentlemen's gardens, tying up flowers, picking dead leaves off exotics, peeping into Melon frames, publishing the banns of marriage between the 'male' and 'female' blossoms; tap, tap, tapping against a wall with a hammer that weighs half an ounce. They have backs as straight and shoulders as square as heroes of Waterloo; and who can blame them? The digging, the mowing, the carrying of loads, all the break-back and sweat-extracting work, they leave to be performed by those who have less prudence than they have. The great purpose of human art, the great end of human study, is to obtain *ease*, to throw the burden of labour from our own shoulders, and fix it on those of others."

The history of Scotch gardeners, in America at least, does not bear out Cobbett's assertion. Here they work, work hard, and through the faithful performance of that work, combined with their native ability and characteristic perseverance, very many raise themselves above the common herd. There is no branch of American horticulture or floriculture in which Scotsmen cannot be found, with the possible exception of the wholesale cut flower commission business, which claimed one solitary representative of the Land of Cakes, who is now dead. Scotsmen occupy, in the United States, the positions of head-gardeners and superintendents of estates; they are park-superintendents, cemetery-superintendents, and landscape gardeners, and two or more are curators of botanic gardens. They own and manage some of the largest seed stores in the country. They conduct extensive commercial plant and flower-growing establishments, and take a foremost place in the retail branch of the business. They are prominent in the work of horticultural societies, florists' clubs, and similar organisations throughout the land, and in every way act well their part in promoting whatever tends to the advancement of their chosen calling.

GRANT THORBURN.—The first Scotsman to carve his name on the roll of honour of American horticulture was Grant Thorburn, who founded the first seed house of New York City, and who probably was the first merchant to handle plants in a retail store way in the American metropolis. Grant Thorburn was born on February 18, 1773, in a small village, or clachan, named West Houses, near Dalkeith. His father was a nail maker, and the son also followed that trade. Grant, accompanied by his brother, sailed for America from Leith on April 13, 1794, the voyage lasting until June 16. (No ocean greyhounds in those days.) On arrival in New York, he worked at his vocation for some time, subsequently engaging in the grocery business, and it was in 1801, while he was a grocer, that he became a seed and plant dealer. This is how he tells the story, which gives us an account of the beginning of an enterprise which has since achieved an international reputation:

"About this time the ladies of New York were beginning to show their taste for flowers, and it was customary to sell the empty flower pots in the grocery stores; these articles also comprised part of my stock. In the fall of the year, when the plants wanted shifting preparatory to their being placed in the parlour, I was often asked for pots of a handsomer quality or better make. All at once it came into my mind to take and paint some of my common flower pots with green varnish paint, thinking it would better suit the taste of the ladies than the common brickbat coloured ones. I painted two and exposed them in front of my window. . . They soon drew attention, and were sold. I painted six pair; they soon went the same way. Being thus encouraged I continued painting and selling to good advantage; this was in the fall of 1802. One day in the month of April following I observed a man for the first time selling flower-plants in the Fly Market, which then stood in the foot of Maiden Lane. As I carelessly passed along I took a leaf, and, rubbing it between my fingers and thumb, asked him what was the name of it. He answered a Rose-Geranium. This, as far as I can recollect, was the first time I ever heard that there was a Geranium in the world; as, before this, I had no taste for, nor paid any attention to, plants. I looked for a few minutes at the plant, thought it had a pleasant smell, and that it would look well if removed into one of my green flower pots to stand on my counter to draw attention. Next day someone fancied and purchased plant and pot. Next day I went, when the market was nearly over, judging the man would sell cheaper rather than have the trouble of carrying them over the river, as he lived at Brooklyn, and in those days there was neither steam nor horse boats. Accordingly I purchased two plants, and having

sold them I began to think something might be done this way; and so I continued to go at the close of the market, and always bargained for the unsold plants. The thing being a novelty began to draw attention, people carrying their country friends to see the curiosities of the city would step in to see my plants. Then they would ask of I had no seed of such plants; then again, others would ask for Cabbage, Turnip or Radish seed, etc. These frequent enquiries at length set me to thinking that if I could get seeds I should be able to sell them; but here lay the difficulty, as no one sold seed in New York, not one of the farmers or gardeners saved more than they wanted for their own use, there being no market for an overplus. In this dilemma I told my situation to George Inglis (also a Scotchman), the man from whom I had always bought the plants in the Fly Market. He said he was now raising seeds with the intention of selling them next spring along with his plants in the market, but if I would take his seeds he would quit the market and stay at home and raise plants and seeds for me to sell. A bargain was immediately struck. I purchased his stock of seeds, amounting to $15, and thus commenced a business on September 17, 1805, that already is the most extensive of the sort in the United States."

Grant Thorburn died in New Haven, Conn., January 21, 1863. The business he founded a century ago continues in New York, and his patronymic is still associated with it.

DAVID HOSACK.—Leaving the practical side of American horticulture for a moment, let us turn to its early scientific aspect. It was to a native Scotsman (or the son of a Scotsman born in America: authorities differ as to his birthplace) that New York City owes its first botanical garden, which was founded in 1801 by Dr. David Hosack, a man of great learning, and during his life a patron of every movement in art, science, and literature. While professor of botany at Columbia Cottage, New York, Dr. Hosack purchased from the city the land he transformed into what he called "The Elgin Botanical Garden," in memory of his father's birthplace, Elgin, Morayshire. The garden was sold in 1810 to the State of New York for $73,000. It was in turn committed to the Regents of the University of New York, the Faculty of the College of Physicians and Surgeons, and, finally, to Columbia College, which latter body by an arrangement with the State Legislature in 1816, annexed the garden, which by that time had been allowed to fall into decay. Dr. Hosack's memory is preserved in the genus Hosackia, which includes some 16 species of plants belonging to the Leguminosæ family. His *Hortus Elginensis*, printed in 1807, gives the names of 2,000 species which his botanical garden contained. It may not be without interest to state that two of the doctor's former students became celebrated in the scientific world, namely, Dr. Torrey and Professor Asa Gray.

DAVID DOUGLAS.—Though not resident in the United States, reference to the work of that illfated, intrepid plant discoverer, David Douglas, for American horticulture, should not be omitted. He explored California, Oregon, and British Columbia in 1823 and 1829. He found and described some of the wild bulb gardens of the Pacific Coast in 1827-1833, and sent bulbs of many species to England. He was a native of Scone, Perthshire, and perished in the Hawaiian Islands at the age of 34, by falling into a pit made for the capture of wild animals.

THOMAS HOGG.—Among early American horticulturists after Thorburn, probably no man was better known than Thomas Hogg, senr. He was born at Polwarth, Berwickshire, on February 20, 1778. He was first apprenticed as a printer on the *Liverpool Mercury*. Going to Edinburgh, his taste for horticulture induced him to enter Dickson's nurseries at Hawick. Thence he went to London, engaging with Lee & Kennedy, of Hammersmith, subsequently taking charge of the famous gardens of William Kent, where he became acquainted with the foremost horticulturists of the day. His health becoming impaired, he was advised by his physician to take a sea voyage. He arrived in New York in 1821 with the intention of going to Canada, but was prevailed upon by Dr. Hosack to stay in New York. Here he began business in 1822. The country being then young, he found great difficulty in disposing of the plants he cultivated; the taste of the people had not yet been educated. A story is told of how Yankee enterprise came to Mr. Hogg's assistance on one occasion. He had a large batch of Pelargoniums which were then just being raised from the native species into the beautiful varieties we now have. These he could not sell in the ordinary way, so an editor friend of his suggested to him to dispose of the plants at auction. Mr. Hogg saw the auctioneer, who was to conduct a sale of dry goods shortly, and that individual was agreeable to the plan being tried. So he announced in the catalogue that there would be "auctioned off Pelargoniums—a new and beautiful article." The plants were kept from sight in an upper floor of the auctioneer's store, and when all the dry goods had been sold, the public were invited upstairs. Thither they flocked, expecting to see what they thought an entirely new article in women's wear, only to find a grand array of Pelargoniums. They accepted the situation, overlooked the trick that had been played on them, and bought up all the plants, Hogg realising double what he would have sold them for through the usual channels of trade. When Don and Douglas were sent out to this country to collect American plants, they were recommended to the charge of Thomas Hogg. Among the plants which he was the means of introducing into England from the United States was the Rhododendron arboreum [?]. He introduced into America the Primula sinensis and Wistaria sinensis. It is said that he was the first to cultivate successfully Nelumbium speciosum and Nymphæa cærulea. He was a successful grower of New Holland plants, and had one of the choicest collections of Cactaceæ in America. The late Thomas Hogg, junr., his son, also was a noted horticulturist and Oriental traveller, introducing many Japanese plants into this country, among them the Hydrangea which bears his name.

ROBERT BUIST.—Robert Buist, a florist, seedsman, and author, was born at Cupar, Fife, November 14, 1805, and died in Philadelphia, July 13, 1880. He received his early training at the Edinburgh Botanical Garden, and came to America in 1828. After working for two years as a gardener, he entered into partnership with Hibbert, whose florist-establishment was one of the first notable ones in Philadelphia. Mr. Buist became a noted grower of Roses. He also greatly improved the Verbena. He introduced Poinsettia pulcherrima into the trade, and his sale of the double form is said to have been the first transaction of the kind accomplished by ocean telegraph. He was the author of several books on horticulture, among them the *American Flower Garden Directory*, the *Rose Manual*, and the *Family Kitchen Gardener*, all of which enjoyed a considerable sale for many years. The seed business he founded in Philadelphia still bears his name.

JOHN SHERWOOD.—Another Scotsman who added his quota of new plants was John Sherwood, of Philadelphia, Pa., a grower of Roses and Camellias. He originated Sherwood's Musk Cluster, a popular Noisette Rose, and Camellias Sherwoodii and Mrs. Cope. He died in 1883 in his 77th year. The late Professor Thomas Meehan said of him: "To have an hour with Sherwood was always regarded as better than medicine, and possibly few have ever passed from gardening circles in Philadelphia more sincerely esteemed." Mr. Sherwood was one of the oldest supporters of the Pennsylvania Horticultural Society.

PETER MACKENZIE, a noted Scotsman, resident in Philadelphia, was at one time gardener to Henry Pratt, of Lemon Hill, where in 1836 he successfully grew the Poinsettia. He entered the commercial florist business about 1842, and became well known as an importer of new and rare plants. He conducted an extensive business, shipping south before the Civil War such plants as Camellias, Azaleas, Daphnes, Olea fragrans, Gardenias, and other hard-wooded stock adapted to the southern climate. He raised the famous Camellia Jenny Lind, which was sold to a London purchaser for 200 guineas.

Contemporary with Mackenzie as another noted Philadelphia plantsman was ANDREW DRYBURGH, who made a fortune growing Camellia japonica for its flowers, which at that time (1842) were in great demand. He had the finest and largest collection of specimen plants in the United States, and probably has never been equalled as a cultivator of Camellias anywhere.

DAVID FERGUSON, who died snddenly in 188[illegible], was best known as an importer and grower of new and rare plants. He established the Laurel Hill Nurseries about 1842, and introduced many novelties from all sources in this country. His great specialty was Acacia pubescens, the propagation of which he understood thoroughly, distributing many thousands. It is still in demand as a decorative plant, but cannot be procured in quantity.

JAMES RITCHIE, a worthy Scot, resident of Philadelphia, was a member of the firm of Ritchie & Dick, who excelled in growing Camellias, Roses, and Azaleas. He contributed a number of articles on steam-heating of greenhouses, which commanded considerable attention; much of the wonderful progress in that department of greenhouse accessories is the result of the interest his papers created. Mr. Ritchie, who was one of the leading members of the Pennsylvania Horticultural Society, and who served with Professor Thomas Meehan for six years in the City Council Chamber of Philadelphia, died from suffocation from coal gas, March 11, 1885, in his 77th year.

ISAAC BUCHANAN (1808-1893) was a native of Cardross, Perthshire, and at one time a leader in horticulture in the Eastern States of America. He received the rudiments of his training as a gardener at the Duke of Montrose's famous seat, Buchanan House. Later he was gardener at Cramond Castle, near Edinburgh, and Caprington Castle, near Kilmarnock, and subsequently worked in the Edinburgh Botanical Gardens under the late Wm. McNab; also at Chiswick. He came to America in 1836, first securing employment with his countryman, Robert Buist, of Philadelphia, ultimately managing on his own account a store in New York City and a growing establishment at Astoria, Long Island. Buchanan in his younger days was an Orchid collector, and for many years was the only successful grower of Orchids in the United States. He was one of the first to grow Gladiolus in this country, and considerably improved that flower by cross-fertilisation. He raised Hyacinths on the low, marshy ground in Astoria, propagating them in the same manner as that adopted by the Dutch growers. He also improved the Petunia. The common, coarse-growing, white-flowered Brazilian species had been cultivated for several years previous to 1830, when the more delicate P. violacea was introduced from Argentina. Isaac Buchanan hybridised these two species and produced mottled and striped seedlings, the foundation of the magnificent varieties now so widely grown.

JOHN SPALDING, a native of Woodside, Perthshire, came to this country as a private gardener, and later entered the florist business, in which he became successful, conducting an establishment at New London, Conn., from which more than one of our present day prominent commercial florists have graduated. Mr. Spalding's ancestors received a grant of the lands of Ashantilly, Perthshire, from Robert the Bruce, for services rendered that monarch. Before coming to America Mr. Spalding served with his father, a famous Scotch gardener in his day; also in the Botanical Gardens of Dublin, Ireland, and on several estates in England. His mind was a literal store-house of history, poetry, botany, geology, and entomology. He died in February, 1905, at the advanced age of 91 years.

JOHN DICK (1815-1903) was a native of Edinburgh. He had a growing establishment at Philadelphia, excelling in the cultivation of Camellias and hardy Roses.

JOHN NISBET (1816-1886), a native of St. Mary's Isle, Kirkcudbright, achieved success as a landscape gardener, laying out several estates in Rhode Island and Massachusetts. For 14 years most of his spare time was given freely as a moral instructor in the State prison.

ROBERT REID, who started what was probably the first retail flower store proper in New York City, was a native of Langholm, Dumfriesshire. He enjoyed the friendship of Dr. Lindley, Donald Beaton, George Glenny, and other eminent horticulturists of the time, and was a frequent contributor to the *Gardeners' Chronicle*. He died in 1863.

(To be continued.)

NEW INVENTIONS.

A RUBBER BUTTON-HOLE HOLDER.

Rubber is now used for very many purposes, and one of the latest uses to which it has been put is for the making of little holders in which the stalks of flowers used for button-holes are sometimes inserted in a little water, and hidden beneath the lappel of the coat. These rubber holders are pliable and secure when in the coat, and the stem of the flower is clasped securely by the rubber cup, which in a great measure prevents the water from escaping. The patentee is Mr. W. J. Tuley, Terrace Walk, Bath.

NURSERY NOTES.

MESSRS. W. CUTBUSH & SON.

ORIGINALLY established at Highgate, now hemmed in by houses on almost all sides, the firm has in its possession two branch nurseries at Barnet, which I had an opportunity of visiting recently. In the one nearer to the centre of this small town are the dwellings of the manager, the offices and seedshop, and a number of old and new glasshouses for the cultivation of plants in pots, and a considerable amount of land which is under trees and shrubs, climbing plants, including many Roses of the Rambler class, as likewise Marechal Niel, W. A. Richardson, Gloire de Dijon, Wichuraiana, Dorothy Perkins, and others, all rather remarkable for the exuberance and ripe condition of their shoots. These Roses were under cultivation in large pots, and standing out-of-doors, preparatory to their removal to winter quarters. The stock of climbing varieties is a particularly large one. Polyantha Roses in red, pink and white, were abundant, and I may mention such dwarf varieties as Mrs. Cutbush, free flowering and pink-coloured, the tint being very near to that of Dorothy Perkins; La Paquerette, white, and Hiawatha, a single-flowered, beautiful Rose. Tea Roses growing in pots were gone or going fast out of bloom, and the varieties are choice and many. The variety G. Nabonnand was still in fine flowering condition

In the houses there were observed capital plants of Heath, just such as find a ready sale for placing in vases and jardinières, namely Erica hyemalis, E. persoluta alba, E. Cavendishi, and E. ventricosa. Two long houses were filled with Tea Roses in pots, and Chrysanthemums for affording cut blooms chiefly.

In an old glasshouse, used as a warm greenhouse or stove, many plants of Bougainvillea glabra, Stephanotis grandiflora, Manettia bicolor, Clerodendron Thompsoni and Bouvardias were noted. Another glasshouse contained Cyclamens —such varieties as grandiflora alba, Crimson King, Mount Blanc, and Princess of Wales. The plants of Aralia gracillima, in this house, arrested attention by reason of their healthy appearance and symmetry, and the now rare Leschenaultia biloba major was observed in a few examples, in better condition than it is usually found in London nurseries. Plunged in the soil, in pots, were numbers of Honeysuckles, Clematis, Vitis purpurea, V. Coignetiæ, Ceanothus, and various plants for forcing.

In the open ground I remarked Escallonia macrantha with fine healthy growth. Actinidia polygama, A. arguta, a plant having beautiful yellow foliage at this season, Ampelopsis heterophylla, A. dissecta, A. Engelmanni, Rhus radicans, Akebia quinata, Bignonia radicans, Clematis flammula, C. montana and Calycanthus floridus, which last has produced its deliciously fragrant blooms in abundance this year. Polygonum Baldschuanicum has been equally floriferous, and its seeds have ripened. Pyrus japonica and P. j. candida have also flowered freely. There were noted numerous specimen Conifers in variety, likewise nice symmetrically-shaped green and variegated leafed Hollies.

The Wood Street nursery at Barnet, distant about a quarter of a mile from the other, contains quarters for fruit trees, clean, vigorous specimens, many Hollies of a large size in fine condition for planting, some good specimen Conifers of planting size, such as Abies Pinsapo, Thuias of several species, Cedrus atlantica, and general nursery stock, (including Clerodendron trichotomum), Cytisus purpureus australis, Rhus Osbecki, whose bold compound leaves are most attractive at this season, and Buddleias in variety. To judge from the exposed site of the Wood Street nursery, on a steep slope of rather heavy soil, I should think that plants taken out of it and planted in exposed gardens, could scarcely fail to give satisfaction under good treatment. *F. M.*

NEW OR NOTEWORTHY PLANTS.

CEROPEGIA HYBRIDA,

N. E. Brown (a new natural hybrid), and

C. SIMILIS, N. E. Brown (n. sp.).

THE Asclepiads, in their remarkable structure, stand apart from all other Dicotyledonous orders in the same manner that Orchids do among Monocotyledons; in both the pollen is agglutinated into waxy masses, and in both there is a complicated provision for the removal of the pollen-masses by insects in a way that no other plants possess, but of the two orders the Asclepiads are undoubtedly the most complicated, and whilst there are a few Orchids that are or may be fertilised without the aid of insects, there is no Asclepiad known to me that can possibly be naturally fertilised by any other than insect agency. As it is therefore an order entirely dependent upon insects for perpetuation by seed, it is not surprising that natural hybrids should occur in it, as among Orchids. In the course of many years' study of Asclepiads, during which I have dissected and examined several thousand flowers, the conviction has been forced upon me that a large percentage of species and some genera have almost certainly originated as natural hybrids, but the Ceropegia here described is the first instance that has come to my knowledge where the hybrid origin can be considered proven. *C. hybrida* has been brought to my notice by Mr. W. Ledger, of Wimbledon, who is an enthusiastic cultivator of the species of this curious genus. Mr. Ledger informs me that he raised the plant from seeds sent to him by Mr. E. Th. Witte, the Inspector of the Botanic Garden at Leiden, who, in reply to questions asked by Mr. Ledger as to the origin of the plant, writes as follows:—

"The case with the Ceropegia you wrote me about is very curious. I grow here Ceropegia Sandersonii, Decne, figured in the *Botanical Magazine*, tab. 5792, fig. 145, and I intended to send you seeds of that species. I collected the seedpod myself, so I am quite sure it came from the right plant. A part of the seeds I sent to you, and another part I sowed myself. The plants I raised are also quite distinct from the mother plant, and I expect they will be the same as yours. At the same time with *C. Sandersonii* flowered *C. Thwaitesii* (not the true plant, but *C. similis* described below, N. E. B.), and because the flowers of my seedlings are something like those of this species, but much larger, I presume they are hybrids of *C. Thwaitesii* ♂ and *C. Sandersonii* ♀. The mother plant must have been fructified by insects, for no artificial fructification was done. I send you some flowers of it, and also of *C. Thwaitesii*," fig. 146.

FIG. 145.—CEROPEGIA SANDERSONII, ONE OF THE PARENTS OF *C. HYBRIDA*. ♂.

I do not know if Ceropegias can be successfully hybridised artificially, but it would at least be a difficult and delicate operation; indeed, the artificial fertilisation of Orchids is as child's play compared to the artificial fertilisation of any Asclepiad, and in the present case there cannot be any suspicion that the hybrid was so produced. The mother parent, *C. Sandersonii*, is represented by Fig. 145, and is also figured in the *Botanical Magazine*, t. 5792. It is well known to lovers of succulent plant, and always attracts attention by reason of the remarkable form of its flowers, which are of a pleasing pale green, spotted with darker green. The male parent (which proves not to be *C. Thwaitesii*) is represented by Fig. 147, which I have drawn from specimens sent by Mr. Witte, and the hybrid by Fig. 148, from which it will be seen that in the stem and corona it more nearly resembles *C. Sandersonii*, the leaves being much smaller than those of either parent, whilst the flower, although

much larger, is more akin to that of the male parent than to C. Sandersonii; this I have drawn from a flower sent by Mr. Witte, and a plant communicated to Kew by Mr. Ledger.

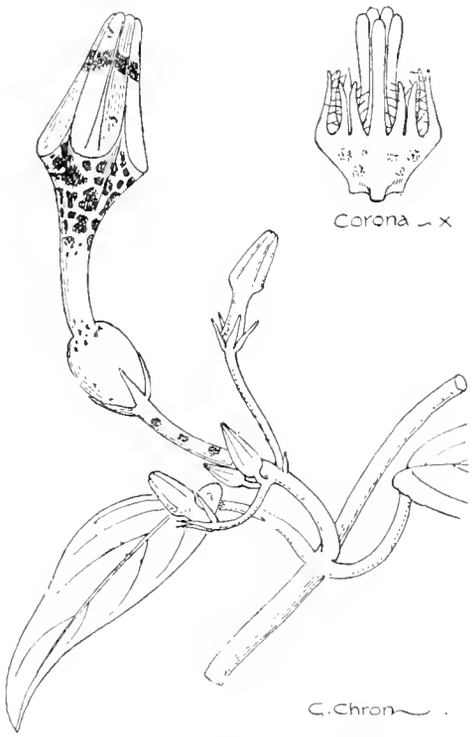

FIG. 146.—CEROPEGIA THWAITESII

The female parent (C. Sandersonii) is a native of South Africa, whilst the male parent (C. similis), judging from its relationship to C. Thwaitesii, is probably from tropical Asia, a difference of origin that adds interest to the parentage of the hybrid. The following are descriptions of the male parent and the hybrid.

CEROPEGIA SIMILIS, N. E. Brown (n. sp.).* Fig. 147.

This plant is cultivated at Kew, at Ledeb, and by Mr. Ledger, and probably elsewhere as C. Thwaitesii; but it differs from that species in the much shorter corolla-lobes, which are white or pale greenish at the basal part instead of yellow, and by the presence of cilia upon them; also in the segments of the outer corona being equally spaced instead of being arranged in contiguous pairs as they are in the true C. Thwaitesii, of which a copy of the original figure of the flower is here given (Fig. 146) for comparison. As stated above, C. similis is the male parent of C. hybrida, and the following description is made from the specimens sent by Mr. Witte.

Stem twining, rather slender, glabrous; leaves thin in texture, with a petiole ½ inch to ¾ inch long, and a blade 1 inch to 2 inches long by ½ inch to 1 inch broad, ovate or ovate-lanceolate, more or less acuminate, rounded at the base, glabrous on both sides, when young bronzy-green, becoming rich deep green, with a velvety sheen, sometimes changing to red when old. Peduncles lateral at the nodes, up to about ½ inch long, glabrous, bearing two to five flowers, which open in succession. Pedicels 5 to 7 lin. long, glabrous. Sepals, 2 lin. long, ½ lin. broad, lanceolate-subulate, glabrous. Corolla (not following the curve), 1¼ inch long; tube curved above the ovoid-inflated basal part, funnel-shaped at the mouth, glabrous outside, pale green on the inflated base, greyish-green, shading into whitish above, and at the funnel-shaped part spotted with purple-brown; inside glabrous, with the exception of a ring of fine white curly hairs at the top of the inflated part, which is light green lined and dotted with dark purple-brown; the middle part is blackish-purple, shading above into whitish or pale greenish, dusted and veined with purple; lobes 3½ to 4½ lin. long, erect, with connate tips, closely replicate and 1¼ lin. broad at the base; viewed sideways, ovate when spread out, white or pale greenish at the basal half, very dark or dull green on the apical part, with a narrow blackish or dark purple-brown band separating the two colours, fringed on the margins with long, jointed, purple hairs. Outer corona divided into 10 equidistant subulate teeth ¾ lin. long, yellow, edged with purple, and entirely yellow on the basal united part, sparsely ciliate. Inner coronal-lobes about 1 lin. long, connivent-erect, blackish-purple at the basal part, yellowish or buff-tinted above. Native country unknown. As shown by my drawings, the lobes of the corolla vary somewhat in form, both flowers of Fig. 147 being from the same plant.

CEROPEGIA HYBRIDA, N. E. Brown (new hybrid), Fig. 148.

A new hybrid, as detailed above, from C. Sandersonii, fertilised by C. similis. Stems fleshy, 2 to 2½ lin. thick, glabrous. Leaves very small, 2 to 4 lin. long, 1½ to 2½ lin. broad, thick and fleshy, ovate, acuminate, glabrous, green. Corolla curved and not following the curve 2¼ inches long; tube inflated, oblong at the base, narrowed and cylindric above, broadly funnel-shaped and 9 to 10 lin. in diameter at the mouth, outside glabrous, green at the base, light olive-green above, and the funnel-shaped part white, marked with five broad, dull green stripes, alternating with five series of connected purple-brown spots; inside with a pubescent band at the base and one above the inflated part, the narrow part glabrous, and the funnel-shaped part and basal half of the lobes pubescent; the very base is creamy, the rest of the inflated part is dull green, above which it is light purple shading upwards into pale greenish-white, with the outside markings showing through; lobes ⅔ inch long, erect, cohering at the tips, closely replicate, ¼ inch broad viewed sideways, somewhat spatulate-obovate and emarginate at the apex when spread out, glabrous and dull green, spotted with darker green or brownish on the back, the inner face pubescent and pale greenish-white on the basal half, the upper half being glabrous and rich purple-black, with a velvety sheen, the margins are thinly ciliate with light purple hairs. Outer corona ¼ lin. long, cup-shaped, with five obscure, minutely bifid lobes, pale yellowish margined with dark purple-brown; inner coronal-lobes 1¼ lin. long, connivent-erect, with re-curved tips, pale yellow, with the basal part dark purple-brown and dorsally connected to the outer corona. *N. E. Brown.*

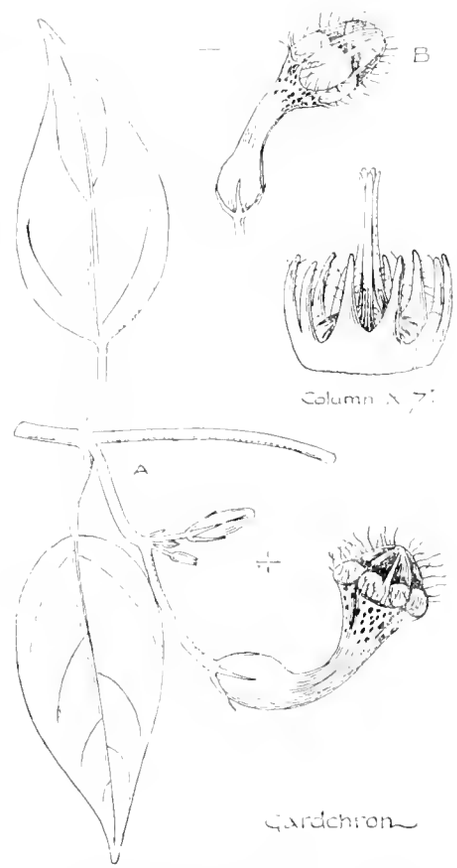

FIG. 147.—CEROPEGIA SIMILIS, A NEW SPECIES
A, portion of the stem with leaves and flowers; B, detached flower.

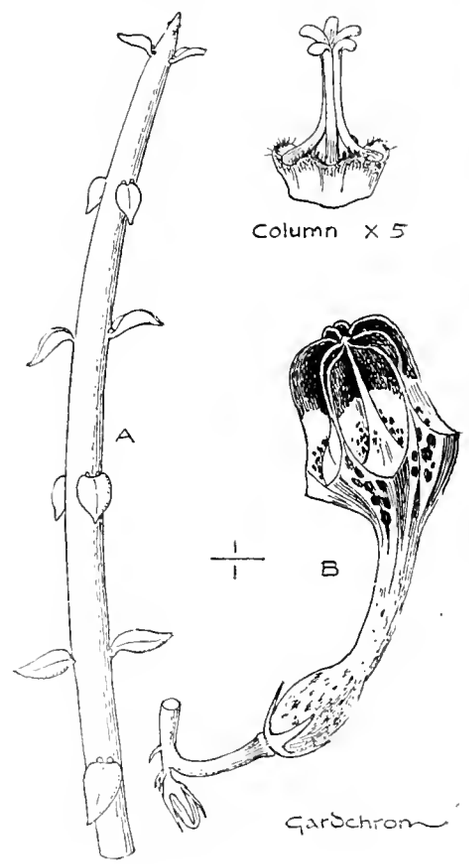

FIG. 148.—CEROPEGIA HYBRIDA ×.
A, portion of the stem of a young plant; B, flower; C, corona enlarged.

COLONIAL NOTE.

FRUIT-GROWING IN BRITISH COLUMBIA.

THE following is an extract from a letter received by a lady from her brother, who is in business in British Columbia:—"Thank you for the *Gardeners' Chronicle* just received. The article on fruit-growing in Canada by Mr. Miller is very good. I take it that Mr. Miller has never visited the south-east of British Columbia—that is, this district and Kootenay generally. I don't know Mr. St. Barbe, of Nelson, but what he says is right—only he does not go far enough. If you read the article in the *Gardeners' Chronicle* again, you will remember he said that to a man with not less than £350 or £400, the Kootenay is an ideal place for settlement; also that with this amount he could buy 20 acres of the very best land and build himself a house on it. I should think so too. Many a man has started who never had a

* Ceropegia similis, N.E.Br.; ad C. Thwaitesii arctissime, caule foliis floribusque persimilis; sed floribus minoribus, corollæ lobis brevioribus et ciliatis, coronæ lobulis 5 equidistantibus differt.

quarter of £350 as capital; £350 is $1,750, which is a big sum out here, calculated by men who work for their living. Another thing, good land can be bought for far less an amount than Mr. St. Barbe says—unless he means land which has been improved, which is a very different proposition. Again, 10 acres will be enough to yield a good living to one man and his family. Twenty acres is all right, but, as the writer says, better too little than too much. One thing he should have mentioned which he did not, is that all fruit lands in this part of British Columbia are covered with timber and brush; such, I think, is not generally known. Some have valuable timber upon them—trees up to 150 feet in height, logs of which are worth $5 to $7 per 1,000 feet. What I want to make clear is that all lands require clearing. The cost varies from about $30 to $60 per acre, according to the amount and size of timber thereon. I notice there are dozens of gardeners advertising for situations in this issue of *Gardeners' Chronicle*. It is a pity the advantages this country offers cannot be brought to their notice, for they are just the men who would do well out here. Eight out of every ten of the men who take up fruit-growing here do not know the faintest thing about it, or, at the best, are merely amateurs, but they can make a do of it.—*Frank Lidgate, Sloan City, British Columbia, November 12, 1906.*

THE UPSALA BOTANIC GARDENS.

FROM its association with the great Linnæus, this garden has a special interest for all connected with horticulture or botany. We are glad of this opportunity of publishing a communication from this venerated spot, the more so as it relates to a very interesting plant originally described by the great naturalist himself:—

"In the Upsala Botanic Gardens there has flowered, these last few years, a rather remarkable plant, the Pedicularis sceptrum Carolinum. This plant is seldom met with in gardens, as it requires special treatment. I think your readers would like to see a photograph of it (Fig. 149). The plant, when flowering, is about 2 feet high, and its erect habit and the stately mass of its yellow and purple-coloured flowers make it a great attraction in our out-door collection of plants from swamps and moist situations. In the place prepared here for the purpose it grows vigorously beside Pinguicula vulgaris and alpina, Parnassia palustris, Narthecium ossifragum, different species of Sphagnum, Eriophorum alpinum and other species of the same genus, Orchids, Drosera rotundifolia and intermedia, Vaccinium and Oxycoccos species, Sedum, and others. As a subscriber and an interested reader of the *Gardeners' Chronicle* I hope the photo will be found suitable for reproduction.—*Iwan Ostendahl, Garden Inspector.*"

FIG. 149.—PEDICULARIS SCEPTRUM CAROLINUM GROWING IN LINNÆUS' GARDEN.

ORCHID NOTES AND GLEANINGS.

CATASETUM LAMINATUM.

A FINE plant of this singular Mexican species is in flower in the collection of J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), the plant having two spikes of seven and nine flowers respectively. The most singular feature in the flower is the ridge-like, serrate blade nearly half an inch high, which extends up the middle of the labellum and causes insects to walk round the narrow path at its base formed by the upturned margin of the lip; the cirrhi of the rostellum are placed over the opening to the nectary, and to reach it the insect must cause the ejection of the pollinia. The petals are lanceolate, 2 inches long and ½ inch wide, the petals similar, but half an inch wide, and arranged forward over the column. The sepals are greenish white, densely spotted with red, and the petals whitish, with fewer and larger spots. The labellum, which is three-quarters of an inch wide and 2 inches long, has an upturned ciliate margin, a raised plate, nearly half an inch high, and uneven at the top, running down the centre, the ridge being forked at the entrance of the spur, which is short, obtuse, and compressed. The lip is greenish at the margin, the blade down the middle being ivory white with purple spots. It is a rare and singular species of considerable beauty.

CYPRIPEDIUM RECORD.

THE Earl of Tankerville, at Chillingham Castle has succeeded in flowering a Cypripedium, the result of crossing C. Leeanum Clinkaberryanum and C. insigne "Harefield Hall" in eighteen months from seeds. Mr. Hunter, the head gardener at Chillingham Castle, sends the record: "Sown May, 1905; flowered November, 1906," and states that there can be no doubt about the identity of the fine hybrid just flowered, as but few were sown before that date, and none which could be confounded with the cross in question. Another plant of the same batch is about to flower, and it will probably be shown at a meeting of the Royal Horticultural Society. The first to flower would have been shown but for the bloom sustaining an accident.

THE ALPINE GARDEN.

ANEMONE APENNINA AND ITS VARIETIES.

Now that planting time is with us, it may be desirable to draw the attention of admirers of the Apennine Windflower to the double variety of Anemone apennina, for, although there are few persons who would prefer it to the single form, it has many beauties, apart from its interest botanically. It originated in the nurseries of Mr. C. G. Van Tubergen, junr., at Zwanenburgh, Haarlem, and was distributed by the raiser in the autumn of 1905, and it flowered in this country in the following spring. Mr. W. E. Gumbleton sent me flowers before my own plant came into bloom, and I was pleased to see that it was, as announced, quite double. The sepals are narrow and of a pale lilac-blue shade. One feels a little disappointed that this variety has not the fine blue colour of some of the best varieties of A. apennina, still, the probabilities of securing a double deep-blue variety of this flower are quite within bounds. Mr. Van Tubergen informs me that he has also raised a very pretty double white variety, but as this increases very slowly, it is not yet ready for distribution. Still another variety has been introduced by Mr. Tubergen, and this is in point of colour remarkably fine. It is A. apennina purpurea, a name which scarcely describes the intense purple colour of the blooms. It has given me even more pleasure than the double variety: its brilliant purple flowers were exceedingly fine in my rock-garden last spring. The flowers are single, and they promise to be among the most valuable of all the varieties of A. apennina, which is a plant so variable in colouring that one is confident careful selection would soon give us many more beautiful varieties.—*S. Arnott, Sunnymead, Dumfries.*

A GLIMPSE AT THE GLOUCESTERSHIRE GARDEN.

IN the month of July I was enabled to pay a flying visit to Canon Ellacombe's delightful garden at Bitton Vicarage, Gloucestershire; but the time at my disposal was unfortunately too limited to allow of more than a casual glance at the treasures it contained. The following notes, therefore, do not profess to do more than draw attention to a few of the interesting plants viewed during an all too brief tour of the grounds. What was equally remarkable to one who is well acquainted with gardens in the south-west, where, in the genial atmosphere, numbers of tender subjects flourish to perfection, was the wonderful health of many of the same plants in the far more severe climate of Bitton. During Canon Ellacombe's and his father's lifetime love and care have been increasingly lavished on the vicarage garden, so that, at the present, it contains an almost unrivalled collection of rare and noteworthy plants. Of Roses there is a very full list, almost every known species being represented, while of the scarce, double-yellow, Rosa hemispherica, which it has been found impossible to strike from cuttings, there is a fine plant against a wall. A large assortment of Hollies is to be found in the gardens, a prostrate form of the variegated Holly being 19 yards in circumference and 6 feet in height at its tallest point. Ilex cornuta had formed a handsome shrub, and I. latispina minor was also pointed out. The Berberis and Box genera were largely in evidence, and of the former B. angulosa, B. congestiflora, B. Fortunei, and B. umbellata were noted. Cotoneasters were also largely cultivated, C. congesta, C. depressa, C. Hookeri, and C. pannosa being viewed amongst others; and of Hydrangeas, H. platanifolia, H. quercifolia, and H. vestita. Amongst Elders were Sambucus canadensis, the variegated and the cut-leaved forms, and an uncommon shrub was the nettle-leaved Filbert. The lawn is beautified by several fine trees, amongst which may be mentioned a noble Cedar of Lebanon, the Maidenhair tree, Ginkgo biloba, between 60 feet and 70 feet in height; a fine Fern-leaved Beech, Catalpa bignonoides, Parrotia persica, Kolreuteria paniculata, 35 feet in height, Juglans rupestris, with very handsome foliage; Oreodaphne californica, 25 feet high, and many others. Amongst the collection of noteworthy subjects were Abelia floribunda, Abutilon vitifolium, which succeeds so well in the south-west, in perfect health here as at Chepstow [and Dover]; the climbing Adlumia cirrosa, with Maidenhair-like foliage and rose-coloured flowers; Amorpha canescens, Artemisia tridentata, Azara integrifolia, the rarely seen Campanula punctata, a supplementary illustration of which appeared on August 26, 1905; and the alpine C. Thomasiana, Calycanthus occidentalis, growing finely; Calceolaria alba, a large bush of the rare Cistus ladaniferus maculatus, 6 feet in height, for which C. cyprius is so often substituted, and a smaller one of the almost unprocurable white type. Clematis recta in a bog bed was unusually fine, being a mass of flower 5 feet in height, and as much through; C. coccinea, C. Durandi, and C. Sieboldi were also doing well in other parts of the garden. Clerodendron trichotomum was just coming into flower, and the Himalayan Plumed Thistle, Cnicus Falconeri, held numbers of inebriated bees in its expanded blossoms. Tricuspidaria lanceolata, better known as Crinodendron Hookerianum, was very healthy, as, amongst the Crinums, was C. Moorei variegatum, while the same was to be said of the New Zealand Coprosma acerosa. Coriaria terminalis was bearing its bright orange berries freely, and Corydalis glauca its pretty pink and yellow flowers, while Cydonia sinensis was remarkable for producing fruits the size of a cricket ball. A mass of Daphne Blagayana, which often proves a difficult plant to grow, was 5 feet square and the picture of health, while D. Cneorum was also doing well. Deerongia clerodes and Decaisnea Fargesii were inspected, as were the pretty pale yellow Dianthus Knappi and D. superbus, 2 feet 6 inches in height. Discaria longispina was a curious shrub from New Zealand. A bed of Erica carnea was a mass of green foliage. This is always clipped with the garden shears immediately it goes out of bloom, a treatment that evidently succeeds to perfection. Erinacea pungens, with deep-blue Pea-like flowers, is seldom met with; the pale yellow Erodium chrysanthum was a pretty sight; Escallonia montevidensis (floribunda) was in good health, as was Euonymus alatus, valuable for its autumnal colouring. The much-branched Mexican shrub, Fallugia paradoxa, bears large white flowers. Genistas were represented by a mass of G. sagittalis 8 feet across, G. horrida, G. hispanica, 16 yards round, and others; Gentiana septemfida, one of the loveliest of the genus, was in full flower, and the rare Gleditschia caspica was doing well. Helianthemum ocymoides, Hypericum aureum, and H. fragile were noted. Jamesia americana, a pretty white-flowered shrub from the Rocky Mountains, rarely seen, was pointed out; Linaria dalmatica, 5 feet in height, was bright with its yellow blossoms; and the Osage Orange, Maclura aurantiaca, was evidently happy. The pretty salmon-pink flowered Malvastrum lateritium was in full bloom, and attention was directed to two rarely seen plants, Melianthus minor and Muhlenbeckia axillaris. Nandina domestica was flowering as freely as it does in Cornwall, and the Mexican Nestea salicifolia, Nierembergia filicaulis from Buenos Ayres, and Osteomeles anthyllidifolia from the Pacific Islands appeared perfectly satisfied with their surroundings. There was a large plant of the new Paeonia lutea; the pretty Perowskia atriplicifolia, 5 feet in height, was bearing its long lavender flower-sprays; Pentstemon campanulatum, both in scarlet and white varieties, was very effective; the creeping North American Pachysandra procumbens was examined, as was Phormium Hookeri, which flowers well in these gardens. Pittosporum eugenioides appeared as contented as if it was growing in Cornwall. Polygonum capitatum springs up annually from self-sown seed, while P. cymosum, P. equisetifolium, a great rarity, and P. molle variegatum are but rarely seen. Pterocarya caucasica, one of the Walnut tribe, has handsome foliage; the creeping Plum, Prunus prostrata, evidenced its peculiar habit of growth, and a very fine form of Pyrus Maulei was said to excel in the rich colouring of its fruit. Rhus cotinoides, splendid in its autumnal colouring, as is the neighbouring Euonymus alatus, R. glabra laciniata, with its beautifully-cut foliage; Rubus odoratus, much superior to R. spectabilis; R. japonicus tricolor; Rhaphiolepis ovata, with its Hawthorn-like flowers; the peerless Californian Poppy, Romneya Coulteri, perfecting the first of its great crêpe-like blossoms; Salvia Grahami; S. involucrata, the new Sophora viciifolia; Dierama (Sparaxis) pulcherrima, with its arching flower-wands, were seen and admired. Anemone sulphurea in a damp spot was very vigorous, and the variegated form of Astrantia major, seldom met with, was in flower, as was Verbena tenora Maonetti; Veronica Cookiana and V. pimeloides were noticed, as were Viburnum Mariesi and V. Awafuki; Wyethia mollis, Yucca filamentosa variegata, and the curious Zanthoxylum planispinum. Interesting as was the collection of plants already enumerated, the high walls and sheltered borders immediately beneath them held an even choicer selection of rare and tender subjects. Here Asparagus verticillatus topped the wall with vigorous growth; the North American Aristolochia tomentosa, rarely seen, was present, and Bignonia capreolata with B. grandiflora were both in the best of health. The Australian Bursaria spinosa was holding masses of small white flowers; Carpenteria californica was displaying its single white blossoms, and the rare Cæsalpinia Gilliesi was doing well, as was the New Zealand Chianthus puniceus. Here I met with Convolvulus tuguriorum, a New Zealand climber, that I only know in one other garden, which is in the neighbourhood of Truro, where it grows to a height of 25 feet over a giant Myrtle. Fremontia californica had flowered well, and Indigofera Dosua was 10 feet high against a wall, while Mandevilla suaveolens was in flower. Marsdenia erecta is seldom met with, but was a pretty object, covered with clusters of small white blossoms. Olearia insignis, the queen of the New Zealand Daisy-bushes, had flowered, but had not made much growth since my visit two years previously. Ozothamnus rosmarinifolius had evidently bloomed profusely, and against the wall the Persimmon, Diospyros Kaki, was fruiting well. Pentstemon cordifolius was red with flower, and Pistacia atlantica, from the Canary Islands, was flourishing; while Plagianthus Lyalli, covering a large space of wall, was white with countless clusters of blossoms rather past their best. The Pomegranate, Punica granatum, was bearing its vivid scarlet flowers, and Salvia leucantha was in bud. I was surprised to see this Salvia doing well in the open at Bitton, as it is a tender subject from Mexico, and is often badly cut during the winter in the south-west. Smilax laurifolius, rare in cultivation, was in good condition, and Solanum Torreyi, only about 18 inches high, was bearing a large flower-head of great, violet-blue, yellow-centred blossoms very similar to those of S. Wendlandi. The Australian Bluebell Creeper, Sollya heterophylla, was in flower, and the blue-flowered South African Thunbergia natalensis was noted, as were Trachelospermum japonicum and the better-known T. jasminoides. Veronica Hulkeana, the most lovely of the New Zealand shrubbery species, was represented, and among the many Vines, Vitis Coignetiæ, V. heterophylla humulifolia and variegata were admired. Along the edges of the paths large and representative collections of Saxifrages, Sedums, and other low-growing plants added much to the charm charms of this beautiful and most interesting garden. *S. W. Fitzherbert.*

KEW NOTES.

STERNBERGIA MACRANTHA.

BY far the largest of the autumn flowering Sternbergias, this species possesses a great disadvantage in that it frequently fails to flower after the first year. Seeing that it is widely distributed over Asia Minor from Smyrna to Western Persia, and south to Jerusalem, one would expect it to be found growing under different conditions in various localities, therefore at some times bulbs may be sent us from a certain district and flower as one could wish every year. Freshly-imported bulbs under the name of S. Clusii from Syria are flowering well, while a few flowers have been produced on bulbs planted against a south wall, and which have been there for several years. A hot, sunny position does not seem to be essential for flowering S. macrantha, as bulbs planted in a rather shady position in the rock garden produce flowers three years out of every four.

GENTIANA SCABRA.

UNDER various names, including G. Buergeri and G. Fortunei, this plant is sometimes seen in gardens, but it is still a rare plant, and seldom met with in good condition. It is one of the latest flowering of all Gentians, coming into flower during the month of November. Belonging to the group which includes our native G. pneumonanthe, it is of more robust habit, with broader leaves and large blue flowers. The throat of the flower is spotted with greenish white, and these spots are more conspicuous in some forms than in others, often spreading into the limb of the corolla. It is a native of Eastern Asia, and has been in cultivation over 60 years, having been sent by Fortune from Northern China in the year 1844. It is usually found growing in shady places on low hills, and

is figured in the *Botanical Magazine* as G. Fortunei, t. 4776.

ARTEMISIA LACTIFLORA.

THIS late flowering Artemisia formed one of the most conspicuous plants this autumn in the herbaceous ground. Of bushy habit, growing between 5 feet and 6 feet high, the stems are well clothed with elegantly-cut, dark-green foliage. The upper half is composed of freely-branching panicles of slightly fragrant white flowers, giving the plant a light and graceful appearance. A mass of it planted near the water's edge would produce a charming effect in autumn, and such a position would suit it admirably. It is not particular, however, as to soil or position, and does equally well in a somewhat dry border or bed. Like many others of the same genus, it is an easy plant to increase, and the roots may be split up into small tufts, each of which will make a good plant the following season. Commencing to flower in September, the flowers last in good condition well into November. *W. I.*

THE FERNERY.

AMERICAN FERN SPORTS.

WITH regard to the immense number of "sports" discovered in the British Isles among the indigenous wild Ferns, it has always been my opinion that the number was mainly due to the fact that for half a century a body of specialists have made a hobby of hunting for varieties, and not, as would superficially appear, to a greater tendency to "sport" in this country. Thanks partly to several contributions from my pen in this varietal connection to the "Fern Bulletin" and other publications in the United States, I have been favoured with numerous letters anent varietal "finds," and even in some cases with plants and spores all tending to show that diligent search alone is needed for the discovery of such productions. The marsh Buckler Fern (Lastrea Thelypteris), for instance, occurs in the States under precisely the same boggy and local conditions as in this country. I have hunted for this species myself among the Norfolk Broads, where it occurs in great abundance, and almost unaccompanied by other species. I was, however, unsuccessful in finding any trace of variation, and it still remains without the record of any "sport" at all on this side the Atlantic. In the States, however, a very marked and good polydactylous form was found some years ago, and a clump of rhizome was sent me by post. Naturally, I watched its development in the spring with great interest, but the first fronds which appeared were those of the Sensitive Fern, Onoclea sensibilis, and after some time a slenderer frond appeared, which developed into a quite normal one of the desired species, so that I concluded a mistake had been made. Subsequently, however, a number of typical fronds appeared, and grew to a great length, all tasselled well at all terminals, while no other normals appeared. Despite its robustness for three years, all fronds were barren, and this year I had almost given up the hope of a sowing with its selective possibilities when I noticed that a comparatively small frond on a small division separately potted in the spring appeared somewhat contracted in all parts, and on close examination I found this was due to an abundant fertility from base to apex, so that now I have the desired material in plentiful measure. Here, then, we have a distinct acquisition to our varietal lists, though not of home production. Polypodium vulgare is generally distributed in the States, and there have already been recorded varieties either like or closely akin to our P. v. cambricum, cristatum, marginatum, deltoideum, semilacerum, ramosum, and multifidum, while a recent find, P. v. Churchiæ, appears, from the description, to be distinct from any previous ones, being not only beautifully crested, but having the basal pinnæ distinctly stalked, a new feature entirely. I am indebted to Mr. B. D. Gilbert, of Clayville, N.Y., for my data, and hope to receive from him before long specimen fronds of the above forms for comparison with the British ones. The "incisum" form of Asplenium Trichomanes has been recorded as found twice, but whether the "finds" are identical with the British ones, of which at least three distinct forms exist, is unknown to me. It would in any case be very desirable to compare them. Some years ago a lady sent me fronds of a neatly tasselled Athyrium filix fœmina (Lady Fern) she had found, and this, too, was a thorough-bred, though the tassels were small. Judging, however, by American Fern literature, most of the students of these interesting plants are much in the position of our Fern students of half a century ago, in so far as they do not care to study the great capacity of the plants to vary widely and distinctly, and thus often discuss and even illustrate minor deviations such as have long since lost all interest on this side. Our own students of the epoch named had little reliable literature to guide them; the material was only then accumulating, but the student of to-day has an ample supply for reference. On the other hand, it is, of course, a fact that the area of the States is so great and its Fern flora has so recently been taken in hand, that the species themselves are quite possibly not exhausted as regards discovery, and it is possibly due to this that some of the ruling spirits over there do their utmost to discourage varietal research, and follow the old and here obsolete lines of argument, that such "variations" are merely "monstrosities," and therefore devoid of interest, and appear to consider the advocates of their study rather as "cranks" than anything else. The "crank," however, on the other hand, not infrequently comes across assertions in his special line, which his wider knowledge induces him to impute to real "cranks" rather than imagined ones. A sneer, for instance, at crested varieties as being akin to two-headed kittens or six-legged rabbits is obviously misplaced, when we consider that the Fern varieties, apart from their ornate symmetry, reproduce themselves truly through these spores, while the true monstrosities in question are mere temporary freaks happily quite incapable of transmitting their deformities to posterity. Furthermore, since the varietal forms have gained scientific attention, it has been found that the tendency to vary pervades also the reproductive systems, so that much light has been thrown upon the life-cycle and its capacity for taking short cuts in all conceivable ways, instead of following the roundabout normal routine. It has been due to such investigation that the curious analogy between the malignant cells of cancerous growths in man, and certain abnormal forms of the nucleus in the reproductive cells in Ferns was discovered by Professor Farmer, forming quite possibly a link in the chain of knowledge of that dire disease which may enable it to be suppressed or cured. In short, it is in Nature's vagaries rather than in her orthodox procedure that lessons are to be learnt regarding the underlying laws, a fact which some of our American Fern-loving cousins have evidently not yet grasped. *Chas. T. Druery, V.M.H., F.L.S.*

FOREIGN CORRESPONDENCE.

NEPENTHES.

I AM sending you four pitchers of hybrid Nepenthes raised by me at Remilly. One, N. "Panli," has received a First Class Certificate from the Société Nationale d'Horticulture de France.

The plant has not yet been pinched to make it flower, and the pitchers are still increasing in size. This is the case with another variety with green pitchers grown on the same hybrid, N. Tiveyi × N. mixta. This plant yields, as you see, large pitchers, but they are too green in colour. The other two pitchers are from plants raised by crossing N. Tiveyi × N. Morganæ. The plants are small and the pitchers are far from having attained their full development; one of them resembles that of N. Curtisii, but is redder in colour. I may add that I have now a plant of N. Curtisii (ordinary variety) in bloom. This is a female, and I have another female plant in bloom of N. Curtisii superba, but this shows the existence of a female N. Curtisii, and that the variety superba is not the female plant of that species. I have seedlings of N. Curtisii (ordinary variety) which are fairly large already; the pollen was taken from N. mixta.

I have, with much trouble, succeeded in raising some 50 seedlings from a cross between N. sanguinea × N. Northiana pulchra, but the young plants are very tender, and grow very slowly. I have, on the other hand, some 300 seedling plants, very sturdy in habit, raised from N. Curtisii superba × N. Northiana pulchra, and hope that these will grow into plants superior to N. mixta, as N. Northiana pulchra has splendid very bright red pitchers, even finer than those of the ordinary N. Northiana. N. Curtisii superba, from which the seed was gathered, has also large and well-coloured pitchers. I have many other seeds ripening, but the fine male varieties, such Burkei, Rafflesiana insignis, &c., have not flowered this year. N. ventricosa has never flowered at Remilly, and I do not know if this is a male or a female plant. *R. Jamy-Desloges, Paris.*

TROPICAL AND OTHER PLANTS.

CUBA.—Early in the coming year the undersigned will issue the first decades of prepared herbarium specimens of his sets of the economic plants of the world.

The uncertainty of the names attached to cultivated plants and to others of economic importance is proverbial. No part of systematic botany is more difficult and none more interesting and important. Current names for garden and greenhouse plants are in the utmost confusion. I specially is this true of plants originally from the tropics, many of which produce only foliage in the higher latitudes. There has been a most remarkable dissemination of plants worthy of cultivation, and this is constantly increasing, and of great numbers of these plants the botanical identity is as little known to the scientific horticulturist as to the grower.

One of the most serious obstacles to a uniform method of naming cultivated plants is the entire lack of a widely-distributed standard set of herbarium specimens, including well-prepared examples of all the species and varieties, which should be deposited in all the centres of horticultural and botanical activity. Under a uniform series of numbers these could be readily referred to alike by botanists and horticulturists the world over. The opportuneness of this publication and its vital importance to horticultural and agricultural botany do not seem capable of exaggeration.

Locally, there could not be a more favourable place than Cuba for the undertaking of such a work. Here both temperate region and tropical plants may be grown, and the extensive introductions of hundreds of years from all parts of the world, besides our own active Acclimatization Garden, will furnish much valuable material. Full series of tropical fruits, timber trees, vegetables, spices, ornamentals, rubbers, Palms in flower and fruit, and medicinal plants, will furnish items of great interest—a sort of material which it has previously been very difficult to obtain. Even the minor varieties will be fully represented, and accompanied by full notes and by prints or tracings of fruits, &c. Where possible, also, such wild plants as indicate the parentage of cultivated forms will be included.

We already have promises of active co-operation from a number of botanists and horticulturists, and all have enthusiastically commended the proposal. Some of the best-known systematists in some of the oldest gardens of the world have promised their active aid in the preparation of this series. We do not desire to sell many of the sets—exchanges only are generally solicited. A few will be sold to cover the expenses of issue, but any persons desiring the set will be able to obtain it by contributing material in quantity of a few forms for the issue. Until further notice, the preparation of sixty good, complete, well-pressed specimens of each of five species or varieties of cultivated plants will ensure the delivery of one century of the published sets. The material to be contributed by each person co-operating must be decided upon by previous correspondence.

The undersigned has been issuing sets of plants for the past 15 years, so there is promise of a really valuable contribution to the working outfit of botanists and scientific horticulturists. As this is not local work, but draws on all Floras, any change of location by the author will, fortunately, not in any way affect the publication, and he looks forward to its uninterrupted continuation for many years. Early replies are requested from all those interested. *G. F. Baker, Departamento de Botanica, Santiago, Cuba.*

FORESTRY.

TREATMENT OF PLANTATIONS WITHOUT REGULAR THINNING.

Some readers may be interested in the results of my final under-planting in my plantation of six acres.

The Beech and Silver-fir that were planted in 1893, at a distance 6 feet apart in the 20-foot cuts, have grown well. The Beech have grown faster, and have been pruned slightly, whence they overgrew the Silver-fir.

In 1897 the denser plants of the Larch plantation, between the 20-foot cuts, were thinned to about 8 feet apart between the plants, and an underplanting of Beech and Silver-fir was made.

Some cutting and some underplanting has been done each year at a cost of £7 2s. 6d., and in 1905 my son planted 400 Douglas Firs, which involved an expenditure of £7 12s. The trees were delayed in transit, and as a consequence the roots were injured, and 68 of the trees died, but these were subsequently replaced. This year we have planted 468 Douglas Firs averaging 2 feet to 2 feet 6 inches in height. They were delivered promptly, and were "heeled" in a field which had been cropped with Mangold Wurtzels, being permanently planted on November 14 and 15.

With seedling Beech, taken up in the plantation, we have planted 600 trees in three days.

The mode of treatment in former years left vistas of 12 feet in one direction and 16 feet in another. These cuts had closed in before the wider cuts were made.

In 1887 I saw Mr. McCorquodale's work in Lord Mansfield's woods, and planted a Douglas Fir among Larch and old Oak when it had bare headroom. This, though planted 30 years after the Larch, is now as tall as the latter, and nearly as large. It has no branches an inch in diameter, but forms a beautiful straight trunk. The pits were made in September, and my workman, when I set him to work, pointed out that we had missed some parts of the wood when underplanting, and a strong growth of Hazel had sprung up under the best Larch. This he cleared away, and made 496 pits with 68 failures last year, 544 to be filled. We planted the other pits with Beech and Silver-fir seedlings taken up in the plantation, and planted some more of the seedlings, making 600 trees in all. The Douglas Fir we had this year were 2 feet to 2 feet 6 inches, and some 3 feet in height, being as good trees as I ever planted.

If the Larch are cut when the Douglas Firs are 20 feet high, there will be some good patches of the latter trees at about 6 feet apart. These will probably be free from branches and will grow rapidly.

In planting I use a large stick with a blunt, rounded point, so as not to injure the roots. Trees thus planted and not trodden about their roots never become loose in the soil, and the rain, of which we have recently had plenty, can enter the soil freely. As I am 81, I cannot expect to live to see the Larch felled, and thus know the result of this interesting experiment. I noticed Douglas Fir near Porlock in Sir Thomas Acland's plantations, and elsewhere, were much branched, and had lost their tops as soon as they got above the other trees. *Henry Rogers, Plymouth.*

VEGETABLES.

HARDY KALES.

Although up to the present time moderate successes have to be recorded concerning the respective trials which have been conducted in the Wisley gardens, there is reason to believe that things will, now that the ground is getting into a better condition as the result of manuring and working, greatly improve. At the present time there is to be seen in these gardens a remarkably good trial of hardy Kales. It is one that all interested in these winter vegetables should be pleased to inspect. Although Kales are plants which, given fairly good soil and plenty of room, will very well take care of themselves, this trial is very instructive, and merits increase. The considerable breadth, including, as it does, all the best-known varieties, was seen by a few members of the Vegetable Committee at the end of September, and it was then agreed that at a later date the entire breadth should be carefully examined. That examination it is anticipated will take place during December, by which time each variety or stock should have fully developed its normal features. Some desire was expressed that not only should the test be one of excellence of stock or otherwise, but also that of hardiness. This latter test is entirely dependent on the winter. Still, it is rare that Kales suffer much in our southern winters, and thus the test may not be furnished. Generally, all Kales are fairly hardy, and after standing through so dry a summer as the last, it is not likely that plants will exhibit undue tenderness during the winter. Accepting the fact that hardiness is the general characteristic of all the varieties, the committee would therefore concern themselves chiefly with the respective merits of the stocks, as classed under the headings of tall curled Scotch, dwarf curled Scotch, Arctic curled, Cottagers', Asparagus, Buda, Chou de Milan, Tall Jersey, Hybrid curled, or other type into which Kales are divided. Generally, Kales are most valuable during hard winters, when other and more tender members of the Brassica family have succumbed to frost or are over. It is during the latter winter months that Kales become so useful and valuable, because of their relatively hardy constitution. Their "heads," after being well frosted, form tender, sweet greenfood, and their abundant stem sprouts, coming in gradually, give delicious, tender leafage for several weeks. Could time and space have been spared, a record sowing of seed of all the stocks now growing at Wisley and a further planting some six weeks later than the first one, would have furnished useful evidence of the value of successional crops of this vegetable, the later one as a rule furnishing an ample supply of sprouts up to the end of April. *A. D.*

The Week's Work.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Hardy Climbers.—At this season of the year, when planting is in full operation, and alterations in the garden are being carried out, a few reminders of suitable climbers or plants for garden-walls may not be out of place. Having already in previous notes dealt at some length on the uses of Roses in similar positions, it will be unnecessary here to repeat the names of the varieties, as they will readily occur to the intending planter, and it will suffice to remark that Roses are invaluable for the purpose.

Clematis.—In the category of climbers, Clematis are bound to take a foremost place, for there is none more diversified in growth, and in the period of flowering, or more gorgeous in bloom. The Clematis are graceful in habit, and in colour embrace almost every shade of red and blue in combination, and even include scarlet and crimson, while yellow flowering species and pure white are common. By a judicious selection of species and varieties they may be had in flower from April until frost puts an end to their blooming. In order to grow them well, at the foot of a wall, the ground should be prepared and good drainage secured, as nothing is more inimical to Clematis than wet, cold, undrained soil, which induces soft spongy growth. The soil should be a rich loam. Amongst the best of spring-flowering Clematis are the following: C. montana grandiflora, Sir Garnet Wolseley, Duke of Edinburgh, Miss Bateman, Mrs. Quilter, and the Queen. Autumn-flowering varieties are: Ville de Lyon, Nelly Moser, Mrs. George Jackman, Countess of Onslow, Coccinea, La France, C. flammula, and B. flammula rubra marginata.

Honeysuckles.—These charming and fragrant flowering plants are delightful aids for the adornment of a wall or porch, but perhaps the two best are Lonicera japonica Halliana and L. j. flexuosa. The former is particularly useful, as its deliciously sweet-scented flowers, which are borne profusely, appear in July and last until nearly Christmas, and both are vigorous growers. For gardens situated in the south and south-west, L. Hildebrandiana, which bears flowers 6 or 7 inches long, of a beautiful orange-crimson colour, with large dark, glossy leaves, should not be omitted, as also L. sempervirens, the Trumpet Honeysuckle. All the Honeysuckles are easy of culture in any soil.

Jasmines.—The ordinary hardy Jasmines, Jasminum officinale and J. nudiflorum, are too well known and their value too much appreciated to require any reminder here, but mention might be made of the new species lately introduced from China, J. primulinum, which is a decided acquisition amongst plants for walls. It flowers profusely in the summertime having large semi-double golden-coloured flowers, while its dark-green foliage is highly ornamental and is evergreen. J. humile (J. Wallichianum) is worthy of more extended cultivation, as it has a light, graceful habit, and it flowers in summer.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Spring Cabbages.—If the plants have grown strongly and now show part of their stems, draw a little soil slightly towards them to afford them some protection during hard frost. As a rule, the stems are the weakest part and should be protected. Select a dry day, when the soil is not in a pasty condition, for doing this work, or more harm than good may result.

Protection of Vegetables.—So far there have been no severe frosts, and crops have continued to grow without check. Autumn Cauliflowers have been abundant, and early varieties of Broccoli, such as Michaelmas White and Self-Protecting. All this, however, may be changed at any moment, and every effort should be put forth to save the crops immediately the change does take place by biting any that are approaching maturity and planting them in frames or outhouses. Ventilate very freely during mild weather all frames containing vegetables. Parsley and Lettuce in frames should have their decaying leaves picked off periodically. Let a sprinkling of lime be worked amongst young plants of Cauliflower in frames to prevent their being damaged by slugs.

Digging.—As soon as the ground becomes clear of crops such as Celery, Broccolis, &c., endeavour to get it dug or trenched in readiness for the next crop. Prepare the ground at the earliest opportunity, because other and unforeseen work may afterwards claim attention. The absence of frost in the mornings has not been helpful to manure-wheeling, but by the use of a few planks the work can be carried out. Do not allow the manure to remain on the surface of the ground longer than is necessary; it is untidy, and it soon loses some of its good qualities when thus exposed to the weather.

Preparing for next season.—It is useful at this season to prepare a general plan for the cropping of the kitchen garden next year. This is a great help, especially to the inexperienced, for he is thus in a much better position to get the best results from the ground, and it will help him in his estimates for seeds, which should be ordered as soon as the gardener can estimate his requirements, or he may find that stocks of certain varieties are exhausted. It is always cheapest in the end to get the best seeds. No one can reasonably expect to grow the best crops from inferior seeds.

The Frame Ground.—The recent wet weather has hindered the work of digging, and even getting on the land, in gardens where the soil is heavy, but in such weather an opportunity occurs for putting everything in proper order in the frame ground. Manure that is ready for wheeling and carting on to the square should be protected with boards to prevent heavy rains from running through it. More often than not no manure water tank exists, and this material is lost in the drains. This should be remedied, if possible, and such liquid drainings from the manure saved for use on the crops. Litter and leaves should be placed in readiness for the making of hotbeds. Decaying vegetable matter should be turned occasionally to assist decomposition, mixing a little lime with it. Hedges round the frame yard should be examined, and any gaps made good. If no hedge at present exists, it will be advisable to plant one. Privet makes rapid growth, and affords suitable shelter from winds. It is also of neat appearance.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to SIR EDMUND G. LODER, Bart., Leonardslee, Sussex.

Training wall trees.—Defects in trained trees are easily apparent when the branches are defoliated. The shoots of horizontally-trained trees need to be nailed at regular intervals of space, which is easily accomplished on walls where the lines of bricks are visible; but if they are not a chalk line should be drawn or some other such means adopted. The branches should be trained at about 14 inches apart, which will equal three courses of bricks. Fan-trained trees I consider the most suitable for growing as large specimens. The bottom branches of these should be trained horizontally, and the next should be at a slight angle, and so on till the whole is fan shaped, with the central branch in a perfectly vertical position. These trees should now be pruned and trained as fast as opportunity permits. Any scions required for grafting in the spring should be collected, labelled, and be "heeled in" on a north border.

Planting.—All kinds of fruit-trees and bushes may still be planted in mild and dry weather. The Bullace and Damson should not be omitted, as the fruits of these are very useful, especially in a season when Plums are scarce. These trees are very hardy, and may be grown in the land skirting an orchard, or they may be given a better position, and be grown as shapely standard trees. Shepherd's Bullace (with large green fruits), Black Bullace (a very late variety) and Veitch's Bullace (a free bearer) are three of the best varieties: while among Damsons Bradley's King, Cheshire and Frogmore may be given as desirable varieties to plant.

Blackberries, etc.—These should be planted as soon as is possible, and the stakes or wires for training be had in readiness. The Logan berry is the most popular of this class of fruit. The Mahdi (Raspberry and Blackberry) is also proving a useful variety. Rubus phœnicolasius, the Wine berry, is very suitable for jam making. Rubus palmatus, the so-called Strawberry-Raspberry, is not worth growing except as a novelty. The variety Wilson Junior has long, handsome berries, and is regarded as the best of its section. Rubus leucodermis is at this season very handsome, and its flowers and fruit in July are both pretty and sweet. This species should be given a Larch pole, about 7 feet in length, for a support. These brambles are pleasing when trained over wire arches or supports.

Pruning, &c.—Continue to prune, root-prune, and train Pear, Apple, Cherry, Currant, and Gooseberry trees, and if the soil is in a very wet condition use planks for stepping upon. These remarks apply especially to bush and standard trees, this work being more easily carried out in the case of trees growing against walls. The present is a good time to prune and train Morello Cherry trees, this being a long and tedious business in cold weather. Most of the old wood should be cut away, laying in straight young shoots and keeping them rather thinly disposed. The pruning and training of this Cherry much resembles that of Peach and Nectarine trees.

Fruit Room.—Examine the fruit regularly, and remove all decaying specimens.

Orchard trees that are in a bad condition should have all the weak growths and wood cut out, more especially from the middle of the tree. Expose every branch, if possible, to the atmosphere and sunshine, remembering that one bushel of good fruit is equal in value to three or more bushels of inferior quality, whether for supplying the market or for home consumption. These trees should also be sprayed. It is surprising how many can be treated in a day or week in fine weather by earnest workers. Grass-grown orchards may be much improved by surface cultivation.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Dendrobiums.—Many of these, especially the deciduous or semi-deciduous species which finished their new growths early in the season, and were thoroughly ripened by the autumn sunshine, are now prominently showing their flower buds. Among them, may be noted D. aureum, D. nobile and its many varieties, also the garden hybrids D. Wiganianum, D. Melpomene, D. splendidissimum grandiflorum, D. rubens grandiflorum, D. Ainsworthii, D. Artemis, D. Burfordense, D. Cybele, D. Sibyl, and others. In order that an early and effective display of bloom may be made, the more forward plants may be removed from their resting quarters into a house where the atmospheric temperature at night will be about 55°, and in a few weeks, when the flower buds are nearly ready to burst open, if they are again removed to the lightest side of the East Indian house, it will assist the flowers to expand, and their colours to become clear and rich. From the present time until the flowers open, a light spraying overhead on warm, bright days, will be helpful to them. Watering must still be carried out very carefully, and only at comparatively long intervals of time, or the "breaks" that are visible at the base of the pseudo-bulbs may grow away and prevent the flower buds from coming to perfection. D. Wardianum and some of the hybrids which have been obtained through its agency, as D. Enterpe, D. Clio, D. aureo-Wardianum, D. Eurycles, D. Alcippe, D. micans, and D. Aspasia are also showing for bloom. These plants invariably produce new growth in conjunction with the flower buds, but if the plants are kept moderately dry at the root, these new breaks will remain almost dormant until the plants have finished blooming, after which time, if the plants are placed in a warm, moist atmosphere, these young growths will develop vigorously. The pretty hybrid D. Wardiano-japonicum succeeds best under comparatively cool treatment, such as is usually afforded to Masdevallias. There are some species, as D. primulinum, D. Parishii, D. tortile, D. albo-sanguineum, D. Pierardii, D. cretaceum, D. crepidatum, D. cucullatum, D. transparens, D. crystallinum, D. superbum, and its varieties Burkei, Huttoni, Dearei, and others which are still growing, should on the completion of their growth be kept on the dry side until the pseudo-bulbs show for bloom, when they should be treated as indicated for the earlier flowering varieties. The rare D. sanguinolentum thrives best if placed with the Mexican Lælias, while such species as D. glomeratum, D. subclausum, D. Jamesianum, D. infundibulum, D. Wattianum, and D. tetragonum should be kept in the coolest part of the intermediate house. Being evergreen plants, they should not be subjected to drying out, the roots requiring to be kept in a moderately moist condition at all times. These remarks apply also to such evergreen species as D. thyrsiflorum, D. densiflorum, D. Farmeri, D. suavissimum, and D. chrysotoxum, also to the nigro-hirsute section as D. Lowii, D. formosum, D. cruentum, D. draconis nebulosum, D. bellatulum, &c., but they require a few degrees more heat at all seasons. Plants of D. phalænopsis, after they have done blooming, require a long season of rest. Place them in a light and dry position in the Cattleya house, or, if more convenient, they may be suspended at that part of the warm house where the ventilators are kept more or less open at all times. Strong plants which are well rooted will require very little, if any, water, until growth recommences. The cultivator should not permit the pseudo-bulbs to shrivel to a harmful degree.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq. Clevelea, Allerton, Liverpool.

The watering of plants.—There is a right and a wrong method in applying water to plants. At this season of the year there is even greater necessity than usual for the exercising of caution now that the roots of most plants are almost inactive. Such caution is needed particularly in respect to plants that were potted late in summer and autumn, and which have not yet filled their pots with roots; also to hard-wooded plants, pot Roses, and Pelargoniums. A very erroneous method of watering plants is that of giving them a little each day, just to prevent them from becoming dry. Some plants will succeed under this kind of treatment longer than others, but they will eventually become unhealthy from the reason that the roots are never properly dry nor thoroughly wet. No plants are sooner affected by careless watering than Azaleas, and often the leaves will fall from the plants to such an extent as to leave them miserable objects to look upon. A plant should not be watered until the soil has become moderately, but not too dry, and then fill the pot from the surface of the soil to the level of the rim, thus giving enough to pass through the ball of earth and wet the whole thoroughly. The temperature of the water used should exceed that of the atmosphere of the house by 5°. A thoughtful and observant man will of necessity watch the temperatures of the water in the tanks, which varies so much during the winter months in the event of snow or hail falling. See notes in the Calendar published in the issue for October 13.

The Conservatory.—There has been plenty of material lately for keeping the conservatory gay, but Chrysanthemums are fast disappearing, and only where a good batch of late-flowering varieties has been grown will flowers be forthcoming at Christmas. Therefore, to keep the supply of flowers equal to the demand, attention must be given to the forcing of Roman Hyacinths, Lily of the Valley, Tulips, early varieties of Daffodils, Freesias, and Lachenalias; also Azalea mollis, Deutzias, Spiræas, Lilac, and Rhododendron, the variety Madame Wagner being excellent for early forcing. Lachenalias should not be subjected to very high temperatures, but may be forced gently. Deutzias will now have fully expanded their blooms, and may be subjected to the somewhat cooler atmosphere in a warm conservatory. Keep the plants moderately dry at the roots. The Poinsettias are very effective when arranged in small groups.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. SIR CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Early Peaches and Nectarines.—Houses containing early varieties of Peaches, such as Alexandra and Duchess of Cornwall, and Early Rivers, Cardinal, and Advance Nectarines, should by this time have been thoroughly cleansed inside and the trees made ready for forming into growth, which should be commenced towards the latter part of the present month. If any of the trees are in pots, these should be started into growth first, leaving the forcing of the permanent trees until a little later to provide a succession of fruits. Trees in pots possess this advantage: they can be moved readily, and thus their growth can be better regulated; but if no pot trees are grown, and ripe fruits are required early in May, the permanently planted trees should be started into growth slowly. Thoroughly examine the borders, and if they appear to be at all dry give them a good soaking with tepid water. The temperature to commence with should not exceed 45° at night time and 55° by day, with a rise of 5° during sun-heat. Very little fire-heat will be necessary to maintain these temperatures. Whenever the weather is favourable afford a little ventilation at the top of the house every day, and syringe the trees during the morning and the afternoon. A slight fumigation should be given once or twice before the flower buds are open, but all must be perfectly dry when this operation takes place.

Successional trees, the forcing of which is to commence on New Year's Day, should be cleaned, and receive any necessary pruning, if this has not been already performed. Trees started at this date or after the turn of the year should be afforded somewhat higher temperatures than the above, but an abundance of ventilation must be provided on all possible occasions. Houses containing later trees should be kept as cool as possible by admitting plenty of air both during the day and the night-time. Any further proposed additions or alterations to the borders should be accomplished with as little delay as is possible, and the roots must never be allowed to become dry, for this is the first cause of bud-dropping.

Vine borders.—Outside borders containing the roots of early and mid-season vines should now be covered with a thick layer of freshly-dropped leaves and long straw. This protection will prevent excessive rain and snow from penetrating the border, and will also keep the roots warmer. These borders should be examined occasionally to ascertain if rats are present, for these pests will soon attack and injure vine roots.

Nectarine Prince Arthur Crowds.—This variety is worthy of extended culture, for the fruits possess a splendid flavour, and can be had early in the season. They are of a desirable size, being pale yellow in colour, flushed with scarlet on the exposed side.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and they signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations. *The Editor will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, etc., but he cannot be responsible for loss or injury.*

Newspapers. *Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, DECEMBER 8.—Dutch Gard. Soc. meet.

MONDAY, DECEMBER 10
Cent. Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, DECEMBER 11
Roy. Hort. Soc. Comms. meet.

WEDNESDAY, DECEMBER 12
Nat. Chrys. Soc. Exh. of Market Chrys. in the Foreign Flower Market, Covent Garden.

THURSDAY, DECEMBER 13—
Nat. Potato Soc. Exh. at Roy. Hort. Hall, Westminster (2 days).
Manchester and North of England Orchid Soc. meets.

SATURDAY, DECEMBER 15—German Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick=40°.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, December 5* (6 P.M.): Max. 54°, Min. 42°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December 6* (10 A.M.): Bar., 29·8°, Temp., 45°, Weather—Overcast.
PROVINCES.—*Wednesday, December 5* (6 P.M.): Max. 48°, S.W. Ireland and Cornwall, Min. 41°.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Roses, Plants, Bulbs, &c., at Stevens' Rooms, 38, King Street, Covent Garden, W.C.

TUESDAY AND WEDNESDAY—
Unreserved sale of the whole of the Nursery Stock at The Lang Nursery, Maidstone, by Protheroe & Morris, at 12.

WEDNESDAY
Bulbs, Border, &c., Plants, at 11; Roses at 1·30 and 3·30; Azaleas, Palms, Plants, Fruit Trees, &c., at 3·30, At 67 & 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY AND THURSDAY—
Unreserved two days' Sale of the whole of the Closes Hall Collection of Orchids, at Closes Hall, Gisburne, near Clitheroe, by Protheroe & Morris, at 12.30.

THURSDAY—
Special Clearance Sale of Nursery Stock at the Nurseries, Fanstead, by order of Messrs. H. Cannell & Sons, by Protheroe & Morris, at 12.

FRIDAY
Consignments of Burmese Dendrobes, Oncidium Marshallianum, Cypripedium Farrieanum, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Need for Co-operation.

When, some years ago, the adulteration of seeds had reached such proportions that honest dealers became more and more disgusted at practices which, as individuals, they were powerless to prevent, the matter was set right by the co-operation of the merchants themselves. By their joint efforts the Adulteration of Seeds Act was passed, and the straightforward vendor, who desired to conduct his business honourably, was no longer handicapped by competition with the unscrupulous adulterator. Now that the Bill for the prevention of "secret" commissions and "corrupt" practices has become an Act, it rests with the traders either to carry out the provisions of the Act, and not to offer secret discounts or commissions, or to run the risk of incurring the very heavy penalties imposed by the law. At the meeting of nurserymen held on November 20 it was agreed that the provisions of the Act should be loyally obeyed. Large and representative as the meeting was, it is certain that very many of the trade were not present, and that even now many may not be aware of the very stringent provisions of the Act. If they refer to p. 279 of our issue for October 20 they will find the terms of the Act printed in full. We must again remind some of our readers who have written to us on the subject that the Act is not specially directed against nurserymen and gardeners in particular, but applies to all trades and occupations in which secret and corrupt discounts or gifts are, or have been, offered or accepted. The words "secret" and "corrupt" have no terrors for the honest, straightforward man who supplies goods of adequate quality at reasonable prices. The unscrupulous man, who is reputed to have ordered more goods than were required in the hope of getting a larger discount will live in apprehension, and the merchants who offer it will assuredly suffer in reputation and public esteem even if they manage to escape the full penalties of the law. It rests, then, with the merchants to co-operate in carrying out the law, it devolves upon the agent and the purchaser to do nothing which can be deemed either secret or corrupt. The provisions of the Act are aimed, not at individuals, but at a system which has been abundantly proved to be fraught with evil consequences.

The London Chamber of Commerce which was incorporated for the purpose of guarding the commerce of the principal city of the world, recognised that in many cases fair trading was being fettered by corrupt considerations, and promoted the Prevention of Corruption Act which, largely owing to the protracted efforts of Sir Edward Fry, the late Lord Russell of Killowen, Lord Alverstone, Lord Halsbury, and others, has duly become law. The Secret Commissions and Bribery Prevention League (58, Coleman Street) has been formed with the support of the leading members of the Secret Commissions Committee of the London Chamber of Commerce for the purpose of taking active measures for the enforcement of the Act. With this object in view the League will take every legitimate means in its power to combat the evil of secret commissions and bribery.

If co-operation on the part of the dealers is necessary it is no less so on the part of the gardeners. There are many gardeners who accept the position and receive the wages of a garden-labourer. The British Gardeners' Association is founded with the object of remedying this state of things, by offering some guarantee to the employer that the man he employs is really, and not merely nominally, a gardener, and by urging the necessity of paying the duly trained gardener at a rate commensurate with his abilities and the responsibilities incident to his position. In too many cases the gardener receives a lower salary than is accorded to other servants in the same establishment, whose attainments and responsibilities are much less. Gardeners are of necessity so isolated that, individually, they can do little, but by legitimate co-operation they can, while scrupulously respecting their employers' interests, improve their own position and do away with the unwholesome competition with untrained and incompetent men.

Roses.

The National Rose Society has issued a new "official" catalogue of Roses, which we heartily commend to all Rose lovers—that is to say, to everybody. It is distributed among the members of the Society, but outsiders can procure a copy for half-a-crown through the mediation of one of the elect. In its compilation the requirements of the ordinary Rose-grower are fully catered for, whilst the interests of the "exhibitor" are not overlooked. First of all we have a descriptive catalogue, arranged alphabetically, and with brief indications of the particular purpose for which each variety is best suited. Then we have a list of Roses arranged according to the classes to which they belong—H.P., T., H.T., &c. This is followed by selections for general cultivation, for bedding, for standards, for walls, for pillars, for pergolas, for covering banks, for edging, for pot culture, for towns, for exhibitions, &c. The most fragrant Roses, as here enumerated, are Alfred Colomb, Camille Bernardin, Cherry Ripe, Common Provence, Dr. Andry, Dupuy Jamain, Exposition de Brie, General Jacqueminot, Heinrich Schultheis, La France, Mdme. Isaac Pereire, Maiden's Blush, Marie Baumann, Mrs. John Laing, Paul Jamain, Rosa Mundi, Senateur Vaisse, and Ulrich Brunner.

The whole list is so instructive that it will prove valuable to amateurs. There are many, perhaps the great majority, who only care for a Rose for its beauty and fragrance, but there are some few who would like to know a little more about their favourites. What constitutes a noisette? What is the difference between a T. and an H.T.? and so forth. They would like also to know why one Rose is globular, another conoid; why one Rose is quartered like the Souvenir de la Malmaison; why one has a tangled mass of petals in the centre like Gloire de Dijon, whilst another, like A. K. Williams, is symmetrical and regular in the disposition of its petals; why some petals recurve and others remain flat, or nearly so, and so forth.

A little information on such points as these would not detract from the pleasure of looking at a Rose, whilst to many they would be a source of additional interest.

To those who have followed the progressive development of a Rose from the time it is no bigger than a pin's head, till it arrives at the full size, these details are, of course, more or less familiar. The great body of rosarians have neither leisure nor opportunity to make recondite researches of this kind, but they could, and many would, appreciate a statement of the general results at which the morphologists have arrived, and which could be readily explained by means of diagrams. By their aid the "reason why" of the varied Rose forms could be set forth without entailing too much uninteresting toil on the Rose lover. We are rather apprehensive as to the reception these suggestions may meet with at the hands of rosarians, but as no one is obliged to adopt them we may hope for a charitable appreciation of our motives.

OUR SUPPLEMENTARY ILLUSTRATION to the present issue depicts four of the newest varieties of winter-flowering Carnations, all of which were present at the exhibition of these flowers in the Royal Botanical Gardens on Tuesday last, a detailed report of which appears on another page. Tree Carnations have flowered in this country in winter for many years past, and Mrs. Leopold de Rothschild, Winter Cheer, and Uriah Pike are some of the older varieties that gained considerable popularity. Since the introduction from America of varieties having large, brightly-coloured flowers, which are produced on stalks sufficiently strong to hold them perfectly erect, the winter-flowering section has become more and more appreciated, and their cultivation is extending widely. We have information of several instances where special houses for tree Carnations have been recently erected in gardens which had not suitable structures for them. New varieties are being raised in great numbers in America, and latterly also in England, and in consequence many of the varieties are only distinct from each other in minor characteristics. The Winter Flowering Carnation Society will soon, we think, have reason to keep a list of "too-much-alike" varieties, and in the meantime raisers should be urged to endeavour to secure definite variations in form and colour. They hardly need to be reminded that a yellow variety is much coveted. The novelties included in the supplementary illustration are White Perfection and Mrs. Robert Norman (white), and Robert Craig and St. Louis, both of which are shades of red. The greater degree of fringing may be seen in the petals of the varieties Robert Craig and White Perfection. Robert Craig, White Perfection, and St. Louis have all received the R.H.S. Award of Merit.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—The sixteenth annual dinner is announced to take place on Tuesday, December 11, at the Holborn Restaurant, when Mr. T. W. SAUNDERS, the President, will preside.

NATIONAL POTATO SOCIETY'S SHOW. We are informed that entries have been received from various parts of the kingdom for the above show, which will be held in the Horticultural Hall, Westminster, on December 13-14. A Potato cooking competition for ladies will be held each day of the show. The non-competitive section will include some of the crop of Solanum Commersoni (swamp Potatos) which Mrs. HANCOCK has successfully cultivated at Horeham Road, Sussex. A satisfactory crop has recently been lifted, quite untouched by frost or disease, although the ordinary tubers in an adjoining plot were seriously affected. The usual conference will take place at 3 p.m. on the first day, when Mr. H. HENSHAW, of the Cambridge University Farm, Impington, will read a paper on "Facts about change of seed." Mr. GEORGE GORDON, V.M.H., will preside. In the evening the members' dinner will be held at the Hotel Windsor, Victoria Street, to be followed by the annual meeting.

DAHLIA SOCIETY IN THE UNITED STATES.—Not until this year has there existed a Dahlia society in the States, but one has recently been established, which is known as the New England Dahlia Society, consisting at present of 100 members. Mr. H. F. BURT, of Taunton, Mass., is president, a man who devotes almost all his time to Dahlias, and Mr. MAURICE FULD, of the firm of Messrs. W. W. RAWSON & Co., of Boston, is Secretary.

"MARKET" CHRYSANTHEMUMS.—The special exhibition of Chrysanthemums, as grown for market, will be held on Wednesday next, December 12, in the Foreign Flower Market, Covent Garden. Particulars may be obtained from the secretary to the National Chrysanthemum Society.

THE LABORATORY AT WISLEY.—We desire to call special attention to an advertisement from the R.H.S. inviting candidates to apply for the post of Director of the Experiment Station. The director will not only have to devise experiments and undertake research, but will also be expected to instruct the students in the elementary sciences affecting the practice of horticulture. The position is one of such importance that we trust a thoroughly competent man, gifted with insight and initiative, will be selected. The success or failure of the scheme depends essentially upon the man selected and the support afforded him by a sympathetic council. From some points of view this is the most important step ever taken by the society and the results will be anxiously watched.

MR. MITTEN'S MOSSES.—We are sorry to hear that the very rich collection of Mosses made by Mr. MITTEN has been allowed to leave the country and has become the property of the American Government.

M. BUYSMANN, of Middelburg, Holland, is about to settle in the interior of the Eastern part of Java, where he will grow not only tropical plants but also such temperate plants as will grow in that climate at an altitude of 1,200 metres. This portion of the island has, up to the present, not been much explored, so that, no doubt, many interesting plants may be expected from that district. M. BUYSMANN will settle in Java in the course of next spring, and will be glad to communicate with any horticultural firm or botanist desirous of receiving plants or seeds from that island.

INTERNATIONAL CONFERENCE ON PLANT HARDINESS AND ACCLIMATISATION.—The responses to the preliminary letter of inquiry issued in the early part of this year have proved so encouraging that the council of the Horticultural Society of New York, at a recent meeting, decided to proceed with the project, and is arranging to hold the conference in New York City about the end of September, 1907. From all parts of the United States, from several European countries, and from South America and Canada, as well as the West Indian Islands, active interest has been expressed, and, at this early date, a number of papers and contributions have been promised. The conference has the endorsement of the United States Department of Agriculture, and the majority of the directors and horticulturists of the State experiment stations have signified their intention of contributing information or sending delegates. The great importance of the subjects to be discussed in their relationship to practical horticulture, fruit-growing and the nursery trade is evident to every one. A special committee of the society in charge of the arrangements for the conference was appointed as follows:—JAMES WOOD, N. L. BRITTON, P. O'MARA, H. A. SIEBRECHT and LEONARD BARRON. Communications from those interested should be addressed to the office of the Society, Room 60, Bryant Building, 55, Liberty Street, N.Y. City.
L. Barron, Secretary

THE SMITHFIELD CLUB SHOW.—We are reminded that the Fat Cattle Show will be held in the Royal Agricultural Hall, Islington, on December 10, 11, 12, 13, and 14. The Board of Agriculture informs us that Lord CARRINGTON will be "at home" to farmers at the offices of the Board of Agriculture, 4, Whitehall Place, S.W., on Tuesday, December 11, and Friday December 14, from 12 o'clock to 2 p.m., and from 3 p.m. to 4 p.m. Lord CARRINGTON will visit the Show of the Smithfield Club on Monday, December 10, and he has accepted an invitation to be present at the Annual Dinner of the Farmers' Club and the Central Chamber of Agriculture on December 11.

BURBANK AND HIS WORK.—Professor KELLOGG, as quoted in the *Florist's Exchange*, gives his impressions in the following summary:—"Let us, in a paragraph, simply sum up the essential things in the scientific aspects of BURBANK'S work. No new revelations to science of an overturning character; but the revelation of the possibilities of accomplishment, based on general principles already known, by an unusual man. No new laws of evolution, but new facts, new data, new canons for special cases. No new principle or process to substitute for selection, but a new proof of the possibilities of the effectiveness of the old principle. No new categories of variations, but an illuminating demonstration of the possibilities of stimulating variability and of the reality of this general variability as the fundamental and transforming factor. No new evidence either to help the Darwinian factors to their death-bed or to strengthen their lease on life; for the 'man' factor in all the selecting phenomena in BURBANK'S gardens excludes all 'natural' factors. Finally, in any summation of the scientific aspects of BURBANK'S work must be mentioned the hosts of immensely valuable data regarding the inheritance of characteristics, the influence of 'epigenetic' factors in development, the possibilities of plant-variability, and what not else important to evolution students, mostly going unrecorded, except as they are added in mass to the already too heavy burden carried by the master of the laboratory, and as they are summed up in those actual results which the world gratefully knows as BURBANK'S 'new creations.'"

WILD FLOWERS AT HOME.—Messrs. GOWANS & GRAY, 35, Leicester Square, W.C., are issuing a set of pretty little nature-books. Of these we note *Wild Flowers at Home*, first and second series, illustrated from photographs by Mr. CAMERON TODD; *Toadstools at Home*, illustrated by Mr. SOMERVILLE HASTINGS; and *Our Trees and How to Know Them*, with photographs by Mr. CHARLES KIRK. Any effort that helps in diffusing a knowledge of the beauties of British country-life should be encouraged, and as each of these little volumes contains 60 pictures and some explanatory notes they should do good work. We are glad to find scientific names quoted, as well as popular and fancy names, and the only thing to be regretted is the unavoidably small size of the photographs. Also, it would have been convenient to have mentioned how much the plants shown are reduced in size in reproduction. There is an attempt to do this in *Toadstools at Home*, the best of the series, but here the sign of multiplication is used instead of that of reduction.

THE BRUSSELS COURT OF APPEAL. It will be remembered that one of our Orchid cultivators purchased, for the sum of 30,000 francs (£1,200), five varieties of Orchids on the strength of some coloured illustrations published by the vendor. When the plants produced their flowers it was found that they were not equal to the representations. The purchaser therefore took steps to have the sale cancelled. As the vendor objected, the case was submitted to the Tribunal of Commerce, who, after hearing the evidence, appointed certain well-known experts, all Belgians, to assist them, and in the result the case was decided in favour of the purchaser. The decision was appealed against, and as we now learn from the short report of the case in the *Revue de l'Horticulture Belge*, the Court of Appeal repudiated the idea of any substitution having taken place and stated that the plants in question are the same as those sold to the purchaser, and that as they do not correspond with the representation made by the seller the sale is annulled. It results that the original purchase money, with interest and expenses, is to be paid back to the purchaser, in addition to the sum of 5,000 francs damages. The law costs to be paid to the purchaser amount, says the *Revue*, to 8,000 francs (£320).

THE ART OF THE FLORIST.—At an exhibition of floral decorations held recently at Brussels and reported in the *Tribune Horticole* for November 3, M. MAUMENÉ, of Paris, availed himself of the opportunity of speaking on some of the principles of floral decoration, &c. He took for his text the baskets, bouquets, and table decorations as exhibited, explaining the principles which govern the florist's art. These principles are not numerous, but comprise good taste in the choice of colours, observation of the natural mode of growth, a little economy, and a good deal of fashion. To have beautiful bouquets it is necessary to choose vases appropriate in shape to the flowers that they are to contain: short and wide vases for Chrysanthemums and long slender vases for Roses and Orchids. Highly ornamented vases are unsuitable and they are best when subdued in colouring. In narrow vases the height of the bouquet should be about 2 to 3 times greater than that of the vase. The flowers must not be crowded, as it is not desirable that bouquets should have too regular outlines. The flowers should, on the contrary, be isolated and suggest their appearance when growing on the plant. Flowers are now not "mounted," the wire used simply serves to support the stem which can thus be thrust into the damp moss in the vase; the bouquets thus keep much longer. When only short-stemmed flowers are obtainable, as is the case with many spring-flowers, very pretty arrangements can be made by sticking them into bamboo stems put together like the branches of a tree. It is thought undesirable nowadays, especially for the decoration in glass vases, to employ bouquets of flowers which fade quickly, hence the flowers are placed in little tubes immersed in zinc pans full of water concealed by greenery. M. MAUMENÉ mentioned the excellent effect of mixing autumn leaves with Chrysanthemums. He insisted on the necessity for contrast in colouring, mauve and yellow, of which there were many examples, giving a good colour, harmony. Green is a neutral colour for florists, and that is why pink Carnations contrast so well with foliage. The use of ribbon in bouquets is rather out of favour; it has been much criticised because ribbons brighter than the flowers were employed. Baskets were much less numerous than bouquets at the exhibition. The lecturer showed a basket of foliage plants where Dracænas struck a prominent note of red. Cut flowers were inserted in the mould and when these faded and were removed there still remained some beautiful plants for room decoration. Table decorations received much attention from M. MAUMENÉ. These should be elegant, light, and interspersed with pendent clusters of flowers, enabling the guests to see across the table easily. Light foliage, such as that of Asparagus, is much used. Those flowers should be chosen which look well under artificial light: Cattleya, pink Carnations, and Parma Violets fulfil these requirements; ordinary Violets on the contrary seem darker in a lighted room. A somewhat novel plan has been adopted for dinners at separate tables, each table being decorated with different flowers, such as Carnations, Roses, Lilies of the Valley, Mimosa (Acacia), Parma Violets, Cattleyas, &c., buttonholes and bouquets of the same flowers being distributed to the guests, who thus easily find by this indication the particular tables reserved for them.

THE SAN JOSE SCALE. The *National Nurseryman*, of Rochester, N.Y., gives details of the success which has been obtained in combating this pest. One gallon of "Scalecide" was mixed with 12½ gallons of water, and with this the trees (pears) encrusted with scale were thoroughly sprayed in October and twice subsequently. The lime-sulphur wash was also used (Professor SLINGERLAND). The results were so successful that an offer of a dollar for every *living* scale has been offered, but no one has as yet claimed the reward.

THE ETHERISATION OF LILACS.—In Dresden, according to an article in Möller's *Deutsche Gärtner Zeitung*, several firms working in association with the Research Station have obtained excellent results with etherisation, and now employ the process regularly. It is sufficient to avert any chance of failure if the directions given by Prof. Johannsen in the first edition of his book are carried out fully. A second edition, which appeared this year, is considerably enlarged, and contains everything that has been published concerning etherisation, besides remarks on the remarkable appearances which the plants present on the completion of the process. The larger cultivators at Dresden, finding that the sort of etherising chamber recommended by Johannsen was too small for their purpose, cultivate dwarf Lilac plants, and knowing the property of ether vapour to sink to the bottom, make the chambers much broader than high, and fill them with tiers of plants laid on their sides. Etherisation may be carried out in a frame placed in a glasshouse, and although much of the ether escapes into the house when the frame is cleared of the plants, no harm results to the inmates of the house, but, as Johannsen states, the dilute mixture of air and ether may excite growth in them. The frame or chamber must be hermetically closed, and it should be opened for an hour or longer time after using it before any person ventures therein. According to observation, etherised Lilac bushes do not need to be placed in a warm house directly they are removed from the chamber, under the belief that the narcotic effects of the drug will evaporate. The effects, in the autumn months more especially, do not go off, so that the growers in Dresden, Hamburg, Kiel, or anywhere else, may safely send etherised Lilacs, &c., to their customers long distances, ready for forcing, a circumstance which has lengthened the Lilac season to an extraordinary extent. It may be said, according to Prof. Johannsen's statements in his book, that any gardener can have flowering Lilac from the end of the month of November, if he carries out the instructions given and possesses a sufficient acquaintance with varieties, some forcing readily in the autumn, and others very slowly, or not at all.

PUNCH'S ALMANACK.—The approach of a new year has been marked by the appearance of *Punch's Almanack* for more seasons than we care to count. The present issue is full, as usual, of amusing skits, written and drawn by well-known humorists. The actual almanack is a double-page supplement illustrating "All the Year Round in Fairy Land," and it is a seasonable pastime to trace many childish friends in the dainty landscape in which Mr. ARTHUR ROGHAM has arranged them. In fact in every detail our old friend is more than up to his usual standard of excellence.

LA REVUE DE L'HORTICULTURE BELGE. This periodical was established more than thirty years ago with the object of giving publicity to new plants, of bringing to remembrance old favorites, of recording progress in horticulture and botany, to serve as a guide to amateurs, and as a medium for the use of nurserymen. It was founded by a group of ardent horticulturists, headed by Count de KERCHOVE, EDWARD PYNAERT, and other friends whose memory will always be held in deep reverence and gratitude by those who had the privilege of their acquaintance. F. BURVENICH, the last survivor, is happily still amongst us. It would not be easy to exaggerate the services the men we have mentioned rendered to horticulture in general, and to that of Belgium in particular. The *Revue* is only one of their good works. It has faithfully adhered to its programme, and is now about to extend its usefulness by appearing twice in the month instead of once only. The number of illustrations will be increased, but the rate of subscription will remain unchanged. *Floreat!*

SUTTON'S RECREATION CLUB.—The employees of Messrs. SUTTON & SONS, Reading, who recently amalgamated their various sections of sports under the above title, assembled on Friday, November 23, on the occasion of the first annual supper in connection with the club. Mr. LEONARD SUTTON presided over a company of more than 200 of the members.

THE NEXT GREAT QUINQUENNIAL, 1908.—The committee is already hard at work drawing up the schedule and making other preparations for this great undertaking. Truly we may say, recalling the late President, *Uno avulso non deficit alter*. A similar remark applies to EDWARD PYNAERT, who is succeeded by his son, as well as to others of the committee.

OLD-FASHIONED FLOWERS.—By MAURICE MAETERLINCK. (London: GEORGE ALLEN.) This book has no preface to explain the writer's intention, and we are only told that it was composed by Mr. MAETERLINCK, translated by A. TEIXEIRA DE MATTOS, and illustrated by G. S. ELGOOD. Consulting the pages, we find for once neither gardening instructions nor a jumbled description of plants, persons and opinions. It is a book in praise of old-fashioned flowers, not necessarily those that have been longest known and grown, but such as we and our immediate ancestors have raised and loved. While sharing the admiration expressed, we need not feel obliged to sympathise with the writer's style of writing, nor with all his opinions. He is welcome to dislike scientific names, and to be inconsistent even in this where he mis-spells some names, and uses others even longer than those to which he objects. As to the language, an extract from the book will enable our readers to judge of it for themselves. Speaking of "News of the spring," he says: "The Peach trees are now no more than a rosy miracle, like the softness of a child's skin turned into azure vapour by the breath of dawn. The Pear and Plum and Apple and Almond trees make dazzling efforts in drunken rivalry, and the pale Hazel trees, like Venetian chandeliers resplendent with a cascade of gems, stand here and there to light the feast." There are some hundred pages of this sort of writing. The coloured pictures are truthful yet bright, and therefore pretty and pleasing; and the whole book is attractive, in spite of florid rhetoric displayed in it.

BLACKIE'S NATURE-KNOWLEDGE DIARY.—This is a memorandum-book ruled into columns wherein notes are intended to be made upon the weather and such natural objects as birds, insects, trees, wild flowers, &c., as children meet with in their daily life. Mr. W. P. WESTELL prefaces the book with some notes on nature study in which he shows how the diary should be used, and how facts observed should be entered in it in the spaces prepared for such notes. To encourage school children, Messrs. BLACKIE & SON (Dublin, London and Bombay) offer to present six books yearly for the six best kept Nature-Knowledge Diaries. To use these books properly will necessitate neatness, as well as calling out powers of observation which it is highly desirable should be cultivated.

DRESDEN INTERNATIONAL HORTICULTURAL EXHIBITION, MAY, 1907.—We have received copies of the schedule of this important exhibition. Applications should be made to the secretary of the exhibition, Neumart 10, Dresden.

BUDDING LIFE. This is a "book of drawings" by JESSIE M. KING, published by GOWANS & GRAY, of London and Glasgow. It consists of less than a score of outline illustrations on note-paper size. The execution is very Japanese in character. The drawings are natural, elegant, and faithful as far as they go, but with not sufficient detail to be useful to botanists or gardeners.

SEED LIST.—The list of seeds of herbaceous plants and of trees and shrubs available for exchange at the Royal Gardens, Kew, has been issued. It must be borne in mind that the seeds mentioned are only exchanged with botanic gardens and regular correspondents and not with the general public.

EPSOM SALTS FOR AZALEAS. It is generally admitted that lime is detrimental to the growth of Rhododendrons and allied plants. In the *Garden Magazine* (New York), Mr. HOGENSON says that the evil effects of lime in the soil may be counteracted by the addition of sulphate of magnesia (Epsom Salts). For pot plants one quarter of an ounce of magnesia sulphate was mixed with 5 pounds of soil, or at the rate of a little over 3 tons per acre. The photographs of Rhododendrons and Azaleas grown in lime-soil with and without the addition of the magnesia, bear out Mr HOGENSON's statement.

A BOOK OF ENGLISH GARDENS. Written by M. R. GLOAG, illustrated by KATHARINE MONTAGU WYATT, and published by METHUEN & Co., 36, Essex Street, W.C. We have in this book chatty accounts of some of the famous old gardens of England. The introductory chapter is a discourse upon gardens in general and a brief chronological account ranging from the Garden of Eden (of course) to our own times. We find here all the time-honoured allusions to the hanging gardens of Babylon, to Pope's Grotto, and to equally familiar eccentricities of intermediate date. The succeeding pages of the book deal with gardens still left to us, showing the work of our forefathers and the fashions of past times. The estates described are Abbotsbury, Albury, Ampthill Park, Ashridge, Beckett, Brownsea Island, Ham House, Hatfield, Holland House, Hutton John, Knole, Sutton Place, and Wrest Park. The chief attractions of these to the makers of the book appear to be their antiquity, and the general sense of repose and pleasure that they afford the visitor. Of horticulture we find but little, and of botany nothing at all. Perhaps it was difficult to separate these gardens and their associations from the history of the houses to which they are attached. In every case we read a good deal about the families owning the estates described, even when their affairs have nothing to do with the gardens. The illustrations deserve notice, as they give a pleasing, though often an inadequate, idea of certain specially beautiful nooks and corners. They are brightly coloured and appropriate to the style of the book. Every reader interested in the "Stately Homes of England" will enjoy turning over these pages and find many stray pieces of information worth remembering, while to the many persons connected with the various estates the letterpress and pictures will of course be of equal importance.

BRITISH ALPINE PLANTS.—To those who want to know something more about "Alpines" than that they are beautiful and attractive, we commend a paper on the distribution of Alpine plants in Britain, read before the Southport Society of Natural Science by Mr. W. H. STANSFIELD. In simple but most interesting manner Mr STANSFIELD traces the origin, ancestry and migrations of our mountain plants. J. J. RILEY, *Guardian* Office, Lord Street, Southport, is the printer.

"HELIANTI."—Under this name M. R. DE NOTER calls attention to the well-known Helianthus decapetalus. According to M. DE NOTER it produces tubers in great abundance, so great that we hesitate to cite the figures he gives. The tubers can be used as food like those of its congener, the so-called Jerusalem Artichoke, but specially for the extraction of starch and the production of alcohol. The stems can be utilised for forage and the fibre for paper-pulp. The culture is simple and the profit large. At any rate, M. DE NOTER'S assertions may be easily tested.

BOTANIC GARDENS, SAHARANPUR.—Mr. H. M. LEAKE, F.L.S., Economic Botanist to the United Provinces, who has had charge of these gardens for the past two years, has been transferred to the Agricultural College at Cawnpore, and is succeeded by Mr. A. C. HARTLESS, lately Chief of the Governmental Gardens in the Bombay Presidency. The latter is succeeded in Bombay by Mr. I. LITTLE, from the Royal Botanic Garden, Calcutta.

GARDEN-MAKING. Mr. JOSEPH CHEAL has published a small pamphlet on this subject, wherein he lays down the general principles of garden-making, dealing with the choice of site, the approaches, the formation of lawns and plantations, the treatment of water, the designing of gardens in various styles, the formation of wild gardens, woodlands, Rose-gardens, and other accessories. The pamphlet is copiously illustrated, and the comments sensible and to the point. We suggest that a rustic timber bridge is not the most appropriate, though it is doubtless the most common, means of crossing a rocky defile, where the stratification of the rocks, natural or artificial, is very apparent.

JOINT RAILWAY AND PARLIAMENTARY COMMITTEE. We are informed that at a meeting of the Joint Railway and Parliamentary Committee held on the 28th ult., Mr MONTAGU (President) and Mr. W. CHEETHAM reported that they had met several members of the House of Commons at Westminster to discuss railway rates, &c., and had been given a favourable and encouraging reception from members representing all political parties. One of them reminded the committee of a hint given by the President of the Board of Trade, that a discussion was likely to shortly take place in the House on owner's risk and kindred questions, and he suggested that the committee should use all possible means to raise such a discussion, as it would bring the matter prominently before the Government, and would also tend to facilitate matters when the Bill which the committee now have in hand was brought up in the House.

"AMATEUR GARDENING."—Our contemporary *Amateur Gardening* issues an attractive Christmas number, with a coloured and gay cover illustrating the Time of Roses. There are many other pictures reproduced from photographs, and therefore truthful as well as pleasing. The letterpress is, of course, not to be overlooked, and in addition to light and seasonable reading there will be found here the usual practical and helpful information.

WHAT IS DONE IN EDINBURGH. We are so accustomed to read of the magnitude and superiority of everything American, that we feel as if a load were removed from us when reading President DUCKHAM's address to the Chrysanthemum Society of America as reported in the *American Florist*. "I had great pleasure in attending the Edinburgh (Scotland) show, 1905, and I must confess I was completely overwhelmed by it, both by the magnificent blooms shown and the attendance. There were over 70,000 paid admissions in three days. Think of that and be humble! Nay, think of that, and lay plans day and night to rouse our people to a similar interest! What could we accomplish if we had a constituency like that?" The old country it seems is not quite played out yet!

DOGS ACT, 1906. "Section two of the Act which comes into operation on January 1st, 1907, empowers the Board to make Orders under the Diseases of Animals Acts for the following purposes:—*(a)* for prescribing and regulating the wearing by dogs, while in a highway or in a place of public resort, of a collar with a name and address of the owner inscribed on the collar or on a plate or badge attached thereto; *(b)* with a view to the prevention of worrying of cattle, for preventing dogs or any class of dogs from straying during all or any of the hours between sunset and sunrise; and *(c)* for authorising a Local Authority to make Regulations for either of these purposes. The Orders and Regulations will take effect under the Diseases of Animals Act, 1894, and the Orders may provide that any dog in respect of which an offence is being committed against the Orders may be seized and treated as a stray dog." If some Act could be enforced requiring the owners of a dog or dogs that disturb their neighbours' peace of mind, especially at night, to wear a collar issued by the police, no doubt the nuisance which residents in the suburbs now suffer would be materially abated.

Publications Received. *Agricultural Bulletin of the Straits and Federated Malay States* (July), Edited by H. N. Ridley and J. B. Carruthers. Contents, Tapioca as a Catch-crop, by Mr. W. Dunman; Rim Rubber Company, Ficus elastica, &c. *Reports on the Botanic Station, St. Vincent* (1905-1906). Mr. Sands, Agricultural Superintendent, reports continued success and extension of the Cotton industry, and good work was done in the Gardens and other departments. California Agricultural Experiment Station. *Mosquito Control*, by H. J. Quayle. A campaign against mosquitos was begun in May 1904. It was found that there were four especially troublesome species around Berkeley, and experts indentified these and traced their life histories. The chief measures undertaken for the control of the pests were the filling in of some waters and the oiling of others. The success so far achieved in this important work should encourage further efforts in this direction.

CHRYSANTHEMUM NOTES.

AMERICAN CHRYSANTHEMUMS.

It is not many years ago since we used to receive from American growers like Spaulding, Nathan Smith, Hill, Waterer, Craig, and others an annual consignment of novelties. On going my rounds this season here and there, I have been reminded of the days when American Chrysanth mums were a factor to be reckoned with, for a change variety in some group or other has aroused many memories. They are still a few, but they are rarely to be met with in the big stands of the leading prize winners at our great shows. Harry Wonder and J. H. Runciman are to be seen in several of the parks. They remind us of the large collection of seedlings raised by Pitcher and Manda, which ultimately passed into the hands of Mr. H. J. Jones. Louis Boehmer is still grown in the parks. This was the second hairy variety introduced, the original one, Mrs. Alpheus Hardy, having so far as my experience goes, completely disappeared. Simplicity (a white Japanese), Esau (a pale pink, hairy), and Col. W. B. Smith (a bronze-yellow Japanese) are all in the collections in the London parks. Ivy Anemones we still have with us. Judge Benedict and Delaware. Several fine blooms of Good Gracious, one of the most distinct varieties there ever was, have been recorded. G. W. Childs (a vivid crimson) I have seen only at Finsbury Park. In France, as here, not many American varieties remain. Julian Hillpert is largely grown for the market, and was one of the Pitcher and Manda seedlings. W. H. Lincoln is occasionally met with; also Wm. Tricker, the Egyptian, Modestum, Col. Appleton, and Mrs. H. Robinson. It is only natural to suppose that every raiser has his day. Salter's seedlings are gone, Delaux's are scarcely known, and so we may expect even the best varieties of the most modern raisers will in their turn give place to others as time rolls on. "Sic transit gloria mundi." *C. Harman Payne.*

YELLOW CHRYSANTHEMUMS.

I do not remember a season to have gone by in the past when so many grand examples of yellow Chrysanthemums have been met with. F. S. Vallis, in my opinion, heads the list, for it has been seen in magnificent form: the finest blooms ever shown anywhere must have been those staged by a new amateur, Monsieur Dubuisson-Joubert, at the Paris Show. He had staged in a vase seven of this variety that measured about 18 inches across from tip to tip. Lieut.-Colonel Ducrocquet is another grand yellow that has been seen in fine style. Mrs. F. W. Vallis, Mrs. W. Knox, Buttercup, Alger-

non Davis, Mrs. R. Hooper Pearson, Merstham Yellow, Sensation, Bessie Godfrey, Le Peyron, Leigh Park Rival, Souvenir de Bailleul, Ministre Morgeot, Ami Nonin, Le Bouvier, Mme. G. Rivol, Calvat's Sun, Emblème Poitevine, Naples, Roi d'Italie, and several others in various shades have all been seen in first-class form. *C. H. P.*

MARKET CHRYSANTHEMUMS

SOME of the finest Chrysanthemums seen in Covent Garden Market are those sent by Mr. Joseph Tulley, Rose Nursery, Enfield Highway. I recently visited this nursery, and the plants seen in the houses impressed me as being quite of the best. Some 18 span-roofed houses are now accommodating some 38,000 Chrysanthemums in pots. Two houses were filled with the variety William Holmes, which, at the time of my visit (November 14), was at its best condition. Dazzler, the bright scarlet crimson variety, had been partially harvested, but there still remained a rich cutting. The bulk of the plants were carrying from 10 to 12 blooms each. The variety Mdlle. Louise Charvet was excellent, the crop being the most promising one I have ever seen both for size of bloom and for colour. Of the variety Mdlle. Th. Panckoucke the flowers were developing too early in the best buds. A house contained the pink variety A. J. Balfour, but none had been cut. Tuxedo is of splendid colour, and suitable for florists' sprays. Eynsford White is still one of the best varieties for decorative purposes. Putney George, although raised many years ago, is still one of the best market kinds, and sells freely in the market. Klondyke, Mabel Butler (the dark Tuxedo), Early Yellow, Mytchett Beauty, and Nagoya were all noticed. One house containing the variety Cullingfordii, the plants being grown under cold treatment in pots, was alone worth journeying to see. The house was filled with 2,000 plants, the flowers being of the deepest colour I ever saw in this variety. Every house was well arranged, the taller plants being in the centre and the dwarfer ones at the side. The nursery is well equipped and up-to-date in every respect. *Stephen Castle.*

CASSIA REMIGERA.

FOR the opportunity of illustrating this rare species, fig. 150, we are indebted to Mr. Millard, Malabar Hill, Bombay, who sends the following interesting note with the photograph —"I send you by this mail a photograph of Cassia remigera in flower in my garden. In Hooker's *Flora of British India*, the flowers are described as unknown: but, of course, that was written many years ago. The tree, which is now about 20 feet high, was sent to me seven years ago by a friend in Rangoon, where it seems to be fairly common. It is the most beautiful Cassia I have seen—even superior to C. marginata and C. grandis. The branches are clothed with the light pink blossoms, each about ¾ to 1 inch in diameter, with prominent yellow stamens. The tree remains in flower for a period of nearly two months. It reminds one somewhat of a Cherry tree in England

FIG. 150.—CASSIA REMIGERA IN A BOMBAY GARDEN, FLOWERS PINK.

LAW NOTES.

SECRET DISCOUNTS.

IT does not appear to be generally known that, apart from the damage to commercial reputation or the risk of blackmail run by those who commit a criminal offence under the "Prevention of Corruption Act," there is a serious financial liability incurred by those who give "secret" discounts to buyers or other agents. In the present article it is not proposed, however, to deal with this aspect of the matter.

Dealing with the question of criminal liability, one must, at the present moment, necessarily rely to some extent upon the wording of the Act itself, coupled with the possible bearing on the point of reported decisions of the Civil Courts under circumstances more or less similar.

The provisions of the Act (see p. 279) have already appeared in these columns, and need not be again set out here, but readers will recollect that for the purposes of the Act, the expression "consideration" includes valuable consideration of *any* kind, while an "agent" includes any person employed by or acting for another. It will also be remembered that the maximum penalty on conviction is, if the case is dealt with at the Assizes, imprisonment, with or without hard labour, for a term not exceeding two years, or a fine not exceeding £500, or both fine and imprisonment. A magistrate has, however, power to deal with the matter in a Court of summary jurisdiction, but in this case the penalties which he may impose are not to exceed four months' imprisonment, with or without hard labour, or a fine not exceeding £50, or a combination of both fine and imprisonment. On conviction by a magistrate, the prisoner has a right of appeal to Quarter Sessions; also it is important to bear in mind that (presumably as some precaution against the obvious possibility of frivolous prosecutions) there is a provision in the Act to the effect that a prosecution under this Act shall not be instituted without the consent of the Attorney-General or Solicitor-General.

This Act not only makes it a criminal offence to give, or agree to give, any payment of the kind now under consideration, but it renders equally liable any person who accepts, or agrees to accept, or even attempts to obtain any such payment. Therefore, although it may be difficult to get at foreign nurserymen carrying on business abroad (their agents in England presumably being careful to know nothing of the matter) yet apparently the gardener who received in England, or even asked for, any such payment would none the less find himself liable to fine and imprisonment.

It has been suggested that the Act would not touch a trader who gives to a buyer or other agent a secret discount or commission after the transaction is completed, but note that the Act specifically includes the words "*having done* or foreborne to do." It has also been suggested that a nurseryman only makes a customer's gardener a small present to induce the latter to give every care and attention to the seeds or plants supplied while they are in course of cultivation, but this argument invites the obvious rejoinder that the gardener is already paid to do his duty, and whether he is adequately remunerated or not by his wages is, in the eyes of the law, entirely a matter between himself and his employer.

It may be suggested that many employers really do not object to their gardeners receiving such presents, since it makes the latter contented with lower wages, but it is difficult to believe that employers, as a body, would deliberately choose to countenance the practice. Suppose, for example, nurserymen were to send out their catalogues or invoices with a heading to the effect that "commission at, say, 5 per cent. on the amount of all orders will be allowed to gardeners on production of their employer's written authority to receive such commission," is it likely that such authority would be forth-

coming in the majority of cases, and is it not far more probable that most employers would argue thus: "Oh, well, if the nurseryman can afford to allow my gardener 5 per cent. commission, why should he not allow it to me instead? Besides, it is only placing temptation in the man's way to let him feel that the more money he spends with my nurseryman the more he will get for himself." The effect of such an offer would probably be to excite prejudice in the employer's mind against the nurseryman suggesting it.

It will be observed that the Act also makes it an offence for any person knowingly to give to any agent, or for any agent knowingly to use with intent to deceive his principal, any receipt, account, &c., which contains any statement which is false or erroneous or defective in any material particular, and which, to his knowledge, is intended to mislead the principal. No doubt this clause is aimed at those firms who have made it a practice to supply two forms of invoice with the goods, one showing discount deducted, and the other showing the sale price in full (the latter document only being intended for the principal's inspection). It may be instructive in this connection to mention a case which occurred not very long since. An official holding a diplomatic appointment under the British Government was directed to obtain certain seeds with a view to seeing how they would grow in the locality where he was resident abroad. Accordingly he wrote to a firm of seedsmen, directing them to send him seeds to a certain value, and referred them to his solicitor in England for payment. The seedsmen actually forwarded the solicitor in question two invoices, one for the full amount, and the other containing a deduction in respect of "discount." It is scarcely necessary to explain the object with which these two invoices were forwarded!

One need hardly deal seriously with the argument that a present between a grower and a customer's buyer is on an equal footing with a "tip" to a waiter at a restaurant or a Christmas box to one's postman. One has only to recollect that the sanction of the Attorney-General or Solicitor-General has to be obtained before any prosecution can be instituted, and one cannot imagine such sanction being given in the case of a person who has given a waiter or a postman a few pence in accordance with the recognised custom of the country.

It is obvious that in any criminal prosecution under the Act for giving or receiving secret discounts the whole question as to whether the accused is "guilty" or "not guilty" will turn largely upon whether the discount is deemed to have been given or received "corruptly" (N.B.—the Act does not even say "fraudulently"), and it remains to be seen whether commercial men will care to take their chance of its being discussed at a criminal trial what the word "corruptly" means. (It is certainly significant to find that the Horticultural Trades' Association of Great Britain and Ireland and the Dublin Nursery and Seed Association have already passed unanimous resolutions deciding to discontinue the giving of private discounts to customers' gardeners.)

In considering this point of view it is impossible to disregard a certain case in which Lord Justice Romer delivered judgment in the Court of Appeal a few years ago.

The judgment itself appears to have been overlooked by many, including most of the official reporters (though fully set out in some reports). It will be well, therefore, to quote the judgment fully here.

LORD JUSTICE ROMER spoke as follows:—

"The Courts of law of this country have always strongly condemned, and, when they could, punished the bribing of agents, and have taken a strong view as to what constitutes a bribe. I believe the mercantile community as a whole appreciates and approves of the Court's views on the subject. But some persons undoubtedly hold laxer views on the subject. Not that these persons like the ugly word 'bribe,' or would excuse the giving of a bribe if that word be used, but they differ from the Courts in their view as to what constitutes a bribe. It may, therefore, be well to point out what is a bribe in the eyes of the law. Without attempting an exhaustive definition I may say that the following is one statement of what constitutes a bribe. If a gift be made to a confidential agent with the view of inducing the agent to act in favour of the donor in relation to transactions between the donor and the agent's principal, and that gift is secret as between the donor and the agent—that is to say, without the knowledge and consent of the principal—then the gift is a bribe in the view of the law. If a bribe be once established to the Court's satisfaction, then certain rules apply. Amongst them the following are now established, and, in my opinion, rightly established, in the interests of morality with the view of discouraging the practice of bribery. First, the Court will not enquire into the donor's motive in giving the bribe, nor allow evidence to be gone into as to the motive. Secondly, the Court will presume, in favour of the principal, and as against the briber and the agent bribed, that the agent was influenced by the bribe, and this presumption is irrebuttable. Thirdly, if the agent be a confidential buyer of goods for his principal from the briber, the Court will assume as against the briber that the true price of the goods as between him and the purchaser must be taken to be less than the price paid to, or charged by the vendor, by, at any rate, the amount or value of the bribe. If the purchaser alleges loss or damage beyond this, he must prove it. As to the above assumption we need not determine now whether it could in any case be rebutted. As at present advised, I think in the interests of morality the assumption should be held an irrebuttable one, but we need not finally decide this, because in the present case there is nothing to rebut the presumption."

In another civil action the Court of Appeal has emphasised the law in a way which may prove of interest to those who contend that their motives are not "corrupt." In the case in question LORD JUSTICE COLLINS said:—

"It is quite possible that the plaintiff might have honestly believed that there was no harm in a would-be vendor agreeing to give a commission to the agent of the purchaser, but his mental and moral attitude on this point could not alter the legal effect of his acts."

In another case LORD JUSTICE JAMES said:—

"According to my view of the law, I take it to be clear that any surreptitious dealing between one principal and the agent of the other principal is a fraud on such other principal cognizable in this Court."

Of course, it by no means follows that in criminal cases the Court would observe precisely the same rules as in the Civil Courts, especially having regard to the difference in penalty. Rightly enough, the law is very jealous in its protection of the liberty of the subject, and indeed it is a matter of common knowledge that Acts of Parliament dealing with criminal offences are construed far more strictly (and, therefore, with far less liberality in following the apparent intentions of an Act, as distinct from its actual wording) than in the case of statutes which deal with civil matters. At the same time the remarks of the Lords Justices above quoted are very explicit as to the view taken by the Court, in civil matters at all events, and are therefore instructive, as showing the possible trend of a judge's mind when similar facts come to be dealt with, as must inevitably occur before long, in a criminal prosecution.

There has naturally been considerable discussion in commercial circles as to whether the Prevention of Corruption Act will, or will not, have any lasting effect on commercial custom. There are some sanguine individuals who declare their opinion that the Act will practically be treated as a dead letter, and that one will find no prosecutions instituted thereunder. Others take the view that, whether or not the Act may have any lasting effect, there is no gainsaying the fact that undoubtedly criminal prosecution will be *possible*, and that so far as they are concerned, they do not care to take their chance of standing in the dock in a state of uncertainty as to whether their acts will be considered corrupt or not. Others, again, are doubtless bearing in mind that even if they may successfully emerge from a criminal prosecution, there remains a further point to be considered, viz., whether even an abortive prosecution would not seriously damage their reputation for commercial morality among their customers, that is to say, the general public. There remains, finally, a large class which considers that even apart from the question as to whether they run any risk of wearing "the broad arrow" at a future time or not, the Act furnishes a remarkable opportunity for any trade to endeavour to put an end, once and for all, to what they consider to be a pernicious practice, an opportunity, in fact, which, if neglected now, may never occur again. With all these divergent views, an article on the purely legal aspect of the case has, of course, nothing to do. The matter is one which for his own sake any trader, who has not yet made up his mind on the subject, will doubtless anxiously consider from all points of view, and having had the legal position put squarely before him, it is of course for him to decide, and decide quickly, as to the course which he proposes to adopt.

Summing up the whole position, it would seem clear that those who wish to keep on the *safe side* of the law have only one possible course before them, namely, to set their face steadfastly *against the giving or receiving of any discount, present, or commission (as between a vendor and a purchaser's agent or buyer) without the previous written consent of the agent's employer.* *H. Morgan Veitch.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE BRITISH GARDENERS' ASSOCIATION.—I have noticed what Mr. T. Smith has written about young men being ready in the evening with the hand on the door ready to go home, &c., and venture to think if Mr. Smith had my experience he would be glad when that time came. Being in a medium-sized place, which is under-handed, where mostly "tinkers" are employed, and never enough done to satisfy the employer, I think he would alter his opinion as to working together towards a common end. I have to work 11 hours each day and through the "tinkers" I have duty to do myself every Sunday without extra pay, and through their ignorance of gardening I have to neglect the houses to put things in order for them outside, and they are paid nearly the same wage as myself who started when I left school at gardening in a large place. If only those still outside the professional fold would exhibit a little more *esprit de corps* and not sit on the fence so long, we should soon become a strong organisation. I think Mr Smith must admit we are about the worst-paid and best-worked body in the Kingdom at present. *A Member of the British Gardeners' Association.*

——— Mr. Smith's (of Newry) reply to the mild letter of protest from the pen of Mr. Watson, against the inclusion of amateurs in professional gardeners' associations, is in keeping with his own attitude towards gardeners. That there are "good gardeners and excellent gentlemen" amongst amateurs no one will gainsay, but the point is this: that a deep gulf lies between the two. In the case of the amateur, gardening is a hobby; in that of the professional, it is his means of living. The B.G.A. was formed to attain a definite object, viz., to raise the status of the professional gardener. The need for such an organisation as the B.G.A. has been felt for many years, but owing to the lack of initiative on the part of those best qualified for the work, it has only recently taken on a definite form. In common with other unions of workers, the B.G.A. has to contend against the suspicions of the employer and also those of a large number for whose benefit the association has been formed. As Mr. Smith says, "there are gardeners and employers who pull together in a sympathetic manner, discussing methods and working together towards a common end." True! but the "common end," in most cases, consists of improving the condition of the garden and not the condition of the gardener or gardeners. For one employer who is fair, there are many who are not. To put forward the statement that gardening is a hobby, or in other words a luxury, is mere twaddle. It is as much a necessity as motoring, racing, hunting, golf and other recreations of the employer, all of which, in spite of increased cost, are still on the increase. When an employer, with a taste for gardening, finds he cannot obtain a professional gardener unless he pays him a certain wage, he will pay him that wage. It is not to the best interests of the gardener to quarrel with the employer who is disposed to be friendly and who recognises his ability in a suitable manner. Such an employer will certainly not fall foul of the B.G.A. It is to those employers, who do not possess this tolerant spirit, and who wish to keep the gardener in his present position of dependence, that a united stand will have to be made against sooner or later. Those who have studied these matters, fully know how little has been gained without personal sacrifice on the part of the workers. It is the same in all struggles between capital and labour, no attention is paid to the appeal of the individual, but collectively the force of public opinion has often been sufficient to bring about the desired result without recourse to drastic methods. *C. T. Ratsill.*

THE CURRANT BUD GALL MITE.—My attention has been directed to a report which appears in the *Gardeners' Chronicle*, of November 24, p. 356, respecting some experiments carried out by Mr. Massee under the auspices of the Royal Horticultural Society, and, presuming that this report is correct, in common fairness to myself and other workers, I should like to draw attention to the fact—which seems to have escaped your attention and, most strange to say, Mr. Massee's also—that the discoveries (!) credited to Mr. Massee have long been in black and white, and further that the statement that "attempts to eradicate this pest

have, up to the present, proved abortive." The statement that the Hazel Bud Gall Mite does not attack the Black Currant is also incorrect. It is surely known to Mr. Massee that the life-history of Eriophyes ribis was almost completely worked out by Mr. R. Newstead in 1901 (*vide J. R. H. Soc.*, vol. xxvi.), and a further and very full account was given by Mr. E. J. Lewis early in 1902 (*Repts. S. E. Agric. Coll., Wye*, March, 1902), followed later in the same year by some valuable details by Mr. C. Warburton and Miss Embleton (*Linn. Soc. Journ. Zool.*, xxviii, p. 366); finally, in 1904 I published the results of my investigations commenced in 1899 (*Repts. on Econ. Zool.*, No. 1), and they were far from abortive, for they have resulted in the only practical cure for the pest yet put forward (*vide Ann. Rept. for 1904 and 1905*). So far as I can learn Mr. Massee has not discovered anything fresh respecting the life history of this mite. With reference to Eriophyes avellana occurring in the Black Currant buds, I published a paper in April, 1905, showing that this actually occurred (*Nature Study*, 1905), and in July, 1905 (*Proc. Ass. Econ. Biol.*, vol. i., p. 10). Without much further experience I am bound to question whether Mr. Massee is capable of differentiating the specific characters of our 35 or 36 British species of this very difficult genus of mites. Finally I question, to quote Prof. E. Ray Lankester, "Whether any man of science is justified in making statements, as though he himself had investigated and was responsible for the accuracy of these statements in virtue of his own observations on the objects described, when all the time he is simply stating what this man and that man have seen, though he omits to mention the name of any of those to whom he is indebted." I do not propose to offer any remarks upon the nature of Mr. Massee's supposed cure, but as a member of the Scientific Committee of the R.H.S. I wish to dissociate myself from work of this character, which is, I feel, not in the best interests of the society. *Walter E. Collinge, University of Birmingham.*

—Mr. Collinge cannot realise how grieved I am to learn that he has deemed it necessary, in fairness to himself and others, to take too serious a view of my remarks. He is perfectly correct in all he says. I am quite incapable of differentiating between our 35 or 36 mites, and I have not added a single fact as regards their life-history. Perhaps I ought to qualify the last statement, and say I observed that when a Black Currant mite attempted to walk on grease, it stuck fast! Trees that have been greased for the past two years have had no more "big buds," have produced a good crop of fruit, and are yet living to tell the tale. These same trees had "big bud" rampant before treatment. Did Mr. Collinge advocate grease? *G. Massee.*

BLACK CURRANT MITE: PREVENTION OF CORRUPTION ACT v. BRITISH GARDENERS' ASSOCIATION. As a fairly close reader of the *Gardeners' Chronicle* for over 45 years, I cannot recall an instance where one copy contained so much of real interest to horticulturists as that for November 24. As to Black Currant mite, if further trials go to confirm what Mr. Massee said, it will be a good thing for fruit-growers and fruit-eaters in this country.

Respecting the Prevention of Corruption Act, I sincerely hope that the bulk of my fellow horticulturists will rise to their opportunity and clear the craft for ever from the too often false imputations made with regard to it. I know from a long experience that these imputations are very often made by men whose daily lives are less free from reproach than those of hundreds of steady working gardeners, although they occupy a much higher social position. Let us show a firm but respectful front to all concerned in this matter and live the whole thing down by trying to do right. I hope I am not appearing self-righteous when I say that during over 40 years' experience as a head gardener, I never asked for a commission from anyone I have dealt with on my employer's behalf. Few, if any, began their gardening careers under less favourable auspices than I did, and yet I have managed to live and pay my way till nearly the old-age pension time, 65.

As to the British Gardeners' Association, my friends tell me I am nothing if not a critic. Well, to live up to it I must say that I have all along felt that a British Gardeners' Guild would have been more con-[illegible] all round, although I know a wise man has [illegible] laid down the axiom that there is not much [illegible]. Well, I hope that within, say, seven years, fully two-thirds of the trained gardeners in Britain will be members of the British Gardeners' Association. My life would disprove any assertion that I am in favour of causing discord betwixt employers and employed. All the same each party has rights as well as duties. Gardeners as a body have never held the position that their prolonged training, their general intelligence and good moral character have entitled them to hold. I know that in the main this has been their own fault. My opinion is that now is their opportunity to lay the foundation for an improved position in the future. See what wise examples the more far-seeing of our employers have set and are setting by joining the Country Gentlemen's Association, Army and Navy Stores, &c., &c. I repeat, that to stir up class-hatred is wholly repugnant to my nature, but I do think every honest, fairminded Englishman is entitled to join his fellow workers in trying to improve their positions in life all round. If horticulturists as a body will be but true to themselves, I can foresee a much better future for them, although I may not live to see the promised land. Imagine a Gardeners' Guild, with not fewer than ten thousand members, all having conformed to wise rules before being admitted. The headquarters to be in London, with branches in all the important cities and towns in the country. Let this Guild embrace all the principles and objects of the Gardeners' Royal Benevolent Institution, the Orphan Fund, and United Benefit Society, then we should have a federation of horticultural societies worth working hard to get, and capable of doing a great amount of good. *Yorkshire Gardener, November 27, 1906.*

BEECH AS COPPICE.—Coppice growers, who read your interesting notice of "The Trees of Great Britain and Ireland, &c.," will draw their own conclusions of the "special qualifications of the authors as foresters," when they read that "it is recommended to grow Beech for coppice and cut it every 15 or 20 years." Beech is practically unknown in Britain, and I believe also on the Continent, as coppice. A familiar acquaintance with coppice plantations in almost every county in England leaves me ignorant of one example of Beech, and I thought both owners and woodmen knew that the reason of its absence was that Beech was practically an impossible tree for coppice, because it is almost destitute of reproductive power from the stool, and dies out in 40 years or less. Oak, Ash, Alder, Sweet Chestnut and Hazel are the coppice trees, because they reproduce freely from the stool and for a long period. It is no uncommon thing to see Alder, Chestnut, Ash and Oak 6 to 10 feet high from old tree or coppice stools the second year, but who ever saw the Beech produce as many inches in the same time? See Schlich, Nisbet, Schwappach and others. *Reader.*

BLACKBIRDS AND TOMATOS.—Your report of the last meeting of the Scientific Committee of the Royal Horticultural Society mentions blackbirds in Cornwall eating Tomatos. There is no mention of place or observer, and although I fancy it alludes to an occurrence in these gardens, it seems of sufficient interest to again, and more fully, record the fact. During the past autumn I frequently saw a cock-blackbird (or birds) voraciously feasting on ripe Tomatos which were growing against a south wall in front of my house. Tomatos were plentiful, and, being interested, I took no steps to stop it, but as the weather turned colder I had some spare lights placed against the wall to assist in ripening the fruits. There was a space of about 4 inches between each light, and taking advantage of this the bird continued his feast. I feel sure the hen birds did not participate, and, judging from the quantity eaten, I should say that probably two birds were so engaged, though I never saw more than one at a time. *A. C. Bartlett, Pencarrow Gardens, Cornwall.*

PHEASANTS AND GUNNERAS.—For some time past it has been the practice here during the autumn of cutting one of the largest leaves of Gunnera manicata and spreading it on the grass near by to show its size. After a few years the pheasants, which consort in large numbers around the stream by which these giant leaves grow, took an occasional peck at them, and each succeeding year eating more. Last year they quickly demolished the cut leaf, and this year they have eaten largely of the growing leaves. But, curiously enough, they prefer the flavour of G. scabra to that of G. manicata, from which they acquired the taste. Although the leaves of G. manicata are reared on stalks 8 feet high, this preference is not to be explained on the score of accessibility, for the outer leaves of G. manicata rest on the ground. Of course the greater number of the pheasants who first tasted the Gunnera are now defunct, so that the liking for the new food must either have been transmitted to the present generation, or is due to imitation. *A. C. Bartlett, Pencarrow Gardens, Cornwall.*

THE BLANCARD FUND.—In answer to my appeal on behalf of the two grand-daughters of M. Blancard who introduced the first Chrysanthemum into Europe 117 years ago, I have to acknowledge the receipt of the sums mentioned below. As I said before these two poor old French women are living in England, and are in feeble health and straitened circumstances. Anonymous, £5; ditto, £2 2s.; Mr. C. E. Shea (President N.C.S.), £1 1s.; C. E. Pearson, 10s. 6d.; J. H. Runchman, 10s. 6d.; Mr. W. B. Reeve, 2s. 6d.; Miss Wayne, 2s. 6d.; Mr. E. Greaves, 1s. 6d.; Mrs. A. Greaves, 1s.; Amateur, 1s.; D. G., 1s.; Mons. E. Bourdelot, 1s.; Mr. J. Culpeck, 1s.; Mrs. Culpeck, 1s. Further donations are earnestly solicited and will be gladly received by *C. Harman Payne, Foreign Secretary, National Chrysanthemum Society, 141, Wellmeadow Road, Catford, S.E.*

SOCIETIES.

ROYAL HORTICULTURAL.

COLONIAL EXHIBITION.

DECEMBER 4, 5.—The sixth exhibition of Colonial produce, held on these dates under the auspices of the Royal Horticultural Society, may be ranked amongst the best of the series. The show under notice was the third during 1906, the others having been held during March and June respectively, the object of fixing the dates at these periods being to suit the seasons when the produce from the respective colonies is in the greatest degree of perfection in London. The chief honours must be given to British Columbia, for this colony had the finest exhibition in the show, apart from the supplementary exhibits of home-grown fruits. The principal fruits in the Hall were Apples and Pears; Limes, Citrons, and other members of the Orange family; Bananas, Pineapples, Cocoa-nuts, &c. There were also examples of Yams, Eddoes, Sweet Potatos, Grenadillas, and other vegetables which are articles of every-day use with our colonial friends; preserved fruits, jams, jellies, and a host of other dainty comestibles. Classes were provided for home bottled and preserved fruits and vegetables, and, judging from the appearances of those staged, our colonies have nothing finer or better to send us in this direction. The show was greatly enhanced by a fine display of hardy fruits staged by Messrs. GEO. BUNYARD, and another smaller but equally good collection staged by Messrs. CANNELL & SONS. The exhibit from British Columbia was contributed by several growers in that colony, their exhibit being almost entirely of Apples. These were displayed in boxes, baskets, and dishes, the boxes being ordinary shipments consigned to our English markets. The grading and packing were examples of how they should be done, and although the fruit had travelled over 5,000 miles, it was seen in the best possible condition. The colour in the Apples was remarkable; one variety labelled Black Twig was almost black, so deep was the shade of its red skin. With many of the varieties we are already familiar, such as Newtown Pippin, the *doyen* of its class, Northern Spy, Jonathan, and King of Tompkins' County. Spitzenberg is a very pretty variety, but we cannot tell of its other qualities. A Gold Medal was awarded the Governor General of the Colony, and a number of medals of lesser value to the individual exhibitors. The small island of Dominica sent a very large number of fruits of the genus Citrus—Limes, Lemons, Oranges, Citrons, Grape fruits, and some of the largest Shaddocks we have ever seen. (Gold Medal.)

The ROYAL MAIL STEAM PACKET CO. showed fruits such as Oranges, Bananas, Grenadillas (a gourd-like fruit), and Shaddocks, Yams, Eddoes, Sweet Potatos, &c. They also staged many exhibits from the Australian Colonies—Currants, Sultanas of exceptional quality, Prunes, Peaches,

Apricots, Citrons (preserved), and wines from New South Wales. Cereals, dried fruits, &c., from Victoria, and a small exhibit from Queensland. (Silver-Gilt Knightian Medal.)

The WEST INDIAN PRODUCE Co., 4, Fenchurch Buildings, London, E.C., was awarded a Gold medal for a large collection of West Indian preserves, sugars, cigars, cigarettes, fruits, pickles, wines, and similar articles found in the grocers' shops. The most interesting of this miscellaneous display were samples of tea, the first grown on a commercial basis in Jamaica.

The GOVERNMENT OF NOVA SCOTIA showed a small but interesting exhibit of Apples, all very fine produce and varieties easily recognisable, such as Ribston Pippin, Golden Russet, Cox's Orange Pippin, &c. A variety shown under the name of Wolf River is an exceptionally fine fruit, being very large and very beautifully coloured. (Silver-Gilt Knightian Medal.)

The BRITISH WEST INDIA CO. showed Limes, Oranges, Bananas, Cocoa-nuts, and other colonial fruits.

Other articles of interest were desiccated fruits and vegetables shown by MCDOUGALL, Ltd., Finsbury, E.C., and articles manufactured from Ramie fibre (Bœhmeria nivea), shown by Mr. D. EDWARDS RADCLYFFE, Staines, Middlesex. (Silver Knightian Medal.)

Prominent exhibitors of home bottled and preserved fruits and vegetables were Mrs. W. H. PLOWMAN, Beddington Corner, Mitcham; Major HIBBERT ASHBY, St. Ledgers, Rugby; Mr. W. POUPART, jun., Fernleigh, Belmont Road, Twickenham; and Mrs. VINCENT BANKS, 102, Park Street, Grosvenor Square.

Messrs. GEO. BUNYARD & Co.'s exhibit, a fine display, included 200 dishes of Apples and Pears. (Gold Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, staged 42 dishes of hardy fruits of high-class quality. (Silver-Gilt Banksian Medal.) Messrs. GEO. MASSEY & Co., Spalding, showed 40 varieties of Potatos and a number of clean-skinned, solid Onions.

Mr. RUSSELL, Richmond Nurseries, Richmond, had an imposing exhibit of evergreen trees and shrubs, and a fine batch of the new Buddleia asiatica in flower. (Silver-Gilt Flora Medal.)

LINNEAN SOCIETY OF LONDON.

NOVEMBER 15.—Professor W. A. Herdman, F.R.S., president, in the chair.

The Rev. T. R. R. Stebbing exhibited Mr. J. G. Pilter's Chart of the Metric System, published by the Decimal Association. He strongly commended the simplicity and clearness with which the system was presented by this graphic method, needing so few words of textual explanation.

On behalf of Mr. John Cryer, of Shipley, the General Secretary exhibited a series of 21 specimens of Polygala amarella, Crantz, selected to show its wide range of form under various conditions. The species was discovered at Grassington in May, 1902. In a communication which was sent with the plants, Mr. Cryer states that this species, which grows on the Great Scar Limestone, in the West Riding of Yorkshire, was to be seen during the past season in great abundance over a large area.

The first six specimens shown were from 3 to 8 inches high from an elevation of 750 feet; as the elevation increased, the height diminished, till the plant became less than 1 inch high.

Blue-flowered specimens were found well distributed over the whole area; white-flowered specimens were unequally dispersed; rose-coloured plants were only found in one locality, but there they were locally abundant. Spatulate rosettes of root-leaves are the winter state of the plant.

One characteristic of Polygala amarella is, that it can grow where there is but little soil for its support. Mr. Cryer has found it growing on what was almost bare rock; it has the habit of thrusting its roots into the cracks and crevices of rocks or between the stones and rocky fragments. Wherever he has found it, with one exception, there has been little or no depth of soil.

Mr. Cryer has compared P. austriaca, Crantz, a closely allied species, in Kentish localities, and points out that the latter has a less condensed habit with smaller, uniformly lilac-blue flowers, more scattered on the stem; cauline leaves smaller, less pointed at the apex, and only traces of a basal rosette of leaves.

The paper of the evening was by Mr. Horace W. Monckton, Treas. and V.P., "On the Fjærlands Fjord, Norway."

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 22.—*Committee present:* Messrs. E. Ashworth, Ashton, Cypher, Cowan, Keeling, Leemann, Ritchie, Rogers, Smith, Shill, Thorp, Warburton, Williamson, Sander, and P. Weathers (hon. sec.).

There was a magnificent display of plants at this meeting, and Mr. A. Warburton is to be congratulated on his fine display, which included many choice plants in addition to a large number of showy Orchids. (Gold Medal.)

Messrs. CYPHER & SONS, Cheltenham, also obtained a Gold Medal for a good group of plants, principally Cypripediums.

O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers) staged a magnificent group of Cypripediums, all in excellent condition, to which a special vote of thanks was awarded.

Messrs. SANDER & SONS, St. Albans, also staged an interesting group.

A FIRST-CLASS CERTIFICATE was awarded to A. WARBURTON, Esq., Haslingden, for a magnificent variety of Cattleya × Fabia var. ardentissima.

AWARDS OF MERIT were given to A. WARBURTON, Esq., for Laelio-Cattleya Clive, "Vine House var.," and L.-C. Clive var. magnifica, Cypripedium insigne var rotundiflorum and Cypripedium × Milo, "Vine House var."

One of the best hybrids yet seen, viz., Cypripedium × "King Haakon," received a First-Class Certificate.

Messrs. CHARLESWORTH & Co., Bradford, obtained an Award of Merit for Cypripedium Lord Ossulton, Heaton var. *P. W.*

BECKENHAM HORTICULTURAL.

NOVEMBER 23. At the meeting of this society, held on the above date at the Church House, Beckenham, Mr. E. J. Holland, Sutton, Surrey, gave "A Chat on Roses." Councillor Cole presided over a large and attentive audience. For fully an hour and a quarter Mr. Holland discoursed on the Rose, at first briefly on its history and subsequently on its culture.

WINTER FLOWERING CARNATION.

DECEMBER 1.—The first exhibition of the Winter Flowering Carnation Society, which was only established during the spring of the present year, was held on Tuesday last in the Royal Botanic Society's gardens, Regent's Park. The society, being so young, has every reason to be gratified with the first display made under its auspices, for the exhibits served to furnish the long corridor, and all the important classes were represented. The honorary exhibitors, all of whom were nurserymen, helped the show very greatly, and their exhibits were of much interest to visitors.

One section alone was disappointing, and that was one consisting of six classes reserved for amateurs. The society has apparently been unable as yet to infuse amateurs with an enthusiasm for competitive exhibition, but it may succeed later. We are disposed to think that the failure of amateurs to exhibit on this occasion is a striking testimonial to the value of winter-flowering Carnations. Several large amateur cultivators were present, and upon asking one of these (a member of the society) why he had not brought an exhibit, he replied: "The flowers are far too valuable at home just now."

It is a fact that the Carnation is at the present time one of the most popular of winter flowers, and although its cultivation is not a matter of any great difficulty to the skilled plantsman who has the necessary means for housing the plants suitably, at the same time, there are few, if any, gardens, where winter Carnations are yet grown so easily and so abundantly that there are more flowers than are required to meet the demand. In view of the general appreciation of this section of Carnations, it is at least remarkable that the National Carnation and Picotee Society refused to widen its scope sufficiently to include these when it was asked to do so. We believe, however, that such was the case, and the Winter Flowering Carnation Society was accordingly established. In these circumstances, it may be capable of doing much good, and it therefore deserves support. The honorary secretary, Mr. Hayward Mathias, has done much work in a short time, and we believe the society has already a membership of about 120.

Subsequent to the holding of the exhibition, a committee meeting was held at which it was shown that after providing for the expenses of the exhibition, there is a considerable balance to the good, and it was decided that another exhibition shall be held in March next at the same place. Much gratification was expressed at the liberal manner in which the Royal Botanic Society had received the society, and the arrangements made by Mr. E. F. Hawes were much appreciated.

COLLECTION OF VARIETIES.

The first class was one for a collection of cut Carnations arranged on a table space of 10 feet by 4 feet, with decorative plants or foliage used for effect. There were three exhibits staged in these conditions, and we assume that the judges awarded the 1st prize for the greater number of varieties rather than for general effect. The 1st prize collection, shown by Mr. C. T. WATERS, Balcombe, Sussex, contained most variety, but the arrangement lacked boldness, and the Asparagus foliage was not so tastefully disposed as it might have been. Several Codiæum plants of bright yellow colour were indifferently placed amongst the Carnations, where the contour of the plants, equally with the vivid yellow colour, were incongruous with the Carnation flowers, which, however, were of good quality. Mr. S. MORTIMER, Rowledge Nurseries, Farnham, who was awarded the 2nd prize, employed tall, trumpet-shaped glasses, and his exhibit had a more satisfactory effect. Messrs. H. F. M. MORRES & Co., Carlton Vineries, Guernsey, were awarded the 3rd prize.

CLASSES FOR DISTINCT COLOURS.

Each of the following classes was for 36 blooms of one variety of a stated colour.—

White.—The two varieties present in this class were Lady Bountiful in two places and Improved White Lawson. This latter variety is a sport which originated at Bexley Heath in 1904, and is said to be distinct from the White Lawson as introduced from America. It gained the 1st prize for Mr. A. F. DUTTON, Iver Nurseries, Bucks. 2nd, Messrs. BELL & SHELDON; 3rd, Mr. H. T. MASON, Hampton Hill, Middlesex.

Blush or Light Pink.—Nearly all the exhibits staged in this class were of the variety Enchantress, but the new variety Mrs. H. Burnett, shown by Mr. H. BURNETT, St. Margaret's Vineries, Guernsey, was awarded the 1st prize. It is a large flower of good form, and very deep salmon-pink colour; 2nd, Mr. A. F. DUTTON; and 3rd, Mr. A. SMITH.

Deep Pink or Rose.—The 1st prize was awarded to Mrs. T. W. Lawson, which, as shown, was nearly of magenta colour. The exhibitor was Mr. A. F. DUTTON. 2nd, Nelson Fisher, from Mr. S. MORTIMER; and 3rd, Mr. T. W. Lawson, from Messrs. BELL & SHELDON.

Crimson.—President, which obtained the first prize in this class, is a moderately-sized flower of very fine form, borne on perfectly erect stems. In shade of colour, it is very deep, but hardly so deep as Harbwarden, which gained the 2nd prize for Mr. A. F. DUTTON and the 3rd prize for Mr. S. MORTIMER.

Scarlet.—A magnificent exhibit of the variety Britannia won the 1st prize for Mr. A. SMITH, Enfield Highway.

In the following classes 18 blooms only were required of each variety.—

White.—The best variety in this class was White Perfection, one of the varieties shown in our supplementary illustration. The flowers were shown by Mr. JAS. GREEN, Reliance Nurseries, March; 2nd, Lady Bountiful, shown by Mr. S. MORTIMER; 3rd, Norway, shown by Messrs. B. and V. CRAIG.

Blush or Light Pink.—There were only two exhibits shown in this class, the varieties being Enchantress and Fair Maid. Enchantress was shown in splendid condition by Mr. HAYWARD MATHIAS, Medstead, Hants, and very easily gained the 1st prize.

Deep Pink or Rose.—The 1st prize was awarded to the variety Nelson Fisher, from Mr. JAS. GREEN, Reliance Nurseries, March. No other variety was shown in this class.

Crimson.—There was only one exhibit, and the 1st prize was awarded to Harbowarden, from Messrs. B. and V. HAIG.

Scarlet.—There were four exhibits in this class, and the variety Robert Craig was shown in two instances, those from Messrs. BELL & SHELDON gaining the 1st prize. Flamingo, from Mr. S. MORTIMER, and Robert Craig, from Mr. MATHIAS, were placed 2nd and 3rd respectively. Mr. DUTTON exhibited Xmas Eve, a very good variety in colour of flower and habit of growth.

Any other Colour, or "Fancy."—The 1st prize was gained by a "fancy" named Mrs. M. A. Patten, shown by Mr. S. MORTIMER. The flowers are white, striped with rose colour.

DECORATIVE EXHIBITS.

The classes that had been arranged for Carnations in various forms of decoration were only very moderately supported. Mr. J. C. KENWARD, 151, High Street, Lewes, won the 1st prizes for a bouquet of Carnations, for three ladies' sprays, and for six gentlemen's button-hole bouquets. Messrs. B. and V. HAIG, Maidenhead, were awarded 1st prizes for a vase of Carnations showing the new, rich-pink coloured Mrs. H. Burnett, and 2nd prizes for six gentlemen's buttonhole bouquets and three ladies' spray bouquets. There was nothing unusual in these exhibits, but the reader needs no reminder that Carnations are amongst the most convenient, as they are also amongst the most effective flowers for the florist's use.

CERTIFICATED VARIETIES.

First Class Certificates were awarded to the two varieties mentioned below:—

Carnation Britannia.—This excellent variety was described in our columns on March 24 last, p. 190, after it had received an Award of Merit from the R.H.S. It is of bright reddish-crimson colour, and in the judging by the Floral Committee of the Winter Flowering Carnation Society was awarded full points for all qualities excepting that of fragrance. Shown by Mr. A. SMITH, Enfield, raiser of this variety.

Carnation Mrs. H. Burnett.—A description of this flower was published in our issue for February 17 last, and it gained a R.H.S. Award of Merit on February 13. The flowers are of considerable size, good form, and the petals are only slightly fringed. The rich shade of pink colour is charming. Shown by Mr. H. BURNETT, Guernsey.

NON-COMPETITIVE EXHIBITS.

Mr. H. BURNETT, St. Margaret's Vineries, Guernsey, made an admirable display, the flowers and foliage being of the best types. Enchantress, Mrs. H. Burnett (new), and Mrs. T. W. Lawson were the three varieties exhibited in best condition. Two vases containing flowers of unnamed seedling varieties were interesting, and one variety was included that went a considerable way towards being yellow. (Gold Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, London, N., gave prominence in their exhibit to the varieties Robert Craig (see supplementary illustration), President, a deeply-coloured crimson-maroon flower, Nelson Fisher, rose-coloured, and Enchantress. In smaller vases the new white Mrs. Robert Norman (see supplementary illustration), Duchess of Portland, Crimson Glow, St. Louis, White Perfection (see supplementary illustration), and others were shown well. (Large Silver-Gilt Medal.)

Mr. A. F. DUTTON had some charming flowers. Those of Fair Maid were really beautiful specimens of this delicately coloured pink variety. Mrs. T. W. Lawson was shown well, also Governor Wolcott (white), Lieut. Peary (white), White Lawson, Robert Craig, White Perfection, Cardinal and Lady Bountiful. (Silver-Gilt Medal.)

A magnificent display of "Britannia," the excellent new crimson variety, was made by Mr. A. SMITH, Enfield Highway. The group included 16 trumpet-shaped glasses, some of which had two dozen flowers in each. Growing plants were also shown, and these exhibited a commendable habit. (Special Gold Medal.)

Messrs. BELL & SHELDON, Castel Nurseries, Guernsey, showed an extensive collection of flowers, but some of them, especially those of Enchantress, were drooping to an extent that lessened their good effect. Mrs. T. W. Lawson appeared better than most varieties in this exhibit. (Large Silver Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park Nurseries, Enfield, arranged an extensive display of flowers on one of the stages in the large conservatory. We noticed in this exhibit the varieties Oriflamme, Floriana, Lady Bountiful, Robert Craig, White Perfection, and Mauvina. The variety known by the last-mentioned name has flowers of a peculiar shade of mauve or purple colour, very similar to the colour common to the flowers of some of the Cattleyas. (Large Silver-Gilt Medal.)

Messrs. HEATH & SON, Cheltenham, showed a group of Carnation flowers. Messrs. F. S. WARE (1902), Ltd., Feltham, Middlesex, and Mr. G. LANCE, nurseryman, Hampton Hill, Middlesex, also staged collections of flowers in which the popular varieties were included.

NATIONAL CHRYSANTHEMUM.

DECEMBER 5, 6.—The early winter exhibition of the above society was held on these dates in the Crystal Palace, Sydenham. Competition in most of the classes was not keen, and the number of entries was below that of last year, although slightly in excess of that of 1904. The weather on the opening day was fine, but the attendance of the public was meagre. Taken collectively, the exhibits made a pretty display, and especially fine was a large non-competitive exhibit staged by Mr. H. J. Jones, Lewisham. Several new varieties were presented for awards, but none was granted.

GROUP CLASSES.

A class was provided for a semi-circular group of Chrysanthemums and miscellaneous flowering and foliage plants, occupying an area of 14 feet by 7 feet. The only exhibit was that staged by Mr. R. FORSTER, Nunhead Cemetery, S.E., who mingled Euphorbias (Poinsettas), Narcissi, Cypripediums, and Roman Hyacinths among creditable plants of Japanese Chrysanthemums, with Ferns, Palms, Grevillea robusta, and other suitable greenery. This group was awarded the 1st prize.

The other principal class for plants, that for a collection of flowering, berried, and ornamental leaved subjects was also represented by one exhibit only. This was staged by Mr. WM. HOWE (gr. to Lady TATE, Park Hill, Streatham Common). It was a very pretty combination of Begonias, Lilliums, Roman Hyacinths, Lily of the Valley, &c., with sprays of Callicarpa purpurea and Solanums in fruit, the whole being set off by graceful greenhouse foliage plants. Mr. HOWE was awarded the 1st prize.

Some good Begonias were seen in a class for these plants, the best being those displayed by F. A. BEVAN, Esq., Trent Park, New Barnet, who had compact, freely-flowered examples of the well-known Gloire de Lorraine variety.

CUT BLOOMS. OPEN CLASSES.

Japanese varieties.—The most important class was that for twenty-four blooms in not fewer than eighteen varieties, and this proved the most interesting and one of the best-contested classes in the whole show. Five exhibits were staged, and good quality obtained throughout the whole of the displays, but Miss WILLMOTT, Warley Place, Great Warley, Essex, had the better examples, and was awarded the 1st prize. A contributing factor to this decision was a magnificent example of the white Mad. R. Oberthur. Mrs. G. Mileham, J. H. Silsbury, W. H. Whitehouse, Mary Inglis, and General Hutton were also shown well in a group that was remarkable for its brightness of colour. 2nd, PANTIA RALLI, Esq., Ashtead Park, Epsom (gr. Mr. G. Hunt), who showed many white varieties. The example of Miss Miriam Hankey was his best flower. 3rd, W. W. MANN, Esq., Ravenswood, Bexley, Kent, some of whose flowers were very fine, especially his yellow varieties.

The two smaller classes for Japanese varieties, those for twelve and for six blooms respectively, were in each case contested by two growers only. PANTIA RALLI, Esq., won easily in the larger class, and Mr. W. G. PREDDEN-CLARK, 4, York Road, Hitchin, was to the fore in the smaller. Mr. PANTIA RALLI's back row contained four very choice flowers in Mad. Carnot, Miss Miriam Hankey, F. S. Vallis, and Mary Inglis. The dozen would have been enhanced the inclusion of a few brighter-coloured varieties.

Incurved varieties.—Six exhibits were staged in the class for twelve Incurved varieties, and of this number three were good and three were inferior. PANTIA RALLI, Esq., Ashtead Park (gr. Mr. G. Hunt), was placed 1st for very excellent flowers, including Mdlle. Lucy Faure, Jaime, The Egyptian, Miss E. Seward, and Doris Raynor. 2nd, Miss WILLMOTT, Warley (gr. Mr. J. Preece).

Chrysanthemums in Vases.—Only one exhibit was forthcoming in the class for twelve vases of Chrysanthemums in not fewer than six varieties, and this was awarded the 1st prize. It was staged by Mr. G. HEMMING, Alexandra Palace, London, N. Many of the varieties were wrongly labelled, and the flowers generally were small. The brightest was the deep yellow "Allman's Yellow," shown without disbudding, a remarkably effective variety for the border.

Twenty-four bunches of Chrysanthemums, any section.—Mr. HOWE had the best display among two, his opponent being Mr. G. HEMMING, the winner of the preceding class. Mr. HOWE had a very creditable exhibit, that embraced Japanese, Singles, Incurveds, border varieties, &c. Mrs. E. Beckett, a large "single" with pure white florets, was shown well, and also the large yellow Japanese variety Beauty of Leigh. Mr. HEMMING, who was awarded the 2nd prize, had a pretty display of small flowering varieties.

Six bunches of Japanese Chrysanthemums.—Three blooms constituted a bunch, and six distinct varieties were called for. By far the better exhibit of two was that shown by A. M. NATHAN, Esq., Little Heath Wood, Potters Bar (gr. Mr. W. Newton). He showed good examples of Duchess of Sutherland, Mr. F. S. Vallis, and the deep red variety named after Lord Hopetoun.

Single varieties.—These were staged on separate tables, each exhibit consisting of twelve bunches in vases, and arranged with any suitable foliage. The tables, each of which measured 8 feet by 3 feet, were draped with white tablecloths. The largest flowers were awarded the premier prize, these being shown by E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson). The pink Edith Pagram was in excellent condition, and did not flag like many of the other varieties. 2nd, Mr. W. C. PAGRAM, The Whim Gardens, Weybridge.

Decorative, Thread-Petalled or Plumed Chrysanthemums.—Mr. G. HEMMING won with an assortment of thread-petalled varieties, such as Mrs. Filkins, Alice Carter, King of the Plumes, &c., and he was followed by Mr. W. C. Pagram (gr. to J. COURTENAY, Esq., The Whim, Weybridge).

Small-Flowered Pompon Chrysanthemums.—Mr. D. B. CRANE, 4, Woodview Terrace, Archway Road, Highgate, N., had the best of these miniature flowers. 2nd, Mr. W. C. PAGRAM.

AMATEUR'S CLASSES.

Twelve Japanese blooms, distinct.—Only two exhibits were seen, the better a very creditable dozen flowers, being exhibited by Mr. C. B. GABRIEL, Eardale, Horsell, Surrey. The deep yellow-coloured General Hutton was especially well shown in this group, which also included good examples of W. R. Church, Valerie Greenham, Mrs. F. Vallis, &c.

Six Japanese blooms, distinct.—This was a better contested class, and the premier exhibit among five was shown by E. M. MOUNTAIN, Esq., West Dulwich (gr. Mr. H. Dodd). Mr. MOUNTAIN showed a beautiful flower of the delicately-tinted variety Florence Penfold. 2nd, W. BRANDER, Esq., 13, Crescent Wood Road, Sydenham Hill.

Decorative classes.—Miss C. B. COLE, The Vineyard, Feltham, was the most successful exhibitor. She showed the best large vase of Chrysanthemums tastefully arranged with any kind of foliage, the best vase of Pompon Chrysanthemums similarly decorated, and the best hand basket of Chrysanthemums.

Non-competitive exhibits.—Mr. H. J. JONES, Hither Green, Lewisham, again excelled with a magnificent group of Chrysanthemum

blooms, arranged in the best decorative style. Very large and beautiful vases, with epergnes and tripods were filled with choice flowers of such noted varieties as Mrs. Swinburne, Mad. Charvet, Mad. R. Oberthur, Mrs. Beech, &c. A tripod filled with the white Moneymaker and pink Winter Cheer formed a charming combination of colours. There were also numerous individual blooms in small vases, among which we noticed the new deep-yellow variety Mrs. Tom Fagg. The whole was carpeted with a green material and edged and interspersed with Palms and Ferns. (Large Gold Medal.)

Mr. PHILIP LADDS, Swanley Junction, Kent, had an exhibit of market varieties of Chrysanthemums of remarkable quality, indeed many of the flowers were up to the best exhibition standard. (Small Gold Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, showed a very large display of Chrysanthemums in vases, and a bright collection of Zonal Pelargoniums. (Small Gold Medal.)

Messrs. W. WELLS & Co., Merstham, showed Chrysanthemums of all types, among which were most of the latest novelties. (Silver Medal.)

Mr. FORSTER, Nunhead Cemetery, showed a semi-circular group of Chrysanthemums and other plants. (Silver Medal.)

Messrs. JOHN PEED & SON, West Norwood, displayed a very fine group of Chrysanthemums, principally large Japanese varieties. (Silver-Gilt Medal.)

Messrs. JOHN LAING & SONS, Forest Hill, London, filled a table with well-grown Codiæums (Crotons) interspersed with Ferns. (Silver Medal.)

Exhibits of Carnations were staged by Mr. S. MORTIMER, Rowledge, Farnham, Surrey (Silver Medal), and by Messrs. W. CUTBUSH & SON, Highgate, London, W. (Silver-Gilt Medal.)

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending, December 5.

A very warm fortnight. During the last 15 days all the days have been warm, and most of them very warm for the time of year, and the same may be said of the nights, which with two exceptions were also unseasonably warm. On the coldest of the two cold nights the thermometer exposed on the lawn showed 10° of frost. The ground is also now very warm, the temperature at 2 feet deep being 1° warmer, and at 1 foot deep 5° warmer, than is seasonable. On the 1st the reading at 2 feet deep was 48°, which is with one exception (1898) the highest I have yet recorded here in December. The last fortnight has not only been very warm, but also very dry: the total rainfall being less than a tenth of an inch. The effect of this dry weather is shown by the soil gauges, through neither of which has there been any measurable percolation for several days. The sun shone on an average for one and a half hours a day, or for 10 minutes a day longer than is usual at this season. During the past week the winds have been high, but in the windiest hour the mean velocity was only 21 miles—direction W.N.W. The average amount of moisture in the air at 3 o'clock in the afternoon was as much as 11 per cent. less than a seasonable quantity for that hour.

NOVEMBER.

Exceptionally warm and very wet.—This was an exceptionally warm November, in fact, there have been only four warmer in the last 20 years. On the warmest day the exposed thermometer rose to 60°, which is the highest ever recorded here so late in the month. On the coldest night the exposed thermometer only registered 11° of frost—a very high minimum reading for the month. Rain fell on 16 days, to the total depth of 3¾ inches, which is nearly an inch in excess of the November average. The last 10 days were virtually dry, so that the whole of that amount may be said to have been deposited during the first three weeks of the month. Owing to the heavy rainfall in October, the percolation through the bare soil gauge exceeded the average by one gallon—that gauge being a yard square. The sun shone brightly on an average for one hour thirty-five minutes a day, which is about ten minutes a day short of a seasonable duration. The winds were light during the first half of the month, but high in the latter half. In the windiest hour the mean velocity was 20 miles—direction W.S.W. The amount of moisture in the air at 3 p.m. was about average, and there were but few foggy days.

THE AUTUMN.

Singularly warm and very wet.—With the exception of 1898 this was the warmest autumn in the last 20 years. Each of the three months proved unusually warm. The fall of rain exceeded the average by 2¼ inches, notwithstanding the light rainfall in September. Although October and November were so exceptionally wet, taking the total falls for the two months together, there have been in the last 50 years five instances in which the last two autumn months have been wetter, and several others nearly as wet. This comes out as a sunny autumn, owing to the splendid record of sunshine in September, for October and November were both rather dull.

OUR UNDERGROUND WATER SUPPLY.

Since the winter half of the drainage year began in October the rainfall of the first two months of it has exceeded the average by 3¼ inches, which is equivalent to an excess of 18,724 gallons on each acre in this district. *E. M., Berkhamsted, December 5, 1906.*

MARKETS.

COVENT GARDEN, December 5.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

REMARKS.—The trade for good Grapes is good; Muscats are dearer. Jersey Beans are a little cheaper. Foreign Tomatos do not, at present, constitute a regular supply. Red or purple skinned Bananas are expected to arrive next week. Trade generally is good. *E. H. K., Covent Garden, Wednesday, December 5, 1906.*

POTATOS.

Bedfords, 65s. to 70s.; Blacklands, 60s. to 70s.; Kents, 70s. to 80s.; Lincolns, 70s. to 80s. Arrivals of tubers are not heavy, and prices are steadily advancing. Trade is slow except for the best samples. *John Bath, 52-54, Wellington Street, Covent Garden.*

COVENT GARDEN FLOWER MARKET.

Trade does not improve much, but a few extra plants are being sold for country orders. Chrysanthemums continue plentiful, but some of the best cultivators have nearly finished for the season. Among the best sorts seen are A. J. Balfour, Western King, Phœbus, and Framfield Pink. Source d'Or is also good, but the flowers are rather small. Lilacs are still abundant. Begonia Gloire de Lorraine and the white variety are both seen in excellent plants. The sale of Poinsettias has been very slow. Indian Azaleas, from Mr. Griffin, Mr. H. Williams, and Mr. Rooke, are good. Daffodils (Narcissus obvallaris) and Tulips in boxes are to be had, but the latter have rather weak flower spikes. Lily of the Valley and Spiræas are both good. Rose Madame Levavasseur, from Messrs. T. Rochford & Sons, Ltd., is very good. This Rose is now available nearly the whole year through. Marguerites are plentiful and good. Chinese Primulas and Primula obconica are seen. Solanums are plentiful and cheap. Among Palms, Kentia Fosteriana and K. Belmoreana in all sizes, fine specimens in 60's pots to very large specimens, are supplied.

Aspidistras, both green and variegated, are very good. Aralia Sieboldi and the improved A. S. Moseri are good Ferns in all the usual market sorts are abundant.

CUT FLOWERS.

Chrysanthemums seen are of better quality. Prices for Liliums have fallen a little. Callas are also cheaper. Lucharis and Pancratiums are plentiful, as also Camellias and Tuberoses. The flowers of Narcissus obvallaris are lacking in substance. Paper White Narcissus from English growers are much better than those imported. Violets are plentiful and good. Roses are realising rather better prices. Madame Chateray is now extensively grown, and I find it is much appreciated by the West-end florists. Carnations vary much in quality. Britannia is the best scarlet variety in the market, and this is almost all sold in advance. *A. H., Covent Garden Market, December 5, 1906.*

LAND TENURE BILL.—From the proceedings in the House of Lords on Wednesday last it would appear that the interests of the nurserymen will receive attention.

Obituary.

THE LATE WILLIAM PARNELL.—Readers of the *Gardeners' Chronicle* who are acquainted with Glasnevin, and especially those who are interested in hardy plants, will be sorry to learn of the death of William Parnell, the general out-door foreman, which was briefly announced in our last issue. He died on Wednesday, 28th ult., after a somewhat protracted illness. He had held the position of out-door foreman for a period of 38 years since the date of his appointment on November 1, 1868. William Parnell began his gardening career at Glasnevin in 1863, and at once commenced the study of hardy plants, and of British plants. He afterwards went to Kew, where he continued his studies, and made such progress that when the late Mr. Bentham was working up material for his *British Flora*, he applied for an assistant, and young Parnell was recommended for that purpose. Having finished his work with Bentham he returned for a second period to the garden, and subsequently came back to Ireland as gardener to Mr. Hone, of St. Dolough's, and from there he came to Glasnevin as general out-door foreman. He was a keen observer of hardy plants, and knew them thoroughly, the critical training he had had under Bentham being of the greatest service to him, and he made full use of his training and of his knowledge. He was of a quiet and retiring disposition, and therefore was not so well known as he deserved to have been. He was a true friend to the men under him, and promoted their welfare in every way open to him, especially by urging them to study and to improve themselves. He passed away, aged 74 years, regretted by all who knew him, and respected by the officers of the department under which he served.

ENQUIRIES AND REPLIES.

VIOLETS.—*Heath's Violet Culture* was printed and published in 1889 by Wm. Birkett of Kendal, price 6d. It is probably out of print. There is an American book *How to Make Money Growing Violets*, by Saltford, published in 1902. Also another American pamphlet *Little Points in Violet Culture*, published 1902. Also Dr. Galloway's *Commercial Violet Culture*, published at $1-50c. 224 pages, illustrated.

ANSWERS TO CORRESPONDENTS.

AILANTHUS: *An Old Correspondent* is respectfully reminded that Ailantus is incorrect and Ailanthus is correct etymologically. It is the spelling adopted in the *Index Kewensis*.

BAMBOOS: *B. L.* We should think that if the flooding of the Bamboos only lasted a week or so at a time they would suffer no harm. Some of the best Bamboos in this country are growing by the side of ponds, &c., with the roots partially in the water. From your experience with *B. Metake* we should judge that *Arundinaria fastuosa*, *A. nitida*, *A. Simonii*, *Phyllostachys viridi-glaucescens*, *P. Henonis*, and *P. aurea* would certainly succeed in the same position. Whether these Bamboos would stand immersion for periods of a month or two is doubtful, and would have to be tested by experience. We have no knowledge of any Bamboos grown under such conditions.

BIRMINGHAM SHOW: *P. and S.* We have referred the matter to our representative, who sees no reason to alter his expressed opinion.

BOOK: *N. L. The Royal Parks and Gardens of London.* Write to the publisher of the *Journal of Horticulture*, Office, 12, Mitre Court Chambers, Fleet Street, E.C.

BRITISH GARDENERS' ASSOCIATION: *C. H.* The words you attribute to Mr. Watson were written by another correspondent a year or more ago. See *Gardeners' Chronicle*, June 10, 1905, p. 362. You cannot do better than join the society at once. In respect to your questions touching the Gardeners' Royal Benevolent Institution and the United Horticultural Benefit and Provident Association, we strongly advise you to join both institutions, for each is doing good and distinct work. The former is a charity, the latter a self-help society.

CAMELLIA FLOWERS: *P. F. P.* Apply to one of the flower salesmen at Covent Garden Market.

CELERY: *Vandon.* The plants have been given too much manure and too much water, which has resulted in such excessive growth that they appear diseased.

CORRECTION (see paragraph on p. 373). Mr. David W. Thomson's nursery is known as Windlestrawlee Nursery, Granton Road, Edinburgh.

FRUIT-GROWING ABROAD: *W. F.* Read the letter printed under "Colonial Notes," on p. 384, also see articles in *Gardeners' Chronicle* March 4, 1905, p. 141, and September 15, 1906, p. 189.

GRAPES: *J. McG.* The injury is caused by Mildew *Plasmopora viticola*, the mycelium of which enters the berries and checks development. Spraying with Bordeaux mixture is a certain remedy.

LOW PRESSURE BOILERS: *V. Chaon.* Any of the sectional tubular boilers advertised from time to time in the pages of this journal will answer the purposes indicated in your note of enquiry. We know of instances where green-houses, basement and second and third floor offices are efficiently heated by the same tubular boiler, and in more than one old castle known to us, a horizontal tubular boiler fixed under the ground-floor is used to heat the basement apartments, and the rooms and corridors on the several landings throughout the buildings with the most satisfactory results, the desired degree of heat in every case being regulated by a series of valves fixed on the flow pipes on the different landings and by good stoking. If boilers of sufficient power to efficiently heat the number of feet of piping attached thereto are properly fixed, and the pipes and valves duly arranged, no difficulty need be apprehended. As regards your fourth and last question, we need only say that all the heating apparatuses referred to are economical in the consumption of fuel, whether it consists of wood, coke or anthracite coal. They—the Strebel, the Quorn, the Robin Hood, the White Rose, the Low Eclipse, Upright and Horizontal Tubulars, &c., are all efficient in heating power, and fuel economisers when properly stoked.

NAMES OF FRUITS: *W. H. B.* 1, Hacon's Incomparable; 2, Scarlet Golden Pippin; 3, Herefordshire Pearmain; 4, Claygate Pearmain.—*F. Eade.* Blenheim Pippin.—*E. Wood.* 1, Old Nonsuch; 2, Waltham Abbey Seedling; 3, Ribston Pippin.—*W. A.* 1, Reinette du Canada; 2, Golden Nonpareil; 3, Wyken Pippin; 4, Golden Noble; 5, Cellini; 6, Claygate Pearmain.—*J. S.* 1, Irish Pitcher; 2, Golden Noble; 3, London Pippin; 4, Reinette du Caux; 5, St. Edmund's Pippin; 6, Reinette du Canada. It is impossible to name the Pear with certainty, as it is such a deformed fruit. It may be Uvedale's St. Germains.—*C. W. Taylor.* King of the Pippins.—*Zola.* 1, Blenheim Pippin; 2, Dumelow's Seedling (Wellington).

NAMES OF PLANTS: *H. W. C.* 5, Ilex crenata var. microphylla.—*Common Spruce.* 1, Picea excelsa; 2, Cupressus Corneyana; 3, Cupressus Goveniana; 4, Podocarpus chilina; 5, Spruce with galls, caused by Chermes abietis; 6, adventitious root of Cryptomeria japonica. We know of no satisfactory method of preventing the leaves of Picea from falling when dry.—*W. H. S.* It is very difficult to name Cypresses from the leaves only. 1, Thuya orientalis var. Sieboldi; 3, probably C. Benthami; 4, perhaps C. sempervirens; 2, 3, 4, conjectural.—*Rev.* The garden varieties and hybrids of Begonia Rex are very numerous, and some of the forms very similar to others of their section. Yours seem to be: 1, Louise Closson; 2, smaragdina; 3, Evansiana maculata; 4, Mrs. Anna Low; 5, Count Alfred de Limminge; 6, Marshalli.—*Felix.* 1, Odontoglossum odoratum; 2, Odontoglossum Lindleyanum; 3, Odontoglossum Hunnewellianum; 4, Oncidium varicosum; 5, Epidendrum selligerum; 6, Tainia barbata.—*J. S.* 1, Pteris serrulata cristata; 2, Lomaria gibba; 3, Polypodium crassifolium; 4, Selaginella Martensii; 5, Selaginella denticulata; 6, Asplenium Trichomanes.—*G. O. S.* 1, Abies Nordmanniana probably; 2, Picea nigra; 3, Picea excelsa, Common Spruce.—*C. H. T.* Sternbergia lutea (the yellow Crocus); Cestrum aurantiacum (the climber); Melaleuca hypericifolia. Why not number the specimens?

PEACH AND NECTARINE TREES: *W. B.* One of two things must be done, either prune back the shoots to a wood-bud, or, better still, allow them to produce fruits, as you are of the opinion they are capable of doing this. The bearing of fruit would serve as a check to excessively strong growth. If the wood is well ripened, cut the shoots back two thirds of their length, and take two shoots up from the base of each that has been pruned. Next season the old shoots may be cut out altogether. You could hardly have expected the trees to fruit last season, seeing they were planted as late as April, when most fruit trees are in flower.

RAIN: *F. G. B.* An inch of rain weighs about 101 tons per acre. The weight would be practically the same in all parts of the country, and under different conditions of the atmosphere.

SEEDS SCREENED FROM BARLEY: *J. G. G.* The seeds are those of Darnel grass *Lolium temulentum* Linnæus. The seeds have injurious effects on chickens which, having eaten them, appear as if intoxicated. Larger animals, horses especially, have frequently shown signs of injury after eating fodder containing a quantity of these seeds. The symptoms noticed were inflammation of the stomach and intestines, diarrhœa and a dry cough. It is not advisable to use the screenings mentioned in your note as food for cattle, similar injuries having been noticed in these animals also.

SWEET PEAS: *A. H.* The making of a Row from "pale pink" to "deep red" is comparatively easy, but the gradation from lavender to blue is abrupt in the Row evolving from "Mauve" to "deep violet." From pale pink to deep red: Duchess of Sutherland, Eliza Eckford, Countess Spencer, Mrs. Gladstone, Lovely, Princess Beatrice, Janet Scott, Phyllis Unwin, Coccinea, Firefly, Prince Edward of York, Scarlet Gem, Queen Alexandra, George Gordon, and King Edward VII. From mauve to deep violet: Lady Nina Balfour, Mrs. Walter Wright, Dorothy Tennant, Lady Grisel Hamilton, Golden Gate, Countess of Radnor, David R. Williamson, Countess Cadogan, Emily Eckford, Captain of the Blues, Indigo King, True Blue, Miss H. C. Philbrick, Navy Blue, and Romolo Prazzani.

VIOLETS DISEASED: *L. W.* The plants are badly affected with the Violet disease, Ascochyta violæ, a pest that is spreading through almost every garden in which Violets are grown. You should burn your diseased stock and plant some other crop, for the disease is sure to attack any plants of Violets that may be grown in the same soil. See *Gardeners' Chronicle*, November 5, 1904, p. 328.

WIREWORM: *W. C.* Give the land a heavy dressing with the gas lime, 8 ounces to the square yard, after which allow it to remain fallow for some weeks, or a season, when the strength of the chemical will have greatly abated. If weeds were uninjured by the former application, the quantity you used was insufficient. Use the material when fresh, as old gas-lime is a comparatively mild substance.

THE KINGDOM OF YVETOT.

[SEE SUPPLEMENTARY ILLUSTRATION.]

"Il était un roi d'Yvetot
Peu connu dans l'histoire."

IN the very centre of a crescent-shaped range of densely-wooded, chalk hills in Normandy, washed at the base by the waters of the Seine, lies the town of Caudebec. The ornate spire of the church, delightful to the eye of the tourist and specially interesting to the architect, is placed in the exact centre of the curve formed by the recession of the hills. The extreme points of the crescent may be some 20 miles apart, and the whole of this area is occupied by forests of deciduous trees, Beeches, Oaks (Quercus sessiliflora chiefly), Limes, with conifers at rare intervals. The river at this point is some half a mile or more across, forming a bold sweep, bounded by the chalk cliffs before mentioned. We shall not attempt to paint the scene in words, but we have surely said enough to show that here are all the elements of a fine landscape.

Not far off is Yvetot, the capital of that king little known to history, but owing his now world-wide fame to Béranger's account of his sayings and doings. It seems that there really was a *roi d'Yvetot*. A judicial murder was committed, and the only way in which the king could make reparation was to confer royal privileges on some relative of the murdered man. So runs the story. True or not, the modern Yvetot is an important railway station, and those who want to get away from Caudebec, which has but a scanty train service, often find it desirable to drive past the cider orchards to avail themselves of the better opportunities offered by Yvetot.

Horticulture is at a low ebb here, what flowers there are to be seen in the gardens being of a very ordinary character; but the visitor, as he stands at the end of the tree-lined quay at Caudebec, can hardly fail to be attracted by a noble Lime tree in a private garden abutting on the towing path. The leaves are covered on the under surface with silvery pubescence, so that the variety may possibly be one of the American forms. We have no data by which to estimate the size of this monster. Its colossal branches are supported and tied together by stout chains, often more or less deeply embedded by the overgrowth of the wood. Further along are two very tall and shapely Wellingtonias (Sequoia gigantea). The native flora is identical with that of our own chalk hills, whilst the banks of the river and adjoining marshes are clothed with practically the same vegetation as that which adorns the banks of our own Thames. Indeed, the bend of the river near Caudebec forcibly recalls the Cliveden reaches, but on a much larger and bolder scale.

Here and there the chalk is overlain with a sandy or loamy deposit, on which the Common Broom, the Heather (Calluna), and other sand-loving plants flourish; whilst the deposits of leaf-mould favour the growth of Scolopendrium, Polypody, Bracken, and other ferns.

On the slopes of the hills, wherever a clearance has been made, are Apple orchards, furnishing material for the cider, which is the drink of the country. The trees are small and of no great age, grown above grass, as in most of the older Kentish orchards. The crop, as far as we could judge, was this year by no means abundant, and we were told that, owing to the hot, dry summer, the Apples were small and deficient in juice. The gathering of the Apples was just beginning, and, as may be judged by our illustration, the methods of gathering and collecting are primitive and wasteful, little or no care being bestowed on the Apples, which are knocked about as if the fruit were not the precious commodity they really are. The orchards, though numerous, are individually of small extent. The "*clos au masure*"—a word not to be found in the ordinary dictionary—denotes a small orchard cultivated by the peasant proprietor, whose little cottage is on the "estate."

When the fruit is ready for gathering, auction sales are held on the ground, the purchaser buying the fruit on the trees and conveying it to the presses, which are shown in our illustration. Tubs and presses were, at the time of our visit, being furbished up for use, and some of the little village streets were redolent of Apples and of cider.

Those who do not feel disposed to quit Paris will find in the Louvre, No. 643, an excellent representation of a wooded hill in Normandy, with the *clos masure* bedecked with Apple trees in full bloom, and only the ends of whose branches are, as it were, covered with boxing gloves, the appearance being due to the grafting clay with which the stumps of the branches are covered. The painter is Millet, which is as much as to say that the picture is full of truth and charm.

A French phrase-book which has often afforded us some amusement bids the traveller in Normandy to ask the innkeeper, "*Avez vous du bon cidre, monsieur?*" Accordingly we took the opportunity to put the question, and the answer came back as if straight from the phrase-book itself, "*Oui, monsieur, j'ai du très bon cidre.*"

In this country it will not do always to confide in the phrase-book, for the natives speak a language which, if once French, is so no longer. Perhaps it may have closer relationship with the Norman French, still made use of in our law courts. Be this as it may, this is the original country of the Harcourts, the Traceys, and many other noble families whose ancestors "came over with the Conqueror," and whose names are still current in Normandy.

OUR FUTURE TIMBER SUPPLIES.

PRESIDENT ROOSEVELT, at the first Forestry Congress held at Washington about a year ago, said: "If the present rate of forest destruction is allowed to continue with nothing to offset it, a timber famine in the future is inevitable." Never were more truthful words uttered, and if this is the case with the United States it may be well to consider what is our own position as by far the largest importers of timber—larger, indeed, than all the rest of Europe put together. When we consider, therefore, that the total area of woodlands in this country is only a little over 3,000,000 acres, that fully 15,000,000 acres of waste lands exist, and that we annually import over 10,000,000 tons of timber at a cost of nearly £30,000,000, the necessity for an increased area of woodlands will be apparent to all, and the more so as a dearth of timber is imminent and outside supplies are being rigidly conserved, while our home demands are ever on the increase.

Taken as a whole, Europe has not enough timber to meet her demands, about 4,000,000 tons in excess of what she produces being annually required, and stringent laws have been passed regulating the output. This is the case with Norway, Sweden, Finland, and Russia. The Canadian forests and those of the United States are both nearly exhausted, and by a competent judge it has been said that in 15 years little or no timber will be left if depletion goes on in those countries as at present. But the worst is that there are no forests to fall back upon, for the timber of those of Africa and India and South America is unsuited generally to our wants. Australia, China, and Japan require at present more timber than they produce.

Quoting again from President Roosevelt's speech, he said: "Remember that you can prevent such a famine occurring by wise action taken in time: but once the famine occurs there is no possible way of hurrying the growth of the trees necessary to relieve it." For the past five-and-twenty years I have not failed to urge on the State and private owners of woodlands the pressing necessity of planting up some at least of the waste and unprofitable lands of our country, in order to provide timber for the future, and leave us less dependent on the gradually dwindling supplies that are annually sent us from abroad. England being, so to speak, a residential country, the retention of a certain amount of heath, mountain, and commons land for the purpose of deer forests, grouse moors, game coverts, and golfing links is imperative, and will considerably reduce the

amount of land available for afforestry purposes. But I think that I am well within bounds in allotting out of the 15,000,000 acres of waste lands 1,000,000 acres to afforesting, and 14,000,000 to game preserves and recreations. Having personally explored much of the mountain and heath lands in England and Scotland, and some of the vast tracts of bog land in Ireland (which alone extend to fully 14 million acres), I have carefully computed that of the land up to 1,200 feet where timber would grow perfectly well, about 9,000,000 acres are available for afforesting purposes. As far as I have been able to find out, the average rental of such ground would be considerably under 3s. per acre, while, on the other hand, I am quite convinced that any land which does not bring in at least three times that amount for grazing or agricultural purposes would be more profitably employed in carrying a crop of timber. It is, perhaps, unfortunate that much of these waste lands is private property, the owners of which, even could they afford it, have little inclination to sink, for a period of, say, 25 years, the necessary capital required to be expended on the formation of woods and plantations.

Under such conditions the question naturally arises, What is the most feasible way to overcome the difficulty? In answer, and without the slightest hesitation, I would say that the State should acquire and plant suitable waste lands at the rate of 40,000 acres annually, for a period of 25 years. Such lands could, in England, Scotland, Wales, and Ireland, be gradually and cheaply acquired by the State with a change of proprietors, and in Ireland vast tracts of bog land would be willingly handed over to the Government at the present moment at a small sum per acre. Quite recently, in Wales, 7,412 acres of upland described as "rough grazing and sheep walk," was sold by public auction for £15,070, or at the low rate of £2 2s. 3d. per acre. The land was particularly suitable for the growth of larch, as the highly-remunerative plantations adjoining clearly pointed out. But numerous similar cases could be given, so that the excuse of no available land is not tenable. Personally I have little faith in the State advancing money to landed proprietors towards afforesting, or in municipalities coming to the front as planters of woodlands. The State, and the State only, can readily acquire the needed land in sufficient quantity and on the best terms, and I am fully convinced that plantations formed under this supervision will, in an economic sense, at least, be far ahead of those planted either by private persons or public bodies.

After careful computation, I have no hesitation in saying that the area of plantations in the United Kingdom could at once be doubled by the planting of waste lands which at present do not bring in over 2s. per acre of rent annually, with infinite benefit to the country generally and a vast increase in the value of land, both to the owner and farmer who cultivates it. I have already suggested that altogether 1,000,000 acres should be planted over a period of 25 years at the rate of 40,000 acres per year, which would be an outlay of about £2,000,000 annually—a small sum, it will be admitted, when compared with the £225,000,000 yearly expended by this country on supplies brought from abroad. In a future paper the cost of planting and financial returns therefrom will be dealt with. *A. D. Webster.*

FRUIT WALLS AT WROTHAM PARK GARDENS.

IT does a professional gardener good to visit a garden which, in the hands of a prudent, caretaking gardener, has made continuous progress in the matter of fruit-culture, inside and outside. In vegetable-growing, and in general up-keep, such a garden is Wrotham, near Barnet. From a variety of circumstances this garden, famous about the middle of last century, when under Mr. Thomson, author of the *Gardeners' Assistant* (a book which few cultivators would like to be without), degenerated slowly but certainly to a rather dilapidated condition. The present head gardener, Mr. Markham, formerly of Mereworth, near Maidstone, well supported in his efforts for the rejuvenation and improvement of the old place by his employers, Viscount and Viscountess Enfield, has been enabled to alter greatly for the better some of the more striking features, of which I may here mention the fine well-built fruit-walls, the vineries, espalier fruit fences, the walks and Box edgings, and mixed herbaceous borders in the combined fruit and kitchen gardens. Much has been accomplished during the last seven years, but I would in this note allude to the fruit trees on the walls, and what has been, and is being, done to make them as complete as is possible. The chief area is a kitchen garden of three acres, enclosed with walls ranging from 18 to 20 feet in height on the north side, on which are the far-famed vineries, a Peach house and an unheated Fig house, and south, east and west walls of lesser height. The last three are furnished with fruit trees on both sides, and one of the so-called "slips" on the outside of these three aspects is likewise enclosed with walls on two sides, or rather on the longer side and the short northern end. The total length of both sides of east and west walls, covered with trees, is about 1,200 yards. The head gardener began six years ago to purchase small trained trees of Peaches, Nectarines, Plums, Cherries, and Pears, with which to furnish the many blank spaces, and to take the place of worn-out, ill-shapen trees of these kinds, and those first planted have now quite filled their allotted sites between the pilasters or shallow buttresses on the west and south aspects. And numerous young trees bought in succeeding years as untrained maidens will in a year or two be sufficiently large to be removed to permanent situations. This is a proceeding that should never be neglected in gardens having great lengths of fruit-walling or several Peach-houses to be kept filled with trees of fruiting age.

When fruit walls become furnished with trees in good bearing, the outlay for maiden trees annually is of no great amount, and young healthy ones are always available for taking the places of those which, for one reason or another, have to be grubbed up. Mr. Markham is a good fruit cultivator, more especially of Peaches and Nectarines, Plums, Cherries, Apples, Pears and Grapes, and his wall trees are most correctly pruned and trained, the wood laid in rather thinly, and the branches, from those at the bottom of the tree, trained horizontally, at 2 feet from the ground level, when the tree is of full size to others touching the top courses of the wall and the pilasters on either side. Almost every one of the trees of stone fruit is trained fanwise, with no erect branch or stem in the middle, even the oldest trees, victims of much pruning and loss of branches from gumming, being made to conform to the general system. The foliage was still quite perfect and of a bright green colour, but putting this aside the colour of the young wood was indicative of certain ripening, and of great promise for 1907.

On a west wall there were observed full-grown trees of Peaches, Princess of Wales, one of the best mid-summer varieties, of a creamy colour, rosy pink on the exposed side; Bellegarde, Violette Hative, Crimson Galande, Condor, a handsome variety coming into use in August and September and possessing a bright crimson cheek and piquant flavour; Noblesse, an old favourite, but disliked by many growers because the fruits will ill bear careless handling; and Early Alfred, a fine freestone variety with rich and pleasant flavour—a seedling from Hunt's Tawny Nectarine. A very fine tree of the Dryden Nectarine found a place on this wall.

The long south wall was covered chiefly with the following Peaches, viz: Stirling Castle, Violette Hative, Hale's Early, Dymond, Sea Eagle, a large September variety of fair flavour and rich colour, Early York, and Marquis of Downshire (syn. Waterloo?). A tree of the Pineapple Nectarine is growing on this wall.

On the west wall were noted fine healthy trees of the following varieties of Plums: Transparent Gage, Golden Drop, Green Gage, Golden Gage, and Rivers' Orange; on an east aspect Wyedale and others, besides Sweet Cherries and some Pears. Numerous espalier fences are covered with young fruiting trees of choice Pears and Apples, and the northern aspect of the south wall is furnished with many Morello Cherry trees, Plum Golden Drop, with many sound, delicious shrivelled fruits thereon at the date of my visit (October 29). The fruit crops of all kinds were exceedingly heavy this year at Wrotham, and in size and colour they were above the average. To secure, as far as possible, another season of abundance, every tree not showing extra vigour, or which had carried a big crop of fruit, received 40 gallons of manure water, and a thick top dressing of decayed manure, for a space equal to the spread of its branches—a much required proceeding, seeing that the rainfall was exceedingly scanty during summer and early autumn. *F. M.*

SINGLE CHRYSANTHEMUMS.

WHATEVER may be our opinion as to the present estimate of the large flowered Japanese Chrysanthemums, there is no doubt but that the single-flowered varieties are now appreciated generally in a greater degree than formerly. They are free in flowering, bright in colour, and may be used for decoration either as pot plants or cut flowers.

The two varieties shown in our illustration at fig. 151 were remarked in a recent exhibit of Messrs. H. Cannell & Sons, at the Royal Horticultural Society's Hall, and we are indebted to this firm for material from which Mr. Worthington Smith's drawings have been made.

The variety Innovation has perfectly formed circular flowers of winy-red colour or mahogany-red, with clear, yellow disc. Its habit is described as dwarf.

Miss Till is of a pretty shade of mauve, and as will be seen from the illustration, the florets remain convolute, whilst the flowers are of much larger size than those of Innovation. Both varieties may be recommended.

FOREIGN CORRESPONDENCE.

THE GARDENS OF MANILA.

To one who has noted the many charming, well-kept villa-gardens that dot the suburbs of Honolulu, of Buitenzorg, in Java, of Singapore, Colombo, and Calcutta, the bald nakedness of Manila is especially distasteful, and is a standing reproach to the foreign resident, as well as to the American who, after eight years, might have found time to make some concessions to the æsthetic side of life. The ill-kempt, squalid yards which are dignified by the name of garden, would be an uncongenial topic were it not for some rare or charming subject that has found and retained a foothold despite siege, earthquake, and continuous neglect.

The physical conditions in and about Manila

are not of the best for high-class tropical gardening. The soil is decidedly poor, the natural drainage bad, and, above all, a five-month continuous drought has to be reckoned with. Soil-amending material is scarce and costly, but, on the contrary, hydrant water is ample and reasonably cheap.

ORCHIDS.

Here we are in a country that teems with Orchids, and yet the difficulties of procuring them are so great that the writer has more than once thought of sending to some English grower for Philippine species! The explanation is simple. The collectors for European houses gather and pack their cases at the nearest convenient port to where the Orchids are found, and, if they come to Manila at all, it is merely for the clearance and transhipment by the first departing steamer. From the hills about Manila, Aerides and the commoner Dendrobes are brought in freely and sold cheaply, but none of the finer species of Phalaenopsis occur nearer than 50 miles, and as they can only be sold when in flower, and as, of course, the blooms get badly damaged in long overland transit in crowded hampers, the native collector finds the cheaper Orchid the most profitable to handle.

The charming Phalaenopsis Luddemanniana, from the mountains of Benguet Province, could once be purchased of the Igorot Indians for about 4d. They now ask 2 pesos (4s.), and it costs another 4s. to get it down to the coast. Phalaenopsis Schilleriana sometimes comes in here in quantity from Tayabas, but is quickly lost from boring insects that attack the [illegible], or it succumbs to our winter atmosphere, which is less humid than that of Tayabas. From distant Mindanao, superb specimens of Vanda Sanderiana, V. Batemanii, or V. coerulea sometimes reach this market. They require radically different handling from the Phalaenopsis, but they are all hung up together, all get their daily "tub" regardless of the resting season, and after one year are generally total wrecks.

The [illegible] and summer typhoon works havoc with both Orchids and [illegible]. One of unusual severity on September 26, 1905, annihilated the few small private collections in this city, and practically wrecked [illegible] plantations worthy to be dignified by the name of garden. One in the direct [illegible] centre of the tornado escaped any serious injury, and affords ocular demonstration that proper [illegible] will protect any garden from such visitations.

The owner, an enthusiastic cultivator, had his garden completely obliterated during the last serious typhoon, which had occurred just 24 years previously. He at once set about renovation work, and, as a preliminary, planted a double line of the giant Bamboo along his [illegible] boundaries. Within these he planted [illegible] of such sturdy and resistant trees as [illegible] [illegible] Tamarindus indica. Within all lay his garden. The last typhoon whipped and lashed the Bamboos till they were as bare as a [illegible] poles stripped of [illegible]. The Tamarinds suffered too, but in lesser degree, and the garden proper was uninjured. Some hundred or more specimen Rex Begonia plants had their delicate, easily-lacerated leaves intact. [illegible] superba showed hardly a rent in its foliage, and his delicate Adiantums received no perceptible check. Meantime all about him howled a 90 mile per hour gale, and for the brief space of

FIG. 151.—SINGLE CHRYSANTHEMUMS MISS TILL AND INNOVATION. (For text see page 402.)

10 minutes a velocity of 103 miles per hour [illegible].

Such preventive me[illegible] [illegible] applied to city gar[illegible]. The B[illegible] [illegible] [illegible] [illegible]

[illegible]

committing myself to their belief in its like baleful influence upon human beings. In the case instanced, at least, nothing of value can be grown within 30 feet of the trunks, so that in this garden there is a total zone of nearly 70 feet that is quite lost to cultivation. But the Tamarind has its consolations. We have no more suitable wood in the Archipelago upon which to establish all species of Phalænopsis, but now (as if confirming the above-mentioned superstition) upon a live limb of this tree we find it difficult to establish any other epiphytal plant.

At this moment has just passed out of flower Dolichandrone Rheedei. I do not recall its cultivation in European conservatories, but have ascertained that by judicious pruning it may be flowered as a shrub, and its rather sparing flowering habit be improved. Among an order (Bignoniaceæ) noted for its fine representatives it has few rivals, the daintily fringed corolla limb of its immense snowy-white trumpets being as striking as they are beautiful. It occurs in waste places about Manila, and, like the prophet within his own country, is without honour in so far as garden representation goes. *Wm. S. Lyon.*

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM BRANDTIÆ, KRANZLIN, SP. N.*

The plant, of which I have only seen a spike, certainly resembles Dendrobium Phalænopsis, bigibbum, dicuphum and other Dendrobia from Northern Australia or New Guinea. The most striking characteristic, however, is that the petals, and especially the sepals, are more or less twisted or even curled, and the plant connects the Dendrobes of the Phalænopsis-group with those having an affinity with D. undulatum, the crests of the lip being elegantly fringed and jagged. The plant shows also an affinity with D. Sumneri, and at first I was not sure that we had not to deal with this plant, described from an imperfect specimen by F. v. Muller (see *Flora Austral*, VI., 278), and not very well-represented in European collections. D. Sumneri, however, is evidently a much smaller plant, not to mention that it has other botanical characteristics. This new species, though not so brilliant as the better varieties of D. Phalænopsis, is very beautiful and merits further attention and cultivation. The flowers, which I received indirectly from Madame Ida Brandt, of Zurich, are rather firm and of a more fleshy texture than those of other species, and approach by this characteristic also to the flowers of the Undulatum group of Dendrobium. The colour is a mauve purple; the crests of the lip are silvery. I regret that I could not get more accurate information about the plant, but being new, and a true member of a familiar group, and well known as to its geographical area and botanical peculiarities, I do not hesitate to publish the plant. *F. Kränzlin.*

* DENDROBIUM BRANDTIÆ, *Kranzlin.*—Planta habitu et inflorescentia D. Phalænopsidis sed minor. Racemi elongati laxiflori. ORCHID NOTES AND GLEANINGS.

A MODEL ORCHID HOUSE.

THE new Odontoglossum house, built for J. Gurney Fowler, Esq., Glebelands, South Woodford (gardener, Mr. J. Davis), by Mr. A. Harris, horticultural builder, Ealing, and now filled with a grand collection of Odontoglossums, seems to be a model structure, for it embodies the best features of modern structures as well as some new ideas of Mr. J. Gurney Fowler himself. The house is span-roofed, 70 feet long and 20 feet wide, all the woodwork having the bars grooved to carry off drip, and the glass cut on the curve with the same object. On the outside an iron frame carries the blinds used for shading over a foot above the glass, and with a view to keeping the atmosphere as cool as may be in hot weather a perforated water-pipe runs from end to end along the ridge. By this means water can be run over the glass. On the inside, on the top of the brickwork, a similar perforated pipe runs to moisten the wall. Both these pipes have water-companies' supplies in order to save the rain water, which is stored in three very large tanks beneath the centre stage. In order to prevent the hard water from running into the rain-water tanks, a separate outlet is provided in the gutters, and the rain-water downfall is blocked during the use of the other supply, which is regulated by taps.

The staging is carried well up and is made of teakwood, with spaces between the bars, the central stage being in four tiers.

The heating is by 4-inch hot-water pipes, which are arranged so as to avoid too direct radiation to the plants, and, to further assist in this direction and to preserve a moist atmosphere, an almost closely arranged lower staging of ironwork, bearing flat red tiles, is fitted above the pipes and beneath the teak-wood staging on which the plants are grown. Temporary brickwork screens, much used at Glebelands to equalise moisture and heat, are also placed where considered desirable.

All the houses have been thoroughly overhauled, and with the new Odontoglossum house the Orchids are now better provided for than ever.

VARIATION IN ODONTOGLOSSUM CRISPUM.

THE chief impression left upon the reader of the article which appeared in the issue for June 2 by those who know the habitat of Odontoglossum crispum is that if the instructions therein given were to be literally followed out the buyer would have to leave the finer varieties and purchase the poorer ones.

To begin with, the writer mentions that varieties of O. crispum have been much more numerous of late years than during the period 1890 to 1900, and explains this abundance of O. Hunnewellianum and O. triumphans, which misrepresent the species bearing flowers with brown and yellowish spot, by stating them to be the equivalents of O. luteo-purpureum and O. gloriosum from the Pacho district.

This opinion is too erroneous to be passed over in silence. O. luteo-purpureum is strictly limited to the Cordillera of the Suma Paz, or to the south (Fusagasugá), while O. Hunnewellianum and O. Adrianæ come from the Velez region.

Every grower of experience would refuse collections of O. crispum in which luteo-purpureum is seen, as its presence would be an indisputable proof that the crispums will be pure Alexandræ, the form with small, starry-like flowers from the Fusagasugá region.

We are quite aware that large consignments of the bad Fusagasugá type have been sent to Europe as being the finer type from the Velez region. The explanation is very simple. The Fusagasuga plants are found abundantly over the whole district, and can be obtained cheaply. They are charming in appearance, and are admired for their vigour, their long, conical bulbs, and flattened at the neck. These plants are transported to Pacho and to Chiquinquira, and sold to ignorant collectors at a good price. The trick is highly successful; native dealers are usually unscrupulous, and find they have thus an easy source of income, and the satisfaction of deceiving the stranger who relies only on their word.

About three years ago I myself saw about 20 case of Fusagasugá crispum on the way to Chiquinquira. The fact of these inferior types being mixed with a large proportion of the good type from the Velez region explains the

FIG. 152. PHŒNIX CANARIENSIS IN SICILY.

large proportion of star-shaped flowers found in collections of crispum. I repeat that any lot of crispum, even if it contained only one luteo-purpureum, should be refused on suspicion, as the number of poor types will predominate if they are not found to the exclusion of all others. There is no luteo-purpureum in the Velez region.

Before proceeding it is as well to enquire about the "districts" mentioned by Mr. de Barry Crawshay. Readers of his article derive the impression that O. crispum is found in numerous "districts" more or less distant from each other, and each providing a different type, and which could be successively exhausted by collectors and explorers. He mentions specially certain districts as having yielded good types, whilst others—that of Velez in particular—have produced but inferior ones.

I do not know where the writer learnt this fact, which appears to me entirely imaginary. The principal districts that he mentions are San Cayetano, Pacho, La Vega, Chiquinquira, Velez, &c. In what sense he uses the term "district" he does not say, but, as I am familiar with, and have traversed these regions, I would state:—1. That in all the localities mentioned except Chiquinquira the Sugar-cane thrives, thus indicating a very different climate to that required by O. crispum. 2. That there has never yet been seen one crispum in either of these localities. These "districts" are but small towns or villages, where, according to their wont, collectors apply for the special commodity which they are seeking. Plants are brought to them, which they have but to count over and purchase. This is done by Indians, who range the mountains, upon which the collectors themselves never set foot. These travellers then, finding the "posadas" more or less comfortable, the price of the plants more or less high, material for their packing-cases more or less easily procurable, and sometimes governed by their own wishes only, move about, and settle successively at Pacho, La Vega, &c. The favourite localities now are Velez, Bolivar, and Jesus-Maria, new "districts" but not more new than others, as a glance at a map shows that they are all adjacent to a small part of the Cordillera, whence the true crispums have always been procured. In this part of the Cordillera, and not north, south, east, or west of it, crispum is found. The centre of the region of crispum is, to be exact, "Sucre Viejo," formerly called La Granja by the natives. This is a hamlet of from 12 to 15 huts at an altitude of about 2,500m., and for years it has been the starting point for explorations in search of crispum. Therefore, the one and only "district" (to use Mr. de Barry Crawshay's expression) is that which I have called "Sucre Viejo," and it is no more logical to speak of the Velez than of the Pacho, or Vega "district."

Why does not the writer mention the districts of Zipaquira, Bogota, Tacatativa, and Aqua Larga—localities whence for some years collectors have quietly waited for the plants brought from Sucre Viejo and the neighbourhood? These localities have an equal right to be called the crispum districts.

Even now, as was the case 20 years and more ago, the fine type of crispum is never obtained, except from the Sucre Viejo region. Only those who are not personally familiar with the country can affirm the contrary, and they can give no material proofs to support their statements.

FIG. 153.—COLLECTING LEAVES OF EUROPEAN DWARF PALM (CHAMÆROPS HUMILIS) IN SICILY. Photo from Mr. Sprenger.

I will now consider the various types of crispum found in the regions of Fusagasuga and Sucre Viejo, which I have called Velez.

The only home of the true O. crispum is towards the south of the region, where the search for crispum began. The allied species to O. crispum are then Lindleyanum, triumphans, gloriosum, Andersonianum, Coradinei, and Ruckerianum. It was then natural that these should not be found varieties with beautiful blood-red and brown-red spots indicative of hybridisation. Then, gradually, exploration was pushed northward, and some good varieties began to appear. At that time Pacho was the meeting-place of the collectors: the Indians or natives came there to sell these varieties, and often to Bogota itself. These intermediaries were careful to conceal from the collector the exact habitat of the plant. Hence the origin of the fine types "from Pacho," &c. Collectors, thus mistaken, declare, in all good faith, that a certain variety is from Pacho or elsewhere. But if they went over those mountains they would at once perceive that the plants all came from one relatively small district around Sucre Viejo. This is the only region yielding, of late years, those fine varieties which hybridists now so much affect. Last year only we witnessed the purchase of many admirable varieties by a collector for one of the largest trade-growers in England. These varieties came, it may safely be affirmed, from the mountains named Pena Bonita, Pelycadero, La Granja (Sucre Viego), Campo hermoso, &c., a large tract that has belonged since 1898 to the Adornado Rubber Co., Ltd. The mean temperature of these mountains is as follows:—

TEMPERATURES. Night.	Day, shade.	ALTITUDE.
0° (32° F.) to 12° (54° F.);	3,000 metres,	very cold zone.
+ 5° (41° F.) to 15° (60° F.);	2,800 ,,	cold zone
+ 8° (47° F.) to 18° (78° F.);	2,400 ,,	,,
+10° (50° F.) to 20° (69° F.);	2,000 ,,	cold temperate.

These temperatures are persistent throughout the year. It is towards an altitude of 2,400 to 2,500 metres that the finest varieties are usually found. The climate is fairly mild, and insects are numerous. Of late years crispum has been sent from the mountains of the cold and very cold zones, where there are no insects. This accounts for a scarcity of varieties and a scarcity of fecundated flowers. Last year, on the contrary, a somewhat large number of fertilised flowers was found among the plants from the cold-temperate mountains, of a considerable number being of the finer varieties.

At an altitude of about 2,200 metres O. Adrianæ and O. Hunnewellianum are found. Can it then be assumed that these pretty varieties result from the reciprocal crossing of crispum and Adrianæ? Without affirming that such is the case, I see nothing improbable in it, as these are the only two species that preserve the perfectly round shape of the fine crispum and the pretty brownish-red spots so esteemed by hybridists.

The hybrid of O. Hunnewellianum, triumphans gloriosum alters the rounded form of crispum, and produces only the star-like, inelegant forms, and those having yellowish spots.

The zone now under exploration furnishes the best types of crispum, but many specimens of roseum are found, and no one knowing the district can deny this fact. It is then the Velez region (Sucre Viejo being the central point) which has yielded, and will yield, perhaps, for a long time the best type of O. crispum. I beg M. de Barry Crawshay to believe that I do not in the least impugn his good faith, but it is necessary, nevertheless, to explain the true state of the case. *Velez, September 20, 1906.* A. *Poirier, The Adornado Rubber Co., Ltd., 15, Rue du Conservatoire, Paris.*

PALMS IN THE MEDITERRANEAN REGION.

ONE of the commonest Palms of the Riviera is Phœnix canariensis. That it finds a congenial home also in Sicily is shown by our illustration, for which we are indebted to Mr. Sprenger, of Naples. The contrast between its spreading pinnate fronds and the dark pyramidal cypresses is very marked.

There is but one Palm that is nowadays indigenous to any part of Europe, and that is Chamærops humilis, which is found here and there on the Riviera, and especially in Sicily, where the fronds, as shown in our illustration, for which we are also indebted to Mr. Sprenger, are collected for various purposes, such as the manufacture of hats, fans, baskets, roofing materials, and similar purposes, whilst the fibre extracted from the leaves is used for rope-making.

COLONIAL NOTES.

VARIOUS BULLETINS AND REPORTS.

THE progress that has been made in recent years in the establishing of botanical gardens or stations in many of our Colonial possessions, particularly in the West Indian Islands and on the West Coast of Africa is more especially marked by the increasing number and regular appearance of the reports and bulletins that now form part of the system under which those gardens or stations are administered. Time was when an annual report of a botanic garden was little more than a mere record of the number of plants received and distributed, together with a few notes on alterations in the plant-beds and walks; but the more general adoption of monthly or quarterly bulletins, instead of an annual report, has changed all this. Besides, the greater attention that has been given to the economic or commercial side of plant culture, and the interchange of the useful plants of one country for those of another, by which the number of their products have been increased, and the constancy of their supplies ensured, has done much in adding to the usefulness of these bulletins. Further, the arrangements adopted for diffusing these publications and the cheap rate at which they are sold—many, indeed, being distributed free of charge—have been the means of putting them into the hands of planters and commercial men generally, so that the needs of one country become known in another, and the needs of the world are known throughout the world.

All this marks a distinct advance in the interest taken in the economic side of botanical science, and promises important results that must accrue to the commerce not only of our vast oversea possessions but also to the mother country, as well as to the world at large. It is a result that has been long looked for. The subject has been brought more prominently to our mind by the receipt of a batch of reports and bulletins from the Imperial Department of Agriculture for the West Indies, the Government of the Gold Coast, the Straits Settlements, and others, a few notes from each of which will emphasise the truth of our statement.

West Indian cultures are, as is well known, carefully looked after by the Imperial Commissioner and a qualified staff, having its headquarters at Barbados, and from which is issued quarterly the *West Indian Bulletin*, and fortnightly the *Agricultural News*, besides numerous publications in pamphlet form. These are all valuable in giving original and extracted articles and notes on every branch of work connected with the department; but, besides these, we have the usual annual reports of the curators of the botanic stations at all the smaller islands; these, however, are more of the nature of financial statements, with details on the general condition of the gardens and some interesting notes on economic plants thrown in, which, if collected into one pamphlet, would be more come-at-able and consequently more useful.

Of the *Jamaica Bulletin*, which is issued monthly and is edited by the Director of the Department of Public Gardens and Plantations, the Hon. William Fawcett, the matter is carefully selected and is mostly of a very useful nature; and the same may be said of the *Bulletin of Miscellaneous Information*, issued quarterly from the Botanical Department of Trinidad, and edited by the Superintendent, Mr. J. H. Hart. Going further afield, we have the *Agricultural Bulletin of the Straits and Federated Malay States*, under the joint editorship of Mr. H. N. Ridley and Mr. J. B. Carruthers, which contains a great variety of notes and articles, both of scientific and commercial interest, and we may perhaps refer to one in particular, namely, that on "Malay Drugs," from the pen of Mr. Ridley, in the June number. As may be supposed, rubber comes in largely for consideration in all these publications, and this is particularly the case in Mr. W. H. Johnson's report on the Botanical and Agricultural Department of the Gold Coast for 1905. Referring to the number of seeds distributed during the year, Mr. Johnson states that it was the largest on record, and was accounted for by the increased interest in rubber cultivation. It is satisfactory to learn that though the seeds of *Hevea brasiliensis*, *Funtumia elastica*, Manihot Glaziovii, and Castilloa elastica have all been distributed, a considerable amount of attention seems to have been given to the first-named species, which is the source of the Para rubber, the most valuable of all; they are reported to have made more satisfactory growth than the African trees, and to be the most promising crop.

NEW VARIETY OF COCOA.

The following paragraph is also of much interest as indicating a new and improved source of commercial cocoa: "The plants of the new species of cocoa, i.e., Theobroma pentagona, continue to make good progress. The beans of these plants are larger and finer than those of the Forastero type; comparatively few plants have, however, been propagated, as the majority of the seeds have been stolen. Unsuccessful attempts have been made to bud the new species on the Forastero stock, but better results are anticipated from inarching the two plants." Referring to this, in his review of the report to the Earl of Elgin, Major Bryan, the officer administering the Government of the Gold Coast, makes the following remarks: "The fact that the majority of the seeds of the new variety of cocoa (Theobroma pentagona), introduced by the director, were stolen from the gardens, shows how quickly the natives appreciated the difference between the finer bean of this plant and that of the ordinary cocoa (Theobroma cacao). It is desirable, however, that they should express their intelligent interest in the experiments undertaken in the gardens in a less inconvenient manner."

From the Imperial Department of Agriculture for the West Indies the following reports have come to hand: — *Botanic Station, Experiment Plots and Agricultural Education, Antigua.*—The drought seriously interfered with many cultural experiments. Mr. T. JACKSON became Curator of the Botanic Station last August. In the Grammar School both boys and girls now receive instruction in agriculture and botany.

In *St. Kitts-Nevis* Mr. F. R. SHEPHERD is Curator and Agricultural Superintendent, and Mr. H. HOLDER is foreman. They report useful work performed during the past year, but drought was a considerable hindrance. At the *Experiment Station, Tortola Virgin Islands*, economic plants are largely distributed and much appreciated, and efforts are being made to encourage the cultivation of Cotton by the peasantry. Mr. FISHLOCK is to be congratulated on good work carried on under great difficulties.

Mr. MILLEN, Curator of the *Botanic Station, Tobago*, reports satisfactorily upon the plant distribution work of the year. This has necessitated enlarging the nurseries. Various improvements have been made. We note that there is now communication between Tobago and Trinidad by means of wireless telegraphy.

Mr. BUTTENSHAW, Scientific Assistant *Department of Agriculture, St. Lucia*, forwards the reports of the Superintendent on the Botanic Station and Agricultural School to March, 1906. The general condition of the Station was satisfactory, and much useful work was done in the educational departments. Mr. HUDSON'S services in Cacao and Rubber cultivation proved of great value.

Throughout these bulletins and reports there is generally a notable improvement in the omission of unnecessary formalisms in quoting official correspondence, by which much space is saved, as well as time in seeking for the substance of the matter dealt with.

The Week's Work.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Early Pinapples.—Towards the latter end of the present month a house should be prepared for forcing a batch of "Queens," if ripe fruits will be required in June. Get the plunging material in readiness, remembering that new tree-leaves or tan will yield a steady and lasting bottom heat. When the heat of the bed has fallen to 90° the pots containing the plants may safely be plunged in the bed at 2 feet apart each way. If the heat is excessive the pots should only be plunged to half their depth, completing the process when the heat has declined. The atmospheric temperature should at first be maintained at about 65° at night, with a rise of 5° during the day by artificial means, admitting a little air when the heat rises to 80° by sun warmth. Keep the soil moist by affording waterings of tepid, weak guano-water, and maintain the atmosphere moderately moist by damping the floors twice each day. Syringe between the plants early in the afternoon on fine days.

Plants bearing fruits should now be kept in an atmospheric temperature of 65° to 68° at night, but in very cold weather a heat of 5° less will suffice. The pits should be covered at night with mats, which will greatly economise the fire heat. The atmospheric temperature may be allowed to rise 10° in the day, keeping the bottom heat at about 85°. Carefully examine each plant every two or three days and afford the roots water when they have become dry.

Successional Plants.—During the next six weeks hard firing should be avoided, relying more on covering the glass with mats at night. Plants of the Smooth Cayenne and Charlotte Rothschild type should not be hurried, but at the same time they should not be retarded by being kept in too cool conditions. The supply of water must be very carefully regulated.

The Cherry House.—To obtain good flavoured Cherries, these indispensable fruits should be grown indoors, either in pots or planted out in borders. Where the latter method is adopted, there will doubtless be some shoots that are not required for extension or for filling blank spaces. These should now be cut back. If almost daily attention was given to stopping and pinching the shoots during the growing season, there will be very little need to use the knife much at the present time, and as the Cherry-tree is so subject to "gumming" this is advantageous. The terminal shoots on pyramids or fan-tailed trees will not require shortening unless the extreme extension has been reached in each case. Wash the trees with Gishurst compound dissolved in warm water, and ventilate the house very freely night and day, until the trees are to be started into growth.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq. Cleveley, Allerton, Liverpool.

Begonia Gloire de Lorraine is an indispensable plant for decorative purposes in winter, and from observations made in reference to propagation I prefer plants which have been grown from leaves, or from seed. At Cleveley we have now in flower some 250 plants grown in pots and shallow pans: the latter are used for suspending from the roof of the corridor. The stock was raised by leaf propagation, from cuttings, and from seed, the latter germinating on the surface of the pans, which last year were suspended in the corridor, thus showing clearly that B. Gloire de Lorraine will reproduce itself from seed, providing the atmospheric surroundings are suitable.

Plants raised from seeds are best.—There can be no question as to the superior quality of the bloom produced by the seedlings, apart from their more vigorous habit of growth, which has been most noticeable throughout the whole period of development. Next to the seedlings, those plants raised from leaves have a more vigorous constitution, and produce finer flowers than the plants grown from basal cuttings.

Propagation by means of leaves.—If propagation by leaves should be the method to be adopted, no time should be lost before making a selection of fully-matured leaves taken from clean, healthy plants. The leafstalk should be about 1½ inch long, and such leafstalks, with leaf attached, should be placed singly into small 60-size pots, rather than pans, because this Begonia is impatient of root disturbance in a young state. The leaves should not be pressed close on the soil, otherwise they will damp off before roots are formed; neither should they be subjected to a confined atmosphere. Once the leafstalk has made roots and become established, the leaf will commence to decay, and eventually the young growth will appear.

Propagation by cuttings.—Growers who favour propagation by means of cuttings should choose those growths that arise at the base in prefer-

ence to side or stem growths; the latter invariably continue to produce flowers. The old plants, after flowering, will need to be shortened, but not too close, and, if placed in a little extra warmth, will soon furnish such basal growths as I have recommended. Much of the success in growing Begonia Gloire de Lorraine is due to maintaining an evenly-balanced atmosphere in the house, which, from the commencement of the flowering period, has been kept at a temperature of 60° and uniformly moist.

General work.—Schizanthus from seeds which were sown early in the autumn may now be pricked off into 6-inch pots, placing to the number of five or eight plants in a pot, and using rather a light soil. Keep the plants in frames or pits, and mat these up as a protection from frosts. These structures will be found better suited to the requirements of the plants than heated pits. Continue to repot Cinerarias and herbaceous Calceolarias before they get pot-bound, and apply artificial heat only when frost is imminent. Clivias should be kept in an intermediate degree of heat at this season, and rather dry at the roots until the flower sheaths appear.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH St. Fagan's Castle, Glamorganshire.

Wistaria.—Any notes on hardy shrubs and climbers for walls would be incomplete which did not include Wistaria sinensis. For decorating the south front of a house, especially in the south of England, it is unrivalled. There is a white variety which grows as vigorously as the type, but is decidedly less pleasing, and also a Japanese species, W. multijuga, which has pale purple racemes of greater length than W. sinensis. To encourage quick growth in the first instance good loam or manure should be supplied when planting, and plenty of moisture at the roots during the growing season is indispensable. The Wistaria requires plenty of space to ramble over, and a sunny aspect.

Solanum jasminoides is suitable for planting against a warm wall, whether of house or garden. Its light, starry flowers, borne in trusses, give a delightful effect in autumn and early winter. Its cultivation is simple. Cuttings will make roots easily and if propagated in October or even at the present time, and treated liberally in pots until planted out in the summer, the plants will flower the first year.

Buddleia Colvilei.—This shrub is somewhat tender, and probably would not succeed in the open except in favoured localities, but planted against a sunny wall it should do almost anywhere. It is one of the prettiest of our flowering shrubs. The flowers, which appear in July and August, are in pendulous panicles 1 to 1½ feet long, and rose-coloured. Its one drawback as a wall plant is its vigorous growth. B. variabilis, having smaller and lilac-coloured flowers and of hardy constitution, is also a desirable wall plant. Both are superior to the more familiar plant B. Lindleyana.

Muhlenbeckia complexa is desirable for growing on a trellis against a wall. It is simply a foliage plant, as the flowers are inconspicuous, but its graceful, free-growing, evergreen trailers are beautiful. It reminds one strongly of an Adiantum Fern. The plant grows freely and rapidly, soon covering a wall 20 feet high.

Ceanothus.—Few shrubs are more useful for wall plants than these, because of their foliage. The colour and profusion of their bloom are very effective. C. dentatus is particularly fine, as its deep blue flowers, appearing first in May, continue almost until autumn. C. Veitchiana and its varieties, too, are splendid.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Early Potatos in frames.—Where Potatos are cultivated in frames a start must now be made, if this has not already been done. The first consideration is to procure good "seed" tubers, and, to save time, place the tubers in a warm house to induce them to start into growth before they are planted. Thin out the sprouts to two to each tuber. These growths may be allowed to grow to 2 inches in length before planting is done, and, if then planted in moderate heat afforded by a hotbed, a few days only will elapse before they are seen through the soil. Care must be taken that hotbeds have been made long enough to allow the first violent heat to subside, otherwise the prospects of a good crop may be quite ruined. There is no need to plant the tubers in a great depth of soil to begin with, but rather add to it when the young growths require earthing-up. Too much soil at first has a tendency to stifle the heat arising from the manure underneath.

Potatos in pots.—Pots may be used for the early crop, if desired, but the returns from these are never so profitable as when the plants are well cultivated in a frame. Now that many Peach houses and vineries will be closed and warmed, it is a good time to start pot-culture. There is an abundance of light in such houses, and the pots can be moved to later houses when necessary. An early crop by this means can easily be secured by Easter. Any attempt to secure earlier crops seldom results in obtaining tubers of good eating quality, which, after all, should be the first consideration.

Early Peas.—This crop must be grown slowly from the beginning, and those who contemplate sowing Peas under glass with a view to planting them out later may safely sow at the present time. It is better to begin early and grow the plants in cool conditions than later, and have to hasten them by too much fire-heat. Boxes or 4-inch pots may be used, and, as a rule, we prefer to use pots, as the plants can be transplanted from these without receiving any check. The Pea, however, transplants very readily, and either method of raising them is satisfactory. When sown in boxes the seeds should be planted 1½ inches apart each way, so that the plants will not become closely entangled with each other before planting time. An atmospheric temperature of 45° to 50° is sufficient, and when the seedlings are well through the soil the pots may be removed to a cold frame. They must not be coddled, as the stems would thereby be weakened. Soil shaken from pot Chrysanthemums, if put through an inch-meshed sieve, will form first-rate material for this early sowing.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir LIONEL G. LOPES, Bart., Chamberlayne, Sussex.

Filberts and Cobnuts should now be pruned. Standard trees may have some of the inner branches cut away. Close, short-jointed wood fruit best, therefore, cut out the strongest growths. Keep the heads shapely, and the ground about the roots free from weeds. Fork over the surface, and apply a mulching of rotten soil from the potting shed or hotbeds. A little lime may also be added. Specimens grown as bushes will require more pruning. Some of the older growths should be taken out, in order to make room for younger ones, but only as many new growths as there is ample room for should be retained. Do not allow Moss, Lichen, or Ivy to grow near the stems. Fork over the surface soil, and mulch it as recommended for standards. Some of the best sorts are Filbert Early Prolific, Red-skinned Filbert, Kentish Filbert, Kentish Cob, Pearson's Prolific, Merveille de Bolwyller (a very large nut, with a thick shell), Louis Berger (a free bearer, and produces very large bunches), and Cosford Cob (a very thin-shelled nut).

Walnuts.—On many old estates these are old trees, which generally get plenty of pruning by the annual thrashing they receive. But a few young trees should be planted on all old and new estates to succeed the old trees when they become worn out. It is the gardener's duty to see that this is done, and, if fair-sized trees that have been properly planted and staked, are now of moderate size, they are not much trouble. The branches may be trimmed off up to about 7 feet in height to allow cattle to walk under them if growing in a park or on meadow land. The variety known in France as Mayette-Charbette produces very large nuts. Juglans fertilis is of dwarfer habit, the shells thinner, and the fruits ripen 10 days earlier. These trees are satisfactory as isolated specimens, or planted in groups of three or five specimens at distances of not less than 12 to 15 yards apart. When planted in groups they are better able to resist the wind, as single specimens are liable to get battered about in the S.W. gales.

Fig trees growing in cold districts should now be unfastened from the wall and have their branches tied together, so that the embryo Figs may be checked from developing. In severe weather, the branches should have some old mats, bracken, Heather, or some other protective material tied around them. In the south this will not be necessary; in the western counties I did not find this system an advantage, and even in the north it is not necessary except in very severe weather. In order to cultivate Figs successfully they need a restricted root area, and should any root-pruning be decided upon it may be done at any time now when the weather permits. Plenty of old mortar rubble should be placed about the roots when the soil is disturbed. The best variety for outdoor culture is Brown Turkey. Negro Largo, a very fine-flavoured variety, succeeds well in some places on a very warm wall. Brunswick is another desirable kind for culture out-of-doors, and White Ischia also does well, but the fruits are small. White Marseilles bears rich and large fruits, but the tree is a shy bearer out-of-doors until it is of considerable age. The Fig should be planted in the poorest of soils, but, at the same time, it should have efficient drainage, for the soil will soon become sour about the roots of Figs in badly-drained land. A sandy soil, in which are incorporated plenty of brickbats, is one of the best rooting mediums. Figs require nourishment in the form of liquid manure when growing.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Miltonia vexillaria.—Plants which are now in full growth will require to be examined occasionally, as sometimes, when growing fast, the tender leaves clasp each other so firmly as to check the younger ones and crinkle them. When this is observed gently separate the leaves by passing the thin bone end of a budding-knife between them. It will also be noticed that at the base of some of the new growths there is a short, brown-coloured, outer sheath, which frequently clasps the growth so tightly as to prevent the young roots from entering the compost. Remove this sheath by carefully slitting it in several places, and pulling it off in small pieces. The amount of water supplied to the roots should be gradually increased. During the winter months I discontinue damping between the pots, in order that the potting material may dry quickly after being watered; if kept in a saturated condition for long together the leaves suffer at their points, and become spotted. This same condition may be caused by the atmosphere of the house falling below its average degree of heat, especially if it is too damp at the same time. Such fluctuations are the more likely to occur if the plants are grown in too much heat during the winter months; an atmospheric temperature ranging between 50° and 60° will suit them admirably.

Other Miltonias.—M. Endresii, M. Bleuana, and its several varieties, also the rare M. Schroderiana, of which some plants have been recently imported, succeed well in the same conditions. M. phalænopsis prefers the drier atmosphere of the Mexican house.

Odontoglossums.—After cleaning the glass and woodwork of the Odontoglossum house, and during the rearrangement of the inmates, each plant should be carefully attended to as advised for the Miltonias, and where rare and valuable varieties of O. crispum, &c., are producing their young, succulent flower spikes, a rough piece of wadding should be wrapped around them, over which slugs will seldom pass. Carefully guard against allowing any unhealthy or shrivelled plant to produce its flower spike, or the plant may be irretrievably ruined.

Oncidium Cavanium.—Plants that are pushing forth roots from the new growths should be protected from the ravages of slugs, &c.

Masdevallia tovarensis.—In the same house with Miltonia vexillaria this well-known Masdevallia is now producing numerous pure white flowers, which appear well above the green foliage. Do not keep the plant very wet at the roots.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, DECEMBER 15—German Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—40.0°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, December* 12 (6 P.M.): Max. 48°, Min. 38°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December* 13 (10 A.M.): Bar., 29·5, Temp., 42°, Weather—Overcast.

PROVINCES.—*Wednesday, December* 12 (6 P.M.): Mon 41° S.W. Ireland and Cornwall, Min. 37° Cambridge.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Bulbs, Roses, Plants, &c., at Stevens' Rooms, 38, King Street, Covent Garden, W.C., at 12.30.

WEDNESDAY—
Dutch Bulbs, Perennials and Border Plants, at 11; 5,000 Roses, at 1.30 and 4; Azaleas, Rhododendrons, Palms, &c., at 4; 1,265 cases Japanese Lilliums received direct, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

FRIDAY—
Hardy Border Plants, Perennials, Roses, Azaleas, Orchids in variety, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The National Rose Society.

The meetings of the National Rose Society are conducted in the most business-like manner, and the annual meeting held on the 6th inst. was no exception to the rule. We do not wish to make any comparative statement, but we may certainly say that the meetings of the Rose Society are not only managed in a careful, business-like way, but they are somehow permeated by a sense of refinement and geniality, as if the members had unconsciously imbibed something of the spirit of the Rose itself—of the Rose without its thorn, be it understood. We are all of us Roses as well as men—more or less influenced by circumstances, by the action of the environment, as the phrase now runs, and, this being so, it is no wonder that the Rose should shed some of its charms upon its devotees. The Rose Society includes among its members a large proportion of really earnest amateurs who put their hearts into the work to a degree not commonly witnessed in similar societies, except among the professional members. Some societies seem to be established and to exist mainly for the benefit of their commercial members. The amateurs take relatively but a small part in the work of the society either as exhibitors or as members of the executive. This is not, and never has been, the case with the Rose Society. Moreover, the society has been specially fortunate in its administrative officers. One of the principal objects of the late meeting was to induct the new president, Mr. Lindsell, in the place of Mr. Shea. By a somewhat self-denying ordinance of the society, Mr. Shea, after a presidency of two years, had to resign his post to other hands. Of course, there are excellent reasons why the presidency of a society should not in all cases be occupied too long by the same person, but the definition of the period connoted by the words "too long" might surely be made more elastic and less automatic than it now is. Be that as it may, we are quite sure that those who were glad to welcome Mr. Lindsell would have been well pleased if the fates had not ordained that Mr. Shea should relinquish his office at the allotted time.

In some societies the presidency is more or less nominal. Some distinguished member is elected on general grounds, and if his tenure of office is short, it affords the better opportunity for the appointment of some other person who would also confer honour on the society. But where the president is a hard worker and a shrewd man of business, full of tact and ability, then it seems a pity that the rules should not be relaxed so as to permit a longer period of office.

To revert to the proceedings. The society is flourishing. It numbers more than 2,000 members, and there are no fewer than 40 local societies affiliated with it. Its income is satisfactory. Its reserve fund, though not large, is increasing, as it should do, in order that the treasurer may not be disturbed by the occurrence of a rainy day. The report and balance-sheet, as presented, were submitted for adoption by the president, seconded by Mr. Prince, and carried without comment. An amendment to Rule 2, to the effect that a commutation fee of £15 15s., or of £10 10s., might be accepted in lieu of an annual subscription of £1 1s. or of 10s. 6d. respectively, was proposed by the Rev. F. Page Roberts, seconded by Mr. Frank Cant, and carried without any adverse criticism. The Rev. H. B. Biren, in a speech full of geniality and pleasant reminiscence, submitted that the members of the committee and the officers were entitled to the best thanks of the members, a proposition seconded by Mr. John Green, and, of course, agreed to by acclamation, renewed when Mr. Mawley got up to respond.

A similar well-merited compliment was paid to the chairman, who then, as we have already mentioned, inducted as his successor Mr. Lindsell, the hero of a hundred fights—best evidence that he will carry out his promise and of his ability to carry out the duties of the office in the most satisfactory manner.

Among the principal features of the report, to which we have not already adverted, were the allusions to the three exhibitions held by the society during the year. At the Regent's Park no fewer than 8,000 "exhibition" Roses were shown, in addition to the so-called garden and decorative Roses, so that the show in the beautiful grounds of the Botanic was altogether a great success. The Edinburgh Show suffered in consequence of the drought, as did the September Show at the R.H.S.

Allusion was also made to the Hole memorial medal, the subscription list to which is now closed, and to the D'Ombrain memorial, which still stands in need of further assistance. The next metropolitan exhibition will be held in the Regent's Park on July 4, and the provincial exhibition at Saltaire on July 16.

The autumn exhibition will be held at the R.H.S., Vincent Square, on September 24. Mention was also made of the publications of the society, whose usefulness is much appreciated. Referring to the obituary record, Mr. Shea mentioned that as the death rate among the members was only 7 in the 1,000, instead of the usual 15 or 16, rosarians desirous of prolonging their years should join the society, and that the attention of the several insurance societies should be called to the fact!

A dinner in the evening formed a very appropriate termination to a satisfactory meeting.

*** **OUR ALMANAC.**—According to our usual practice we shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1907. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical, and Allied Societies, or any of our correspondents, will send us* IMMEDIATE INTIMATION *of all fixtures for the coming year.*

LINNEAN SOCIETY OF LONDON.—At the evening meeting, on Thursday, December 20, 1906, at 8 p.m., the following papers will be read:—1, Dr. A. B. RENDLE, M.A., F.L.S., and others, "Botanical Results of the Third Tanganyika Expedition, 1904-5"; 2, Mr. F. CHAPMAN, A.L.S., "Fossil Foraminifera of Victoria."—"The Balcombian Deposits of Port Phillip." Exhibitions: Albino Woodlice, by Mr. WILFRED MARK WEBB, F.L.S.

ROYAL BOTANIC SOCIETY.—The Rev. Canon BARKER, Chairman of the Reform Committee, has given notice that at the Fellows' meeting to be held on Friday, the 14th inst., at 4.15 (after the publication of this journal for the week), he will ask "if the Council still maintain that the only means of keeping the Society alive is to increase the Fellows' subscription, and if so (as this proposal has on a vote been twice rejected by the Fellows), by what means they now propose to keep the Society alive; also whether they still contend that the appointment of a competent Superintendent is unnecessary and inexpedient."

PROF. PFITZER. We greatly regret to have to record the death of this gentleman, the well-known professor of botany, at Heidelberg, and the author of various treatises on the morphology and classification of Orchids. Prof. PFITZER took part in the Hybridisation Conference last summer. He died of heart affection on the 3rd inst.

MR. E. H. WILSON left Liverpool on the 5th inst. for his third visit to China. He goes out this time under the auspices of Prof. SARGENT, of the Arnold Arboretum, Boston. We can only wish him an equally successful journey and a safe return.

VACANCY ON STAFF OF IMPERIAL DEPARTMENT OF AGRICULTURE, WEST INDIES.—The post of Scientific Assistant on the Staff of the Imperial Department of Agriculture in the West Indies will probably be vacant by the promotion of Mr. W. H. BUTTENSHAW, M.A., B.Sc., to an appointment under the Government of India. The salary is £350 per annum. A highly qualified scientific man, with good experiences in editing and bringing out publications, is desired.

THE ROYAL GARDENERS' ORPHAN FUND.—So few flower-show committees do anything to help either of the gardeners' charities, it is quite refreshing to learn that the Bradford Chrysanthemum Society, by means of a flower stall at their recent exhibition, have again been able to send £6 to the Royal Gardeners' Orphan Fund, a fact which is very satisfactory, as we understand that, owing to bad weather, the show was not so well attended as usual.

SUCCULENT EUPHORBIAS.—M. BERGER, of La Mortola, has recently published through M. EUGEN ULMER, of Stuttgart, an illustrated monograph of the succulent species of Euphorbia, to which we shall allude at greater length later on.

BOTANICAL MAGAZINE.—The December number is the concluding portion of the volume for the year, which is dedicated to Mr. RIDLEY, the director of the Botanic Garden, Singapore, who, with untiring generosity, has surpassed all recent contributors in enriching the Kew collections with rare and novel plants. The plants illustrated are:—

ÆCHMEA GIGAS (*E. Morren*), tab. 8,107.—A very handsome Bromeliad, with tufted, broad, finely-toothed leaves, large crimson bracts finely toothed at the edges, and encircling a dense tuft of greenish flowers.

PONTEDERIA CORDATA (*Linn*), VAR. LANCIFOLIA (*Morong*).—Only differs from the type in its lanceolate leaves.

VANDA WATSONI (*Rolfe*), tab. 8,109, and in *Gardeners' Chronicle*, 1905, i., pp. 82, 123, fig. 52.—Native of Annam. Flowers white; leaves subterete.

COREOPSIS GRANTII (*Oliver*), tab. 8,110; *Watson* in *Gardeners' Chronicle*, 1906, i., p. 162, fig. 64.—Native of E. trop. Africa; leaves bipinnatifid, flower heads yellow surrounded by an involucre of short oblong bracts. A good plant for the decoration of the cool greenhouse in the winter months.

RHODODENDRON FORDII (*Hemsley*), tab. 8,111.—A very pretty Southern Chinese species with shortly stalked ob lanceolate leaves, covered in the young state with fulvous down and bearing trusses of campanulate flowers, the corollas of which are white flushed with rose, the upper petal spotted at the base. It has not proved hardy at Kew.

LEGISLATION FOR NURSERYMEN.—We understand that in accordance with an arrangement made during the debate in the House of Lords last week on the Land Tenure Bill, LORD BALFOUR OF BURLEIGH has had an interview this week with Sir THOMAS ELLIOTT, the legal adviser to the Board of Agriculture, Mr. HARRY J. VEITCH and Mr. MORGAN VEITCH, solicitor, being present to watch the interests of the nursery trade from the practical and from the legal points of view respectively. The proceedings were private, but we understand that the gentlemen named came away satisfied with the result of their visit. So long as the legal position of nurserymen is put right without unreasonable delay, it is, of course, immaterial to them in what Act of Parliament the necessary section amending the law is inserted. We hope to be in a position to throw further light on the subject during the course of the present month.

AMERICAN GOOSEBERRY-MILDEW.—The Board of Agriculture and Fisheries have received information that the American Gooseberry-mildew (Sphærotheca mors-uvæ) has been discovered in more than one place in England, and as there is reason to believe that the disease, in at least one case, is of some years standing, they think it desirable to warn all fruit-growers, nurserymen, gardeners, and other growers of Gooseberries of the dangers involved. The disease, which is termed American owing to the extensive damage it has done in America, is of a very serious character, and has rendered the culture of Gooseberries unprofitable and practically impossible wherever it has appeared. The mildew generally becomes visible during the last half of May or the first half of June, when it appears in the form of "glistening frost like spots" on the fruit on the lower part of the bush where there is usually dense shade. It then spreads to the leaves and tender shoots. In its earlier stages it has a cobwebby appearance, which soon becomes white and powdery from the development of the light conidial spores. Later in the season the leaves and other parts affected turn a rusty brown. The fungus prevents the berry from growing, and the fruit becomes worthless. All during the summer therefore the disease can easily be detected, and the bushes can be dealt with according to the extent of the disease. But during the winter the disease remains dormant and will not spread from plant to plant. During this period, however, it can be conveyed from one district to another in bushes and stocks. It is clear that enormous and irreparable mischief may be done in this way, and it is the duty of all nurserymen to take precautions not only for their own sake, but for the sake of the locality in which they live. The Board of Agriculture and Fisheries therefore urge all nurserymen and market-gardeners who intend to buy bushes or stocks of Ribes aureum, whether from abroad or from Ireland or even from other growers in Great Britain, to observe the following precautions. 1, Only to purchase from those growers or dealers who are prepared to offer a guarantee that the plants they are selling are of their own growing, and that no case of American Gooseberry-mildew has ever appeared in their gardens or in the immediate neighbourhood, and that the said plants have not been near any Gooseberry-plants recently brought on to the seller's premises; 2, to plant such Gooseberry bushes or stocks as they may buy or acquire from premises other than their own in a special part of their nursery or garden at some distance from other Gooseberry bushes; 3, to destroy all plants found to be infected with the mildew and to spray with Bordeaux mixture all others suspected of being infested, with the object of destroying any external mycelium or adhering spores that may be present. This should be carried out during the period when the disease is dormant; 4, to keep a careful watch on all Gooseberry plants in the forthcoming spring for any signs of mildew, and to report any appearance suggestive of the disease to the Secretary of the Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., immediately it is detected; 5, to assist the Board in discovering any unreported cases of the infestation during the past summer. There is, at present, no law dealing with the eradication of the pests of fruit trees in this country, but the Board believe that the American Gooseberry-mildew has not spread very far as yet and that it depends very largely on the action of the fruit-growers, nurserymen, and market-gardeners whether its further development can be prevented. *Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., December 6, 1906.*

IRISH GARDENING.—A popular gardening periodical, published monthly at 2d., commences its second volume forthwith. It was good at the beginning and its progress has been so satisfactory that there seems every prospect of a successful future. The articles are of excellent quality, and the illustrations appropriate. We are very sorry to read a complaint made by an exhibitor, regarding the theft of some prize Apples at the Dublin show, which were subsequently found in a winning class at Belfast. This is a particularly contemptible practice, and, if the charge can be substantiated, the name of the guilty person should be made public in every horticultural show of the country.

ARBOR DAY AT EYNSFORD.—Saturday, December 8, was Eynsford's Arbor Day, and the happy proceedings passed off most successfully in spite of the unkind elements—a drizzling rain and a very sharp wind. Tree-planting was proceeded with throughout the day in the centre of the village, and about 200 fine, healthy saplings and shrubs, supplied by Messrs. CANNELL & SONS, were planted. As in previous years, lady students from the Horticultural College at Swanley were largely responsible for the tree-planting operations. The word "Love" was spelt out by the following trees:—Laurustinus, Oak, Viburnum, Elm! The trees planted throughout the day consisted of Elms, Oaks, Poplars, Yews, Laurels, Bamboos, Junipers and Veronicas.

THE LATE ARCHDUKE OTTO OF AUSTRIA.—By the death of his Imperial and Royal Highness Archduke Otto, which occurred on November 1 this year, the Horticultural Society of Vienna lost a zealous supporter and influential patron and liberal donor of valuable prizes of Honour to be competed for at its various exhibitions. His Highness was likewise an exhibitor of very fine collections of fruit from his gardens at Schonau.

THE BLANCARD FUND.—Mr. HARMAN PAYNE announces further donations to this fund on behalf of the Mesdemoiselles BLANCARD amounting to £2.

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—The annual general meeting of this society will be held in the room of the Horticultural Club, Hotel Windsor, Westminster, on Saturday, December 22, at 2.30 p.m.

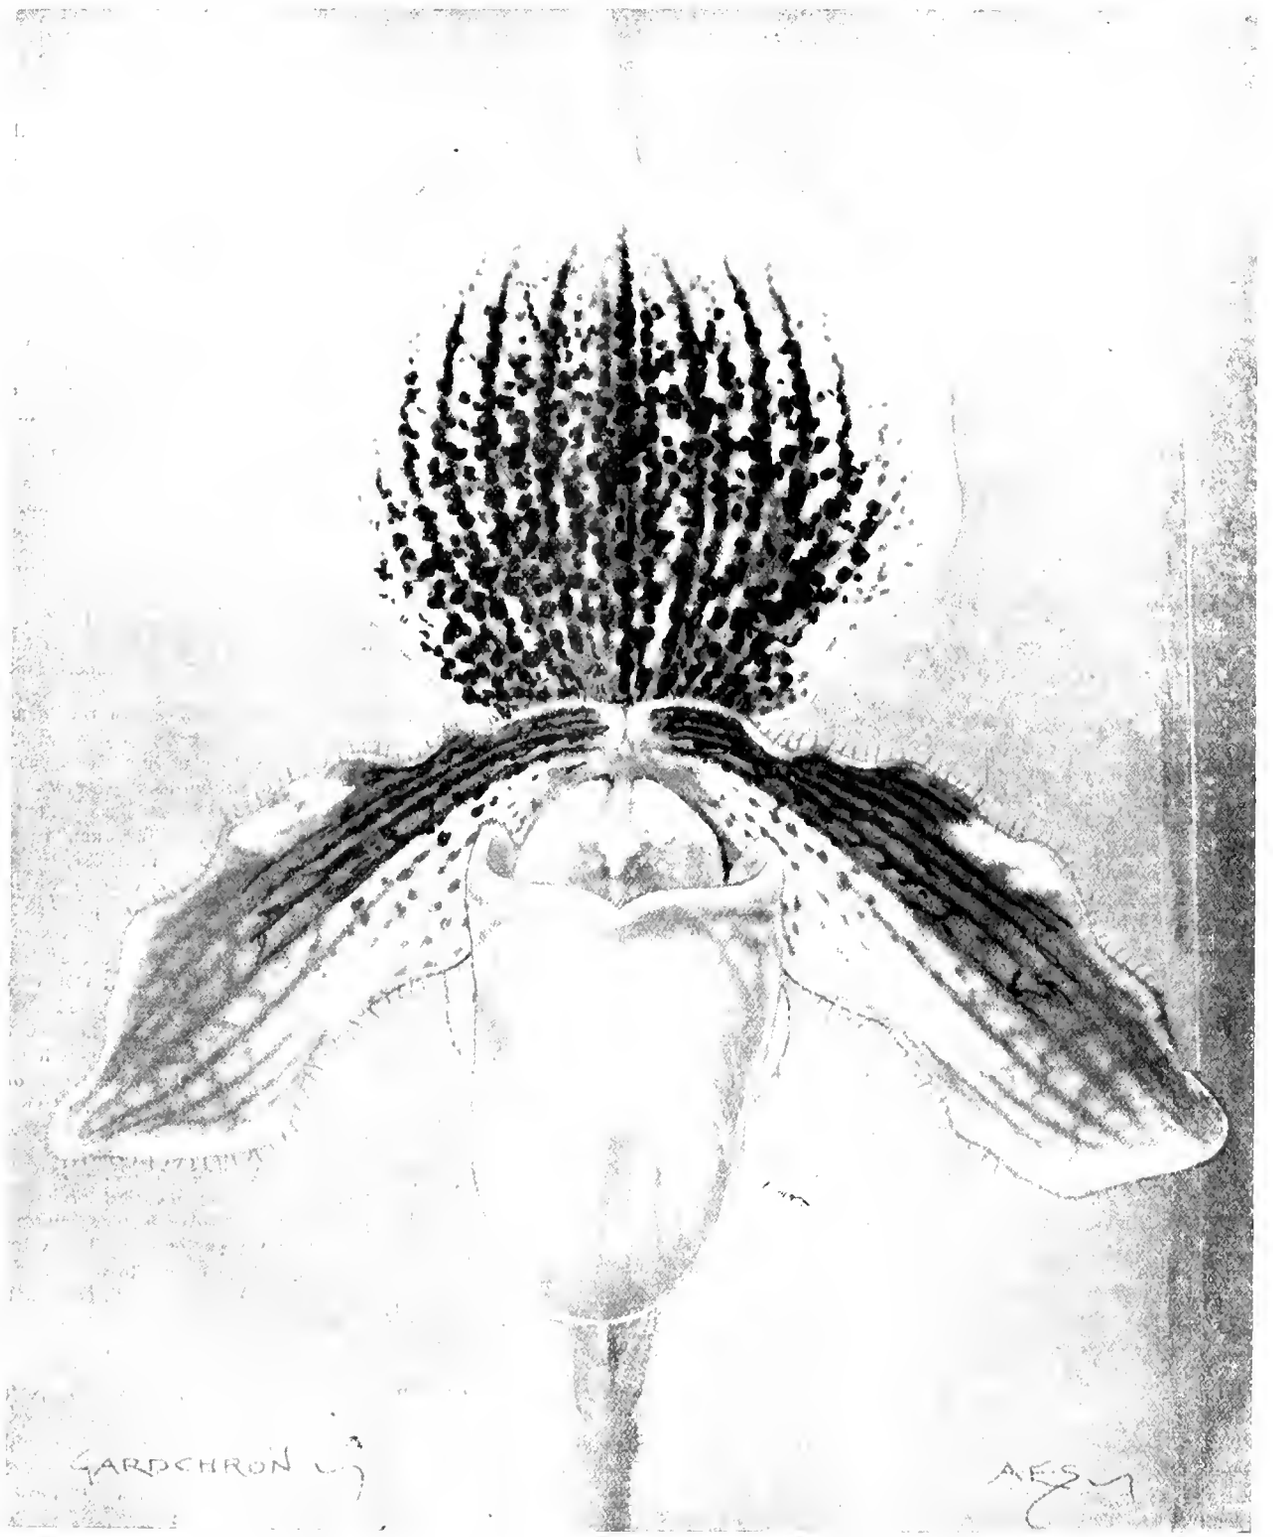
BEECH COPPICE. With reference to a note in our last issue relating to this subject, in which the writer speaks of the Beech as practically unknown in Britain as coppice, we are informed that on one estate Beech has been cut in rotation for coppice for a century and probably much more. In the article at p. 372, the exact words of the author of the volume were not given. Basing the statement on personal knowledge, one of the authors of the book writes as follows: "Therefore in cases where the Beech has been planted merely as a nurse to Oak or other trees, and there is no deciduous tree better adapted to this purpose, I should not hesitate to cut over the trees if they seemed likely to smother their neighbours, with the expectation of getting a quantity of excellent firewood, or small poles fit for turning, fifteen or twenty years later."

WHO'S WHO? 1907.—Messrs. A. & C. BLACK have issued this most serviceable book. It is one of those books which are indispensable on an editor's table and scarcely less valuable to the general reader. Owing to the changes caused by the General Election which could not be inserted in the last edition, this volume is particularly useful. *Who's Who Year Book, 1907*, is a supplement to the preceding, containing various tables and lists crowded out of the larger volume. The editor asks for suggestions, so that we venture to suggest that a useful addition would consist in the publication of the correct titles to be given to suffragan, assistant, Indian, Colonial, and Missionary Bishops respectively.

NAPLES SEED LISTS.—We are accustomed to hear of short supplies of seeds owing to unpropitious seasons, but it is not so common to hear of a deficiency from volcanic action. The heavy and prolonged rain of ashes which fell in April last during the outbreak of Mount Vesuvius destroyed many crops around the volcano, and supplies of vegetable and flower seeds will in consequence be deficient, as may be readily understood from the illustrations lately given in our columns.

PRESENTATIONS TO GARDENERS.—At the meeting of the Doncaster Gardeners' Society, held on Thursday, December 6, Mr. HENRY BUTCHER, who is leaving the district, was presented with a marble timepiece as a token of the members' esteem and in recognition of his past work for the society.——At a recent meeting of the Loughborough and District Gardeners' Mutual Improvement Association, Mr. D. ROBERTS, of Prestwold Hall gardens, was presented with a solid silver salver (inscribed), a purse of gold, and a framed illuminated address in recognition of ten years' service as honorary secretary to the association.

THE SMITHFIELD CLUB SHOW. The fat cattle show in the Royal Agricultural Hall, Islington, which has been open during the present week, may be said to be remarkable for the success which has been gained by the KING'S Shorthorn beast and his Majesty's Southdown sheep. But gardeners, scarcely less than farmers, were interested in the exhibits of seeds and roots, displayed by the seedsmen in the gallery, and in the exceedingly good collection of farm and garden implements that were also to be seen arranged round the sides of the building. Messrs. SUTTON & SONS, Reading, arranged, as usual, a very imposing stand, on which their specialities were disposed to excellent advantage. Mangolds, Turnips, Swedes, and choice varieties of Potatos, as well as samples of the various grains, were included in the exhibit. The two 20-guinea cups, presented this year by His Majesty the KING for the best root crops, have been won by customers of Messrs. SUTTON, and the cups were therefore on view. Messrs. J. CARTER & Co., High Holborn, exhibited an unusually fine display of Mangolds, Swedes, and Turnips, also tubers of selected varieties of Potatos, Onions, Carrots, and seeds of the usual "grains." Messrs. E. WEBB & SONS, Wordsley,



(Photo by J. Gregory.

FIG. 151.—CYPRIPEDIUM GERMAINE OPOIX, "WESTFIELD VARIETY" (NATURAL SIZE). (See p. 411.)

CYPRIPEDIUM GERMAINE OPOIX, "WESTFIELD VARIETY."

OUR illustration at fig. 154 represents this very fine Cypripedium for which Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins), received a First-Class Certificate at the Royal Horticultural Society's meeting on November 6, and which further added to its honours by taking the First Diploma as a C. Fairrieanum hybrid on November 20. This beautiful hybrid was the last of a small batch raised by M. Opoix in the gardens of the Luxembourg Palace, and it proves to be the finest.

As will be seen by the illustration, which has been prepared from a natural-size photograph by Mr. Gregory, the flower is of fine proportions. In colour it is also remarkably good and distinct, the large white dorsal sepal, which is yellow at the base, being finely marked with blackish purple lines changing to rose-purple in the smaller, upper spots. The petals and lip are honey-yellow, marked with purple. It is a very beautiful hybrid, and a free grower.

THE AMERICAN GOOSEBERRY-MILDEW.

WITHIN the last few days, chiefly through the energy of the *Evesham Journal*, further outbreaks of the American Gooseberry-mildew have been discovered in the neighbourhood of Evesham. An outbreak at Pershore has also been discovered by Mr. K. G. Furley, of Wye College.

Full particulars of all of these outbreaks are not yet to hand, but the particulars which I have obtained of one case are of such interest and importance that they should be widely circulated.

A certain nurseryman received a few bushes as a sample of a lot of 6,000 bushes which were offered for sale by a grower in the neighbourhood of Evesham. This nurseryman, in the ordinary way, would have consigned these 6,000 bushes to a purchaser in Essex, but his attention having been drawn by my lecture recently given at Evesham to the necessity of closely scrutinising all Gooseberry bushes before sending them out, he was led to suspect the condition of these sample bushes; they were forwarded to me, and I reported to him that they were badly infested with the American Gooseberry-mildew. Some thousands of bushes have already been sent out from this nursery to various purchasers.

Now this case is one of extreme interest and importance for two reasons. In the first place, we see the way in which this new disease will be distributed gradually to all the fruit-growing counties unless measures are used against this plant disease similar to those employed to stop the spread of infectious diseases in animals. We must note, too, that if these bushes had been sent to Essex (I am told that the purchase has been countermanded) and the disease had broken out there next season, as it inevitably would have done, an unscientific or hasty person would have jumped to the conclusion that the disease having appeared on bushes raised in an English nursery, must be indigenous to this country, whereas we know as a matter of fact* that some firms of nurserymen in the district of Evesham have been importing foreign bushes from the Continent, and in all probability have thus unwittingly imported the disease. In the second place, this case demonstrates the absolute necessity for immediate legislative measures being obtained, permitting the Board of Agriculture to deal with this disease so that they may prohibit in the first place all further importation of Gooseberry bushes (and *Ribes aureum*), and then by official action stamp out the disease in each affected area as it is discovered. Those who enquire of the officials at the Board, as I have done, learn that the Board has at present no power whatever to control or stop the importation of any bushes, even if they were found to be covered with this mildew, and that the Board has no powers whatever beyond those of persuasion to make the owner of any infected nursery or plantation stamp out or even control the disease, or stop sending out diseased stock.

It is for these reasons that Col. Long, M.P., Mr. Laurence Hardy, M.P., and others have been endeavouring to get the Board of Agriculture to obtain these legislative powers. A Bill to deal with the matter is being pressed forward by Col. Long. But, having been told that a Private Bill such as this has no chance of being introduced this Session, I have been pointing out to the Board of Agriculture the great danger of temporizing in the face of these outbreaks in Worcestershire, and urging them to get brought in by the Government this Session—as an emergency measure—a short Amending Act to the Destructive Insects Act, 1877 (still in force) to bring this disease within its scope.

Unless promptitude such as this is shown now by the Board, it is quite clear to anyone who has watched closely the way in which this disease is spreading over Europe, that the possibility of eradicating or even controlling the disease in this country will pass away, on account of the rapid increase of affected areas.

Efforts to obtain such legislative measures were being vigorously made by Col. Long, Mr Laurence Hardy, and others, and all growers in the affected areas in Worcestershire were taking the greatest pains to deal as energetically with the disease as I had advised them to do, when Mr. Massee, on being sent down to Evesham as the Board of Agriculture's expert, at once tries to stop—or, at any rate, deliberately hinders—the work in both these directions. I publish without comment the statements sent to last Saturday's *Times* as the result of Mr. Massee's visit, and published there on his authority and a copy of the letter in reply which I sent to the Editor of *The Times* on the following Monday:—

Mr. G. Massee, of the Royal Gardens, Kew, has been at Worcester this week, by the instruction of the Board of Agriculture, and recognised American Gooseberry-mildew in a plantation near Evesham. The owner said the disease had been there 30 years and had not affected the fruit. It only affected the bushes in the low, swampy part of the plantation. Mr. Massee says that climatic conditions in Worcestershire were against the development of the disease. In Ireland the conditions favoured its growth, but the injury there had been exaggerated. The disease would not necessarily reach the fruit, and it seemed clear that the disease was indigenous to the county and not introduced, so that legislation to prevent its importation was unnecessary. There was absolutely no necessity for panic. The statement that it was impossible to grow Gooseberries in America was a mere figure of speech. He had made careful inquiries of Americans this year, and the majority knew nothing of the disease, and those who had it on their farms said it only did harm in some places. On the other hand, Mr. Salmon, Wye Agricultural College, has said that immediate legislation is necessary, as the whole Gooseberry crop is imperilled. [It should be stated that the above paragraph, which has been the round of the papers, was not contributed by Mr. Massee, as we learn from that gentleman.—ED.]

THE OUTBREAK OF THE AMERICAN GOOSEBERRY-MILDEW IN ENGLAND.

To the Editor of *The Times*.

SIR,—Last Saturday you published a series of statements made by Mr. G. Massee, of Kew, the present scientific adviser to the Board of Agriculture, on the recent outbreak in Worcestershire of an epidemic fungus disease of Gooseberries, the American Gooseberry-mildew. As Mr. Massee denies the necessity of legislative measures to control the disease (such as those which Col. Long is now endeavouring to obtain from the Government), and makes statements which, if correct, would show that I have been needlessly raising an alarm as to the danger likely to be caused by this new pest, I must ask for space to make the following statements:

Last October I discovered the American Gooseberry-mildew in a nursery in England on recently-imported standard Gooseberries. With the object of warning Gooseberry growers of this new danger, I have been giving a series of free lectures in various fruit-growing centres. I addressed meetings at Worcester, Pershore, and Evesham. In these lectures I emphasised the following points:—That this disease was one recently introduced into Europe, and, being highly infectious, should be immediately stamped out on its appearance anywhere in England; that, since its introduction, it has spread over the eastern half of Ireland, causing considerable damage to the crop, and re-appearing annually in the affected gardens; that immediate legislation was necessary to prohibit the uncontrolled importation of Gooseberry plants; that the disease was most dangerous (having rendered the cultivation of the European Gooseberry on a commercial scale impossible in the United States), and, if once established here, likely to cause growers losses as great as—or greater than—those occasioned by "big bud" in Black Currant plantations.

In consequence of the attention thus directed to the subject, I received information which led to the discovery of the existence of the disease in a large commercial plantation in Worcestershire. Since then, chiefly through the energy of the staff of the *Evesham Journal*, two further outbreaks have been discovered.

As a result of the emphatic warnings I gave of the serious nature of the disease, all growers of Gooseberries in the district have been making the most earnest endeavours to stamp it out, and to track the source by which it is being introduced into the county.

Within the last few days my work in this affected district has been to a certain extent nullified by the visit of the Board of Agriculture's expert. Mr. Massee, as scientific adviser to the Board, has been sent to one of these recently discovered infected areas, and the following statements made in your paper are given on his authority [this is, we are informed, not correct.—ED.]:—(1) The climatic conditions in Worcestershire are against the development of the disease; (2) in Ireland the conditions favoured its growth, but the injury there had been exaggerated; (3) the disease would not necessarily reach the fruit; (4) it seemed clear that the disease was indigenous to the county and not introduced, so that legislation to prevent its importation was unnecessary; (5) the statement that it was impossible to grow Gooseberries in America was a mere figure of speech.

I wish to make the following necessarily brief replies to these statements:—(1) The climatic conditions obtaining in Worcestershire are certainly no less favourable to the spread of the disease there than are those of some of the various countries in Europe, where the disease is now rampant. (2) My articles in the *Journal Royal Horticultural Society*, Vols. xxv., xxvi., xxvii., and xxix. contain the reports—given in their entirety—from all the growers in Ireland with whom I could get into correspondence, and give a detailed account of the annual damage done to the bushes and the crop. The Irish Board of Agriculture, in Leaflet No. 76, speaks of the damage done to the crop, and gives the advice that the safest step is to uproot and burn the attacked bush. (3) Mr. Massee, in his short visit, did not apparently learn that in a certain plantation in Worcestershire the fruit, last year, was so affected by the present disease that it had to be picked over before being marketed. (4) I have mentioned in the papers referred to above certain facts which I obtained that point to the disease having been brought into Ireland on imported stock. Further, in the case of the

* See *Gardeners' Chronicle*, December 1, 1906.

infected Gooseberry standards found in an English nursery, the disease occurred only on the imported plants; also, at Evesham, I obtained information that bushes have been imported from the Continent into this district. Prof. A. de Jaczewski has published facts which show that there is every reason to believe that the disease in Russia was imported from America: and Prof. J. Eriksson, the most eminent economic mycologist in Europe, in his recent article in the *Zeitschr. z. Pflanzenkrankh.*, Bd. xvi., traces the spread of the disease in Europe to three distinct sources. Mr. Massee must be well aware of these scientific opinions, yet gives credence at once to the statement of an unscientific person—the manager of the nursery—that the disease "had been there thirty years," and publicly states his opinion that the disease is indigenous to the country, and that legislation to prevent its importation is unnecessary. Even supposing that the disease is of long standing in Worcestershire—which has yet to be proved—it is an incontestable fact that it is becoming so prevalent on the Continent that it would still be necessary to prohibit the uncontrolled importation of Gooseberry bushes. (5) The statements which I have made that the cultivation on a commercial scale of the European Gooseberry in America has been rendered impossible by the susceptibility of the plant to this disease are based on the facts given in the Year Book of the Department of Agriculture (United States) for 1899, in the Report of the Commissioners of Agriculture for 1877 (Washington), in Bulletins 114 and 161 of the New York Agricultural Experimental Station, and on information supplied to me by Prof. S. A. Beach, one of the chief authorities in America on the cultivation of Gooseberries.

This is not the place to bring forward further scientific facts, which show the dangerous character of the present disease, and the need for immediate legislative action to prevent more diseased stock coming into the country. One serious misstatement made by Mr. Massee on the manner in which the disease could be imported on bushes I corrected in the *Gardeners' Chronicle* in January last; but this has not prevented Mr. Massee from repeating it in a chapter on "Legislation and Disease" in his recently-published book.

Since I believe that the most energetic and consistent action, assisted by careful expert advice, is now required from the Board of Agriculture to save Gooseberry growers from great losses, I ask that the Board shall investigate the value of the opinions of its scientific adviser on the present disease by submitting the question to some independent and competent scientific authority in this country or abroad. The Board should then state publicly the decision arrived at, and if it is decided that the danger is as serious as I believe it to be, the Board should at once send an official to the affected areas in Worcestershire to repair, as far as possible, the mischief caused by the statements which Mr. Massee has circulated in the district to the effect that the danger has been exaggerated, that no legislation is necessary, and that the disease has not been introduced through the purchase of foreign Gooseberry bushes. I ask that the investigation shall be carried out immediately, since it is useless to expect growers to carry out sufficiently drastic measures in face of the statements which will be widely circulated as the opinions of the scientific adviser of the Board of Agriculture. *E. S. Salmon, F.L.S., Mycologist to the Wye Agricultural College.*

———At the last meeting of the Worcestershire County Council, the Agricultural Committee reported an outbreak of American Gooseberry-mildew at two places in Worcestershire, one a nursery, and that the Board of Agriculture's expert believed the outbreak was not confined to one nursery. It was decided to petition the Board of Agriculture to take steps to obtain powers to deal with diseases of plants such as existed in the case of diseased animals and to prevent the importation of the plants. It was further decided to carry out the inspection of nurseries and gardens in the county to detect any further cases. A similar resolution was, we learn, passed by the Council of the National Fruit Growers' Federation on the 11th inst.

HOME CORRESPONDENCE.

PHEASANTS AND GUNNERAS. — Pheasants damage the Gunneras here in the same manner as described by Mr. Bartlett on p. 396—more especially those in high and sunny situations, and not only do they attack the foliage, but the crowns. To prevent them we put some twiggy sticks around, and this is effectual. I do not think they eat any portions, but they seem as if they suck the juice which exudes after a wound has been made. *W. A. C., Leonardslee.*

BLACKBIRDS AND TOMATOS. — Blackbirds make excellent meals from these, and will even go through the ventilators after them. Peacocks also will devour them greedily when growing on the wall. They will reach up and destroy all they can that have any colour. When these birds attack them they must be driven off or they will continue the attacks. *W. J. Cook, Leonardslee.*

——— It is nothing new to me to watch blackbirds and thrushes helping themselves to often the largest and best fruit on the plant. This year in particular the fruits attracted these birds more than usual. It is curious that our Raspberries are seldom attacked by the blackbird or thrush. I don't know if this is the case in other gardens. Peacocks have a great predilection for the Tomato, but the palate of the peahen seems more exacting. For some seasons past I have at various times, when all was quiet, suddenly surprised this bird ravenously devouring one of the brightest coloured fruits; with consciousness and skill he makes a sufficiently large hole, that the interior may be got at without devouring the skin. During its final ripening stage the Morello Cherry is not immune from attacks by the peacock, and I have to take extra precautions to have the nets well fastened to the ground, at some distance from the walls, in order to protect this fruit. It is a recreation for thought and brain to watch the vagaries of birds and animals, &c. The freaks of the hedgehog much amused, and at first baffled me last year. Although securely protected by nets, the fruit on the lowest branches of a Morello Cherry tree, and near the garden door, disappeared excepting the stones, which were left hanging; the fruit on either side of the centre of the tree up to 2 feet high bilewise disappeared. As no birds could reach them the mischief was attributed to rats, and this idea seemed probable, because some of the gravel had been scratched away from the door, a regular run having been formed. I gave instructions for a trap to be set just inside the fish-netting close to the wall, and the traps were to be brought on the following day. The depredator, however, brought about his own end; in making another excursion that night, it became entangled in the fish-netting and was found next morning dead: subsequently two others were caught in the trap, and with their capture the fruits remained secure. *W. H. Clarke, Aston Rowant, Oxon.*

——— Some correspondents seem to think that the fact that blackbirds eat Tomatos is an entirely new thing. We grow here quantities of Tomatos outside in the open, and each season, for the past seven years at least, the blackbirds have been a perfect pest, attacking the fruit as soon as it commences to colour a little, and I am not quite certain but I think thrushes too eat these fruits. It is not so much what they eat as what they spoil that matters. *C. D. Buss, The Nurseries, Lodge House, Smeeth, Kent.*

——— In reference to the notes which have recently appeared in the *Gardeners' Chronicle* on this subject, I may say that here (Essex) for several years in succession large coveys of the audacious sparrow have made determined and continuous onslaughts on field Tomatos as soon as the fruits began to colour and until the crop was finished. The attacks are only rendered less frequent and damaging by shooting at the rogues when, on the approach of the somewhat irate grower, they rise *en masse*. Blackbirds, and even the tolerated robin, all join in disfiguring and demolishing a large percentage of the ripe fruit if not closely looked after. This is best done by picking and sizing the fruits as soon as they begin to colour, and placing baskets containing them in a glasshouse in which a dry, airy atmosphere is maintained, for 12 hours or so, to bring up the proper degree of colour in the fruits before sending them to market. *H. W. W.*

CHRYSANTHEMUMS AT THE CRYSTAL PALACE. —If *A. J.* (see p 377) lives in Essex, his expenses to exhibit in the great Vase class alone would probably amount to £3 or £4. Little wonder then that few gardeners enter in a class entailing such an outlay, unless they are tolerably sure of getting into the prize-list. The three dozen vases staged in this class at the last show, with a table over 100 feet long all to themselves, did not produce the effect they would have done had they been arranged more closely together, and a double row of triplets would have been much more effective. Twelve varieties, three blooms of each, are as many as most gardeners can find. A greater number than this makes a nurseryman's class of it, and, if my memory is not at fault, it has generally been won by a nurseryman. Much as I admire Chrysanthemums in vases, I think it will be a pity if the time should come when the showing on boards is [entirely] abolished by the N.C.S., for there are hundreds of gardeners and amateurs who visit these shows annually for the sole purpose of selecting the varieties to grow in the ensuing year, and it is only on the boards that any great variety is found. Independently of those shown on the boards, I do not suppose there were many more than two dozen varieties of Japanese Chrysanthemums staged in competition at the November show. Whatever other societies may do, there is surely room enough for both methods at the shows of the N.C.S. *C. J. D., Sussex.*

VIOLETS.—I can fully endorse all that Mr. W. Honess has said respecting this valuable variety La France. I find that for "pot work" nothing better could be wished for. I also have it planted outside with Princess of Wales and the Czar; the latter is by far the most free-flowering and hardiest of the three, and as quantity is generally the first requisite the gardener has to lean a little that way. The flowers of La France are large, have long stalks, and, unlike most varieties, show themselves well above the foliage, but Princess of Wales I find is hardly worth growing with the first two mentioned varieties. I intend after this season to grow all double varieties in 6½-inch pots. Having tried several I find they throw more freely in pots, produce larger flowers, and are less liable to damping. With a good ash bottom to the frame slugs and woodlice are less troublesome; they can also be moved to a slight shelter in the spring to finish their flowering should the frames be required for other purposes, most gardeners being hard pushed for room during the spring months. The frames too will benefit greatly under this system, as when filled with soil to within a few inches of the top they soon decay. I enclose a few flowers of La France from 8-inch pots in frame [excellent examples], the Czar and Princess of Wales from outside, Marie Louise and Mrs. J. J. Astor from 6½-inch pots in frame, and Lady Hume Campbell from frame. I find Mrs. J. J. Astor the best of all doubles, being free and continuous flowering from the end of September to the beginning of May. *F. G. Brewer, Bryntirion Gardens, Bontddu, near Dolgelly, N. Wales.*

SILVER LEAF DISEASE.—This disease is more prevalent in some localities than in others, and it is especially found in places where the soil is not naturally suited to the growth of the Peach, as in the case of a stiff, cold clay. I have tried most of the remedies suggested, but without success, and have found the destruction of the affected trees the best course to pursue. One characteristic of the disease is that it develops between the fall of the leaf and the commencement of growth in spring. The first indication of its presence is seen just as the young leaves begin to unfold, when they present the well-known silvery appearance. A season is thus lost before it can be dealt with. It is a rare occurrence to see the whole of the tree diseased, and it may affect a branch only, or even a part of a branch, or one side of the tree. In the spring of 1905 a tree of Early Rivers Nectarine in an early house in these gardens was completely covered with silver leaf disease, and my disappointment was great, for this tree was intended to furnish our earliest fruits.

We shaded the house, lightly, but more completely, as the sun gained power, as bright sunshine causes the leaves to drop. The fruit lacked both size and flavour. Early in October we removed the tree, cleared out all the old soil and furnished new, and planted another tree from a later house on the same site. I was very surprised to find that the roots of the affected tree showed no sign of disease whatever, but, on the contrary, all were clean and healthy. So instead of putting it on the fire I planted it as an experiment against a wall facing to the south south-west, and I am more than pleased with the result of that experiment. We picked from that tree in August last four dozen full-sized, highly-finished fruits. The growth of the tree was clean and healthy, and showed not a sign of disease. I should add that not a particle of the old soil was allowed to remain on the roots. I attribute the crop of fine fruits to early planting in new loam, and I am more than ever convinced that the condition of the soil is in every case responsible for the spread of this disease. *James Fulton, Grims Dyke, Harrow Weald.*

ROBIN HOOD SECTIONAL BOILERS.—Having had one of these boilers under trial for one year, I am convinced of its great advantages over boilers of the old-fashioned types. It is more easily worked and is more economical in the consumption of fuel. It affords a steady heat, and is clean and smart in appearance. There has been another placed in a position for the heating of the mansion, and I am told that it does more work in two hours than the old one used to do in 36 hours. At South Lodge, a neighbouring residence, Messrs. Foster and Pearson have put in two Robin Hood boilers, and the proprietor is so pleased with the results that two more are now being added. Mr. Moody, the gardener, speaks highly of their qualities. *W. A. Cook, Leonardslee Gardens.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 11.—The last meeting of the committees for the present year was accompanied by an attractive exhibition of rather less extent than usual. Orchids were the dominating feature, and several fine displays of these flowers were made. The ORCHID COMMITTEE recommended four First Class Certificates and eight Awards of Merit to novelties.

The FLORAL COMMITTEE had not occasion to make any award to a novelty, and the principal groups before the committee were composed of Conifers and other shrubs, Begonias, Orange trees in fruit, flowers of Zonal Pelargoniums, and winter-flowering Carnations.

The FRUIT COMMITTEE recommended an Award of Merit for a new culinary Apple, raised by that successful veteran raiser, Mr. ROSS, of Welford Park Gardens, and there were several collections of Apples and Pears exhibited, the best exhibit of Apples being one from Lord Aldenham, for which the "Hogg" Medal was awarded.

The lecture which had been announced for delivery on Tuesday could not be read, having been delayed during its transit from Japan.

It may be added that, in referring to the meeting as the last for the present year, it is the calendar year that is meant, for, as most of our readers are probably aware, the society's year does not terminate until February next.

Floral Committee.

Present: H. B. May, Esq., in the chair, and Messrs J. Green, T. W. Turner, G. Reuthe, C. J. Salter, W. Bain, C. E. Shea, C. E. Pearson, W. P. Thomson, E. H. Jenkins, W. J. James, C. T. Druery, J. W. Barr, J. Douglas, Jas. Walker, J. T. Bennett Poë, H. J. Cutbush, J. F. McLeod, W. Howe, C. Blick, J. Jennings, A. R. Goodwin, and R. Hooper Pearson.

Messrs. JOHN WATERER & SONS, Ltd., Bagshot, Surrey, showed an extensive group of decorative shrubs of various kinds. Hollies were very fine, and included a capital standard of "Waterer's Gold," a very effective variety; "Golden Queen," and the newer "Golden King" were shown as freely-grown, well "coloured" specimens. Thuya plicata var. zebrina was attractive by reason of its elegance of habit and distinct colouring; Osmanthus myrtifolius and the variegated variety were good, also Cupressus in many varieties. Taxus fastigiata alba, Picea Parryana glauca, P. concolor, and many other good "foliage" shrubs. (Silver-Gilt Flora Medal.)

There were several exhibits of Gloire de Lorraine Begonia. One from F. A. BEVAN, Esq., Trent Park, Barnet (gr. Mr. PAIT), was composed of plants which furnished one side of a long table, and the type, together with the white-flowered "Turnford Hall" variety, all growing in pots 5 inches in diameter, were excellent specimens. (Silver-Gilt Flora Medal.)

Another extensive exhibit of these plants came from E. H. BROWN, Esq., Highwood, Roehampton (gr. Mr. Bradford). The type and white variety were again shown in 5-inch pots, the exhibit consisting of 70 or more plants about 2 feet high, were perfect pyramids. The same exhibitor had a group of plants of Euphorbia (Poinsettia) pulcherrima, with well-developed bracts. (Silver Flora Medal.)

Major NELSON GEORGE, Lovell House, Lowfield Heath, Crawley (gr. Mr. W. T. Wilks), exhibited the same Begonia growing in 8-inch pots.

Some plants of Euphorbia pulcherrima were shown with a few other decorative plants by Lady SALISBURY, Hatfield House, Herts (gr. Mr. H. Primett).

A capital group of Orange trees (Citrus sinensis) in pots was shown by Messrs. W. CUTBUSH & SONS, Highgate Nurseries, London, N. The plants were of considerable size, freely fruited, and they exhibited excellent cultivation. (Silver Banksian Medal.)

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, exhibited some of their fibrous-tuberous-rooted Begonias described on p. 374. Winter Cheer and Julius were the varieties shown on this occasion. Jacobinia coccinea and J. chrysostephana were included in the group. (Silver Flora Medal.)

Messrs. HUGH LOW & Co., Clapton, exhibited a few Cyclamens of many varieties, also hard-wooded flowering plants such as Ericas, Acacias, &c., in flower; Euphorbia pulcherrima, with developed bracts, and a few winter-flowering Carnations.

Mr. L. R. RUSSELL, Richmond Nurseries, Surrey, exhibited nice dwarf plants of Aucuba vera abundantly decorated with their red fruits; also Euonymus latifolius albus.

Mr. H. BURNETT, Guernsey, made a pretty exhibit of flowers of "Mrs. H. Burnett," his new pink, winter-flowering Carnation. (Silver Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited forty trumpet-shaped glasses, furnished with flowers of Zonal Pelargoniums in much variety, and of such brightness as was not equalled by any exhibit in the hall. (Silver Flora Medal.)

Chrysanthemum Annie, as exhibited by Mr. A. NOBBS, Beechhurst Gardens, Hayward's Heath, is a small single, white or tinted-flowered variety with rolled florets.

Messrs. W. WELLS & Co., Merstham, Surrey, contributed flowers of a number of varieties of decorative and "single" Chrysanthemums.

Messrs. J. PEED & SON, Roupell Park Nurseries, Norwood, exhibited a large number of Alpine plants in small pots.

Messrs. BARR & SONS, King Street, Covent Garden, London, W.C., showed a few Narcissus "White Hoop Petticoat" in flower, Iris alata in flower, &c.

The Misses HOPKINS had a few hardy flowering plants.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair, and Messrs. Jas. O'Brien (hon. sec.), De B. Crawshay, Francis Wellesley, Norman C. Cookson, W. A. Bilney, W. Bolton, G. F. Moore, W. Thompson, H. G. Alexander, H. A. Tracy, W. H. Young, J. Charlesworth, F. J. Thorne, W. H. White, W. Cobb, T. W. Bond, Arthur Dye, A. A. McBean, and W. Boxall.

G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr. Mr. Page), staged a grand group extending two-thirds of the end staging in the Hall, and almost as great a space on the side, the whole forming a charming display, for which the society's Gold Medal was voted. The group, which was composed principally of fine Cypripediums, and especially of varieties of C. insigne, of which there were about two hundred forms, was tastefully arranged with selections of Oncidium varicosum, Vanda cœrulea, Dendrobium Phalænopsis, Odontoglossums, &c. Among the very remarkable collection of C. insigne were C. insigne Harefield Hall, with 17 flowers; a most complete sequence of yellow forms of which Sanderæ is still the most beautiful. Others noted were C. insigne Kathleen Corser, Louisa Dean, Oddity, Perfection, Bourton Gem, montanum magnificum, Parc Leopold, Dormanianum, Majestic, Victor, &c. The forms of C. Leeanum were equally well represented, and among specially good hybrids were C. Blanche Moore, C. Mrs. E. V. Low, four forms of C. Niobe, and a very good set of varieties of C. Actæus. The immense number of specimens staged were splendidly grown and finely flowered.

JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr. Mr. W. P. Bound), was awarded a Silver Flora Medal for an effective group of varieties of Cypripedium insigne, among which were good C. insigne Harefield Hall, and several C. insigne Sandera, various pretty Lælio-Cattleyas raised at Gatton Park, the best being several forms of L.-C. epicasta and L.-C. Phryne. The ends were of scarlet Sophronitis, and noted as specially good were Masdevallia cucullata with 13 dark claret flowers, &c.

The Lindley Medal was awarded to Mr. C. J. Salter (gr. to Mrs. T. B. HAYWOOD, Woodhatch, Reigate), as a reward for fine cultivation of a very remarkable collection of 18 large specimens of the pure white Masdevallia tovarensis, each with over 100 spikes of flowers.

Messrs. HEATH & SON, Cheltenham, staged a very effective group of Cypripediums, for which a Silver Flora Medal was awarded.

Messrs. JAS. CYPHER & SONS, Cheltenham, staged a very nice group of good and rare varieties, for which a Silver Flora Medal was awarded. The group contained a very fine selection of Cypripedium insigne, C. Leeanum, and other favourite classes; C. Fairrieanum, varieties of C. Niobe, various Odontoglossums, and, among other good species, a fine Odontoglossum Uro-Skinneri, with a very prettily spotted labellum.

Messrs. SANDER & SONS, St. Albans, secured a Silver Banksian Medal for a very interesting group, the leading plant in which—Cœlogyne Mooreana—securing a First Class Certificate (see Awards). In the centre was a fine orange-lipped form of Dendrobium formosum giganteum, on each side two richly-coloured Vanda Sanderiana, and with them Saccolabium bellinum, Pilumna laxa, Lælia Gouldiana, varieties of L. anceps, Cypripediums, &c.

Messrs. J. W. MOORE, Rawdon, Leeds, staged a group of Cypripediums, with which were Cymbidium Cravenianum (Lowianum × Tracyanum), with pretty, whitish flowers striped with red; Lælio-Cattleya Helena, Oncidium ornithorhynchum, &c.

R. I. MEASURES, Esq., Camberwell (gr. Mr. Smith), was awarded a Bronze Banksian Medal for a selection of hybrid Cypripediums and other Orchids, including one of the rare Miltonia Endresii, and some Restrepias, &c.

FRANCIS WELLESLEY, Esq., Westfield, Woking, again showed the beautiful Cypripedium Thalia Mrs. Francis Wellesley and C. T. giganteum (see Diploma Awards); C. Fred Hardy superbum, C. Curtiso-præstans, C. tonsum (Westfield variety), C. Charlesianum Rex, the pretty pale yellow Lælio-Cattleya Norba superba, and others.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. Alexander), showed some new hybrids, including the handsome Lælio-Cattleya rubens var. Pan (see Awards).

DREWETT O. DREWETT, Esq., Riding Mill-on-Tyne (gr. Mr. Renwick), staged a number of fine Cypripediums, principally varieties of insigne, nitens, and Actæus, most of them cut flowers.

S. BRIGGS-BURY, Esq., Bank House, Accrington (gr. Mr. Wilkinson), showed several rare Cypripediums.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford, showed Odontoglossum Wilckeanum, Fowler's variety, a very handsome form; a singular O. luteo-purpureum hybrid, and the fine O. amabile Glebelands variety (see Awards).

Mr. G. W. MILLER, Clarkson Nurseries, Wisbech, sent a very fine form of Odontoglossum Andersonianum.

R. G. THWAITES, Esq., Streatham (gr. Mr. Black), showed Sophro-Cattleya Doris, with a cinnabar-scarlet flower of good size.

The Earl of TANKERVILLE, Chillingham (gr.

Mr. Hunter), showed Cypripedium nitens, Chillingham variety.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, showed a bunch of cut sprays of the singular Lælia Briseis.

Messrs. HUGH LOW & Co., Enfield, staged a group, in which were Cypripedium insigne "E. J. Seymour," a large and effectively marked variety; Cattleya Clarkiæ; a selection of varieties of Cypripedium insigne, &c.

Messrs. EDGAR & Co., South Woodford, staged a selection of Cypripediums.

Messrs. LINDEN, Brussels, showed two magnificently blotched varieties of Odontoglossum crispum, raised by crossing fine spotted imported forms. The darkest was O. Madame Linden (O. crispum Queen Emma × O. c. Prince Albert), a grand form with the greater part of the broad segments of a rich claret colour, thin lines of white showing between the colour. The lighter and larger flower was O. crispum Jean Linden (O. c. Lindenii × O. c. primatus). The large flowers had broad, white-fringed segments, the sepals and petals of which were heavily blotched with reddish orange colour.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Dusseldorfei var. Undine (intermedia alba × Mossiæ Wageneri) from Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander). A very pretty and distinct snow-white variety, with but the slightest trace of primrose-yellow at the base of the broad front lobe of the lip.

Cypripedium Actæus Langleyense (insigne Sanderæ × Leeanum giganteum) from Major G. L. HOLFORD. The fine form for which Messrs. Veitch were given an Award of Merit, January 23, 1900, and in which the dorsal sepal is large and white, with but a small greenish base and a few purple markings.

Cypripedium choraicum, from J. H. CRAVEN, Esq., J.P., Keighley (gr. Mr. Corney). Said to be the result of crossing C. insigne Harefield Hall and C. nitens magnificum Ball's variety, and with very strong resemblance in some points to C. insigne Harefield Hall.

Calogyne Moorcana from Messrs. SANDER & SONS, St. Albans. A very handsome white variety, comparable with the rare C. Mossiæ illustrated in the *Gardeners' Chronicle*, March 31, 1894. Flowers seven or eight in arching spikes, each nearly as large as C. cristata, pure white, with a yellow disc to the lip, which has several rows of yellow papillæ.

AWARD OF MERIT.

Cypripedium Wiganianum Westonbirt variety (eburneum × Tracyanum) from Major G. L. HOLFORD. A very handsome variety with ivory-white flowers striped with dotted lines of light purple; lip white with red-brown blotches.

Brasso-Lælia Mrs. M. Gratrix, Westfield variety (B. Digbyana × L. cinnabarina) from FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins). The darkest in colour of any form of this pretty hybrid, and good in shape and substance. Colour an almost uniform reddish orange.

Dendrobium Phalænopsis, Gatton Park variety, from JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr. Mr. W. P. Bound). A novelty in colour, and a good flower in every respect. Flowers white with the faintest blue shade, the lip having a tinge and veining of that peculiar slate-blue seen in Lælia pumila, Gatton Park variety.

Odontoglossum amabile, Glebelands variety, from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). A very effective hybrid with large cream-white flowers spotted with purple, the colours being arranged as in some of the best O. Andersonianum.

Cypripedium Actæus, Bank House variety, from S. BRIGGS-BURY, Esq., Bank House, Accrington (gr. Mr. Wilkinson). A pretty variety, with greenish petals and lip, and fine white dorsal sepal, having slight purple-spotted lines.

Cypripedium Zeno, Craven's variety (nitens magnificum × insigne Harefield Hall), from J. H. CRAVEN, Esq., J.P., Beeches, Keighley, Yorks. (gr. Mr. F. Corney). A massive flower differing closely to C. nitens; in colour yellowish, the dorsal sepal finely blotched with purple-brown, the upper part being white.

Cypripedium Actæus superbum from DREWETT O. DREWETT, Esq. (gr. Mr. Renwick). A very fine light-greenish flower with large white dorsal sepal.

Odontioda Heatonense, St. Vincent, from Messrs. CHARLESWORTH & Co., Heaton, Bradford. A very pretty variety, with broader segments than the original, and finely spotted with carmine-rose colour.

DIPLOMA AWARDS.

CYPRIPEDIUM SPICERIANUM HYBRIDS.—*1st Diploma:* C. Niobe, Oakwood variety, from FRANCIS WELLESLEY, Esq. (gr. Mr. Hopkins). *2nd Diploma:* C. Memnon from S. BRIGGS-BURY, Esq. (gr Mr. Wilkinson).

CYPRIPEDIUM INSIGNE.—*1st Diploma:* C. insigne Harefield Hall. *2nd Diploma:* C. insigne Sanderæ, both from JEREMIAH COLMAN, Esq.

CYPRIPEDIUM INSIGNE HYBRIDS.—*1st Diploma:* C Thalia Mrs. Francis Wellesley. *2nd Diploma:* C. Thalia giganteum, both from FRANCIS WELLESLEY, Esq.

CALANTHE HYBRIDS.—*1st Diploma:* Calanthe alpha. *2nd Diploma:* Calanthe revertens, both from JEREMIAH COLMAN, Esq.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., chairman, and Messrs. S. Mortimer, Geo. Keif, A. Dean, E. Beckett, W. Pope, H. Parr, R. Lye, H. J. Wright, J. Vert, P. D. Tuckett, H. Somers Rivers, Jno. Lyne, Geo. Reynolds, J. Davis, J. Jaques, Chas. Foster, O. Thomas, W. Poupart, A. R. Allan, and A. H. Pearson.

Lord ALDENHAM, Aldenham House, Elstree (gr. Mr. E. Beckett), showed a collection of Apples of exceedingly good quality. They were arranged in large and small baskets, dishes, &c., there being about forty receptacles in all. Particularly good were the specimens of Gascoyne's Scarlet, Tower of Glamis, Hollandbury, Gloria Mundi, Golden Russet, Lane's Prince Albert, King of the Pippins, Ribston Pippin, Blenheim Pippin, Lady Henniker, Cox's Orange Pippin, and Golden Noble. (Hogg Medal.)

From the UNIVERSITY COLLEGE, Reading (gardening instructor, Mr. C. Foster), came excellent fruits of the following varieties of Tomato: Winter Beauty, Eclipse, Sutton's Sunbeam, Holmes' Supreme, Carter's Sunrise and Hillside Court. Sutton's Sunbeam, a yellow fruit, is described by Mr. Foster as a very desirable variety, possessing good flavour.

Excellent little Carrots were shown from seeds sown in the open garden in September. These varieties were Champion Horn, Parisian Forcing, Carter's Long Forcing, and Golden Ball. Some roots of Celeriac completed the exhibit. (Silver Knightian Medal.)

An extensive collection of Apples and Pears was shown by Sir LD. G. LODER, Leonardslee, Horsham (gr. Mr. W. A. Cook). Sixteen varieties of Pears were included, and the remainder were Apples. Among the Pears we remarked nice fruits of Marie Benoist, Le Lectier, Doyenné du Comice, Easter Beurré, and Glou Morceau. Some of the best Apples were Court Pendu Plat, Lord Derby, Blenheim Pippin, Golden Noble, Forge, Dumelow's Seedling, Mère de Ménage, &c. (Silver Banksian Medal.)

Nearly fifty dishes of Apples and Pears were shown by the Dowager Lady HILLINGDON, Wildernesse, Sevenoaks (gr. Mr. J. Shelton). The best Apples were Lord Derby, Blenheim Pippin, Beauty of Kent, Adams' Pearmain, Cox's Orange Pippin, Newton Wonder, Peasgood's Nonsuch. The six "dishes" of Pears were Winter Nelis, President Barabé, Olivier de Serres Madame Millet, Easter Beurré, and Marie Benoist. (Silver Knightian Medal.)

Messrs. GEO. MASSEY & SONS, 17, Market Place, Spalding, showed very good firm, moderate-sized bulbs of the following varieties of Onion: Bedfordshire Champion, Ailsa Craig, Giant Zittau, White Spanish, and Massey's Excelsior. (Bronze Banksian Medal.)

Several seedling varieties of Apples were shown for certificate, but none gained the approval of the committee except the one from Mr. Ross, Welford Park, mentioned under awards.

Messrs. W. CUTBUSH & SONS, Highgate, London, N., showed fruits of varieties of Tomatos named Muirtown Seedling and Lye's Early Gem. The latter variety received an Award of Merit in September last whilst growing in the R.H.S. Gardens at Wisley.

Several exhibits of Potatos were made, albeit the display of the National Potato Society was expected to be made in the same hall during the week. One of these exhibits was from Mr. R. W. GREEN, Wisbech (Silver Banksian Medal); another from Messrs. GEO. MASSEY & SONS (Bronze Banksian Medal); and a third from Mr. GEO. DEAL, Brooklands, Kelvedon, Essex. (Silver Banksian Medal.)

AWARDS OF MERIT.

Apple "Encore."—This culinary Apple is a seedling from a cross between Northern Greening and Warner's King. The fruits are of very large size, pale yellow, or greenish, with very little red colour on one side, particularly towards the base of the fruit. Eye, very large, open, with reflexed segments, set in a very deep irregularly-formed cavity. Stalk less than an inch long, inserted in a funnel-like cavity as deep as the stalk is long. The fruits appear as if they would keep in good condition until March. Shown by Mr. C. Ross (gr. to Colonel ARCHER HOUBLON, Welford Park, Newbury), who has already raised many good seedling Apples.

LECTURE ON THE WEST INDIAN LIME.

DECEMBER 4.—The paper on the "West Indian Lime," by Mr. Archibald Brooks, of Dominica, read at the recent show of Colonial Fruit, was well illustrated by photographs. Sir Albert Rollit, LL.D., member of the Council, presided, and there was a large attendance.

In the course of his paper Mr. Brooks, himself an old Chiswick student and now superintendent of the Agricultural School at Dominica, gave a short history of the industry in the West Indies, and then described the cultivation, which is principally from seed, but he pointed out how much yet remains to be done by selection, to get a thin-skinned fruit full of juice and containing an average of about two seeds. He mentioned the serious loss and damage caused by the Orange mussel scale (Mytilapsis citricola) and the Orange snow scale (Chionapsis citri), which together in 1902 seriously threatened the industry, many of the trees being killed outright, and left as if bleached with fire. The Imperial Department of Agriculture then recommended that the trees should be sprayed with rosin and whale oil soap compound, which proved very effective.

The fruit is collected after it has ripened and fallen to the ground, and the essential oil is then extracted, after which it is carted to the crushing mill. He showed how each product was extracted and dealt with, and pointed out that the exports of Lime products from Dominica had risen from £282 in 1848 to £45,370 in 1902, but the export in 1903 had, on account of the scale-insects referred to, fallen to £23,470, but in 1905 they had recovered to the value of £40,000, this sum including the amounts for Raw and Concentrated juice, Essential Oil, Green and Pickled Limes, and Preserved Peel.

At the close of the lecture Sir Albert Rollit said: The paper was an excellent illustration of the fruit show in the exhibit from the West Indies, and especially from Dominica. Both the paper and the show indicated the industrial regeneration of the West Indies, one of our very oldest colonial possessions. Formerly, the islands were practically dependent on the sugar crop, and a staple trade was always dangerous. There was safety in variety. Of this there could be no better illustration than the Portuguese island St. Michael's, which was once a great Orange-growing country, the trade of which decayed, though it is now reviving. Man could not live by Sugar-cane alone any more than by bread, or, for that matter, by Bananas. He should also add that the West Indian islands had not only staked everything upon one product, but they had not been quite up-to-date with their competitors with modern machinery and appliances. Still, this was now greatly improved, and nothing was more welcome than shipments from the West Indies, especially when they were so excellent as those in the show. He knew well one rival of the West Indies which was, indeed, quite close to them—Florida. Here the Oranges, as in the West Indies, and the Pineapples, grown under a wide open lattice and protected by wood fires which had only to be lighted three or four times in a normal season, were among the finest in the world. He had himself grown many of the Citron fruits in Yorkshire under glass, and Limes, Lemons, Tangierines, Grape fruit, &c., could be so grown in plenty and perfection, but edible Oranges were more difficult to fruit well, and the beauty of such products was difficult to excel in their florescence, in fragrance, a property which was now

too often sacrificed to other qualities, and in the appearance of the fruit, while the commercial importance of the fruit of the Lime could not be over-estimated, inasmuch as the supply of it to sailors as an anti-scorbutic, was a statutory obligation in the Mercantile marine. The paper contributed much most useful and interesting information, and he moved a vote of thanks to Mr. Brooks for the care he had bestowed upon it. This was carried by acclamation.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM.

NOVEMBER 29.—The annual dinner of the members and friends of this society took place on the above date at the Spread Eagle Hotel, Wandsworth. The chair was occupied by Geo. Britten, Esq., and there were nearly 90 persons present, including some ladies. This society has held annual exhibitions for 30 years past, and there appears the same enthusiasm for the cultivation of Chrysanthemums as formerly. Speeches were made by the chairman, and by Messrs. J. McKerchar (vice-chairman), Rawlings, McLeod, Reynolds, Dawkins (James Veitch & Sons), Smith, Bradford, Pearson, &c. The toasts were interspersed in a first-class programme of vocal music.

NATIONAL SWEET PEA.

DECEMBER 6.—The annual meeting of the members of this society took place at the Hotel Windsor, Westminster, on the above date. Mr. A. Watkins, president, presided over a moderate attendance.

EXTRACTS FROM THE REPORT OF THE EXECUTIVE COMMITTEE.

"The Royal Horticultural Hall, Westminster, was selected as the best place for the society's sixth exhibition. The date, July 5, was somewhat early for a season that was unusually backward and trying. The competition was very keen, but the general effect of the exhibition was slightly marred by some bare staging where members failed to fill their entries. Steps will be taken to prevent this waste of space in future. In the competitive classes 1,949 bunches of Sweet Peas, in 153 varieties, were staged.

The society's "annual" was an unqualified success, and the sales to non-members amounted to nearly double those of 1905.

The provincial show held at Ulverston, on July 20, in connection with the North Lonsdale Society's Rose Show, must be regarded as the success of the year. There was a record attendance for Ulverston, £142 being taken at the gate. There were no fewer than 1,081 bunches of Sweet Peas in competition.

The committee wishes to thankfully acknowledge its indebtedness to the authorities at the University College, Reading, for permission to hold its trials of new Sweet Peas in their gardens. To Mr. Chas. Foster, superintendent of the Horticultural Department, the committee also tenders its best thanks for his able conduct of these trials, and heartily congratulates him upon the splendid manner in which the Sweet Peas were cultivated. Further trials will be conducted at Reading in 1907, and an endeavour will also be made to determine which are the best varieties, new or old, for cultivation in clumps for garden decoration.

The retirement of Mr. Horace J. Wright from the post of hon. secretary was the only misfortune sustained by the committee during the year. The committee, as a small token of its appreciation, unanimously voted him a Gold Medal.

No fewer than 184 new members, drawn from England, Scotland, Ireland, Germany, France, Belgium, British Columbia, United States of America, Cape Colony, and far-off New Zealand [were admitted].

Ninety-five new, or presumably new, varieties of Sweet Peas were entered for the society's awards on July 5 at the London show, and 38 on July 20 at Ulverston. The following are the awards made:—First-Class Certificate and Silver Medal, as the best variety, to Audrey Crier, from Mr. C. W. Breadmore, Winchester. Awards of Merit were made in favour of the following:—Horace Wright, Maud Guest, and Princess Maud of Wales, from Mr. H. Eckford, Wem. Elsie Herbert, Etta Dyke, and Mrs. Collier, from Mr. C. W. Breadmore, Winchester (the latter variety was shown as Dora Cowper, but subsequently proved to be identical with a variety previously shown as Mrs. Collier; Mr. Breadmore has agreed to use the title Mrs. Collier to avoid confusion of names). Queen of Norway and Tom Bolton, from Mr. R. Bolton, Carnforth. Mrs. Rothera, from Messrs. T. Rothera & Co., Burton Joyce, Notts. The Marquis, from Messrs. Dobbie & Co., Rothesay. Queen of Spain (Hurst's), from Messrs. Hurst & Son, 152, Houndsditch, London, E.C.; the committee requested that this name be altered, as a variety bearing a similar name had already been before the public.

The committee has decided on the formation of a Floral Committee composed of 12 members, and consisting of seven amateur and five trade growers, the chairman to be an amateur. The Floral Committee will meet in a private room at 11 a.m. on the morning of the exhibition, and all varieties will be presented to them under number only. Every member must vote. A two-thirds majority of those present will be necessary to secure an Award of Merit, but a five-sixths vote passed on a variety that has been on trial at the society's trials at Reading University College will secure a First-Class Certificate. The society's Sweet Pea trials will be inspected by the Floral Committee before it sits in judgment upon new varieties.

The society's "annual" for 1907 promises to be as full of interest and information as previous issues.

To the Horticultural Societies at Dublin, Edinburgh, Cardiff, Southampton, Ulverston, and Wolverhampton the committee has offered one Gold and one Silver Medal each, to be competed for at their exhibitions, and the committee has suggested to these societies that the medals be offered as prizes in an "Audit class." Silver Medals have also been offered to several Colonial societies who make Sweet Peas a feature."

The report and balance-sheet were adopted unanimously. Votes of thanks were passed to retiring officers, and the following officers were elected or re-elected:—President, Sir George Cooper; chairman of committee, Mr. Leonard Sutton; treasurer, Mr. Edward Sherwood; hon. sec., Mr. C. H. Curtis.

Several new members were added to the General Committee.

DUBLIN SEED AND NURSERY EMPLOYEES ASSOCIATION.

DECEMBER 8.—The fourth annual dinner and social reunion of this association took place on the above date at the Gresham Hotel, Dublin. Mr A. J. Sinclair presided, and there were also present Prof. Jas Wilson, Mr. D. Houston, F.L.S., and Mr. F. W. Moore, Curator Royal Botanic Gardens, Glasnevin. Congratulatory messages were received from the kindred associations in Glasgow and Edinburgh, and 140 sat down to dinner, the table decorations being arranged and supplied by Messrs. Ramsay, Dickson and Watson respectively. The chairman distributed the prizes to those who had been successful in the various competitions.

Prof. Wilson, in proposing the toast of the "Dublin Seed and Nursery Employees Association," said the seed trade as they knew it at present was not known until about 100 years ago. Two crops which led to this were the Clover and Turnip. About the middle of the last century grass seeds were introduced, and the trade established first at Norwich, gradually spread, and prosperity had followed it ever since.

Mr. J. Rochford, in proposing "Our Employers," said if it were not for them the association would not be in its present position. With regard to their educational programme he thought managers and head-shopmen should see that every member of their staff belonged to that association, attended the lectures, and entered for the competitions held at the end of each season.

Mr. M. Ramsay, in reply, said they owed a deep debt of gratitude to Mr. Houston, and advised the young men to study, learn and cultivate themselves in every department.

"Our Guests" was suitably proposed by Mr F. G. Bell, and responded to by Mr. F. W. Moore, who expressed astonishment at the progress made by the society during its short career. Where there was not intellectual activity there could be no business progress. Competition was becoming keener every day, and they also had to face co-operation, which could be met by ability in business and conscientiousness in work. With this competition in front of them they had maintained their position, and there was no reason why they should not keep the whip hand. He thought perhaps Irishmen wanted more self-confidence, determination, and originality.

NATIONAL CHRYSANTHEMUM.

DECEMBER 10.—A meeting of the Executive Committee was held on this date at Carr's Restaurant, Strand, Mr. Thomas Bevan presiding. After the usual preliminaries, there was some discussion on a point of interpretation in the schedule of the Eastbourne Society, which was duly dealt with. An interim financial statement was then presented by the secretary, Mr. R. A. Witty, showing a balance in hand, which it was hoped would be materially augmented before long by the receipt of the money due from the Crystal Palace Co.

Some discussion next ensued upon the question of shows for 1907, some members advocating the abolition of the December show, others suggesting the removal of that and the October show to a more central place in the metropolis. It was finally resolved that three shows be held in 1907, and that they take place on October 2 and 3, November 6, 7, and 8, and December 4 and 5.

The dates of the Floral Committee meetings were then fixed. There will be one on the first day of each show, wherever held, and others at the Essex Hall on September 16, October 14 and 28, November 18, and December 2.

The Executive Committee will meet as under:—September 16, October 28, November 18, December 9, 1907, and January 13, 1908.

Members of the society desirous of contributing to the fund for the erection of a monument to the memory of the late Comte Oswald Kerchove de Denterghem, of Ghent, can do so through the society's foreign secretary, Mr. Harman Payne, who is authorised to receive donations as a member of the international committee appointed for the purpose.

DECEMBER 12.—The third exhibition of market varieties of Chrysanthemums held under the auspices of the above society took place on this date in the Foreign Flower Market, Covent Garden. The Chrysanthemum, as grown and displayed for market purposes, is probably seen at its best as a decorative flower, and the varieties are selected chiefly for their brilliancy of colouring and freedom of flowering. Thus many old varieties, such as W. H. Lincoln and Avalanche, are still grown, but the cultivator is not slow to seize upon the latest kinds if they show any advance for his purpose, thus Rivol, Mad. P. Radaelli, and Mdlle. Louise Charvet were noticed extensively among the exhibits. Messrs. PHILIP LAPPS were awarded the Silver Bowl offered to the winner of the greatest number of prizes in the exhibition.

MARKET GROWERS AND NURSERYMEN'S CLASSES.

Cut blooms.—Three exhibits were staged in a class for a collection of market Chrysanthemums in bunches, 12 blooms in a vase, the whole occupying a table space measuring 15 feet by 3 feet, and of these the best was shown by Messrs. PHILIP LAPPS & SON, Swanley, Kent. This exhibit was remarkable for the freshness, brilliancy, and general high quality of the blooms. Some of the more notable examples were Mrs. Judson, Snowdrift, both white Incurveds; Buttercup, a yellow Incurved; Lady Violet Beaumont, a splendid red flower; Framfield Pink, Golden Age, a Japanese variety of the rose-yellow colour; Mad. P. Radaelli, &c. (Small Gold Medal); 2nd, Messrs. CRAGG, HARRISON & CRAGG, Merrivale Nurseries, Heston, Hounslow, who also had first-class material, but it was less effectively staged. This firm showed Mrs. F. Judson, Mad. T. Panckoucke, White Cheer, Frank Hammond, F. J. Brooks, &c. (Silver-Gilt Medal); 3rd, Mr. F. S. GOUNDRY, Heathside Nursery, Dartford Heath.

A similar but smaller class was also provided for a collection of market Chrysanthemums in vases, the space occupied measuring 10 feet by 5 feet. Mr. J. TULLEY, Rose Nursery, Enfield Highway, was the only exhibitor, and he was awarded a Silver-Gilt Medal. Only one exhibit was also staged in a class for a collection of single Chrysanthemums in bunches, a variety

only in a vase, and not more than three vases of one variety. It was put up by Messrs. CRAGG, HARRISON & CRAGG. A pleasing variety is Lady Windsor, the white florets of which are tipped with vinous red. (Small Gold Medal.)

The best 12 vases of market Chrysanthemums (disbudded), 12 blooms in a vase, were displayed by Messrs. LADDS, who had a highly meritorious exhibit, of such varieties as Messrs. J. Thompson, Mad. P. Radaelli, Lady Violet Beaumont, Framfield Pink, &c., and for which they were awarded a Gold Medal. Messrs. CRAGG, HARRISON & CRAGG, who followed, had a good vase of Mrs. Geo. Beech (yellow), and some magnificent examples of Mrs. Swinburne. (Silver-Gilt Medal.)

Mr. G. ERICKETT, St. Ann's Road, South Tottenham, had the best exhibit among two of sprays of market Chrysanthemums in bunches, not disbudded, with popular kinds of border, single, decorative, thread-petalled, and other types. (Gold Medal.) Messrs. LADDS, who were placed 2nd, had larger flowers, but the assortment was not so good. They showed the beautiful Allman's Yellow very finely.

Groups of Plants.—Two exhibits were staged in a class for six plants of decorative Chrysanthemums in 5-inch or 6-inch pots, as grown for market. The winning group contained charming little specimens freely flowered, some of the smaller being scarcely more than 1 foot in height. They were of popular kinds, and were staged by Messrs. BUTLER BROS., Burr Farm Nurseries, Bexley Heath (Large Silver Medal); 2nd, Mr. F. S. GOUNDSIE, with taller specimens.

In the open classes provision was made for a group of pot-grown market Chrysanthemums arranged in a half-circle measuring 9 feet by 6 feet. Two groups were staged, and Messrs. BUTLER BROS. were again to the fore with excellently-flowered dwarf specimens. (Silver-Gilt Medal.)

In the "colour" classes the best three vases of a yellow variety were shown by Mr. R. WEIR, 3, Forest View Villas, Enfield Highway, in the variety Nagoya, which was a feature throughout the exhibition among the yellow blooms. The best three vases of a bronze variety were shown by Mr. NORMAN DAVIS, Framfield Nurseries, Uckfield, the variety being Mdlle. G. Rivol. Lady Violet Beaumont was shown well in this class. Exmouth Crimson was the best crimson. It was shown by Messrs. CRAGG, HARRISON & CRAGG. Guy Hamilton, splendidly shown by Mr. R. WEIR, won in the class for a white variety. Mrs. J. Thompson was also well shown in this class. The Incurved Mdlle. Laurence Zede, shown by Messrs. J. & S. CHATFIELD, was adjudged the best pink variety.

The boxes of flowers as packed for market formed an interesting feature, and the exhibits must have required much care in judging, for they were all excellent. Mr. D. INGAMELLS showed the winning boxes.

The best novelty in market Chrysanthemums not in commerce was adjudged the variety Snowflake shown by Messrs. W. WELLS & CO., Merstham, Surrey. It is a white sport of Mad. H. Domillet.

THE NATIONAL HORTICULTURAL SOCIETY OF FRANCE.

This important society occupies in France the same position as the R.H.S. does here in England.

The following details are chiefly extracted from a short account given by the secretary, M. Abel Chatenay. The National Horticultural Society of France was founded by decree dated August 11, 1856, with the object of encouraging every branch of scientific and practical horticulture. It holds every year, in May and November, two great shows. The annual subscription is 20 francs (16s.) Minor exhibitions of Dahlias, Roses, Gladiolus, early Chrysanthemums, &c., are also held at different periods of the year in the society's hall in the Rue de Grenelle. Every member receives gratuitously a copy of the society's journal, which appears once a month. At the society's headquarters there is a fine hall, which has been decorated with many hand-some paintings of fruit and flowers by eminent French artists. The library consists of 15,000 volumes arranged in perfect order. The catalogue, edited by M. Geo. Gibault, the librarian, is divided not only into subject headings, but also has a division of authors' names, by which it is easy to find any work that may be required. A supplement to the catalogue has recently been issued. Fortnightly meetings are held, at which all kinds of subjects on horticulture are dealt with. Committees are appointed for special work, and of these there are 12, which possibly accounts for the paucity of special societies in France.

The society awards medals and prizes to exhibitors; it makes awards to authors of new books, and to gardeners for long and faithful service, &c.; £1,200 per annum are given by the society in this way. At the present moment there are 3,870 members, of which 299 are corresponding or [belong to] affiliated societies. *C. Harman Payne.*

ENQUIRIES AND REPLIES.

COCKROACHES.—Can any of your readers tell me the best means to rid an old house of black-beetles? Keating's powder, borax, also various traps, &c., have been tried with very little result. *D. W. H.*

ANSWERS TO CORRESPONDENTS.

ACETYLENE GAS REFUSE: *A. C. W.* We believe that for horticultural purposes the refuse may be used as lime, as was stated by Mr. Andrew in *Gardeners' Chronicle*, February 13, 1904, p. 108.

ARAUCARIA TIMBER: *H. B.* In his recently published *Trees of Great Britain and Ireland* Mr. Elwes says the wood does not show any especially attractive quality. The Earl of Ducie, in our columns, 1900, ii., p. 633, speaks of it as not unlike good deal, but smoother to the touch. On testing a thin batten by breakage, it proved to be tough and strong for its size, but the fracture was abrupt, and showed little longitudinal fibre. The wood is somewhat heavier than ordinary deal.

BOOKS: *F. J. L.* 1, We do not know of a book which treats of these questions. 2, *Greenhouse Construction and Heating*, by B. C. Ravenscroft, price 3s. 10d., post free, from our publishing department.

FUNGUS: *C. B. G.* The fungus found among dead leaves is Tricholoma leucocephala.

GRAPE GROS COLMAR: *Lady D.* The fruit lacks colour because it is unripe. This late Grape requires an extra long season to grow and ripen perfectly and as hot an atmosphere as is generally afforded Muscats. We suspect the vines were not started into growth sufficiently early, or, if they were, the house has not been heated properly. The large size of the berries seems to indicate that the borders are in good condition, and that the roots have been very active, but it should be remembered that where there is unusual vigour there is less certainty of obtaining perfect finish. Start the vine early next season, afford plenty of fire heat, and make the best use possible of the sun heat by closing the vinery early in the afternoon, even if a little ventilation is afforded again late in the evening. We suspect you wrote the words Lady Downes in error. The variety is Gros Colmar.

HEATING A HOUSE 15 FEET LONG AND 16 FEET WIDE: *A. R. G.* You will require six rows of 4-inch hot-water piping to heat your house of the above dimensions in order to ensure a minimum atmospheric temperature of 45° during severe weather in winter. A convenient and efficient way to distribute the six pipes would be to have two flows (one above the other) fixed parallel with, and close up to, the side wall on either side of the house, fixing the return pipes on each side of the central pathway (assuming the house to be a span-roofed structure). If the boiler is set close up to the house, about 300 feet run of 4-inch hot-water piping will be required, including the lengths necessary for connecting the flow-pipes with returns at both ends of the house. If there is no other house to heat besides the one indicated a No. 1 Chatsworth boiler, 21 inches long, 14 inches wide, and 11 inches deep (inside arch) would be required. The actual heating power of this apparatus is 375 feet of 4-inch piping.

KOHL RABI: *Inquirer.* We do not know of anyone in the Stratford Market who would purchase some tons of these roots. Advertise the fact that they are for sale.

LEGAL ARTICLES: *Eucharis.* The articles to which you refer were contributed by a well-known solicitor who, though having the same name, is in no wise connected with the firm of James Veitch & Sons, so that your comments are wide of the mark.

LILY OF THE VALLEY: *W. B.* A new bed may be planted any time before growth is likely to commence in spring, but you should carry out the work when the soil is not soddened by rain or hardened by frost.

MUSHROOM MYCELIUM: *Inquisitive.* We know nothing of the advertisement to which you allude. It may, however, be said, that if the mycelium is that of Agaricus campestris, and the mycelium is alive and in good condition, it would be better for use than ordinary spawn, which is mixed with manure. There would be less likelihood of having trouble from the presence of other species of fungus in the bed, although it should be remembered that the manure and soil forming the bed itself may not be free from fungus pests.

NAMES OF FLOWERS AND FRUITS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *Arthur Price.* Apple Northern Greening; Tyler's Kernel—yes.—*Brocklehurst.* 1, Margil; 2, Pile Russet.—*J. E. Thorn.* We cannot name such undeveloped fruits with accuracy.—*H. W.* 1, Franklin Golden Pippin; 2, Court Pendu Plat; 3, Lady Leunox.—*W. S.* 1, Frogmore Prolific; 2, Deux Ans; 3, Minchull Crab; 4, Hormead's Pearmain; 5, Flemish Bon Chretien; 6, Easter Beurré.—*Daniels Bros.* 1, Norfolk Beefin; 2, Pile Russet; 3 and 4, Frogmore Golden Pippin; 5, Reinette du Canada.—*A. C.* Nouveau Poiteau.

NAMES OF PLANTS: *L. G. T., Kenley.* One of the many forms of Cupressus Lawsoniana.—*P. I.* The white form of Ionopsis paniculata.—*A. R.* 1, Catasetum barbatum; 2, Stelis ophioglossoides; 3, Masdevallia muscosa; 4, M. simula; 5, Pleurothallis rubens; 6, Oncidium pubes.—*H. H.* Vriesia brachystachys, *Bot. Mag.*, t. 6014, and Adiantum Capillus veneris.—*Salop.* Arbutus Unedo, commonly known as the Strawberry Tree.—*O. B.* Heterocentrum mexicanum; Apple (next week).—*C. E. A.* Iris fœtidissima.—*Pomona.*—Alocasia Lowii.

TOMATOS: *A. N.* The swellings on the roots are caused by eelworms. Plants so infested cannot be cured, and should be burned. Mix some gas lime with the soil and let it be placed out-of-doors for three months before making use of it again.

TULIPA GREIGI: *Clansman.* This species was first introduced by Dr. Regel, St. Petersburg, by whom it was named in compliment to General Greig, who was then President of the Imperial Russian Horticultural Union. It has been said that the species was discovered almost simultaneously in Turkestan by two collectors, Sewerzow and Fedschenko. The species appears to have been introduced in 1872 or 1873, and was figured in the *Botanical Magazine*, tab. 6177. The bulbs were selling at 5s. each in 1876, so that it was by no means plentiful at that time. Subsequently Max Leichtlin obtained stock of it, and in all probability did more for its general distribution than the original introducer.

VIOLETS DISEASED: *J. P. R.* The plants are badly affected with the disease described on p. 400 last week in answer to *L. W.*

COVENT GARDEN MARKET.

(SEE SUPPLEMENTARY ILLUSTRATION.)

THE new buildings which are shown in our supplementary illustration form an extension of the Flower Market, and have been carried out for His Grace the Duke of Bedford, K.G., and his trustees.

The work was commenced in 1905, when a large area was cleared at the corner of Russell Street and Wellington Street, and in the spring of 1906 the ground floor portion of the building was incorporated with the Flower Market.

About 92 stands have been added to the Flower Market accommodation, and the gangways have been greatly improved, the extension having permitted of direct communication being made north and south through the market between Tavistock Street and Russell Street, and east and west between Wellington Street and the Market Square.

The height of the new portion from floor to ceiling is nearly 30 feet, and the addition is light and spacious.

The basement, including a considerable area below the public footpaths, is approached from Wellington and Russell Streets by means of the usual market step ladders, shoots being provided to facilitate the handling of consignments of Apples, Oranges, &c., awaiting sale. Glass pent roofs are provided on both frontages to afford protection from the weather.

At the angle of the building, and separate from the above-mentioned basements, are coal cellars, &c., for the use of the offices above.

These offices are on the first, second, and third floors, and it is anticipated they will be largely occupied by firms engaged in business either directly or indirectly connected with the market. They are exceptionally well lighted and spacious, and are approached from the corner entrance by means of a handsome staircase, with an electric passenger lift.

In addition to the main staircase, an iron escape staircase is provided at the back, available for use by the housekeeper and the occupants of each office floor in case of emergency.

The system of lighting adopted in the market is an extension of the high-pressure gas system recently installed in the older portion of the Flower Market: the basements and office staircase and corridors are provided with electric light, which is also available for the offices.

Externally the building is carried out in red brick and Portland stone, similar to other and recent buildings at Covent Garden, and which is similar in general appearance to the red brick and terra cotta, of which the previous addition to the Flower Market was built 20 years ago.

An attempt has been made to express externally the various uses to which the building is being put, namely, the market on the ground floor, with its large semi-headed windows, similar in idea to the large arched windows on the ground floor of the older portion of the market; the existence of the angle staircase leading to the offices above is also emphasised in the elevation, the angle being carried up, as shown in our illustration, in the form of a tower containing the electric light machinery, easily accessible from the top floor.

As part of the scheme, the footpaths in Tavistock Street and Russell Street have been widened by throwing into the public way a considerable extent of space formerly occupied by private paving, railed area, etc.

The architects were Messrs. Lander, Bedells, and Crompton, of No. 6, John Street, Bedford Row, W.C., who recently erected the New Foreign Flower Market, and the builders were Messrs. Langdale, Hallett, and Co., of No. 70, Keppel Street, Chelsea, S.W.

COVENT GARDEN AT CHRISTMASTIDE.

In the early hours of the morning, when most people are asleep, Covent Garden Market is most active. And before most City men arrive at their offices the large hall, or "New Flower Market," is closed, immense quantities of plants and cut flowers having been disposed of during the early morning hours. The Grand Row, as it is called, is open during all the day, but the chief wholesale Flower Market closes at 9 a.m.

In almost all businesses there is an increased trade just before Christmas, but in none is there a more decided increase than in that of Covent Garden Market. Holly, Mistletoe, and evergreens of various sorts arrive in immense quantities. Many of these who send large wagon-loads by road sell the whole consignment to one buyer, who re-sells the same in smaller quantities. The consignments which arrive by rail are sold by commission agents. Christmas Trees in all sizes, from those about 18 inches high to large trees 12 to 15 feet high, are sold in very large quantities. It is hardly pleasant for the casual visitor to be about when the trade is in full swing, for he is quite likely to get his hat knocked off or his face brushed in an unpleasant manner by people carrying armfuls of evergreens. It is not only for the London trade that there is such a large increase, but vans from all the railway depôts collect for the provinces. In some instances produce is actually carried back close to where it was grown. All the commission men have a very busy time. Last week, on a cold, frosty morning, we noticed plants being packed for rail; in most instances they were protected, but some were observed on Charing Cross Station with scarcely any covering, and one could only wonder in what state they would reach their destination.

This, of course, is but one part of the business connected with the market. From all the suburbs vans arrive early, and many are loaded up, and start away again quite early. On an ordinary market morning the busiest time is from 6 to 7 a.m. At this time of year the market opens at five o'clock, and those who would like to see what Covent Garden Flower Market is like should get there at that time. During May and June it opens at 4 a.m., and from March until the end of July it is open for the sale of plants every morning, but not at such an early hour on bye-mornings. Tuesdays, Thursdays, and Saturdays are ordinary market days, and the others are termed bye-days. During the winter cut flowers only are sold on bye-days, and a portion of the market only is opened, so that those who have stands in the closed part have to occupy other stands. Since the newest addition has been made there are altogether 404 stands, and these are let at an annual rental of from £10 to £13 each, but extra tolls are charged for bye-days, porterage, &c. Although let at an annual rental, the authorities have the privilege of sub-letting any stands that are not actually occupied after a certain hour. There are many growers who have no regular stands. Some may come in at one time, and others at another season of the year. It is in the spring that there is the largest influx of what are termed "casuals." Since the last addition to the Flower Market several of these, though they only occupy the stands for a few weeks, have taken them permanently. It is just now that the additional accommodation is most appreciated, for many who had to stand in the open, exposed to all weathers, are now able to get under cover. Many who come in now occupy the stands which in spring are filled with bedding plants. In autumn there are many to bring cut flowers from the open ground, and at the present time there are those who grow hardy shrubs, climbers, &c. A good many stands are also filled with imported Palms, Draccenas, Aspidistras, &c. It may be difficult to procure just what is wanted sometimes, yet Covent Garden is the centre, where everyone looks for the best of everything that can be had in cut flowers, or plants for decoration, and for many choice plants it is the best mart. Though they are not always on sale, they can be procured through the grower's salesman, or the commission men, who have a wonderful knowledge of where to get almost everything known in horticulture.

Most plant growers have their own salesmen, while large quantities of cut blooms are sent to be sold on commission. Then there are the men who buy plants, &c., for sending away; this is an important branch of the trade. Almost anything grown can be procured through this agency, and often at lower prices than by buying direct from the growers.

History of the Market.

It appears that this important market originally started, like many large businesses, on very humble lines. The ground which is now covered with large buildings was originally the garden of a convent, hence the name "Covent Garden," and the produce was sold in the streets adjoining. After the disestablishment of the convent, huts were built where garden produce was sold, and gradually growing in importance, in 1835 some definite improvements were made, but it was not until 1872 that the first portion of the "New Flower Market" (as it is still called) was opened. Until that time flowers and plants were sold under considerable difficulties; yet the salesmen had advantages even then, for supplies were short, and instead of having to wait, they were often met on the road, and most of their produce bought before reaching the market.

Since the opening of the new market hall it has been found necessary to further increase the accommodation. The Jubilee Market, which was opened on a space west of the new market, was one step; this necessitated the removal of the house property in Tavistock Street, which provided a large open space. A portion of this was afterwards covered in by building the foreign flower market. This large hall stands above the ordinary market space, being built on pillars, on what is still known as the "Jubilee Market," and although a useful adjunct, it was found insufficient for the increasing trade, and the addition, shown in our illustration, opened early in the spring, which takes the corner of Wellington Street and Russell Street, is the last, and a most useful addition.

Seeing that Covent Garden Market first originated from a few women selling the produce of the garden in the streets, it is wonderful to see how it has developed. It is now the largest market in the world for flowers, fruit and vegetables, and, taking the management, it is surprising how well all the details are looked after. Mr. Asbee, the superintendent, is about early in the mornings, and, though he has an efficient staff, he has much to attend to himself, and has carried out these duties for over 25 years. He is respected by buyers, sellers, and all who come under his immediate control. It may be interesting to note that the market originated by the nuns selling the produce of their garden, and women have ever since been connected with the market. Women porteresses do nearly all the carrying out, and they are registered and wear a numbered badge. Their legal charge is 2d. for every parcel carried out to the vans, which stand in the adjacent streets. It would surprise many to see how easily many of these women take boxes of plants weighing upwards of a hundred weight on their heads and carry them long distances. There are many male porters employed, but their duties are to help unload all produce as it arrives, and to assist in keeping the gangways clear, &c. Altogether, quite a large staff of men and women get their living in one way or another. All are under supervision, and if there are any complaints they are suspended. The other morning Mr. Asbee asked one of the women to show her badge, and she apologised for not having the regulation apron on on account of it being a wet, dirty morning, but was able to show her badge, and allowed to pass on.

Outside Business.

Since the market has grown to such large proportions, several of the commission salesmen have large stores which are open pretty well all through the day, and some growers also have depôts which are open until after mid-day. It is generally considered to be rather trying work to attend the market, and there are some who do not last long, yet we meet others who have been regular attendants for over thirty years. Mr. Wermig, whose chief feature is hardy foliage and flowers grown in the open, states that he has not missed being at his stands any morning that the market has been open for over thirty years. Mr. T. W. Childs is another who has been attending for over thirty years. And Mr. S. Hills, who is considerably over seventy years of age, still sells his own produce. There are not many who attend the market who do not know Mrs. North. Her "stand" is outside the maket hall, and she supplies hardy foliage, moss, &c.

One of the most interesting personages amongst buyers is Mr. P. Garcia, who has a retail flower store in the grand row. He has been connected with the market for about fifty-four years, and his father and grandfather before him were also in the business, dating back for over a century. Mr. Garcia has a knowledge of the time when most of the business was done in small wooden huts, and much other valuable information concerning the progress of the largest fruit, vegetable and flower market in the world can be obtained from this gentleman.

Although, strictly speaking, it is a wholesale market, all sorts and conditions of people may be met there, especially at Christmas time and other festive seasons. On Saturday morning, December 22, the market will be invaded by nurses, ladies connected with churches of all denominations, clergymen, and many housewives and others anxious to get as many flowers as possible for a small outlay. At one time salesmen would not sell to any except to members of the trade unless high prices were paid, but since the supplies have been so plentiful there are but few who are not willing to take money from anyone who comes along.

CLEMATIS MONTANA RUBENS.—*Le Jardin*, December 5.

CRINUM LAURENTII, Durand and De Wildeman.—*Tribune Horticole*, December 1. A new species from the Congo. Flowers pure white.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUMS FROM BRUSSELS.

AT figs. 155 and 156 are illustrated two richly-spotted varieties of Odontoglossum crispum shown at the R.H.S. meeting on December 11 by Messrs. Linden, Brussels. O. "Jean Linden" is said to be from a cross between O. crispum Lindeni and O. c. primatus, whilst O. "Madame Linden" was obtained from a cross between O. crispum "Queen Emma" and O. c. Prince Albert. The larger flower is "Jean Linden," and it has more white in it. The illustrations are from photographs supplied by Messrs. Linden, and they represent the flowers at about their natural size.

CYMBIDIUMS FROM GLASNEVIN.

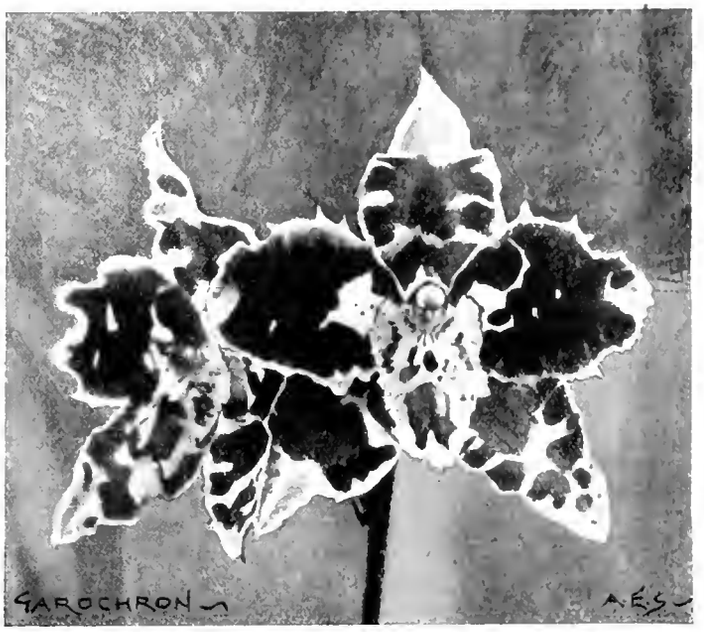
FROM the Royal Botanic Gardens, Glasnevin, Dublin, the Curator sends spikes of several handsome Cymbidiums, calling attention to the great variation in C. giganteum, three varieties of which are sent. The No. 2 is a remarkably beautiful variety, the marking on the sepals and petals being bright purplish-red, and the blotching on the lip of a similar colour, the upper side of the column being of dark claret colour. A fine form of C. Tracyanum has delightfully fragrant flowers; and an inflorescence of C. elegans has a dense head of primrose-coloured flowers with an orange-coloured blotch on the lip, and is much larger than the ordinary form. This species, although originally named Cymbidium elegans by Lindley, was the subject of the new generic title Cyperorchis, Blume, the narrower connivent segments and some other minor characters being considered distinguishing features. To Cyperorchis elegans were added C. Mastersii and C. cochleare. The hybridist, however, crossed the two sections, and in Cymbidium Lowio-Mastersii and C. Ballianum (eburneum × Mastersii) they merge. The Orchid Committee of the Royal Horticultural Society therefore include all the Cyperorchis and their hybrids under Cymbidium.

MORMODES BADIUM.

THIS fine species, which was originally described from the Hon. Walter Rothschild's specimen, is again in flower at Tring Park, Tring (gr. Mr A. Dye), where its clear yellow-coloured variety has also recently bloomed. The plant has a stout ascending inflorescence bearing eleven showy flowers with powerful aromatic odour. The sepals and petals are of a glowing red and the broadly-expanded labellum bright claret purple. The plant has the same singular provision for ejecting the pollinia as the Catasetums, and on the cirrhus being touched they invariably spring out in the same direction. It seems near to Mormodes igneum, which is very variable in colour.

DOUBLE FLOWER OF ODONTOGLOSSUM CRISPUM.

MESSRS. J. & A. McBEAN, of Cooksbridge, send us a spike in which all the flowers are more or less double. The three sepals and the three petals are normal or nearly so, but the column is broken up into its constituent parts, some generally retaining their usual conformation whilst the others are petaloid. We published an illustration of a similar deviation in our volume for 1872, p. 538.



(From a photograph.)

FIG. 156.—ODONTOGLOSSUM CRISPUM "MADAME LINDEN": FLOWERS WHITE, WITH CLARET-COLOURED BLOTCHES.

CYPRIPEDIUM INSIGNE TWO-FLOWERED STATE.

MR. W. C. UPHILL sends us a flower stalk of C. insigne with two flowers. This condition is not very unusual, but is always interesting, especially when the flowers are, as in this case, of good form and size.

BANANAS *v.* ORANGES.

THE frequent recurrence of exhibitions of Colonial fruits at the Royal Horticultural Society is no doubt one of the causes of the diffusion of a more general knowledge of these fruits amongst English consumers, and a consequent increase in their consumption. This is markedly the case with the ever favourite Orange and the now popular Banana, the consumption of which has for the last two or three years been increasing by leaps and bounds, so much so that with the extension of cultivation there is every prospect of its overtaking the Orange; and this for several reasons, notably that the Banana is obtainable for a great part of the whole year, and even in its dearest season is a cheap fruit, and further that its nutritive value seems to have become already appreciated by all classes.

That the juicy, refreshing Orange will ever be supplanted by the Banana is not to be expected or even hoped for, but that the two will run side by side is very clearly evidenced by a careful watching of the fruit trade and a comparison of imports. The omission of the golden-skinned Orange from the Christmas dessert fruits would be the removal of one of the traditional symbols which makes Christmas what it is to so many old-fashioned people, and a joy to the younger ones. Besides, the fruit supply, whether British, Colonial, or foreign, is one that we cannot afford to diminish. It is now fully acknowledged that the general consumption of fruit is a thing to be encouraged, and one that has much increased of late years, a fact which is confirmed by a note in the *Agricultural News* of Barbados, which the West Indian mail brings us at the moment of writing. Referring there to the annual report of the Collector-General in Jamaica, for the year ending March 31 last, on the Banana industry, the writer says: "The consumption of fruit throughout the world at the present time has enormously increased. This, no doubt, is due to the teaching of the advanced schools of dietetics, and in the list of fruits most in demand it is safe to say that the Banana takes the most prominent place." It is further stated that during the last fiscal year the outturn of the United Fruit Company of Jamaica amounted to 30,000,000 bunches, against 21,000,000 in the previous year. The principal markets to which Bananas were sent were the United States of America, 8,192,970 bunches in 1904-5, which had increased in 1905-6 to 13,763,363 bunches; and to the United Kingdom in 1904-5, 694,952 bunches, and in 1905-6, 1,217,901 bunches. With smaller quantities to Canada and other countries not enumerated, the totals were made up to 8,903,739 bunches in 1904-5, and 14,981,135 bunches in 1905-6. In the same journal the following notes occur on the Jamaica Orange industry: "It has often been said that the Jamaica Orange is the finest in the world. This may or may not be true, but the fact remains that Jamaica is capable of supplying Oranges that need fear no competition. There is, however, a 'but' that bars the entrance into the privilege that should belong to the island, and this barrier can only be removed by the people interested in the industry." Attention is then drawn to the practice of immature picking and bad packing, and the writer concludes with the following remarks: "There is a great possibility in the industry; it is an asset of great value to the people, but is subject to keen competition, and can only come to a full development by being most jealously safeguarded, and by the adoption of the most intelligent methods of marketing.' It is interesting to note in connection with the competition between Bananas and Oranges that the exportation of Jamaica Oranges during the same period as that already referred to in the case of Bananas showed a considerable increase in the quantities sent to the United Kingdom and a decrease in the amount sent to the United States of America; thus the number of Oranges exported to the mother country amounted in 1904-5 to 18,683,600, and in 1905-6 to 21,040,730; while the number to the United States shows a falling off from 47,441,518 in 1904-5 to 44,801,671 in 1905-6, the total number of Oranges exported to all countries in 1905-6 being 74,503,351, against 73,053,108 in the previous year.

Adverting more particularly to the present condition and future prospects of the Banana supply to this country, the time seems to have arrived when the public verdict has decided that the Banana has "come to stay," and that in future its attention will be given to the selection of the best varieties, namely, those possessing the finest and most delicate flavour. In this the Canary Islands fruit has hitherto had the foremost position, the Costa Rica and Jamaica fruit being less mellow and without the distinct flavour of the former. The individual fruits of the Canary Islands variety

are also smaller and have much thinner skins. It is this variety, namely, the produce of Musa Cavendishii, that has been cultivated so successfully during the last two or three years in Barbados, and to which especial attention has been drawn by the Imperial Department of Agriculture.

The manner of shipping this fruit is different from that adopted in the case of that from Jamaica, which arrives in "naked" or unpacked bunches, while that from Barbados is always packed in open hexagonal crates, that are now beginning to be so familiar at the principal centres of the fruit trade. In these crates the fruit bunch is first wrapped in soft paper and cotton wool, and the crate fitted up with Banana "trash," namely, the dried leaves, which prevents the bunch from shifting, but at the same time affords a springy bed for it to lie in. An interesting fact worth recording, as it now no longer exists, is that at the commencement of this trade all the Barbados Bananas brought to this country were brought by the Royal Mail Steam Packet Company's boats, and were landed at Plymouth, being lifted from the hold of the vessel, which anchored at the breakwater, in large waterproof sheets by cranes and lowered into lighters sent out to meet the mail boat. In this way a cargo, often of some 2,000 crates, would be discharged in the course of an hour, and it was a busy scene that ceased about a year ago, when the steamers ceased calling at Plymouth, and now discharge their cargo on the quay in a more matter-of-fact way at Southampton. The extension of the cultivation of this form of Banana in Barbados is a thing hoped for and anticipated, and there seems to be a prospect of its cultivation also in some of the smaller islands of the British West Indies, which, if successful, will bring one of the products of our own colonies into competition with that of the Canary Islands, the returns of which, according to the official "Statement of the Trade and Navigation of the United Kingdom" for 1905, showed that from those islands alone as many as 2,451,966 bunches of the value of £1,022,259 were landed on our shores. *John R. Jackson, Claremont, Lympstone, Devon. Dec.* 12, 1906.

NOTICES OF BOOKS.

PICTORIAL PRACTICAL POTATO-GROWING. By W. P. Wright & E. J. Castle (Messrs. Cassell & Co.)

The authors start with a brief historical account of the Potato. Oddly enough they make no mention of the exceeding importance to European Potatos of the introduction during the seventies of many new, remarkably productive, and sturdy varieties from the United States. Not only were these in time found in every garden in the kingdom—some such as Early Rose, Beauty of Hebron, Early Puritan and White Elephant being still in wide cultivation—but these Americans were afterwards intercrossed with British varieties, and the fine ones of to-day are primarily the result of the Anglo-American breeding, a fact some have forgotten and others never learned. Evidently the real history of the Potato in Europe has yet to be written. The question of "Potato Deterioration" forms the subject of a chapter, whilst the authors seek to show that deterioration is with the Potato an inevitable product of the tuber method of propagation. Not enough stress is laid on the fact that in myriads of cases stock of seed, cuttings, or other raised plants die out not because they deteriorate but solely because they are elbowed out by new and better varieties. The fact that the Ashleaf Kidney remains as good as ever is due to the fact that nothing in the entry of early Potatos has yet displaced it in gardeners' esteem. When dealing with the very important question of "Change of Seed" we are on common ground. A change, especially from strong land to light land, was a part of a grower's practice 50 years ago. Now that we have had wider experience of the actual and results following from the planting of Scotch raised tubers in the better soils of the north, the subject has been doubly emphasised, and even Ireland too is showing us that in more humid climates Potatos obtain a remarkable reproductive power such as cannot be found in the over-ripening soils of the south of England.

It is still amusing to read that expert opinion is, however, in favour of acclimatising Scotch "seed" somewhat by giving it one year's growth in Lincolnshire, especially when intended for the southern counties, as the change from north to extreme south is too drastic, whilst the expert opinion referred to may be that of the Lincolnshire growers. Southern growers, who have been importing seed tubers direct from Scotland to the south, will indeed smile. The suggestion is as amusing as it is inexact.

The particulars given under the heading of "Cross Fertilisation" are very detailed, and many raisers will doubtless read and marvel. We are told that seed Apples (berries) must be put away to decay, then have the seeds washed out from the pulp through a sieve to separate them from the pulp. If seed Apples (berries) be put away for the winter in a small box and in a dry place they will dry and shrivel up, leaving nothing but the seeds and skin to rub up and sow. Over myriads of breadths of Potatos in bloom at one time, scarcely a single berry is, a few weeks later, to be found. The inference is obvious, either that the pollen is not carried by the wind or insects, or that very little is formed to carry.

Propagation by means of cuttings, and cut and whole sets, with numerous illustrations, furnish some of the most interesting reading in the book, although these methods have been placed in detail before the public for many years. Then follow instructions with many, and some rather odd, illustrations as to the preparation of the soil, by means of the plough, spade, and fork. Much of the instruction seems very elementary in light of the fact that thousands of growers, large and small, have been doing all that is advised for many years. Sprouting sets, planting, earthing, lifting, and storing, all relating to very practical subjects, are well described, and even the best methods of marketing tubers are not overlooked. The various insect pests which affect Potatos, happily not serious enemies, and the far more troublesome

(Photo by H. F., Macmillan.)

FIG. 157.—"TAPPING" PARA RUBBER BY THE HERRING-BONE METHOD.

(For text see page 421.)

fungoid diseases and remedies have full consideration. Even the preparation of tubers for exhibition is not overlooked, neither is the culinary aspect of the Potato omitted. Neat as is the text the illustrations seem hardly to do justice to the book. It is, however, cheap, and if read by those who have some practical knowledge of the Potato they may find interest in it, even if no additional knowledge be gained.

THE SCOTS GARD'NER. By John Reid. Edited by Alfred H. Hyatt, with appreciation by the Earl of Rosebery. (T. N. Foulis, London and Edinburgh, 1907. Price 2s. 6d.)

This is a daintily-got-up little volume, the pages of which purport to "stand as originally written," a few "grammatical errors" only being remedied. It is published as a transcript of the 1683 edition, and, to a large extent, it bears out that character, but there are unfortunate and, as we think, gratuitous interpolations from a later edition which sometimes, as on page 8, give a distorted view of Reid's meaning. This is largely or, perhaps, altogether due to the "Eminent Hand" who improved the second edition, mistaking the meaning of the words "confined" and "immediately" which Reid used respectively as "restrained" or "restricted" and "nothing intervening," and the passage has been altered to suit the usual meaning of these words. Reid's "red Pear Achans," in a similar manner, is altered to "red Pear, Achans." Happily the text of Part 2, the Appendix, and Kalender are not largely altered, but in a rare work of this kind, which must ever remain invaluable as giving the earliest presentation of gardening in Scotland, as well as for the merit of the work intrinsically, it is a pity the editor did not see his way to let the original text stand, and give such explanations as he thought needful towards its elucidation. Notwithstanding these, which we cannot help considering serious faults, this edition of *The Scots Gard'ner* will be welcomed by those interested in the gardening of bygone times, as well as by readers who are attracted by the quaint in literature.

COLONIAL NOTES.

GERBERA JAMESONII.

IN reference to the communication which appeared in your columns on October 27th, I may say that it is quite erroneous to state that Gerbera Jamesonii occurs only in the Kaap Valley. It is common at various points all along the eastern slope of the Drakensberg Range, at an altitude of about 2,000 to 2,500 feet. I have found it in great quantity on the Government Tobacco Estate in the Zoutpansberg district, about 150 miles north of Barberton, and have heard of its occurrence in plenty in the Middelburg district.

I have seen plants bearing flowers of the various colours referred to by Mr. Graham-Lawrance, which are not of infrequent occurrence, though not common. There is also considerable variation in the tints of red displayed by different plants.

The "Barberton Daisy," as it is called in the Transvaal, grows luxuriantly in Pretoria gardens (altitude 4,500 feet), withstanding several degrees of frost and forming handsome clumps of dark-green foliage.

During the last three dry years it has been rather unusual to find fertile seed on either wild or cultivated plants, but this year my plants are bearing more fertile seed, perhaps on account of the better rainfall, or perhaps because the plants are older. *Jos. Burtt-Davy, Agrostologist and Botanist, Pretoria.*

FIG. 158.—A PRETTY VIEW IN THE ROYAL BOTANICAL GARDENS, PERADENIYA, SHOWING THE TROPICAL CHARACTER OF THE VEGETATION.

THE FIRST RUBBER EXHIBITION.

CEYLON has long been known as the "Island of Spices," and

> Confessed the best and brightest gem
> In Britain's orient diadem.

In more recent years it has become noted for the production of coffee, quinine, tea, and other tropical products, but just recently it has led the way in an entirely new agricultural industry, viz., the growth and production of plantation rubber. The Rubber Exhibition was characterise by two unique circumstances—it was the first of its kind in the world, and its venue was the famous Royal Botanical Gardens at Peradeniya. The exhibition is thus practically the christening of the new industry which here had its recent birth, at least as regards the Eastern tropics. Thirty years ago the first young plants of the Brazilian or "Para rubber" tree (Hevea brasiliensis) were introduced and established here, though the general cultivation of this tree for rubber did not attract the attention of planters until about 20 years later. Nor did the prices then ruling for raw rubber, with the scanty knowledge of its growth and preparation, encourage investment in its cultivation. With, however, the development of the trade in cycles and motor vehicles the price of rubber, especially the fine plantation article, rose rapidly, and with this began the exploitation of the tropics for land likely to be suited for the growth of rubber-producing trees. A curious fact is that it is now almost impossible to procure seed in any quantity of this useful Brazilian tree in its native country, owing partly to the ruthless methods which have been adopted there for obtaining the rubber from the trees. The tropical world now looks to Ceylon for rubber seed as well as for information on rubber cultivation.

WHAT IS RUBBER?

To this question the average person in temperate climes could give but the vaguest answer, notwithstanding that the substance is now so largely and universally employed in the manufacture of tyres and other articles. In various compounds, chiefly with sulphur, it is known as vulcanised rubber, the proportion of sulphur varying according to the degree of hardness desired. Crude rubber, it may be mentioned, was first brought to Europe in 1735, and in 1770 its value for erasing pencil marks was made known. Its next important use was discovered early in the nineteenth century, by Charles Macintosh, who employed it in the form of varnish for waterproofing cloth, which has been called after the inventor's name. The industrial uses of rubber may, however, be said to date from 1839, when the important process of vulcanising was discovered. Now it is almost impossible to mention a use which rubber does not serve in some form or other, from the makers of street-paving to the manufacture of tooth-brushes, its latest application, perhaps, being in America the replacement of broken ribs in human beings. Technically known as "Caoutchouc," crude rubber is obtained from the milk or "latex" of certain species of trees, and sometimes shrubs or climbers (belonging chiefly to the three natural orders, Euphorbiaceæ, Urticaceæ, and Apocynaceæ) inhabiting the forests of tropical regions. This milk is analogous to cow's milk, which in appearance it much resembles. It is obtained (on plantations) by a process of tapping, which consists of incisions made in the bark, these being somewhat varied to suit local conditions, and the particular tree cultivated. The illustration at fig. 157 shows tapping by the herring-bone method. Stuck in the bark at the top of the cuts are drip-tins containing water, which, dripping slowly on the cut surface, encourages a free flow of latex. With each tapping a shaving of bark is taken off the lower surface of the cut, which in course of time becomes several inches wide, as shown in the illustration. The milk or latex trickles from the newly-made cuts, and is collected, according to the method of tapping adopted, either into small tin cups stuck in the bark at the base of the cuts, or in basins placed at the foot of the tree. The milk ceasing to flow in 10 to 15 minutes (being more abundant in the morning and in the evening and in wet weather), it is emptied into pails or other

vessels and conveyed to the factory. Here it coagulates or curdles by exposure, but the process is usually hastened by adding to it, after it is freed from impurities, a few drops of acetic or other acid; rennet has been found to produce the effect of curdling it, as it does cow's milk. The rubber or caoutchouc thus forms in a soft floating mass, which is then well washed with water, and afterwards pressed into marketable forms and dried for export. This vegetable milk must not be confused with the watery sap, from which it is different both in substance and function; unlike the sap, its extraction does not materially affect the welfare of the tree—a fortunate fact for the cultivator. Rubber trees may be tapped when from six to eight years old, and on an average from ¾ lb. to 3 lb. of dry rubber per tree a year may be obtained, according to age and development. In recent years rubber cultivation as an investment has attracted considerable interest. This is not surprising considering that the product can at present be sold in London at a clear profit of four shillings or more a pound, yielding about £130 to £150 per acre after deducting all costs. It is estimated that the area under Rubber cultivation of different ages in Ceylon is upwards of 100,000 acres.

THE EXHIBITS.

These were worthy of the important occasion, and, as might be expected, represented products from widely separated regions of the tropics. One enterprising London firm showed samples of rubber from the Congo, Uganda, Mozambique, West Coast of Africa, Madagascar, South and Central America, Assam, Rangoon, Penang, Borneo, &c. But Ceylon and the Straits Settlements contributed the bulk of the exhibits, which in their various forms made a most interesting show, though perhaps not equally attractive on account of beauty or fragrance. All one side of a wing, about 85 feet in length, was occupied with rubber "biscuits," which looked like brown or amber-coloured pancakes. This has hitherto been the most popular form for making up plantation rubber, but it is now being discontinued in favour of "crepe," "sheet," and "block" rubber, which effect economy in freight and other advantages. A number of other rubber forms, as "lace," "flake," "scrap," &c., were also exhibited, either singly or in collections. It is well to explain that this has reference almost exclusively to the product of Hevea brasiliensis, known as "Para rubber," which is *the* rubber tree of the day. Small lots, however, of the products of Ficus elastica (Ramong rubber), Castilloa elastica (Panama or Central American rubber), and Manihot Glaziovii (Ceara rubber) were also displayed. An idea of the extent of the exhibits may be gathered from the fact that the judging of rubber alone, which was done by four experts from London, occupied three days. Appliances for tapping, &c., covered a considerable area, and the machinery section included different machines for treating rubber in the initial stages of preparation.

The utilitarian aspect of the exhibition was by no means neglected by the promoters, for the elaborate programme included a series of lectures by scientists and experts on subjects connected with rubber, one such lecture at least being delivered each day in one of the pavilions. Appropriately led by the Director of the Premier Gardens and foster-mother of the rubber industry in the East (Peradeniya), here were divulged and discussed the latest discoveries made on the subject by the science of the botanist and chemist or by the knowledge and ingenuity of the planter and engineer. In contrast to the usual principle of an exhibition, the objects in this case were entirely *pro bono publico*, *i.e.*, the financial part had no serious consideration. The necessary funds were supplied from the public revenue, and an immediate return was not, of course, to be looked for; but one would begrudge the expenditure against the undoubted far-reaching effects. Hitherto it was felt that rubber-growers were working a good deal in the dark, being either unaware of, or unable to obtain, the latest facts and information concerning the planting and growth of the trees, the collection of the latex and its preparation for market in the best paying forms. To such the Rubber Exhibition must have been an education beyond the dreams of the most optimistic.

But for the astrologer, the natives agree that the whole work connected with the exhibition would not have been so successfully and quickly accomplished. As in all important operations here, this official was of course consulted, and asked to divine the lucky day and hour to start work. Accordingly twenty minutes past nine on the morning of a Tuesday, the signal for starting was conveyed by the worthy chief, Mr Dunnville, who, as prescribed by ceremony and tradition, was dressed in white, facing the east, having previously partaken of rice boiled in milk (not water). From that moment the workmen laboured as at a labour of love, faithfully trusting to the wisdom and foresight of the weather prophet, who himself worked as one of them. As no large gang of native workmen is ever complete without at least one doctor or "rederala" (who cures chiefly by the invocation of Buddha and the stars) the present occasion has not, of course, been an exception to the rule.

Regarding the Peradeniya Gardens, often compared by travellers to the "Garden of Eden," they are entitled to at least a few remarks. These date their origin back to the beginning of the nineteenth century, the site having been originally a royal demesne of the Kandyan kings. Though their progress as a botanical institution has been more or less interrupted until about a decade ago, they have long been famous for their peculiar natural beauty, constituted by their favoured position, undulated contour, and wealth and grandeur of vegetation. The area is about 150 acres, mostly surrounded by the river "Mahaweliganga" (great sandy river), and the average elevation above sea level is approximately 1,600 feet. The climate is hot, moist, and very equable, the mean annual temperature being about 75 Fahr. The vegetation is, as might be expected, purely tropical, being characterised by an abundance of climbing plants, Palms, Screw-pines, epiphytic Orchids, and Ferns. A special feature is the majestic Giant-bamboo, monarch of the grass family, growing in large dense clumps and reaching a height of 120 feet or more, of which a large illustration was given in our columns in issue for September 10, 1892. The general character of the vegetation is, of course, eminently distinct from that of temperate climes, chiefly by the abundance of aerial or buttressed roots of trees, whose fruits are often of immense proportions, and, by a provision of Nature, borne on the trunk and stouter branches. The leaves are generally large and leathery, and the flowers brilliant and considerable in size. Amongst the most striking views in the gardens are the avenue of Talipot Palms (Corypha umbraculifera), deservedly known as the "Giant of Palms," the main central drive, the flower garden, the Fernery and Palmyra avenue, the extensive "Great lawn," and the "Great circle." The latter is a flat, circular area of lawn surrounded by some magnificent trees, and with a handsome group of Palms in the centre; in a somewhat altered form, mostly covered by buildings and illuminated by electric light, this formed the site of the recent exhibition. Individual objects of much interest are numerous, amongst those which especially attract the attention of visitors being the "Candle-tree," whose hanging fruits closely resemble candles in size and appearance; also the "Cannon-ball tree" (a name suggested by the large globular brown fruits), and the "Traveller's tree." The various spices are a never-failing source of interest, and a very complete collection of these may be seen here, including nutmeg, clove, cinnamon, allspice, ginger, vanilla, cardamon, and others. Equipment for scientific research here is now very complete, with laboratories, a large library, herbarium, &c., and a new commodious museum and herbarium building is being erected. About ten years ago, with the appointment of a new director, Dr. Willis, from the University of Cambridge, the scope and staff of the Botanic Department of Ceylon have been very considerably extended; and the Peradeniya Gardens have been greatly transformed and improved in many features. *H. F. Macmillan, F.L.S.*

CHRYSANTHEMUM NOTES.

POPULAR CHRYSANTHEMUMS IN FRANCE.

ONE of the great differences between an English Chrysanthemum show and a French one is the greater number of varieties shown by the French exhibitors. At the recent Paris show there were scores of varieties long since discarded by English exhibitors, but which are, nevertheless, usefully retained by French growers for decorative purposes in their groups. Others freely used in France have never yet found favour in England. F. S. Vallis is certainly one of the most popular varieties with the French, and I have this season seen some enormous Blooms of it. Lt.-Col. Ducroiset is another to which these remarks apply; and President Viger, Mme. Paolo Radaelli, Mme. Geo. Rivol, Mrs. Coomber, Mrs. Barkley, Sapho, Le Peyrou, Sensation, President Loubet, Mme Gustave Henry, and W. R. Church were in nearly all the important exhibits of cut blooms.

In the plant classes Tokio, a pale pink, stiff-petalled Japanese variety, is frequently used, and is very effective. Mme. Lem Bowen, a golden-bronze, incurving flower, of deep build is certainly a useful kind. Duchesse d'Orleans, a white Incurved, is grown in enormous quantities for the Paris florists' shops, and is, in addition, a favourite with exhibitors of pot plants. Mme. Ant. Marmontel is fine in colour, being bright rosy-mauve, with a good floret. It is very fine when grown as specimen plants, and as such is largely exhibited. Vierge Montbrunoisi, a big white, and Souvenir de Lombez, golden-bronze, are both frequently met with as pot plants. Papa Bie, a curious, dull, reddish-crimson variety, is useful for exhibiting in groups. For furnishing decorative dwarf groups Baron de Vinols, a medium-sized Japanese, of bright rosy-amaranth, can hardly be surpassed, and almost everybody at the Paris show uses it. Hortus Tolosanus, a fine reddish-terra-cotta, with gold reverse, makes a good specimen plant. *C. H. P.*

SCOTCH GARDENERS IN AMERICA.

(*Continued from page 382.*)

W. D. BRECKENRIDGE was born near Ayr in 1810. He was head gardener for Dr. Mell, of Edinburgh, for four years, after which he accepted a position at the Botanical Garden in Berlin. In 1837 he landed in Philadelphia, and became foreman for Robert Buist. The year following his arrival the Wilkes Exploring Expedition was about to start, and Mr. Breckenridge was selected as botanist of the expedition, which lasted four years. He made many collections of plants and seeds, some of which laid the foundation of the National Botanic Garden at Washington, D.C. On his return he was made superintendent of the garden, succeeding Charles Downing, and in that capacity accomplished a great deal of work around the parks of that city. An exhaustive work written by him, embracing a description of the Ferns and Mosses collected on the cruise, was published by the Government. After resigning his position at Washington he entered the nursery business at Govanstown, Md., which he conducted until his death on February 3, 1893.

JAMES LITTLEJOHN, a native of Crieff, where he was born in 1818, was apprenticed at Blair Drummond, Perthshire, and was an old Kewite. He was one of the pioneer growers at Madison, New Jersey, a section famous for its fine Roses, Littlejohn's Magna Charta being the best that came into the New York market. He died in 1893.

ROBERT MCCRON was born in Kilmarnock in 1820, and died October 28, 1892. He came to America when eleven years of age, became an expert carpet weaver, then a grower of vegetables, afterwards a florist. He was a successful cultivator of Stocks. He received scanty education in his early life, but studied books while at work, and attended evening school. During slavery days he conducted what was known as an "underground" railway, and many a fleeing slave he helped over the lines to a place of safety. His funeral services were conducted by a coloured preacher.

PETER HENDERSON.—It can, I think, be safely said that among modern horticulturists in America no man was better or more favourably known than Peter Henderson. His name was familiar in every State in the Union from Maine to California. Peter Henderson was born in Pathhead, near Edinburgh, June 9, 1822, and died at his home in Jersey City, N.J., January 17, 1890. At sixteen years of age he was indentured as an apprentice in the gardens at Melville Castle, near Dalkeith, where George Sterling was head gardener. While serving his apprenticeship Mr. Henderson competed for and won the medal offered by the Royal Botanical Society of Edinburgh for the best herbarium of native and exotic plants, the competition being open to Great Britain. He came to America in 1843, and began work in the nurseries of George Thorburn, Astoria, L.I., and afterwards with Robert Buist, of Philadelphia. Subsequently he was gardener for Mr. Charles F. Spang, Pittsburg, Pa., and it was while in the latter capacity that Mr. Henderson became so discouraged that he resolved to enter the Army to serve during the Mexican War. Fortunately, he was dissuaded from his purpose. With his brother James, he first engaged in commercial vegetable growing in Jersey City, subsequently turning his attention to the cultivation of plants and flowers, and latterly to the seed business. He laid the foundation for, and till his death assisted in building up, what is probably the largest business of its kind in the United States. As a catalogue maker and advertiser Peter Henderson had few, if any, equals. He was a prolific writer, and his books and other contributions to horticultural literature have, perhaps, done more for the advancement of gardening in America than any other known factor. Among his best-known works, all written in a popular, practical style, are *Gardening for Profit*, *Practical Floriculture*, *Gardening for Pleasure*, *Garden and Farm Topics*, Henderson's *Handbook of Plants*, and *How the Farm Pays*, the latter written in conjunction with William Crozier, and being a stenographic record of Mr. Henderson's questions and Mr. Crozier's responses. It would occupy too much space to tell of all Mr. Henderson's achievements to horticulture, of the plants he introduced into commerce, of his own charming personality, and the great interest he took in every Scotch gardener who sought his advice. A most interesting account of his progressive career is given in a "Memoir," written by his son Afred, now deceased. From the tribute to his memory paid by a fellow-countryman, A. D. Cowan, in a paper read before the New York Florists' Club, I quote as follows:—"No one but he handled the pioneer's pen which brought the dark, selfish and ignorant methods of the old school of horticulture into daylight; and to Peter Henderson will belong for generations to come the credit of popularising, improving, and developing gardening in these United States."

The business is continued under the former title of Peter Henderson and Company, a son, Charles, being president of the concern.

WILLIAM SAUNDERS.—Of the many names of Scotsmen emblazoned on the pages of American horticulture few stand out more prominently than that of the late William Saunders, of the Propagating Gardens, Department of Agriculture, Washington, D.C. He was born at St. Andrew's in 1822, his parents originally intending him for the Church, his own tastes leaning to gardening. Among his best-known landscape gardening achievements are Clifton Park, Baltimore, Md.: the designing of Fairmount Park, Philadelphia; and the national cemetery grounds at Gettysburg. In 1862 he was appointed superintendent of experimental gardens and grounds at Washington. Through his direct instrumentality nearly all of the tropical fruits have been introduced into the United States, one of the most valuable being the seedless or navel Orange, which he received from Brazil in 1867. He was the originator of the Patrons of Husbandry, and rendered valuable service to the city of Washington as a member of the Parking Commission. Mr. Saunders was a prolific contributor to the technical Press. His knowledge of plants from an economic standpoint was an extensive one, and his ability as a landscape gardener was universally recognised. The beautiful grounds of the Department of Agriculture are an enduring monument to his skill.

WM. FOWLER was born near Glasgow in 1822, and served his apprenticeship at the Glasgow Botanical Gardens. He was appointed by the British Government to collect specimens in Australia. For over 40 years he was gardener at John Hopkins Estate, Baltimore, Md., and laid out the plans for a botanical garden in connection with the university which bears the name of his employer, but through the latter's death the scheme fell through. Fowler was extremely fond of New Holland plants, an excellent collection of which he gathered together for Clifton Park greenhouse, Baltimore. He died in 1897.

ROBERT HALLIDAY, of Baltimore, Md., whose father was born at Dumfries, Scotland, was an expert grower of Azaleas and Camellias, and wrote a book on each of his specialties. He died in 1894.

WILLIAM ELLIOTT (1824-1897), a native of Crailing, near Jedburgh, was, during his lifetime, one of the best-known seedsmen in New York City. He served an apprenticeship in the Earl of Minto's gardens, afterwards working on several places in England. He came to this country in 1851. Three years later he opened a seed store in New York, and in 1858 inaugurated the plant auction business. On the latter rostrum Mr. Elliott had few equals. His dry, pawky, Scotch humor never failed to keep things moving, nor was he backward at times in the employment of biting sarcasm. He was nevertheless a most genial wholesouled fellow, well liked by hosts of friends, several of whom were, on social occasions, more than once the butt of his banter. A good story is told where Peter Henderson one time turned the tables on Elliott. At a dinner of the New York Horticultural Society the auctioneer had been having some fun at Henderson's expense. Peter "tholed" it right through, and then his turn came to speak. He said a Scotch gardener, not long over, had called in at the store one day looking for a job. He was informed there was nothing on the books just then, and Mr. Henderson advised him to try Elliott's, across the way.

"Elliott?" queried the gardener. "Is he a richt?"

"Certainly he's all right," said Mr. Henderson. "Go over and see him."

The knight of the spade hesitated a moment, then volunteered the explanation of his hesitancy in this wise: "The reason I speer at you is because whaur I cam' frae a the Elliotts were tinklers."

The laugh was now on the other fellow.

The seed and auction businesses are continued by Mr. Elliott's sons, William J. and Carl.

T. B. MCLUNIE (1826-1903) was born in Dumfries. In his youth he served as a page to Thomas Carlyle. He was a practical landscape gardener, and laid out the grounds around some of the State Buildings at the Philadelphia Centennial Exposition in 1876. He also was at one time engaged in engineering work on the Panama Canal.

JOHN SCOLLAY.—In the greenhouse engineering line the name of the late John A. Scollay, of Brooklyn, N.Y., holds a prominent place. He was born in Dundee in 1827. Among his inventions are the Scollay Invincible boiler, rubber plant sprinkler, automatic air valve, rubber putty bulb, and a patent thermometer. The business he formed is still conducted by his sons, C. G. and Wm. Scollay.

WM. C. WILSON, a native of Aberdeenshire, born in 1827, was at one time a very successful grower, with a large establishment at Astoria, L.I., which finally passed out of his hands, owing to his conservatism and his persistency in growing stock not desired by the trade. He was among the first of the florists to give the commercial Palm an impetus, as well as to build long greenhouses, although in our day his 300-foot house, then considered a monster, would excite but little attention. He died poor.

ROBERT LIDDELL, a native of Glasgow, where he was born in 1828, was for 30 years in the service of Peter Henderson, being at his death, in 1904, treasurer of the firm.

WILLIAM GREY, a native of Greenlaw, Berwickshire, where he was born in 1828, was one of the ablest private gardeners in the United States. He came to this country in 1851, and for years had charge of the famous collection of Orchids possessed by the late Erastus Corning, of Albany, N.Y. Mr. Grey was an entomologist of no mean order, and spent many years in pursuit of that study, his collection embracing 30,000 specimens from all parts of the globe. Especially was it rich in Sphingideæ, Noctuidæ melanic and dimorphic forms.

His son, Robert M., is an Orchid specialist, and has originated numerous Cypripedium seedlings. He also is an entomologist of ability. At present he is in Cuba on behalf of the Harvard Botanical Garden, conducting experiments in connection with various economic plants.

JAMES FLEMING (1833-1878), a native of Ayrshire, at one time had charge of the then finest collection of Orchids in the country, which belonged to Mayor Van Worst, of Jersey City, N.J. Mr. Fleming entered the seed business, and became a partner of Peter Henderson. He was a great friend of the young Scotch gardeners in America, inspiring and aiding them with hopeful words and sound advice.

Other associates of Peter Henderson were W. H. Carson and William Davidson, the latter of whom assisted Mr. Henderson on his *Handbook of Plants*.

JAMES Y. MURKLAND, also an Ayrshire lad, was a member of the seed house of Young and Elliott. He was secretary of the New York Horticultural Society, now defunct, and what success it had during his term of office was largely due to his energy and well-judged efforts.

DUNCAN ROSS, who was born on the Balgowan Estate, was one of the earliest wholesale cut-flower commission dealers in America, and was the only Scotsman whom I knew or have ever heard of in that branch of the trade. He died in 1896.

WM. MCKELLAR (1833-1900), a native of Paisley, received his training in Scotland on the estate of the Duke of Argyle. In the United States he achieved great success as a grower of Niphetos, once a very popular market Rose.

FARQUHAR MACRAE (1843-1905), a native of Ross-shire, served his apprenticeship at Conon Gardens, the estate of Sir Kenneth McKenzie. He came to the United States in 1870, and while yet a private gardener soon achieved success as a grower of Grapes. Later he became a commercial florist, and originated several varieties of Chrysanthemums. Mr. Macrae died in Providence, R.I. He was at one time president of his local florists' club, and for a term was vice-president of the Society of American Florists and Ornamental-Horticulturists. His brother, John Macrae, also of Providence, R.I., is a successful grower for market, being especially interested in Chrysanthemums; while a fellow apprentice, Donald Matheson, is superintendent of the Phelps Estate in New Jersey.

WILLIAM MCMILLAN.—A staunch, sterling type of Scotsman was William McMillan, a native of Inverness, one of the foremost of park superintendents of America, who landed on these shores in 1852. A clogging course to the majority of the city park systems in this country is their connection with politics. Mr. McMillan was appointed park superintendent of Buffalo, N.Y., in 1871, an office which he held most acceptably to all concerned for over a quarter of a century, but when politics interfered, and made the office of park superinten-

ment elective instead of appointive, whereby votes rather than merit determined the choice of the holder, Mr. McMillan refused to be a party to that system, immediately tendering his resignation. He afterwards laid out the Essex County Park system in New Jersey. He was an advocate of the natural system of park and landscape gardening, and by his writing and example aided much in the suppression of the "carpet bedding" which assumed some importance in the gardens of this country in years gone by. I cannot refrain from quoting the beautiful tribute paid to McMillan by Captain James Braik, himself an Aberdonian, at one time associated with him, and now the practical head of the Buffalo, N.Y., park department —"He was an ardent and intelligent student of horticulture in all its branches. He was a devout worshipper of nature unadulterated and of nature's God. He was the best and truest representative of our native land I have ever met in America. When those of us who knew him best and loved him most laid the body of this gentle, loving and lovable soul in the 'mools' in our beautiful Forest Lawn Cemetery (near his masterpiece, Delaware Park) more than one bitter tear was shed over his grave, and the remark made, 'We will not soon look on his like again.'"

The citizens of Buffalo, headed by the Scotch residents there, in recognition of Mr. McMillan's personal worth, as well as of the eminent services rendered to the community, erected a memorial to him in 1905. It is a drinking fountain, hewn out of rough granite, emblematic of his own sturdy, rugged, honest character, and is located in his famous creation, Delaware Park, being the first tribute of this kind ever paid to an American horticulturist.

A. D. COWAN, a native of Dalry, born 1850, died 1895, an expert seedsman, served his apprenticeship with Kennedy and Company, Dumfries. He managed a seed store in New York. Cowan was an excellent judge of Mushroom spawn, and his views on this subject have been incorporated in a recent work on *Mushroom Culture*.

DAVID ALLAN, born in Banff in 1853, served his apprenticeship on the estate of Sir George McPherson Grant, was a noted Orchid grower, and one of the best all-round plantsmen of his day. He died in 1896.

So far I have spoken mainly of the men who have passed from among us and of their achievements. I shall now briefly refer to those who, still in the midst of us, are following faithfully in the footsteps of their predecessors in upholding Scotland's reputation in the gardening world.

LIVING REPRESENTATIVE MEN.

W. R. SMITH.—Among the oldest of the Scotch gardeners in America still living is William R. Smith, superintendent of the Botanic Gardens, Washington, D.C., a post he has held for over half a century. He was born in 1828, and served his apprenticeship in Lord Elcho's gardens at Haddington. He entered Kew in 1853, whence he came to America. He first secured employment in Philadelphia as a private gardener, later going to Washington. He developed the Botanic Gardens from a swamp into the beauty spot they now present. Mr. Smith is the friend of presidents and statesmen. He is an enthusiastic admirer of Robert Burns, the Scottish poet, and possesses one of the largest private collections of Burnsiana in the world. He has been chairman of the Parking Commission of the District of Columbia for many years, and has done much to beautify the streets, squares, etc., of the national capital. Mr. Smith was instrumental in securing for the Society of American Florists and Ornamental-Horticulturists, of which body he was at one time president, a national charter. During his long career he has had several amusing experiences, one or two of which I may be permitted to relate here. A pompous senator walking one day in the Botanic Gardens, in company with Mr. Smith, confessed to the fact that he could see no utility in the garden, nor any plausible reason why Congress should maintain it. Casting a withering glance at the statesman, Mr. Smith is reported to have said—"My dear sir, if the Great Creator of the Universe had had utility in mind when he made you, He would have put you on four legs and set you to eating grass."

(To be continued.)

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Planting trees.—While the weather remains favourable, the planting of all kinds of trees may still be performed. The work of pruning should also be pushed forward, but with the recent favourable weather much of this work should by now have been accomplished. Plums, Pears, Apples, Gooseberries, and Currants are all in a suitable condition for pruning. Nailing and tieing should follow the pruning without loss of time, for the flower-buds can now be distinguished quite easily. Where there are evidences of a plentiful supply of bloom, cut the shoots well back, with due regard to a proper regulation of the branches, especially those of young trees. If a branch is required to fill a vacant space, prune one of the shoots either above or below the vacant spot, almost to its base, and train in two of the shoots that will "break" next season. In the case of a fan-shaped tree, re-arrange the whole of the branches. To prevent birds from destroying the buds of Gooseberry and Currant bushes place some black thread smeared with bird-lime over the tips of the branches. After pruning is finished clear the ground, and lightly fork it over to make it tidy, and to bury the old mulching material, finally applying a good dusting of quick-lime.

Lifting.—Any tree that requires lifting or root-pruning may still be attended to while the weather continues mild. It is a good plan to lift cordon trees, and to furnish some fresh soil about their roots, every few years, especially when they are grown in very shallow borders. If these trees are moved carefully they will not suffer greatly by the disturbance.

The fruit room.—The majority of Apples are keeping well this season. I finished picking on December 1 with the fine late dessert variety Duke of York. The new Edward VII. promises to be a good keeping Apple. When a variety is desired for a certain date it can be kept for a period of about ten days longer than in ordinary circumstances by using Wood's microcide. I have experimented with this preparation on several kinds. I dipped the fruits in the microcide, and laid them by the side of others not treated, with the above result.

Apples and Pears in season include: Apples (dessert)—Ribston Pippin, Cox's Orange Pippin, Cockle Pippin, Brownlee's Russet, Christmas Pearmain, Allington Pippin, Barnack Beauty, King of Tompkin's County, &c. Culinary—Blenheim Pippin, Lane's Prince Albert, Sandringham, Bismark, Tower of Glamis, Gascoyne's Seedling, Mère de Menage, Lord Henniker, Lord Derby, and Hoary Morning. Pears—Doyenné du Comice (nearly finished), Glou Morceau, Winter Nelis, Passe Colmar, Charles Ernest, Bacon's Incomparable, Nouvelle Fulvie. These, with the exception of the first-named, will be in season for Christmas. Cooking: Catilac, Uvedale's St. Germain, Duchess de Mouchy, and General Todleben.

Cobnuts and Walnuts will never be in a better condition for use than now, but they can still be kept for a considerable time.

Medlars.—A few trees should be put in now and again, as the fruit from young, vigorous trees is larger than from old specimens. The Medlar does not require much pruning beyond thinning and keeping shapely. Good varieties are Dutch (very large and good-flavoured), The Nottingham (a small fruit, but one of the best), and Royal (large and a free-bearing variety). The best situation for Medlars is in a good, rich, loamy bank, which is moderately moist. The Medlar can be raised from seeds, and these should be sown as soon as ripe. They are sometimes two years before germinating. The quickest way to propagate Medlars is to graft them on to the Pear, Quince, or Thorn. The Thorn is best in dry soils, but the Quince is best for a moist position. When grafted 6 feet high on the Pear stock the trees are most suitable for ordinary positions and purposes.

Mulberry.—Trees are generally grown as pyramids. The Mulberry succeeds on nearly any soil, but the fruits ripen better on a light, well-drained soil. Trees may now be planted.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

Potatos in clamps.—Where signs of disease were evident when the crop was being "lifted," it is pretty certain that some of the tubers are now in a state of decay. Therefore, uncover the clamp and turn them over, carefully picking out all those affected. Choose a fine day for the work, and afterwards cover the clamp as before. Sufficient protection should be given the clamps by means of straw or bracken during frosty weather. Where Potatos are stored in a cellar, the tubers can be looked over during wet weather. Keep such tubers covered to prevent the air toughening the skin.

Rhubarb will now force readily, and especially if the crowns have been exposed to the weather and well rested. It is advisable to place some of the roots in heat fully exposed to the light; the growth will then become more like that made out of doors, and it is crisper, some cooks preferring it to the paler produce grown in the dark, as it has not the earthy flavour so noticeable in some forced Rhubarb.

Winter Tomatos.—The days being at their shortest, sunlight is very deficient. Keep the plants a trifle on the dry side, and in a slightly lower atmospheric temperature, during specially dark or foggy days. It cannot be expected that fruit will ripen rapidly at this season, and hard forcing would harmfully debilitate the plants. Slight top-dressings are of the greatest importance in encouraging healthy root action. Plants raised from cuttings in autumn will be ready for a shift soon after Christmas, and they may be successfully grown in an atmospheric temperature of 55°. Plants raised from cuttings become fruitful earlier than those from seed, but there is not much gain from either method over the other. Keep the plants as near the glass as possible.

Mint and Tarragon should be lifted and boxed-up to form a succession to the earlier batches raised from cuttings. These herbs are much in demand early in the year, and may be easily grown in warm frames or placed in a vinery or Peach house, where the daily syringings will be all to their advantage. Keep a look-out for greenfly if much heat is applied, but little trouble from this pest need be experienced if the plants are well supplied with water, both by syringings and applications to the roots.

Salads.—Sow seeds of Mustard and Cress and Radishes in warm frames at regular intervals. Lettuces grow slowly now and require care. Keep them well picked over, and the soil stirred between the plants. Place batches of Endive under cover for blanching purposes, and protect the outside crop from snow and frost with a covering of straw or leaves. Sudden changes in the weather have a disastrous effect on these plants when not protected.

Storing soils.—It is well to collect a quantity of soil and place it under cover in readiness for use when pricking off young vegetables early in spring. Soil is all the better for having been stacked for a short time at least before using. Repairs to old boxes can be carried out, or new ones made, during odd time at this season.

Pea sticks should be obtained as early as possible, and especially when they have to be cut on the estate, so that they can be sharpened or otherwise prepared for the next crop. Sticks serve their purpose well if they last two seasons, and if there is plenty of choice it is best to select Ash (which last longest) or Hazel. Spruce branches make the very worst stakes, being much too close for permitting freedom of growth. It is well to grade the sticks into different sizes for convenience when staking the plants.

THE FLOWER GARDEN.

By HUGH A. PETTIGREW, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

The flower garden in winter.—The present is naturally a dull and uninteresting period of the year, so far as the appearance of the flower garden itself is concerned, but yet much can be done by attention to neatness and order to make it inviting and cheerful even now. If the weather is "open," lawns and grass paths should be frequently brushed to remove worm-casts, and lightly rolled; this not only improves the turf, but at the same time greatly enhances

its appearance. For the winter embellishment of beds and borders in the immediate vicinity of the house, by the use of dwarf shrubs in pots plunged in the soil, has much to recommend it. When one considers the wealth of material to hand, suitable for this phase of gardening, it is surprising that it is not more practised, especially in gardens attached to mansions which are exclusively winter residences. Shrubs remarkable for their beauty of form or light gracefulness of habit, or those admired for their winter tints and delicate colouring of foliage, are all appropriate for this style of gardening. Under the category of such shrubs would be included many of our handsome "ornamental coniferæ," which alone offer material for attractive schemes of bedding, while the thought of "berried shrubs," which naturally arises, at once conjures up the prospect of achieving at least brightness, if not indeed gayness, in the design. Not only evergreen shrubs of attractive form and colouring may be used for this purpose, but also deciduous shrubs possessing brilliantly-coloured wood may with advantage have their place, and serve to relieve the sombreness of the garden in the dull days of winter.

A reserve ground needed.—An essential accompaniment to this form of gardening is a spacious reserve ground, which would be the home of the shrubs during the other months of the year. Naturally the site of this reserve garden would have to be so situated as to receive abundance of light, and be open in respect to air, to ensure the plants being retained in continued health, while at the same time facilities must be afforded for the plentiful supply of water, which is imperative to their well-being. The following list comprises some of the plants which are pre-eminently suitable for the purpose described, but there are many others which will of themselves occur to the reader.

Suitable plants.—Cupressus Lawsoniana and its numerous varieties, particularly "gracilis pendula aurea" and "lutea"; C. obtusa nana aurea; C. nootkatensis and its variety "lutea"; C. pisifera plumosa and its var. "aurea"; C. macrocarpa aurea; Juniperus chinensis aurea; Taxus baccata aurea; T. baccata fastigiata aurea and T. baccata semper-aurea; Thuya gigantea; T. orientalis aurea; T. occidentalis and many of its varieties; Cupressus [Retinospora] obtusa in variety, C. plumosa, and C. filifera; Aucuba, particularly the female plants, because of their berries; many of the Berberis; Cotoneaster Simonsii; Euonymus alatus americanus and E. europæus, the latter for its coral-coloured seeds; Hippophæ rhamnoides; many of the Willows; Cornus sanguinea and others; Hollies, Box, Laurel, &c., &c.

Mahonia twigs.—A simple means of covering and furnishing the ground of "parterres" during the winter, and the use of which is very much in vogue in France—particularly around Paris—is that of employing twigs of Mahonia. These twigs, or branchlets, are stuck into the soil methodically and evenly. The foliage keeps fresh and bright for quite a long period of time, and so is fitted for the object intended, and hides the coldness—and what is to some the repulsiveness—of the bare earth.

PLANTS UNDER GLASS.

By B. Cromwell, Gardener to T. Sutton Timmis, Esq., Cleveley, Allerton, Liverpool.

Plumbago rosea coccinea is a useful plant at this season of the year, when a demand exists for choice flowers. For the decoration of the dinner table this plant is most suitable, owing to its lightness of growth and the brightness of its flowers. Its only bad quality is the short duration of its flowers when in a cut state, but this defect is more than compensated for by its extreme floriferousness. The culture of this plant is simple; its principal requirements are as follow:—After the flowering period is over, diminish the supply of water to the roots and rest the plants in a temperature of 55°. About the end of February the plants should be shortened back, shaken out of their pots, and, when repotted, placed in a brisk moist heat. When growth has well advanced they should be gradually accustomed to a lower temperature, and be finally placed in a cool pit or frame for the summer months. The structure containing these plants should be closed early in the afternoon throughout the summer, and the syringe should be used freely to keep red spider in check. Avoid over-potting; 6-inch pots will be found a suitable size. The potting medium should consist of good fibrous loam, leaf soil, sand and charcoal siftings. The drainage should be perfect, as the plants are impatient of excessive moisture at the roots. In September the plants should be accommodated in a warmer structure, and during the winter months they should occupy a position near the roof of a Melon or Cucumber house, as the colour of the flowers is much improved by affording the plants plenty of light. This Plumbago should not be retained after its second year of growth, as the flowers produced after this period deteriorate in both colour and substance.

Adiantum cuneatum.—If the fronds of this species have become shabby, the plants should be entirely defoliated. Previous to performing this operation the roots should be kept somewhat drier than is usual. If the plants are in a proper condition at the roots, and the drainage perfect, they may be placed in a temperature of 65°-70°, where they will soon furnish a new crop of leaves, which will be useful for decorative purposes during the early spring months; batches of these Ferns may be thus treated every fortnight, to ensure a succession of fronds.

The Potting Shed.—The present period affords an opportunity to cleanse and limewash the walls of this structure, and to put everything in order ere the busy time for potting commences. The various kinds of materials required in potting should be stored and kept dry. Pots should be sorted and cleansed, stakes should be re-pointed and painted, for these details attended to will lessen the amount of work when the busy time arrives.

Stove Temperatures for the month should not exceed 62°-65° at night time, while 68°-70° is ample during the day. Use every means to economise the fuel when the sun raises the temperature 5° higher than the figures I have given.

FRUITS UNDER GLASS.

By T. W. Birkinshaw, Gardener to Lt.-Col. Sir Chas. Hamilton, Bart., Hatley Park, Bedfordshire.

Strawberries in pots.—The earliest batch of Strawberry plants should now be started if fruits are required very early in the season. A small number should be selected, because much better results will be obtained from plants which will be introduced into the forcing house early in the New Year. The plants this year seem to be well "ripened," owing to the favourable summer, and the recent frosts will have prepared them for responding to the influence of heat. In regard to forcing, it is not often that a house can be set apart for these plants, therefore they have to be accommodated in the Peach houses and vineries that have just been started, but, nevertheless, good results may be obtained from them. Before taking the plants indoors all dead leaves should be removed from them, at the same time retaining every bit of green leaf. Lay the plants on their sides, and give them a thorough good syringing in order to dislodge any insects that may be present. I do not advise the application of a top-dressing, or that the surface soil should be loosened, it being better to depend more on artificial feeding with "Le Fruitier" later on. Those who have a pit which can be filled with new tree-leaves, for the plants to be plunged in, will have the greatest advantage in the attempt to secure earliest fruits. Royal Sovereign and La Grosse Sucrée are two excellent varieties for early forcing, and Monarch is a good variety for succession.

Fruit in pots.—Plants that are now carrying fruit will require careful watering and good treatment. As the fruits begin to change colour, they may be cut from the plants and placed on a dry shelf in a warm house. This will relieve the plants, and allow the fruits that are left more room and light to aid further development.

Raising young plants.—In order to obtain ripe Tomatos as early in spring as possible, a sowing should now be made of Sunrise or Perfection. Where a large quantity is required, shallow pans are preferable for raising the seedlings. The seed should be sown thinly in light, open soil, and the pans placed in an atmospheric temperature of 60°. When the seedlings are through the soil, place the pans on a shelf well up to the light, so as to secure sturdy growth in the plants. When they have made two or three young leaves, dibble the plants singly into 3-inch pots, using soil of rather coarse description, and keep them growing in the same degree of heat, giving them subsequent shifts as they require it.

Orchard House.—This structure should now be thoroughly cleaned out if the work has not been already done. Before placing the trees in the house, let each be made scrupulously clean. Plum, Pear, and Apple trees may still be allowed to remain in the open air, but the pruning of them may be carried out at once.

THE ORCHID HOUSES.

By W. H. White, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Imported Dendrobiums.—Numerous plants of the recently imported Burmese Dendrobiums have assuredly by this time passed into the care of various cultivators, some of whom are experienced growers, whilst others may now be only commencing to interest themselves in the cultivation of these plants. As regards the newly-acquired pieces of D. Wardianum, some cultivators may prefer to grow them in the ordinary flower-pot, others may find it more convenient to place them in shallow Orchid pans, that may be suspended from the roof; but whichever kind of receptacle is used it should be just large enough for a plant for several seasons. The receptacle should be nearly filled with drainage materials, and the plants need to be made quite firm in the pots by tying the pseudo-bulbs to neat stakes, while those in pans may be easily fastened to the wire suspenders. By keeping the plants firmly in their places they will be able the sooner to obtain a good root-hold. The crocks in which the plants are placed should be very sparingly watered at first, and as soon as new roots are seen pushing out from the base of the young growths, a compost of equal quantities of fibrous peat and sphagnum-moss may be packed firmly around them in the ordinary manner. Afterwards, as the roots form, and the new growths gain in strength, water may be more frequently and liberally afforded. A cool, dry part of the Cattleya or intermediate house will suit them during the next few months, but when growing freely they will require a more genial atmosphere. These remarks are also applicable to the recently imported plants of D. nobile. Those plants of the evergreen species, D. thyrsiflorum and D. chrysotoxum, should be similarly treated as regards potting, &c., but in a few weeks' time the warm, moist atmosphere of the plant-stove will be more suitable for them.

Cypripedium Fairrieanum is again being imported in large numbers, and it is probable that by this time plants are to be found in almost every collection in the country. At Burford we have plants growing well alongside the different varieties of Cypripedium insigne, &c., also with Miltonia vexillaria, and in the warmer atmosphere of the Cattleya house, some are suspended in a shady position near to the roof-glass, whilst others are standing upon the ordinary staging, and up to the present time there is no perceptible difference in the growth of the plants.

Oncidium Marshallianum.—Recently imported plants should be placed in pots of suitable sizes which should be filled with crocks. The plants require similar treatment to that advised for the Dendrobiums, but they should be placed in the cooler division. When the roots show signs of pushing out it will be advisable to repot them. For the provision of drainage I twist some well dried pieces of Fern rhizome around the bottom of the pot, and for a compost use peat, leaf soil, and sphagnum-moss in equal parts, intermixing with it a moderate quantity of small, broken crocks to prevent rapid decay and to increase the drainage.

Deciduous Calanthes.—In the warmest division plants of the C. vestita section are now flowering, and only a moderate quantity of water should be afforded till all the flowers are expanded, when it should be withheld altogether. Arrange the plants in a cool part of the house, or, if more convenient, they may be removed to a similar position in the Cattleya house, and, if it is possible to keep their surroundings somewhat drier than is necessary for the other occupants of the house, the flowers will last a long time in good condition. If the flowers are opened in the Cattleya house, they generally last longer, and when cut for decorative purposes will fade less quickly than those which open in the East Indian house or plant stove.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Editor and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DECEMBER 25—*Christmas Day*, Quarter Day.

WEDNESDAY, DECEMBER 26—Bank Holiday.

SATURDAY, DECEMBER 29—Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—38·3°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, December* 19 (6 P.M.): Max. 47°; Min. 38°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December* 20 (10 A.M.): Bar., 30·5, Temp., 40°; *Weather*—Foggy.

PROVINCES.—*Wednesday, December* 19 (6 P.M.): Max. 48° Wigtonshire; Min. 43° Cambridge.

"The Plants of the Bible." This is not the first book that Prof. Henslow has written on this subject. A "primer" bearing the same principal title was issued by him some few years ago. The present volume is an expansion of the former one, with various additions. Fruit and timber trees, shrubs, flowers, herbs, agricultural plants, textile plants, spices, perfumes, dye plants, desert plants, and water plants are all passed in review. Of course, in many cases, it is impossible to determine with accuracy what precise plant was intended by the Scriptural writers. Often a particular term was used in a general sense, or had a symbolical significance attached to it, just as nowadays people speak of Roses, Lilies, or Laurels, and apply those names to many different plants, without the slightest regard to their strict botanical application.

In other cases it is possible to state with more or less confidence what the writers had in view. The determinations are arrived at from internal evidence furnished by botanical characteristics, from a knowledge of the existing flora and climatal relations of Palestine and adjacent countries, and from philological deductions from the Hebrew, Arabic, and Greek languages.* Prof. Henslow has availed himself of all these sources of information, and has first-hand knowledge of the vegetation of Eastern lands. He states his opinions very lucidly, and gives copious references which will enable the curious to pursue the subject more fully. In a few cases, the professor has supplied his own interpretation of the significance of certain names—for instance, *almug*, which he identifies with the Yew. The manner in which he arrives at this conclusion is typical of his procedures throughout. He first cites the Scriptural books in which the name appears, and then gives the opinions of preceding commentators which all point in the direction of some coniferous tree growing on Mount Lebanon. Then he takes us to Nineveh, whence have been obtained portions of wooden beams which on microscopical examination have proved to be made of the Yew. In Greek, we are told, the Yew was called *Smilax*, and hence the question arises what, if any, connection is there between the Hebrew word *almug* and the Greek *Smilaks?* Take away the initial and the terminal letter s, and we are left with milak—now *k* is equivalent to *g*, and *m* and *l* are supposed to be transposed, and so ultimately we arrive at *l, m, g,* or *almug*! Philological sleight of hand of this description would enable us to prove (?) anything. As in the case of statistics, the evidence requires to be very fully sifted to see what is relevant and what imaginary. It would not become us to express an opinion on this particular case. We cite it to show the care which the professor has taken to cull information from all accessible sources. We feel that we are on safer ground when we demur to the author's statement on p. 53 that the sweet, juicy scarlet cup which surrounds the seed of the Yew is very poisonous. It certainly is not so always, though the seed itself, like the foliage, may be.

Under the head of Willow, Mr. Henslow speaks of Salix babylonica as a native of Palestine. It is generally considered to be a native of China, and that the "Willows" upon which the Israelites hanged their harps were more probably what we now know as Populus euphratica. Very few flowers are mentioned in the Bible by name. The true Rose, as we understand it, is not alluded to in Scripture; what does duty for it, according to our author, is the Meadow-Saffron, Colchicum autumnale. It would take up too much of our space to allude to any other plants mentioned by Prof. Henslow. We have said enough to show that the book is of very special interest to the general, as also to the botanical, reader, and that if there is room for differences of opinion as to the identity of species, there is none as regards the diligence and skill of the writer. There are numerous illustrations and a good index. In connection with the botany of Palestine, we may refer to Mr. Sutton's letter from the Holy Land printed in our issue of April 28.

* *The Plants of the Bible: their Ancient and Mediæval History*, popularly described by the Rev. Prof. Henslow. ([illegible] & Co.)

*** **OUR ALMANAC.**—According to our usual practice we shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1907. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical, and Allied Societies, or any of our correspondents, will send us* **IMMEDIATE INTIMATION** *of all fixtures for the coming year.*

LETTERS TO YOUNG AND OLD.—By Mrs. C. W. EARLE, author of "Pot-Pourri from a Surrey Garden," &c. (London: SMITH, ELDER & Co., 15, Waterloo Place). A book by Mrs. EARLE can be taken down at any time with the assurance of finding something in it to amuse and interest. The present volume is in this matter no exception to its predecessors, and readers of all ages and of varied tastes will enjoy it. Here are letters written by the authoress from Germany and from Paris, as well as many pages devoted to gardening topics, and there are also included some very interesting letters sent by Lady NORMANBY from Paris in the eventful year 1848. Mrs. EARLE need not write deprecatingly of her own contributions to these chapters, for her unassuming gardening notes offer many suggestions to other lovers of plants and they show appreciation and discrimination where uncommon or new varieties are concerned. As we cannot be expected to sympathise entirely with all the many opinions here expressed, it is no bad compliment to say that the remarks of the author on a vegetarian diet seem to us extreme. But from this topic and from cookery receipts it is easy to turn back to the safer subjects of travel, household management, or modern history. The arrangement of the letters into chapters makes them very convenient for reference and each chapter or section is prefaced by an appropriate quotation from some standard author. The book is nicely got up, so that being in all ways attractive, it would make a seasonable and welcome gift both to those to whom previous volumes by Mrs. EARLE are ranked as old friends and to others who will find her writings new and pleasant acquaintances.

ORNAMENTAL-LEAVED BEGONIAS.—As market plants, a writer in *Muller's Deutsche Gartner-Zeitung* recommends the cultivation of "Leaf" Begonias in pots in hot-bed frames, in which growth is better and the leaves firmer than in warm houses, the colours more intensive, and lastly the plants are less liable to attacks from disease and mites. When the roots have reached the sides of the pots the amount of air afforded should be largely increased. It is advisable to put a thin shading of lime and sour milk or other mixture on the glass in order to prevent the scorching of the leaves, and in very hot weather to supplement this with some portable shading. These "Leafed" Begonias make excellent material for filling jardinières, large vases, and bowls. *F. M.*

POTATOS IN SURREY.—The following extracts are taken from Mr. JOHN WRIGHT's report on the Potato trials at Merton in 1905, and at Farnham in 1906. For the purpose of testing the influence of seed tubers from cooler and later districts with Surrey and Middlesex raised tubers in the production of crops, an equal number of tubers were procured last year and planted side by side in dark sandy soil at Merton. Though all were grown under identical conditions of soil, manure and weather, the results varied enormously. The yields are accurately summarised as follows:—*Crops at Merton, 1905.*—From Irish sets, 140 lbs.; Scotch sets, 119 lbs.; Middlesex sets, 74 lbs.; Surrey sets, 71 lbs. As may be seen at a glance, the difference between the worst crops (from Surrey grown seed) and the best (from Irish seed) is within a shade of 100 per cent. The planting tubers from Ireland were a trifle larger than those from Scotland, but not than those which were raised in Surrey. With such remarkable divergencies in yields, another test of the same nature became necessary for confirmation or otherwise of the facts obtained. At Farnham this trial was placed in the charge of Mr. A. DEAN, a recognised expert, who contributes the following pertinent observations: "The results obtained present to all Potato-growers bear out what was found in the previous trial and other experience in the south of

England. It is also interesting to find that not only do Irish seed tubers prove to be as reproductive as the Scotch seed, but in some cases the products exceed those from the last-named source. This may be seen in summarised form, taking the first six varieties from the table, i.e., the yields from an equal number of tubers of each variety." *Crops at Farnham, 1906.*—From Surrey tubers, 65 lbs.; Lincoln tubers, 150 lbs.; Scotch tubers, 225 lbs.; Irish tubers, 237 lbs. *Variety trials.*—On spare land in the seed trial enclosure equal numbers of tubers of the undermentioned varieties were planted, with the results appended: Conquering Hero (Irish), 38 lbs., Up-to-Date (Basingstoke), 38 lbs.; Peckover (Wisbech), 36 lbs., Superlative, 28 lbs., The Scot, 26 lbs. Several varieties from Surrey sand gave such poor yields in comparison that they are not worth mentioning. *Soil.*—If we take from the table of results six typical yields, we find the average to be as follows: From sand, 61 lbs.; peaty loam, 135 lbs., medium loam, 188 lbs.; strong loam, 233 lbs. It may be that in a wet season strong soil might not give equally good results, while the land of good medium texture might give somewhat better. Light, poor, sandy soil should be avoided for Potato culture where stronger land is available. *Climate.*—Beyond doubt climate is an important influencing factor. In the south the tubers are liable to *over-ripening*, and the harder they become, as in sandy land, the more they are impaired in reproductiveness. The matter has been thoroughly tested in a carefully conducted series of trials by Messrs. Sutton & Sons, Reading, during the past and the present seasons. Immature tubers give better results in crops than hard, fully-ripened, or *over-ripened* tubers can do in any kind of soil. That is the rule. There are no worse Potatos for planting than those grown in Surrey sand in a dry, hot summer.

THE SWEET PEA TRADE in England is reported in the *Florists' Exchange* to be simply phenomenal.

THE LATE COUNT DE KERCHOVE DE DENTERGHEM.—All those interested in progressive horticulture, and especially visitors to the Ghent quinquennials, will realise the extent of the loss entailed on European horticulture by the death of the President of the Société Royale d'Agriculture et de Botanique de Gand. Many such persons will feel it a privilege to contribute towards the memorial which is to be erected in Ghent to perpetuate the memory of a man as remarkable for the number, variety, and excellence of his public services, as for his personal character. It is to be hoped that such a response will be forthcoming as will show that our countrymen are not insensible to the many services rendered by the late Count to horticulture or ungrateful for the abundant manifestations of helpful courtesy bestowed upon them at the quinquennials and on other occasions. Subscriptions for the above purpose may be sent to Dr. MAXWELL MASTERS, F.R.S., 41, Wellington Street, Covent Garden, and will be acknowledged in these columns.

CIDER-MAKING.—At a recent meeting of the Devon and Exeter Gardeners' Association, Mr. HENRY WHITEWAY, a member of the firm of Messrs. WHITEWAY & Co., cider manufacturers, of Whimple, stated that, in addition to the produce of 240,000 acres of orchards in the country, Great Britain annually consumed imported Apples to the value of nearly three millions sterling, besides large quantities of Apple juice in the shape of cider, concentrated Apple juice for sauces, and Apple vinegar. The demand for Apples was practically unlimited, and even France and Germany were large importers of the fruit. As regarded his recent visit to Germany, Mr. WHITEWAY remarked that he was bound to say he saw nothing in that country's mode of cider-making which was worth imitating. But the most astounding thing to him was to be told that—in a country where the small peasant farmer tilled his land to the very last inch abutting on that of his neighbour's, and where the hedgerows were even dispensed with to make the most of the land, and where the culture of the Apple tree had been understood for ages—after Christmas in each year Germany depended upon America and Canada for a very large proportion of the Apples required. If an English farmer were asked to sprinkle a little fluid over every tree in an orchard, say of three acres, he would probably demur, but in America and Canada the farmer who had a hundred acres of orchard would not miss spraying every branch three or four times, or at any rate once or twice, every spring. The value of the operation for destroying insect pests, preventing spotted and worm-eaten fruit, and for promoting the healthy growth of the tree and foliage, was so well recognised that a Canadian farmer would no more think of omitting to spray his orchard than a Devonshire farmer would neglect to dip his sheep.

THE NATIONAL AMATEUR GARDENERS' ASSOCIATION held its sixteenth annual dinner at the Holborn Restaurant on the 11th inst. Mr. T. W. SANDERS, F.L.S., presided. In proposing the toast of "The National Amateur Gardeners' Association and its Affiliated Societies," the president commented upon the remarkable growth of the association since its inauguration 16 years ago, a success which was in large part due to the untiring efforts of the officers, and in particular to the secretary, Mr. RICHARD CORDWELL.

LIST OF SEEDS FROM LA MORTOLA. We have received from Mr. ALWIN BERGER, Curator, a list of the seeds collected during 1906 in Sir THOMAS HANBURY'S garden at La Mortola, Ventimiglia, Italy, and note among them many beautiful and uncommon species. Growers wishing to obtain seeds or cuttings should make speedy application for them, mentioning what seeds or plants they can offer in exchange. A list of "desiderata" is given in the list and should be consulted.

SUCCULENTS AT MANCHESTER.—The collection of the late Mr. DARRAH, of Heaton Mersey, has been presented to the city of Manchester and has been housed in the Alexandra Park where suitable buildings have been erected for the culture of these very interesting plants. We have at various times given illustrations from Mr. DARRAH'S collections, and can heartily congratulate the city of Manchester on possessing so fine a collection. Mr. ARTHUR COBBOLD, we are pleased to see, remains in charge of the collection.

NEW HORTICULTURAL THERMOMETER.—A new horticultural thermometer, sent out by Messrs. NEGRETTI & ZAMBRA (38, Holborn Viaduct), has the glass tube and bulb filled with spirit guaranteed to maintain its red colour under all circumstances. The figures and divisions are plainly marked and it is especially strongly made. A self-registering thermometer for determining the greatest cold during the absence of the observer is a necessity in the outfit of both the professional and the amateur gardener.

MILD WEATHER IN DECEMBER 100 YEARS AGO.—A correspondent, who is evidently somewhat irritated by his elders' frequent references to the "good old times" when the winters were really cold, and the fact was reflected on what answered to Christmas cards by the robin and the snow-covered ground and Holly, has sent us the following extract from the *Northampton Mercury*, of December 13, 1806:—"The extraordinary mildness of the present season is shown in several remarkable instances. At Hampton-Lucy, in the grounds of Mr. OSBORNE, of that place, there is a May-bush now in bloom, and in the garden of Mr. FORSTER, surgeon, there is an Apple-tree in full blossom." Our correspondent may therefore console himself. "History repeats itself" in respect to the weather conditions of our country, as in many other things, notwithstanding the contempt of "the oldest inhabitant" for all things modern, and the change that has taken place in the character of our Christmas cards.

WEED-KILLER POISON.—At Chelmsford, the Medical Officer has reported that in some suspicious cases at Margaretting, he found eight people suffering from arsenical poisoning. The affected persons had drunk beer from a gallon bottle, in which the doctor found a crust of arsenical salt sufficient to kill nearly the whole village. The bottle was purchased at a farm-sale, and it probably (says a newspaper report) had been used to hold sheep-dip or weed-destroyer, which had dried up.

DAHLIAS.—The following First-Class Certificates were awarded by the National Dahlia Society to new Dahlias in 1906.—Show—Gloria and Claret Cup, Mr. S. MORTIMER. Cactus—Meteor, Dr. G. G. Gray, Diavolo, Rev. Arthur Hall and Sunshine, Messrs. J. STREDWICK & SON; Daisy Staples, Messrs. F. CARTER & SONS. Hyacinth and Ruby Grinsted, Messrs. J. STREDWICK & SON. Pompon—White Perfection, Mr. W. EACOTT; Portia and Rodney, Mr. CHARLES TURNER. Singles—Kitty, Messrs. J. CHEAL & SONS, Mavourneen, Mrs. M. V. SEALE. Special Awards on September 6, 1906:—Silver Medal, for best bunch of Cactus Dahlias in Trade Classes—Messrs. J. STREDWICK & SON, for Rev. Arthur Hall. Silver Medal, for best bunch of Cactus Dahlias in Amateur Classes—Rev. A. BRIDGE, for Fairy. Bronze Medal, for best new Show or Fancy Dahlia—Mr. S. MORTIMER, for Gloria.

Publications Received. Liverpool University, Institute of Commercial Research in the Tropics. *A Catalogue of the Aburi Gardens.* This is a "complete list of all the plants grown in the Government Botanical Gardens at Aburi, Gold Coast, West Africa," prepared by Mr. A. E. Evans, Curator of the Gardens.—Board of Agriculture and Fisheries. *Report on the Decline in the Agricultural Population of Great Britain, 1881-1906.*—County Council for the County Palatine of Lancaster. *Report of Experiments on Liming Meadow Land.* By Edward Porter and R. G. Gaut. Mr. H. Lloyd Snape, Director of Education, forwards this important report, which deals with a comparison of the use of ground limestone with that of ground lime and of cob lime.—*Farm and Home Year-Book for 1907.* This well-known publication will be welcome as usual to all interested in agriculture and fruit-growing, and contains many useful notes as well as the longer articles. It is brought up to date, and written by competent authorities.—*The Estate Magazine*, December. This is a Supplement to the *County Gentlemen's Estate Book.* The contents include articles upon Whaddon Hall, The Woburn Experiments, Weeds and Leaves as fodder, Gardening, &c.—*The Garden City*, December.—*Agricultural Bulletin of the Straits and Federated Malay States*, September. H. N. Ridley and J. B. Carruthers.—*Bulletin of Miscellaneous Information, Botanical Department, Trinidad*, October. Edited by J. H. Hart. With notes on Castilloa, Cacao diseases, the Date Palm, &c.—*Bulletin of the Department of Agriculture, Jamaica*, November. Edited by W. Fawcett. Contains notes on rubber-producing plants.—*Report of the Board of Commissioners of Agriculture and Forestry of the Territory of Hawaii.* For the year 1905. Various trials were made with Tobacco and with different fruits. Much successful work was accomplished and progress made.—*The Salvation Army Emigration Gazette.* November. A new publication that gives an idea of the useful work undertaken by "the Army" in assisting emigrants. Canada offers a still open field for them, and gardeners (amongst others) are recommended to try life in Ontario, where, if strong and able-bodied, there is no lack of employment, and their wives and families will be made equally welcome with themselves.—*Live Stock Journal* (Vinton & Co., Bream's Buildings, Chancery Lane). Of special interest to breeders of cattle, horses, sheep, &c. Copiously illustrated and with much useful information.—*The World's Work*, December. A very "fresh" magazine, full of practical interest and richly illustrated (London: Heinemann).

ROME.

THE BORGHESE GARDENS.

THESE gardens were originally established, or commenced, early in the 17th century, by Camillo Borghese, who was raised to the Papal Throne in 1605. He already had a villa and gardens at

[Photo by Mr. J. Cheal.

FIG. 159.—VIEW IN THE BORGHESE GARDEN, ROME.

Frascati, but he desired a residence where he might receive Ecclesiastics, Roman nobility, foreign ambassadors, and Court-ladies nearer to Rome. He therefore built the fine villa and commenced to lay out the gardens. These gardens soon became famous and were frequently opened to the public. In after years they were enlarged to a considerable extent by succeeding owners. The family of Borghese was an old and influential one in Rome, and amongst its members was Pauline, sister of Napoleon I., who married Don Camillo Borghese in 1803.

About half a century ago the gardens passed into the hands of the Corporation of Rome, and they considerably altered and adapted them to the requirements of a public park. Although the original character of the garden had thus been partially destroyed, yet many of their old features have been retained, noticeably the "Garden of the Lake," with its swans and Pseudo-Greek Temple (see fig. 160), which is so beautifully reflected in the water, and is surrounded by lovely woodlands, brilliant in the spring with the pink flowers of the Judas tree. There are beautiful drives laid out through the well-wooded grounds, which are a fashionable resort of Roman society to-day, whilst its ample terraces form promenades for citizens.

It is interesting to note that Duff House, which has just been presented to the Corporation of Banff and Macduff by the Duke of Fife, is an imitation of the celebrated Borghese Palace.

THE VATICAN GARDENS.

The Vatican Hill has been from prehistoric times a sacred and interesting spot, and was anciently the Garden of Agrippina, and the Circus of Caligula. Pope Sextus IV., who first laid out the gardens in somewhat of their present form, surrounded them by terrace-walls and high hedges, and they are all a good example of the 15th century style of Italian gardening.

The terrace, from which the accompanying view was photographed (see fig. 161), affords the most beautiful view of the Dome of St. Peter's, and has long been a favourite promenade of successive Popes.

There are many interesting and beautiful features in these extensive gardens, which are open to visitors after obtaining the necessary permits.—*Joseph Cheal, Crawley.*

In addition to the photographs kindly sent us by Mr Cheal, we have reproduced others at fig. 162, which were obligingly placed at our disposal by Mr Sprenger, of Naples. These illustrate the decorative purposes to which Agaves and Palms are employed in Rome, and incidentally, also the attractive appearance of the Railway Stations in that city.—ED.]

VEGETABLES.

COOKING POTATOS AND SOILS.

No test of the merits of any variety of Potato in a properly cooked state is complete or satisfactory unless tubers of equal size and grown under similar conditions of culture, but on soils of diverse nature, are included. Recently I had sent me from Dorset chalk, even-sized tubers of both Factor and Up-to-Date. Having samples of these varieties of equal size from medium loam and from black sand in Surrey, I was enabled to test the merits of each when cooked, and found those from the chalk to give much the best quality, loam coming next and the black sand last. But it has long been notorious that chalk, whilst on the whole not giving the heaviest crop, invariably gives the best table quality. Thus in any Potato-testing in a cooked state, one variety from chalk, another from loam, a third from sand, a fourth from clay, and a fifth from bog, it will be found that it is the soil on which the tubers are grown which determines the table quality. *A. D.*

FIG. 161.—THE VATICAN GARDEN AT ROME, SHOWING THE DOME OF ST. PETER'S IN THE DISTANCE.

THE GRASSITES.

A PARABLE FOR THE SEASON.

ONCE upon a time there was a world very much like our own, but upon which nothing but vegetation had been evolved, so that there was nothing but trees and shrubs and smaller plants of many kinds down to tiny mosses, and even to still tinier vegetation that could only be seen had microscopes existed, which, of course, was not the case. This state of affairs had lasted for many quintillions of years, and although there was naturally a good deal of pushing and shoving among the plants for elbow room and light and a good many weaklings thus came to grief entirely, there was a sort of balance arrived at which enabled the bulk of the plant-world to live and even flourish. In course of time, however, something akin to thoughts and ideas became developed in every plant, and these being naturally the outcome of their environment, it came to pass that the bold and lofty trees had broader

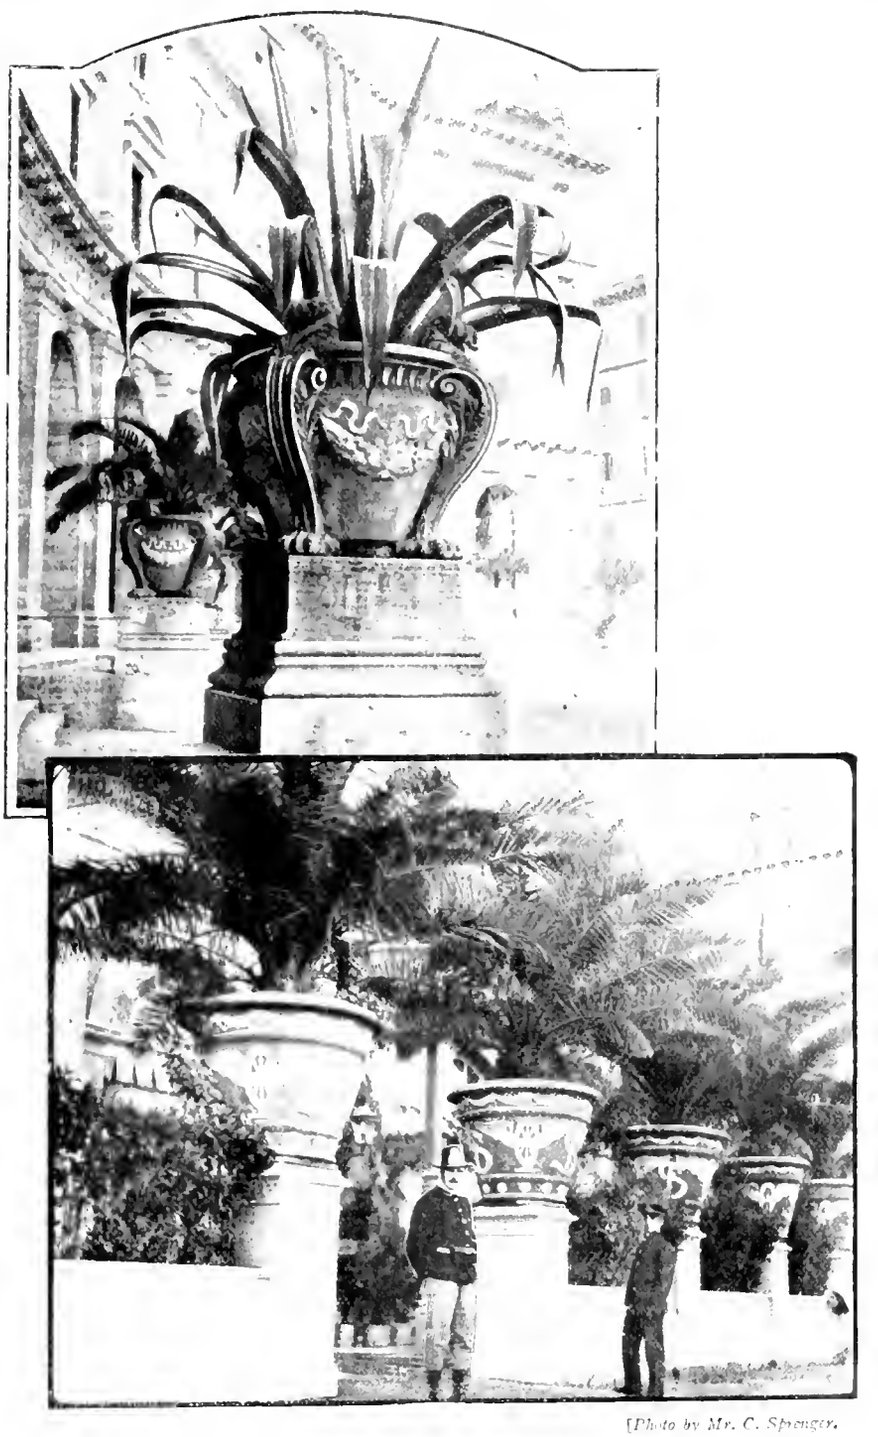
views and were more far-seeing than was possible, say, for the grass of the fields, which could not even see any farther than its neighbours, and being so cramped in view was inevitably more short-sighted than the big trees aforesaid. All through the vegetable world there was thus a grading downward and upward from the grand to the infinitesimal, and vice versâ. Still for a long time these differences led to nothing, but presently the idea got about—how it is difficult to say, but it did—that one opinion was as good as another, and that this being so the more there were who had a particular opinion, the greater the chance there was of that opinion being right, and this idea led to another, for the grass population, in which each blade counted as an individual, began to put this and that together, and finally claimed that as they formed by far the largest number, making what they called in their vegetative tongue "a madjority," they should practically rule the roost and be, not exactly the kings—they did not like to put it like that—but the "bosses" over all the rest of plant-creation. The big trees listened to all this, as did the shrubs and other larger vegetables, and being eventually summoned to a sort of conference by the Grassites, were foolish enough to accept their views as regards the equality of value of all opinions and though they did not mention this (not having grasped the fact), the consequent equality of a blade of grass to the nob'est Oak. Some, indeed, of the most far-seeing trees had their doubts, but as unfortunately the tree party at the conference had already unwittingly gone far in the same direction, by admitting a lot of inferior shrubs and assertive weeds to a voting equality, the Grassites were granted in all future councils equal individual rights with the trees, so that if a big Oak tree said "No!" and a blade of grass "Yes!" the one counterbalanced the other. This was termed, also in vegetative language, "universal sufferage." Having got this length, the Grassites now began to assert themselves and to complain that the big trees and many of the shrubs were encroaching on their rights by growing far too high and spreading their branches far too widely, so that they monopolised large areas of ground upon which thousands of Grassites could otherwise flourish, and that this sort of thing was an injustice, an oppression, and several other things of that unpleasant kind, and at the next meeting of Parleyment it was decided by an overwhelming madjority, that although the Grassites did not see their way to cut down the existing trees and shrubs, the offspring of these should be deprived of their hereditary tree tendencies and should be reduced to Grassite dimensions so as to uphold the great law of "equality" in the adopted motto of vegicreation. The poor trees and shrubs saw, alas! how greatly they had erred, but it was too late, and in the course of a generation or two all the great forests and thickets, and even the Roses and Lilies and all their tribe, had disappeared, and the Grassites alone ruled the world. Now, however, strange to say, it came to pass that among the Grassites, the big trees being gone, very marked inequalities began to be noted, such as the big Bamboozians, the smaller but worthy Cerealians, and the small fry of the Pastureans, and as the Pastureans were in the so-called madjority, the big Bamboozians and the worthy Cerealians also disappeared, and the whole world was like a fine lawn. Now, however, when everybody ought to have been content, there began to be a great lack of rain, which is the life blood of the Grassites, and when it did fall, instead of dripping "like a gentle dew from Heaven," it came in rushing torrents, sweeping the Grassites away into the rivers and into the ocean, and when it passed leaving bare wastes to be sunburnt and rendered sterile as the desert and utterly inaccessible to Grassites. Then and then only did it dawn upon this miserable little folk, that the big trees and the shrubs and the Roses and Lilies which they had banished had practically provided the life-giving rain by their beneficent influence, and that the levelling of plant-society they had brought about by their vanity and ignorance had literally become a dead level, and though they had got their desert in one sense, they had also unfortunately got it in another.

But their misfortunes were not yet ended, for the doctrine of equality began now to be asserted by all the still lower forms of vegetation than the Grassites, the mosses, lichens, seaweeds, fungi—nay! even the very bacteria themselves held a conference, and as the bacteria outnumbered the Grassites, forming even a "madderjority," everything was eliminated but the bacteria themselves, and the whole world became optically lifeless! *Chas. T. Druery, V.M.H., F.L.S.*

IMPORTANT DEPUTATION ON RAILWAY RATES.

On Thursday, the 13th inst., Mr. Lloyd George, President of the Board of Trade, received a deputation of about 130 representatives of all important industries and Chambers of Commerce throughout the Kingdom, including 27 M.P.'s, who sought the help of the Government in aid of a Bill presented by Mr. Hooper, Member for Dudley, "To amend the law relating to Railway and Canal Companies' rates and conditions of conveyance."

The deputation had been arranged by the Mansion House Association on Railway and Canal Traffic, the market gardeners being represented by Mr. W. J. Lobjoit and Mr. Walter Mann, horticultural traders and nurserymen by Mr. Rivers and Mr. Cuthbertson (Dobbie and Co., Fruit and Potato Trades' Association by



[Photo by Mr. C. Sprenger.

FIG. 162.—A RAILWAY STATION AT ROME, SHOWING THE DECORATIVE EFFECT PRODUCED BY AGAVES AND PALMS.

(For text see page 428.)

Mr. John Dennis and Mr. Geo. Monro, of Covent Garden.

Mr. Hooper went very fully into the grievances caused by the combinations of railway companies, and especially in regard to the objectionable conditions of the owners' risk rate, and was supported by Sir W. Tomlinson, Lord Brassey, Mr. Edmunds, M.P., Lord Glantawe, and Mr. Geo. Monro, president of the National Fruit and Potato Trades' Association.

The latter stated that possibly no industry represented in that large gathering was so penalised by the railways as the fruit-trade, mainly arising from the fact that when the existing classification was approved by Parliament, fruit-selling was but a small trade, and therefore was not represented. The railway companies consequently had imposed fancy rates, and the only reductions now obtainable were all on the basis of owners' risk, with the conditions which Parliament never intended should be applied to any rates between railway companies as carriers and traders. They were thus gradually driving the whole trade into this rate by making a great difference between companies' risk and owners' risk rates, in some instances the difference amounting to over 100 per cent.

In answer to Mr. Lloyd George as to the conditions wanted on owners' risk rate, and a definition of the risks traders should take under that rate, Mr. Monro gave as an instance the question of time limit, a most essential element in any trade in goods of a perishable nature; that under owners' risk railway companies should not be liable if trains were prevented by fog or accidents from making a reasonable delivery, but in cases where it was simply delay on their part, without any outside obstruction, they should be held liable, and not (as at present) deliver goods hours, and even days, after the usual recognised time, or lose them altogether, and still refuse all liability.

The reception given to the deputation was so encouraging that it is hoped that the grievances under which the trade suffers may shortly be remedied.

LAW NOTES.

STORY OF AN ORCHID.

At the Salford County Court (December 17), as we learn from a local paper, an action was brought to recover £75, the balance of price of an Orchid sold and delivered.

In June last plaintiff attended a sale of Orchids, and bought a number of plants. One of them proved to be a valuable Cattleya. The defendant eventually agreed to purchase the plant for £78. It was arranged that the payment should not be made in cash, but that the plaintiff should receive from the defendant Orchids to the like value in exchange, and he made his selection of the plants he was to receive. The defendant assured him that these plants were worth £100. When they got to his place, however, the plaintiff missed one plant he had selected, and upon making further examination he had reason to believe that only six of the 40 plants he had selected had been sent. Subsequent information confirmed his opinion that the plants had been changed, with the result that these proceedings were taken.

The plaintiff, in the course of his evidence, said that if the flower of the Cattleya he sold to defendant had been all white, instead of being slightly tinged with yellow, it would have been worth a thousand guineas.

A gardener in the defendant's employ, and afterwards in the plaintiff's employ, said that a number of the plants selected by the plaintiff were changed. Those which were sent would not be worth more than £10

His Honour: Did you think defendant was defrauding plaintiff?

Witness: Yes.

His Honour: And you helped him to cheat his friend—is that it?

Witness: Well, I——

His Honour: Very well.

Another gardener, also formerly in defendant's employ, spoke to a number of the plants having been changed.

The defendant's version of the case was a flat denial of the allegation that the plants had been changed. He said the only price ever mentioned in connection with the Cattleya he obtained from the plaintiff was £10.

His Honour said he entirely accepted defendant's evidence, and had no doubt that he had been perfectly honest in the transaction. The plaintiff had possibly been inspired to bring the action by listening to the tales of discharged servants. There would be judgment for the defendant with costs.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE BRITISH GARDENERS' ASSOCIATION.—The statement made by Mr. Watson in the *Gardeners' Chronicle* for November 24, that this association has dropped into the undignified position of an employment-registry office is undoubtedly the opinion of many who have become members. That there should be cause for such an opinion is certainly to be regretted, particularly after the able manner in which the matter had been taken up by Mr. Watson and other gentlemen on behalf of the profession, for the purpose of "mutual protection and assistance." After nearly two years' hard work, the number of members has reached nearly one thousand; surely everything should now be done by the Executive Council and the various committees to avoid a single reduction in this number: on the other hand, any suggestion that may possibly lead to the increase of numbers should be carefully considered. It is very clear by the present feeling, that a secretary with a London office (however necessary this may be) will not be able to keep its members in full sympathy with one another, particularly those residing in the provinces. In some of our towns the members of the British Gardeners' Association have been able to form a Mutual Improvement Branch, this will greatly add to the interest taken in the society generally. Other towns again already possess a Mutual Improvement Branch *so called*, but carried on, unfortunately, by "undesirables," who have no sympathy with the professional gardener, although amongst their number they may have a few highly-respected professional men (gardeners), who are "generously" allowed to place before them their life experiences by way of reading papers on various subjects, and answering the many questions put to them by the "tinkers" and "tailors" present. When a branch of this description is already formed it is a very difficult one to combat, owing to lack of support from the head office of the British Gardeners' Association, which is due to the diminutive subscription received from each member. It is very doubtful whether there is another society anywhere with a subscription of less than three farthings per week per member. What can be done with such a small sum? If our society is ever to be worth the name of a society, it was worth a larger subscription from the commencement, half of which sum, I think, should have been returned to the local secretaries in proportion to the number of members in their respective branches. This financial assistance would have enabled them to have held the annual meeting and also engaged a room for lectures, &c., at various times or whatever the local committee selected, or even provided funds for sending a representative to London for the annual general meeting to put forward any suggestions that might have been brought forward by the local branch. All this would increase the interest of individual members in the society as to the advantage of co-operation Under the present conditions this manner of working is entirely out of the question, owing to the expense which would be entailed thereby. It would, I feel, be impossible to obtain an increase of subscriptions locally, or, rather, by any local method; but no gardener with the objects of the society at heart would have objected to the subscription being large enough to have made the society a success. Meetings that have been held have been undertaken at the expense of a few generous members. [We are informed that the executive has paid the cost of meetings when asked to do so.—ED.] This surely is not as it should be. It certainly is a matter for immediate consideration by those in authority. It is not only an employment registry office in London that is required, but a real "live" gardeners' society, which is only possible to obtain by having the necessary financial assistance from headquarters, coupled with the assistance of educated professional gardeners with the love of their profession at heart, and a keen desire to help the younger members and those who have perhaps been less fortunate than themselves. This and this alone will cause a real interest to be felt in all local branches *H. R., Cardiff.*

RE-NAMING AMERICAN CARNATIONS IN ENGLAND.—Recently, in the *Gardeners' Chronicle, New Yorker* accused the English nurserymen of re-naming the new American Carnations on their arrival in this country. As a result of this, the New York *Florists' Exchange*, copied the remarks of *New Yorker*, and shortly commented thereon in the issue dated November 17. The following week, November 24, the enclosed note appeared in the American paper named, from which it will be seen, as I pointed out in the *Gardeners' Chronicle* at the time, that the name Mrs. W. T. Omwake was bestowed upon a sport of Enchantress in America by the introducer of the sport. That there is more than one pink sport of Enchantress is now quite obvious, and purchasers and sellers alike should therefore be made aware of the fact. The two varieties have already appeared at the Royal Horticultural Hall. *E. H. Jenkins, Hampton Hill.*

"RE-NAMING CARNATIONS IN ENGLAND.

"You are doing the Enghshman an injustice in claiming that Mrs. W. T. Omwake is a re-named Rose-Pink Enchantress. We introduced our sport of Enchantress through your columns only, under the name of Mrs. W. T. Omwake, and sold some stock in England. Our sport is not the dark rose-pink one, but is of a colour between those of Enchantress and the rose-pink sport. It is at its best the colour which Enchantress should be, as Enchantress in spring and fall is too pale. Unfortunately the past wet season had its influence on our sport, as well as on other sports, so that the colour does not come alike, some flowers shading darker, some lighter, which is also the habit of the parent itself; but by careful propagation the shades may be separated. But England was not guilty of re-naming an American variety in this case, as was claimed on page 602, issue of November 17. *Henry Eichholz, in the Florists' Exchange, November 24, 1906.*"

CHRYSANTHEMUM EXHIBITIONS.—Is the same amount of interest now taken by gardeners as was the case some few years back, when they used to attend the exhibitions in numbers to take down the names of the different varieties which were new to them, in order that they might form their own opinions as to the merit of particular varieties, that they might give each new or extra well-grown variety due consideration at the proper time when they might be ordering a few new varieties to replace some of the older ones? Is the present lack of interest caused through the principal classes having to be shown in vases, which is slowly but surely diminishing the number of varieties required, and will eventually lead to the raiser of new varieties being absent when there is no chance of obtaining further remuneration for his labours? This is being brought about by the exhibitor's decision to grow only about half the number of varieties, and to show in fewer classes than he has been accustomed to do. He is no longer able to arrange the flowers along the corridors or conservatory on boards after the show, each properly named, and thus to interest his employer in the different varieties and keep the flowers in good condition for a fortnight; and to decide which he will discard, and to receive some congratulations and encouragement for the extra labour which he has bestowed during the last year, This would mean good news to the Chrysanthemum Society and an order to the Chrysanthemum specialists or nurserymen. Some dissatisfaction is in the air. The employer has a right to expect that the flowers should arrive home in a presentable condition. It would serve a very good purpose to have the opinions of the present-day exhibitors through your columns. I think that a

few vases, evenly distributed through an exhibition, are a very great acquisition and break up the sameness of the shows. But while the chairman of the N.C.S. said he would like to see the boards driven from the show, I think such a proceeding would end in the exhibitor also being driven from the show. *L. K.*

BLANCARD FUND.—This fund will close on December 31 so that I can announce the result to the Mesdemoiselles Blancard on New Year's Day. There are still many names I should like to see on the list. Meantime I beg to acknowledge further donations amounting to £7 3s. 6d. *C. Harman Payne, Foreign Secretary N.C.S., 141, Wellmeadow Road, Catford, S.E.*

THE AUTHOR OF "THE GARDENERS' ASSISTANT."—Your correspondent *F. M.* is seriously in error in his statement on p. 402, that the gardens at Wrotham Park were, about the middle of the last century, under the management of Mr. Thompson, author of *The Gardeners' Assistant*. The Mr. Thomson who made the reputation of the gardens at Wrotham Park was the late Mr. William Thomson who founded the famous Tweed vineyard at Clovenfords, N.B., and who was previously at Dalkeith. The author of *The Gardeners' Assistant* was the Mr. Robert Thompson who practically all his life was associated with the old Chiswick Garden of the Royal Horticultural Society. I knew them both well. *Sabrina.*

APPLES FROM WREXHAM.—I am sending a few Apples for your inspection, hoping that they may be helpful to you in making recommendations for this district. Those enclosed are, perhaps, the most reliable of all the varieties grown here (upwards of 70). I may add to the list Mr. Gladstone, Beauty of Bath, Ecklinville Seedling, Stirling Castle, Tyler's Kernel, and Margil; although not big croppers, they are excellent in quality. The garden is a very exposed one, being sheltered on the north and north-east only, and we get most of our worst winds and storms from the south and south-west. One half the number of trees are planted on ground having a gentle fall to the south-west; the other half, on a similar slope, to the east, which is very unfavourable to the trees. The trees are given ordinary treatment. Spraying is never missed, which is a very important point, for notwithstanding the fact that we do not get the large size into the fruits that some do, we usually compare very favourably from the point of view of quality.—*Geo. Aitkens, Gardener P. L. Yorke, Esq., The Gardens, Erddig Park, Wrexham.* [Our correspondent has every reason to be proud of such apples as he has forwarded to us. They are of large size, good colour, and in every way satisfactory specimens of the particular varieties. We append the names of these, which are as follows: Alfriston, Bismark, Cellini, Cobham, Court of Wick, Court Pendu Plat, Cox's Pomona, Fearn's Pippin, Holland Pippin, Lady Henniker, Lane's Prince Albert, Lord Suffield, Mannington Pearmain, Margil, Mère de Ménage, Pomeroy, Pott's Seedling, Peasgood's Nonsuch, Schoolmaster, Tom Wood, Tyler's Kernel.—ED.]

PHEASANTS AND GUNNERAS, ORCHIDS, LILIUMS, &C.—I have been much interested in reading the letters that have appeared in these columns on this subject. In and around the wild garden and grounds here many hand-bred pheasants are put down each year, but in no instance have I observed them damaging Gunneras, although they have ample opportunity for doing so. Last spring we planted a quantity of Orchis foliosa by the bog garden; the crowns were well covered over, but the pheasants soon found them out and commenced to devour the crowns. All would have been destroyed had we not taken measures to protect them. Could it be the sense of smell that led them to the Orchis, as quite close to these were a lot of different varieties of Cypripediums which were not touched? I am well aware that pheasants are exceedingly fond of certain Liliums, and will dig down 6 inches for Lilium auratum, and this when the bulbs are at rest in the winter. Last spring they devoured a lot of bulbs of L. auratum and did not attempt to touch L. pardalinum, L. giganteum, L. canadense, or L. superbum, all of which were quite near L. auratum. Why did they select L. auratum? I wish they had been satisfied with a plainer diet. When Crocci commence flowering, yellow sorts—here at least—are the first to receive attention, flowers and roots being devoured; in loose soil they will clear them out 6 inches down in the ground. Another plant they seem fond of is the Marsh Marigold; this is taken when the plant is about to start into growth. We have to protect the Podophyllum. When Rhubarb commences to grow, these birds sometimes hollow out the crowns, but this does not happen every season. I wonder if it is only the hand-bred birds that are so mischievous? I do not object to them having a few Potatos or Turnips, but would like to draw the line at Liliums and other such treasures. *D. S. Melville, Pettalloch Gardens, Lochgilphead, N.B.*

SCHOOL GARDENING.—Whatever may be done in other counties, certainly to Surrey is due the credit of being the pioneer in the establishment of what are generally known as continuation school-gardens for boys who have left school, as, prior to the Education Act of 1902, by which the control of elementary education was given to the county councils, there were several hundreds of these evening-school-gardens in the county. With the advent of the new educational authority, a great change has taken place. Evening or continuation-school gardens for boys who have left school have given place to horticultural instruction in small gardens for the elder lads attending elementary schools, and now entirely under the charge of my friend and colleague, Mr John Wright, V.M.H., there are in Surrey some 65 blocks of such school gardens, and about 1,200 boys are being instructed in gardening in an elementary, yet practical, way. Let no one, however, assume that in this way it is hoped to raise up a race of professional gardeners. Horticulture is now recognised as a class subject, and earns a Government grant. Lessons last usually about an hour, are given twice a week, and the boys delight in the out-door occupation, because it brings a welcome change from the class-room desk—work of which there is far too much in schools. These boys learn how to use tools, and gain some information as to the nature of soils, seeds, and plants. They learn something of the requirements of vegetable existence, and their faculties are excited in a most useful direction. In a small way also they appreciate something of the discipline of labour. They have the benefit of instruction by either really good gardener-schoolmasters, or of some local gardener specially employed. There is also some economic sentiment clustering round school-gardening, because it is hoped, not unnaturally, that by thus early implanting in the young mind a love for gardening, and a taste for working the soil, our youth may be kept on the land rather than driven into overcrowded towns and cities. An old schoolmaster in Surrey quite recently said to me: "Being always fond of gardening, I long did my best in a small way to give the lads instruction in it, and so successful was I that whenever any lady or gentleman wanted a garden-boy, they sent to me for one. Many of those lads are now in good situations." That is indeed valuable testimony. Now, not only is all ground provided by the authority, but seeds, plants, manures, tools, and good instructors are all found for the lads. Mere ornamental gardening is not taught; something more practical is looked for, hence vegetable culture is the dominant feature, all the best-known kinds being grown. A few simple flowers also are added. At some schools where spare ground is available, a special plot is devoted to fruit-culture also. Here, in Kingston-on-Thames, where the authority is not of the county, but local, in consequence of the erection of some fine new schools, spare ground was available for school gardens. At the authority's request, I set out the area in 23 plots each 20 feet by 10 feet, making the boys set the line, drive the corner pegs, mark out the paths and plots, and cast the surface path soil on to the plots. That was the initial lesson, and a useful one. Then seeds and Potatos were obtained, and a gardener-instructor secured. Since then lessons have gone on twice a week in school days and once a week in the holidays. We are hoping next year to see a big county exhibition of school-garden-produce initiated. *A. D.* [This is an example which might with great benefit be followed in every country district. We recently published an illustrated account of similar school-gardens in Hertfordshire, formed under the direction of Mr. George Paul.—ED.]

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

DECEMBER 11.—*Present:* Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Spencer Pickering, F.R.S.; G. Massee, Odell, Douglas, Bennett-Poe, Bowles, Worsdell, Hooper, Saunders, Gussow, and Chittenden, hon. secretary.

Dying Sempervivum.—Mr. SAUNDERS reported that he could find no reason for the death of the Sempervivum shown at the last meeting from Mr. O'BRIEN. "There were no signs of injury to the leaves by insects, nor did I notice any on the roots. I could see no trace of fungi. Perhaps the plants had been kept too damp?"

Cattleya fly.—Mr. SAUNDERS also reported that "the shoots of the Orchids shown by Mr. BOWLES were undoubtedly infested by the so-called 'Cattleya fly' (Isosoma orchidearum). It is not, however, a fly, but a hymenopterous insect belonging to the family Chalcidideæ, the members of which are parasitic on other insects as a rule. The genus Isosoma is placed in the sub-family Eurytomideæ, several members of which are found in gall-like swellings in the stems and shoots of various plants. I believe that it is still an open question whether these insects are the cause of the swellings, or whether they are parasitic on others which have formed them. This ought not to be a difficult question to answer if one had sufficient material to work upon, as the parasitic grub ought to be found at some time of its existence devouring the maker of the gall. Considering that the Chalcidideæ are nearly allied to the Cynipideæ who are undoubtedly gall makers, I am inclined to think that Isosoma is the real cause of the injury to Orchids. I cannot recommend any remedy but the very obvious one of burning, or in some other way destroying the infested shoots. The present would appear to be a very good time for doing this, as most of the insects are in the pupal state, just ready to emerge."

Oncidium Walueva.—Dr. MASTERS reported that he had examined this plant, referred to him at the last meeting. It was not a new plant, and he could find nothing sufficiently remarkable in its structure or history to entitle it to a Botanical Certificate. The following synonyms and references were quoted: Leochilus pulchellus, Cogniaux, *Fl. Brasil*, Orchid. v., p. 450, tab. xcv., fig. II. Waluewa pulchella, Regel, *Garten Flora*, xl., 1889, t. 1341; O'Brien in *Gardeners' Chronicle*, 1901, xxx., p. 365.

Lælio-Cattleya. This, also shown at the last meeting and referred to Mr. ROLFE, will be reported upon at the next meeting.

Root formation in Apples.—Mr. SPENCER PICKERING, F.R.S., showed roots of Apples, on Paradise stock, which had been grown in sand, and were remarkable for the extraordinarily numerous root fibres, some of which were thickened and of a very light colour. He also showed photographs of trees of the same age, and otherwise treated in the same way, but grown in a clay soil, where there was much less development of roots. In those grown in sand, however, the shoots formed were very short, while in those grown in clay they were much more vigorous. In reply to questions he stated that the addition of nutrient salts had had no appreciable effect upon the extent of the root system, nor upon the growth of the branches. The roots were not only of a peculiarly light colour, but were also very soft, the cortical tissue in some being greatly developed; no investigations as to the number, &c., of the root hairs had been made. It was suggested that the structure of the roots was due to the mechanical condition of the soil, and others suggested that the presence or absence of certain species of bacteria that possibly have considerable influence upon the proper action of roots might have caused the remarkable differences noted, but it was clear that much more experiment was needed before a full reason for the observed differences could be assigned.

Sweet Williams diseased.—Mr. CHITTENDEN reported that since the last meeting he had received and examined Sweet Williams from

Cobham, Surrey, badly attacked by the fungus Puccinia arenariæ. This fungus is exceedingly destructive to these plants, and apparently spreads to them from such weeds as the Chickweeds and Stitchworts, which are very frequently attacked by it. Affected plants are best removed and burned, as they never recover.

Effect of environment on plants.—Mr. SAUNDERS showed a very dwarf specimen of the Thorn Apple, Datura Stramonium, about 4 inches in height, bearing at its apex a single small fruit. The plant had been growing in a hedge.

Fungus on Chestnut.—Mr. WORSDELL showed a piece of the bark of Horse Chestnut bearing the small bright red warts typical of the presence of the fungus, Nectria cinnabarina, so common upon dead wood, but also spreading from dead wood to the living tissues of plants.

Malformed Orchids.—Dr. MASTERS showed a specimen, on behalf of Mr. MACBEAN, of Odontoglossum crispum, in which all the parts of the column which are usually confluent were developed in the form of free petals, resulting in the formation of a double flower. Mr. BENNETT-POE showed a specimen of Cypripedium in which the dorsal sepal was doubled. Dr. MASTERS will report upon this at the next meeting.

Hybrid Orchid.—Mr. DOUGLAS showed flowers of a hybrid Orchid raised from seed of Lælia harpophylla crossed with pollen of L. purpurata, the only sign of the latter in the colour being a small purple spot near the end of the labellum. Dr. MASTERS will report upon it further at the next meeting.

Gooseberry mildew (Sphærotheca mors-uvæ).—A specimen of the American Gooseberry mildew from Worcestershire was shown by Mr. GUSSOW. The specimen showed an abundance of the mildew and its typical "peritheciа" upon the younger parts of the branches. Mr HOOPER said the disease did such great damage in Canada and in parts of the United States, that the European Gooseberry could not be grown there with any prospect of a crop, and its cultivation had been practically abandoned in America. He brought forward the following resolution concerning the disease: "That it is most desirable that the Board of Agriculture should take immediate steps to promptly submit all evidence obtainable on the matter of the American Gooseberry-mildew to a small skilled committee, for a decision at once as to the danger of the disease spreading, and other important facts in the matter." The resolution, however, was not seconded, and therefore lapsed. Mr. MASSEE remarked that he had visited the Evesham district, and had found the mildew on Gooseberries in three distinct places, and in one where the bushes had been growing in a damp and sheltered place, the grower said, when it was pointed out to him, he had known the disease for the past thirty years, and he had not imported any Continental or Irish grown Gooseberries for that period. He thought it quite possible that the disease had existed in the country for a considerable time, and that since the spores were so minute, it was quite likely that they would be carried for a great distance by the wind or with merchandise of various kinds, although the importation of the plants from Ireland and the Continent should be prohibited. Other members concurred, and it was pointed out that the fungi found in a certain country frequently attacked newly imported plants with increased vigour, rendering their cultivation practically impossible; this had apparently been the case with this fungus in Canada. It was pointed out by Mr. GUSSOW that in a certain year in Germany the Cherries were very badly affected by the disease, due to Monilia fructigena; but this disease had not appeared to an injurious extent in succeeding years upon the Cherry, thus showing that a number of circumstances, acting together, frequently affected the prevalence or otherwise of any fungoid attack.

ROYAL SCOTTISH ARBORICULTURAL.

DECEMBER 8.—The annual general meeting of the Aberdeen branch of this society was held in the Aberdeen University buildings on the above date. There was a good attendance of the members, and Mr A. M. Gordon, of Newton, president of the branch, occupied the chair.

Mr. Robert Scott, secretary and treasurer, submitted a financial statement, showing a substantial balance in favour of the society.

Later in the evening, Dr. A. W. Borthwick, Royal Botanic Gardens, Edinburgh, read a paper on "A Visit to the Forests of Kelheim, on the Danube."

SOCIETY OF ARTS.

DECEMBER 12.—A paper on "Fruit Growing and Bird Protection" was read on the above date by Mr. Cecil H. Hooper, a member of the council of the National Fruit Growers' Federation.

Mr. Hooper said that agriculturists and fruit-growers admit that birds, as a class, are more beneficial than they are injurious to the cultivator. Yet many of the most common and injurious insects to fruit are eaten sparingly and by few species of birds, whilst there are others, he believed he was correct in saying, were eaten by no bird, but were most detrimental to the plant, e.g., red spider, Apple sucker, Black Currant mite.

With the introduction of spraying, grease banding, and other devices to prevent or destroy insects, fruit-growers are less dependent on birds for their protection from injurious insects than they were, say, 50 years ago; yet the damage done by birds is more severe than at that date. The increase and spread of fruit-cultivation probably favours the increase of birds that devour fruit and fruit-buds, whilst the close preservation of game destroys the birds, which act as a natural check on their undue increase, and favours other birds living in the woods, such as the bullfinch and wood pigeon, which are injurious to the fruit-grower and farmer, yet are not interfered with by the gamekeeper.

Again, the many advantages possessed by the house sparrow has enabled it to multiply inordinately to the detriment of other and more useful birds.

Among the natural causes influencing the increase or decrease of certain birds are mentioned: (1) Migration, not only from one country to another, but from different parts of our own country; (2) the character and habits of the bird; (3) the quantity of food available; (4) the number of young the birds rear yearly; (5) the capability of the bird to withstand adverse conditions, such as long continued snow and frost.

Again, there is the possibility of change of habit in birds, influenced perhaps by other birds eating the food the first bird was accustomed to, and therefore being compelled to adopt a new food; it is suggested that the starling, by taking the food of the rook, urges on the rook to take more corn and birds' eggs to make up for it.

The general opinion is that the starling and blackbird have extended their menu in the way of food, and add to Cherries, Red Currants, and Strawberries, fruits such as Plums, Pears, and Apples, Mulberries, &c., and the blackbird has started eating Tomatos.

As to the effect of the influence of man. Owing to children being kept at school longer, the fear of the policeman, and the kind and humane teaching at many village schools, children do not take anything like the number of eggs from the hedges and elsewhere that they used to before the passing of the Wild Birds' Protection Act.

Again, with men and lads, the more rigid exaction of a gun license has lessened indiscriminate shooting, which probably chiefly affected the more common birds, such as sparrows, thrushes, blackbirds, and the smaller birds generally.

The Wild Birds' Protection Act allows a landowner or tenant of land, or, anyone authorised by either, to shoot most of the commoner birds detrimental to the garden and the farm, but the public, unless owning or occupying land, is not allowed to shoot any bird. The scheduled birds, including the rarer birds, no one is allowed to shoot, on pain of a fine and confiscation of the bird.

With regard to eggs, most of the commoner birds' eggs are not protected, and therefore may be taken by anyone, but on the scheduled birds nets, decoys, &c., may be forfeited.

It is illegal to snare scheduled birds, and nets, decoys, etc., may be forfeited.

Anyone may demand the name of any person shooting at a scheduled bird.

The pole trap, a cruel trap used by gamekeepers to catch owls, hawks, jays, &c., is prohibited, with a fine of £2 for first offence, £5 for second.

The writer of the paper pointed out that the Wild Birds' Protection Act should be summarised instead of having to refer to six brief Acts of Parliament in order to know what a man or boy may do and what he is forbidden to do.

Mr. Hooper then asks: Is it justifiable to decrease the number of injurious birds? and points out that it is our duty to encourage the beneficial birds and to lessen the numbers of those which are injurious in the most merciful way practicable.

The lecturer went on to deal with the habits and food, &c., of partially injurious birds, such as the house sparrow, bullfinch, blackbird, starling, missel and song thrushes, chaffinch, greenfinch, hawfinch, lark, rook, jackdaw, magpie, jay, wood pigeon and stock dove, and then remarked on the birds more or less useful to the fruit-grower, including blue tit, great tit, cole tit, long-tailed tit, robin, hedge-sparrow, redstart, tree creeper, pied wagtail, wren, nuthatch, spotted flycatcher, whitethroat, blackcap, garden-warbler, cuckoo, wryneck, the woodpeckers, plover, nightjar, kestrel, and sparrow-hawks, barn and tawny owls.

As a summary, in conjunction with Mr. W. E. Collinge, he strongly advocated the most stringent measures to decrease the numbers of the house sparrow, wood pigeon, and stock dove, as being distinctly injurious to cultivation generally. He is in favour of taking the eggs of the chaffinch, greenfinch, and bullfinch, and in fruit-growing districts considers it necessary to decrease the number of blackbirds and starlings, and more reluctantly of missel and song thrushes, also of the rook in districts where it interferes with fruit, as in Scotland with the Raspberries. It is the duty of those who own woods to check the undue increase of wood pigeons, and of those who own rookeries to shoot a proportion of the young rooks to keep the numbers stationary.

In the case of hawks (especially the kestrel) and of owls (particularly the barn owl), swallows, flycatchers, wagtails, hedge sparrows, redstart, and all such birds, no effort should be spared to protect and encourage them, and every inducement should be offered to them to increase in number.

NATIONAL POTATO.

DECEMBER 13, 14.—The third annual exhibition of this society was held in the Royal Horticultural Hall, Westminster, on these dates, and three weeks later than the exhibition of last year. Whether due to this change of dates or not, the show was certainly smaller than the preceding ones, especially noticeable being a falling off in the nurserymen's exhibits, and among the competitive classes green baize was pretty conspicuous. However, there was plenty of material to satisfy the most exacting, and if the show lacked somewhat in quantity, it was not behind its predecessors in quality.

A Potato show, by reason of the unavoidable repetition of varieties, and the total lack of anything decorative in dishes of Potatos, does not appeal to many others than those who have an interest in the exhibit, and it is not surprising that the attendance of the general public was very meagre, although this was undoubtedly influenced by the weather conditions, which were extremely unfavourable.

A conference was held in the lecture room at 3 p.m. on the opening day, when Mr. H. Henshaw, of the Cambridge University Farm, Impington, read a paper on "Facts about Change of Seed." Illustrative of his lecture, Mr. Henshaw showed an interesting exhibit, which included Chilian and German varieties; first and second year's seedlings; Solanum Commersoni, showing the difference between its fruits and those of Solanum tuberosum; tubers from the Black Congo; some remarkable variations shown in the first generation from a single cross, &c.

Another interesting exhibit was shown by Mrs. HANCOCK, of Crelash, Horeham Road, Sussex, in samples of Solanum Commersoni (the swamp potato). Whilst the ordinary Potatos in adjoining plots in her garden had suffered from frost and disease, this variety remained unmjured.

Mrs. NOBLE, Park Place, Henley-on-Thames (gr. Mr. T. J. Powell), contributed an exhibit of new Potatos raised from retarded tubers without the aid of artificial heat.

Cookery competitions were held in co-operation with the Universal Cookery and Food Associa-

tion, 329, Vauxhall Bridge Road, London, S.W. Mr. B. Ashton (gr. to the Rt. Hon. Earl LATHOM, Lathom House, Ormskirk) was the most successful exhibitor: he secured the Llewelyn Cup, offered for the best exhibit in the show, the Carter-Findlay Cup, and 11 other prizes. In the evening the annual dinner was held at the Hotel Windsor, under the presidency of Mr. G. Massey, of Spalding. The dinner was followed by the annual meeting.

CLASSES OPEN TO TRADE GROWERS.

Eighteen varieties, distinct.—The best exhibit in this important class was staged by Mr. R. W. GREEN, Wisbech, Cambridgeshire, who showed a representative collection of most types in well-matched, clean-skinned tubers of such varieties as Bountiful, Duchess of Cornwall, The Factor, Sir John Llewelyn, Mr. Bressee, Blue Bell, &c. Mr. HENRY SCOTT, Warminster, Wilts., followed with tubers of a rich brown skin—evidence of soil influence, and admirable samples for culinary purposes. His collection included Warrior, The Factor, Snowdrop, Sir John Llewelyn, King Edward VII., &c.

Nine varieties, distinct.—Only two growers contested in this class, and here Mr. GREEN was beaten by Mr. WILLIAM DEAL, Brooklands, Kelvedon, with a meritorious exhibit of not over large tubers, of such kinds as Windsor Castle, Purple Eye (a very pretty Potato), Superlative, Gold Mine, &c.

TRADE GROWERS EXCLUDED.

Greater competition was seen in these classes than in the preceding ones, and in that for 12 distinct varieties eight exhibits were staged. The Rt. Hon. Earl of LATHOM, Ormskirk (gr. Mr. Ben Ashton), was successful with large tubers, that were evenly selected, and with spotless skins, and shallow "eyes." Empire, Queen of the Veldt, Empress Queen, and Eastern Planet are some of his best examples. 2nd, Mr. ALEX. LAWSON, Annfield, Kingskettle, N.B., whose exhibit was one of the finest in the show in all points save size. They were the acme of external quality, the dish of King Edward VII. being awarded a silver medal as the best dish of coloured Potatos in the Amateurs' and Cottagers' classes. Mr. Ambrose (pale rose), Eldorado, Ruby Queen, Empire, and Eightfold may also be instanced. 3rd, Earl SPENCER, Althorp Park, Northampton (gr. Mr. Silas Cole), with large tubers.

Six varieties, distinct.—There were also eight exhibits in this class, and Mr. ASHTON was again to the fore with similar Potatos as won 1st honours in the preceding class. He was followed by Mr. JOHN GEMMELL, Flakefield, Chapelton-by-Hamilton, N.B. 3rd, Mr. THOS. ANDERSON, Darvel, Ayrshire.

COTTAGERS' CLASSES.

Two classes were provided for cottagers, the larger for six varieties, and the other for three varieties. Mr. COLEMAN, 13, Hunter's Street, Buckingham, won the 1st prize in both classes with popular varieties, and in the larger class he was followed by Mr. F. G. TYLER, Milton, near Sittingbourne, Kent. Four and nine entrants respectively contested.

CUP CLASSES.

As stated, Mr. BEN ASHTON won both the Carter-Findlay and the Llewelyn Cups, which he secured with his exhibit in Class 7, of 12 distinct varieties, 9 tubers of each variety. The Carter-Findlay trophy, which is of the value of £50, was offered for the first time last year, when Mr. ASHTON was successful, and he only requires to win it again next year for it to become his absolute property, but the wins must be consecutive. He showed Evergood, Empress Queen, Empire, Snowball, Royalty, Great Scott, Royal Kidney, Advancer, Monarch, Goodfellow, and Northern Star. Mr. THOMAS STEWART, Annfield, Fife, was awarded the 2nd prize.

AFFILIATED SOCIETIES.

A class was provided for societies affiliated to the National Potato Society, the requirements being six distinct varieties, of any shape, to include four white and two coloured kinds. Four societies were represented, the successful one being the CAMBRIDGESHIRE HORTICULTURAL SOCIETY, Cambridge (sec. Mr. Arthur Matthews).

POTATOS FOR FLAVOUR.

A class was provided for six varieties of Potatos, specially selected for their flavour, to include at least three of the following: Factor, Duchess of Cornwall, Royal Kidney, Windsor Castle, Sir John Llewelyn, and Snowdrop. The winning exhibit, which contained the whole of these varieties, was staged by Mr. W. COLEMAN, 13, Hunter's Street, Buckingham. 2nd, Mr. SILAS COLE.

An interesting class was that for the best cwt. of London market-size tubers, to be shown as dug, the variety to be named. Factor, shown by Mr. HENRY SCOTT, Warminster, Wilts., was placed 1st, with Southern Queen, grown by Mr. F. G. CRAMPTON, Gate House, Sissinghurst, 2nd.

The single dish classes were well contested, and for the variety Up-to-Date there were as many as 24 contestants. The principal winners were Messrs. ALEX. LAWSON, SILAS COLE, J. GEMMELL, and F. G. CRAMPTON.

NON-COMPETITIVE EXHIBITS.

Exhibits of Potatos were displayed by Messrs. WILLIAM DEAL, Kelvedon (Large Silver Medal); GEO. MASSEY & SONS, Market Place, Spalding, Lincolnshire (Silver-Gilt Medal); T. A. SCARLETT, Edinburgh, seed tubers; HENRY SCOTT, Boreham Road Nurseries, Warminster (Silver Medal); J. W. BOYCE, Welney, Wisbech (Silver Medal); W. P. LAIRD & SINCLAIR, LTD., Dundee; JAMES GARDINER, Perth, N.B.; JAMES GRAY, Glasgow, seed tubers (Silver Medal); W. DAVIE & CO., 38, Market Street, Haddington, N.B. (Silver Medal); EDWARD STEWARD, 57, Carrington Street, Nottingham; COLIN MACPHERSON, Carnousie, Scotland, seedling tubers; R. W. GREEN, Wisbech (Large Silver Medal); DOBBIE & CO., Mark's Tey, Essex, and Rothesay, N.B., 27 varieties of their own introduction (Silver Gilt Medal).

Messrs. J. CHEAL & SONS, Crawley, exhibited a large display of miscellaneous fruits and vegetables, including many varieties of Potatos (Silver Medal). Mr. HENSHAW was awarded a Silver-Gilt Medal for his interesting exhibit of seedlings and species.

THE DINNER.

At the close of the show on the first day, the members' dinner was held at the Hotel Windsor, Victoria Street. Councillor G. Massey, of Spalding, presided. The chairman proposed "Success to the Potato-growing Industry." He coupled with the toast the names of Mr. W. Cuthbertson, of Marks Tey, and Mr. W. Davie, of Haddington. The annual meeting was subsequently held, Mr. G. Gordon being in the chair. The preliminary statement showed that the exhibition, financially, had been disappointing. The meeting was adjourned until a detailed balance-sheet could be prepared, and it was also decided to defer any arrangements for the next show until after the members' meeting had been held.

ROYAL BOTANIC.

DECEMBER 14.—A meeting of the Fellows of the Royal Botanic Society was held on the above date in the club rooms of the society's gardens, at Regent's Park, Dr. Granville Bantock presiding. The proceedings were of a heated character. Prebendary Barker had submitted eight questions, to which Mr. J. R. Diggle, on behalf of the council, replied. The first question had relation to the resignation of members of the council. The answers to the second and third questions were that seven Fellows had been appointed to fill vacancies on the council. The fourth question was whether the liabilities of the society, amounting on December 31, 1905, to £34,000, had increased or diminished since that date, and the answer was that on December 1, 1906, the liabilities had been reduced by £1,500. As to £6,000 of the debentures, it was stated that a redemption policy had been taken out, and that they were being automatically provided for. In reply to the remaining questions, the council stated that the raising of the subscription was only one of five suggested means of increasing the income of the society; they denied that the proposal had been twice rejected by the Fellows, the fact being that on each occasion a majority had declared in favour of the increased subscription. This question and that of the appointment of a superintendent were both matters which would arise in the course of the proposed conference. The council denied that they had brought the society to the verge of ruin, or that the Fellows had on a vote on the last three occasions rejected the council's proposals. Considering how recently the present council had been formed, and upon a review of the whole facts of the case, the council saw no necessity for asking the Fellows to pass judgment upon their action till the date of the annual general meeting in August next. Both Mr. Rubinstein and Prebendary Barker expressed dissatisfaction with the replies given, and the latter proposed a resolution that the Fellows had no confidence in the council. This was seconded, but the chairman ruled it out of order. A heated discussion ensued. A proposal on the part of members of the reform party (who were termed by their opponents not "reformers," but "agitators") fell through, and the meeting, which lasted nearly two hours, terminated without practical result, although Prebendary Barker repeatedly called upon the council to declare their policy.—*Condensed from the Times.*

GLASGOW SEED & NURSERY TRADE ASSOCIATION.

DECEMBER 15.—The second annual dinner of the above association was held on this date under the presidency of Mr. W. Leighton, and with satisfactory results. Several friends were present from Edinburgh, who were welcomed by the chairman in his opening speech.

Mr. Hugh M. Mackie, secretary of the West of Scotland Horticultural Society, in proposing "The Seed and Nursery Trade," said it was one of the oldest and most honourable of all businesses that existed. Mr. A. N. Hunter, of Messrs. Austin and McAslan, replied on behalf of the trade. Mr. Williamson, of the firm of Messrs. Williamson, Cremmell and Co., proposed "Kindred Societies." A collection taken at the meeting on behalf of the Royal Gardeners' Orphan Fund amounted to £3 5s.

NATIONAL DAHLIA

From the report of the committee for the year 1906, we learn that the past season was not a favourable one for Dahlia growing. During July and August in the south there was a long-continued drought, and in the north an excess of heavy rains, while the unprecedented hot spell just before the show was universal over the whole country.

In spite of these adverse conditions, a magnificent display was made at the annual exhibition, held on September 6 and 7, at the Crystal Palace.

Some 90 new varieties were submitted to the inspection of the judges, who awarded certificates to eight of them. On September 25 a meeting of the committee was held at the Horticultural Hall, Vincent Square, on the occasion of the fortnightly show of the Royal Horticultural Society. Seven certificates were awarded to new varieties. The total number of certificates awarded to new varieties in 1905 was 32, and in the present year 15.

The number of new members joining the society continues to increase, and was 38, as compared with 32 in the previous year. This increase in membership, however, has been partly neutralised by resignations and deaths.

The publication of the official catalogue and culture guide and of the yearly supplements appeals to all classes of Dahlia-growers, whether exhibitors or not.

By the courtesy of the Royal Horticultural Society, raisers of garden Cactus Dahlias are invited to send plants to Wisley for trial. A joint committee of this society and of the Royal Horticultural Society will visit Wisley during the flowering season for the purpose of granting "Garden Cactus" certificates to those varieties that are considered suitable. By this arrangement the merits of new varieties suitable for garden decoration should become known quickly. The financial statement shows a small balance on the right side, but the formation of a reserve fund is recommended. This year it has been impossible to pay all the prize money owing to the delay of the Crystal Palace Company in paying their promised grant.

LINNEAN SOCIETY.

DECEMBER 6.—Professor W. A. Herdman, F.R.S., president, in the chair. The Rev. H. Purefoy FitzGerald, F.L.S., exhibited specimens and a water-colour drawing of Stegesbeckia orientalis, Linn., which has been recently described as a valuable external curative agent in skin diseases. He had been supplied by M. Sers of Reunion with seed, and the produce has been sent to a dermal hospital for trial. The author has been unable to find that the plant has hitherto been recognised as a therapeutic agent of value, and would welcome any information which Fellows of the Society might be able to supply.

Mr. A. O. Walker, F.L.S., exhibited cut specimens of Chosya ternata, which were now in full flower in his garden near Maidstone. These bushes had flowered normally last May, but the present flowering he attributed to the drought of last season acting as a resting period to vegetation, which is usually performed by the cold of winter.

Dr. A. T. Masterman, F.L.S., showed an abnormal specimen of the common dab with three eyes, which had been obtained from the Dogger Bank.

The first paper read was by Professor A. J. Ewart, F.L.S., on "The Physiology of the Museum Beetle, Anthrenus museorum (Linn.), Fabr." The mischief wrought by this species in the National Herbarium at Melbourne is great, and is only kept in check by the systematic use of a chamber impregnated by the vapour of carbon-bisulphide in which the plants are placed for several days at a time. The use of corrosive sublimate is not advisable owing to the grave danger to health in a dust-forming atmosphere.

The most remarkable feature of the larvæ is their power of feeding on dry material with less than nine per cent. of water; and yet these larvæ exhibit the usual amount in their structure, averaging 70 per cent. The author suggests that the water may be chemically derived from decomposition of the carbo-hydrate food they consume. Bacteria are present in abundance in the alimentary canal of these grubs, and oxidise the carbon of the food where no transpiration of water is possible.

The second paper was read by Mr. E. R. Burdon, F.L.S., entitled "Note on the Origin of the name Chermes or Kermes." He summarised the contents of his paper thus: "It will thus be seen from the foregoing that the existence of the same generic name in two families of the Hemiptera is due to the following causes: (1) That the dye-insect of the Oak, Quercus Ilex, Linn., had been known since the Arab conquest of Spain by the popular name of Kermes all over the South of Europe. (2) That Linnæus, apparently unaware of this fact, put the Kermes dye-insect into the genus Coccus, and employed Chermes as the generic name for another group of insects, amongst which he placed the Spruce gall-insect. (3) That Geoffroy, objecting to this misapplication of a well-known popular name, used Chermes as the generic name for the dye-insect which Linnæus called Coccus. (4) That Botard used the name for the same insects as Geoffroy, but spelt it Kermes. (5) That the majority of workers at the Spruce gall-insects have retained the Linnæan name of Chermes, and at the same time Coccid authorities have naturally continued to use the name Kermes for the insect which had popularly been so called from early times."

The author concludes that, in view of the wide acceptance of both Chermes and Kermes, any alteration would only make confusion worse confounded.

MA PRATIQUE DE LA CULTURE MARAICHERE.

M. J. CURÉ (Paris) publishes, under this title, a handbook on market-gardening in the open and under glass. The subjects dealt with include the consideration of the soil, manures and hot beds, choice of seeds, tools and accessories, calendar of operations, Mushroom growing and injurious insects. The book is illustrated and contains an index, and is likely to be very serviceable to market-gardeners and others to whom the French language offers no bar. The book is published by the Librairie Agricole, Rue Jacob 26, Paris.

MARKETS.

COVENT GARDEN, December 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

Watercress, per doz. bunches	0 4	0 6

REMARKS. Cauliflowers are dearer, and prices for Jersey Beans are also firmer. Muscat Grapes are scarce, but Alicante and Gros Colmar are plentiful, and a good demand exists for them. Doyenne du Comice Pears are practically over for the season. Oranges are scarce, owing to delays in arrival caused by the bad weather. Pineapples are seen in large quantities, and are realising good prices; it is computed that considerably over 20,000 will be sold during Christmas week. Canadian Apples are considerably cheaper. Crystallized fruit is plentiful and fairly cheap. Nuts are also abundant, although Almonds are a little dearer than usual. Trade generally is scarcely as brisk as usually obtains at this season of the year. *E. H. R., Covent Garden, Wednesday, December 19, 1906.*

POTATOS.

Bedfords, 65s. to 70s.; Blacklands, 60s. to 70s.; Kents, 65s. to 80s.; Lincolns, 70s. to 90s.; Dunbars, 80s. to 95s. The trade for best samples has improved, but it is less good than it should be at this season. *W. J. C. & S., Covent Garden, December 19.*

COVENT GARDEN FLOWER MARKET.

Trade has been fairly busy during the present week, and many plants have been despatched for country orders. There is an abundance of all material. Rather advanced prices are asked for Chrysanthemums, of which some very good plants are seen. Ericas are also a little dearer. Azalea indica in various colours is plentiful. Callas in pots sell readily. Marguerites are still plentiful. Best Cyclamen sell well, but second quality plants have no demand. Large quantities of Begonia Gloire de Lorraine were seen this morning, but their sale was slow. Among forced plants are Spiræa astilboides floribunda, Lily

of the Valley in pots, Roman Hyacinths in pots and in boxes, and a few Dutch Hyacinths. Supplies of Lilums are very uncertain, and, in general with all flowering plants, it is difficult to say what variations there may be in supplies and prices during the next few days. Solanums continue abundant and command a better trade at slightly advanced prices. Araucaria excelsa, of which I noticed some good plants, always finds purchasers at Christmastide. The Fern stands have been cleared better this week, and Palms also sold more readily. Codiæums (Crotons) are plentiful. Dracæna Veitchii, with many of the terminal leaves quite white, are appreciated for decorative purposes, but they are of no value for stock purposes. They look well mingled with scarlet Poinsettias, which are very numerous.

CUT FLOWERS.

It was disappointing to see large quantities of good flowers unsold at closing time this morning. Chrysanthemum growers are experiencing a bad time, which may have the effect of preventing them growing such excessive quantities another season. It would pay them better to grow smaller quantities of only the best varieties, and to finish the blooms as well as possible; such high-quality blooms as were exhibited at the recent market show do not remain long on the stands. English Roses are scarce, but owing to arrivals from France, the prices for these flowers are not as high as they were this time last year. Carnations are dearer. Calls vary; high prices were asked for them this morning. One commission agent showed me a number of boxes in which almost every bloom had been damaged in transit. Lilium longiflorum sold well this morning, and it may be difficult to procure them during the next few days, except at very high prices. L. auratum are rather small. Lily of the Valley is over plentiful. Tulips and Daffodils (Narcissus obvallaris) are now abundant. Shorter supplies of Violets are seen, but the imported ones keep prices low. Eucharis may advance in price considerably. Very large consignments of Christmas Trees, Holly, Mistletoe, &c., are arriving, and the trade in evergreens is brisk. *A. H., Covent Garden Market, December 19, 1906.*

DEBATING SOCIETIES.

BOURNEMOUTH & DISTRICT GARDENERS'.—A meeting of this association took place on Tuesday, December 4, at the Avenue Restaurant, Mr. F. W. George was voted to the chair. Mr. Nippard read a paper on "The Cultivation of Winter-flowering Begonias." Mr. C. Nippard exhibited a collection of these Begonias, including such varieties as Agatha, Agatha compacta, Success, Mrs. Heal, Winter Cheer, Gloire de Lorraine, Turnford Hall, &c.

GUILDFORD AND DISTRICT GARDENERS'.—A meeting of this association was held on December 11 at the Workman's Hall, Guildford. Mr. W. Hogsden, a well-known bee expert, delivered an instructive lecture on "Bees and Beekeeping," illustrating his remarks by the aid of a large quantity of bee-keeping appliances. At the conclusion of the paper many questions on the subject were answered by Mr. Hogsden. The third annual general meeting has been fixed for January 8, 1907. *G. E. Bullen, Hon. Sec.*

HEADLEY AND DISTRICT GARDENERS'.—At the meeting of this society held on Wednesday, December 12, at the Institute, Mr. Phillips, of Craigendowie Gardens, Reigate, gave a lecture on "The Melon House from January to December." The lecturer dealt fully with the culture of the Melon. He stated that a Melon house could be used for two successional crops of Melons, and for the remainder of the season it could be planted with Beans on the one side and Asparagus on the other. *Thos. Beeson.*

BECKENHAM HORTICULTURAL.—At the meeting held on Friday the 14th inst., Mr. W. Jones, of Sutton, Surrey, gave a lecture on "The Culture of Mushrooms." There was a good attendance of the members. The culture of these popular esculents out-of-doors, indoors, and in portable boxes, &c., was fully dealt with. A good discussion ensued after the reading of the paper. *T. C.*

CARDIFF GARDENERS'.—The usual fortnightly meeting of this society was held on Tuesday, December 11, at the Philharmonic Restaurant, when an interesting address was given by Mr. James J. Graham, entitled "A Gardener on Holiday." The lecture was both interesting and amusing. Mr. Graham, when on his holiday in September last, visited among other places such celebrated gardens as those at Longford Castle, Wilton House, Drayton Park and Bromham, and he gave a brief description of these places.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending December 15, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather* was generally cold and unsettled, but although the amount of precipitation was rather large, there were many fine, bright intervals in almost all parts of the kingdom. A large part of the precipitation consisted of hail, sleet, or snow. On the coasts of Norfolk and Suffolk the snow was very heavy and accompanied by thunder and lightning at the commencement of the period, the yield at Yarmouth and Lowestoft being more than 1 inch in the gauge. A thunderstorm occurred at Arlington on Tuesday, and thunder and lightning were rather general over England and Wales on Wednesday.

The *temperature* was below the average, the deficit ranging from between 4° and 5° in the most northern and north-eastern districts, to between 1° and 2° over Ireland and the south-west of England, and to only 0·4° in the English Channel. The highest of the maxima were recorded either on the 11th or 12th in many places, but on the 15th in the W. They varied from 54° in Ireland S. to 44° in Scotland E. The absolute minima which were mostly registered about the middle of the week were rather low over the United kingdom generally. In Scotland N. and E. the thermometer fell to 16° or 17°, and in Scotland W. and England N.W. to 20°. In many other districts the minima were below 25°, but in the English Channel the lowest reading was 34°.

The *rainfall* exceeded the average in all districts except Scotland N. and England S., but the excess was not large except in Ireland and the north-west of Great Britain.

The *bright sunshine* was above the average except in the English Channel and England S.W. The percentage of the possible duration ranged from 38 in England S., and 34 in the Midland Counties to 18 in England S.W., and to 12 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending December 19.

The first fall of snow.—After 10 days of low temperatures the weather has since the 16th become much warmer. The cold during the 10 days in question was persistent, but at no time severe—the greatest cold indicated by the exposed thermometer being only 14° of frost. On one day the thermometer at 1 foot deep in the ground fell to within 4° of the freezing point, but at the present time stands at 42°. At 2 feet deep the temperature is now about seasonable, but at 1 foot deep 2° warmer than the average for the time of year. During the past fortnight rain has fallen on all but five days, and to the total depth of nearly 1¼ inches. Rain began falling at midnight on the 15th, and continued without intermission until 8 p.m. on the 16th, or for 20 hours, but to the aggregate depth of less than three quarters of an inch. The first fall of snow of the present winter occurred on the night of the 13th, and on the following morning the ground was covered to the average depth of half an inch. The sun shone on an average during the week for 50 minutes a day, which is 23 minutes a day short of the September average. On four consecutive days no sunshine at all was recorded. The winds were high at the beginning of the week, but the last four days have been very calm. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by six per cent. *E. M., Berkhamsted, December 19, 1906.*

Obituary.

GEORGE ELLWANGER.—We condense from the *Florists' Exchange* the following particulars relating to the career of one who had earned the respect of all who knew him on this side of the Atlantic. George Ellwanger, of the firm of Ellwanger & Barry, Rochester, N.Y., died at his home on Monday, November 26, at the advanced age of 90 years.

Mr. Ellwanger was born on December 2, 1816, at Gross-Heppach, Wurtemberg, Germany, the son of a Grape grower. He came to America in 1835. In partnership with Patrick Barry he established the Mount Hope Nursery Company in 1839. Mr. Barry died on June 23, 1890.

Messrs. Ellwanger & Barry set out together to create and supply a demand for fruit. They selected their stock in Europe by personal visits to France and Germany, shipping the stock to America in sailing vessels. The nursery comprised seven acres at first and was on the site of the present extensive establishment.

After producing a brisk trade in fruit trees the firm created a demand for ornamental stock which increased rapidly. From the pioneer days to the present time it has kept pace with the wonderful progress in fruit and ornamental tree culture, much of which has been the direct result of the firm's efforts. The Mount Hope Nurseries now comprise over 500 acres.

One son, the late H. B. Ellwanger, was author of *The Rose*, and another, George H., who died April 23 of this year, was the author of several books on outdoor and other subjects. Two sons survive, Wm. D. being an active member of the nursery firm.

As a citizen Mr. Ellwanger exerted a beneficial influence upon the growth and material prosperity of the community, and was always prominently identified with every public enterprise of a helpful nature. A man of strong force of character, determined purpose and sound judgment, he possessed not only the ability to plan, but was able to execute large business interests, and through all the long years of a successful career he maintained an enviable reputation for honesty and square dealing. Beginning at the very bottom of the ladder, Mr. Ellwanger advanced steadily step by step until he occupied a position of prominence and trust reached but by few men, and throughout his long business career he was upheld as a model of honour and integrity, never making an engagement he did not fulfil. He stood as an example of what determination and force, combined with the highest degree of business integrity, can accomplish for a man of natural ability and strength of character.

In 1900 Mr. Ellwanger gave eight acres of land, including a large building, on South Avenue, which is now used as a Home for Aged Germans, and to his firm the city is indebted for its gift of beautiful Highland Park. He was a lover of paintings and statuary, and in his home are many rare works of the sculptor's and painter's art. Two years ago a birthday celebration was given as a tribute to his character by many prominent citizens.

ENQUIRIES AND REPLIES.

COCKROACHES.—If *D. W. H.* will send to Mr. Ramsden, Wilmot Street, Derby, and get a tin of his Ramsden Beetle Paste, he will never be troubled further with beetles or crickets. It is without doubt the finest remedy. *H. Webb, Moorfield Gardens, Swinton, Lancashire.*

——Let *D. W. H.* (p. 416) obtain a small tin of Steiner's Vermin Paste, and place bits about the size of a nut on pieces of paper, laying them before dark in the places frequented by the cockroaches and beetles, removing in the morning what remains of the paste, and renew with a fresh dose at night again until the house is cleared of these very objectionable creatures. Riddance will be effected within a week or ten days if the baiting is carried out as indicated. This phosphorous paste, if spread thinly on pieces of bread, and placed in or near the holes of rats or mice before night, a clearance will also be made of these undesirable pests. The paste, if mixed with barley-meal or middlings, and put on pieces of glass, wood, or tin, and then placed in the haunts of woodlice, will exterminate them within one week or ten days, providing that the right article of recent make is obtained; and which, I believe, is supplied by most chemists. *H. W. W.*

BUD-GRAFTING ROSES.—In the note on p. 367 it was said that a little wood should be inserted with the bud adhering to it. I am not acquainted with budding in the stock, but a gentleman over 80 years of age, who is still a Rose-enthusiast, says that budding in the stock was the only method formerly practised. I should be pleased to know which month is the best for "stock" budding, and if an incision should be made, or a cross cut? *Henry Davis, Haslington, near Crewe.*

——The operation should be carried out in July and August when buds on Roses are fully developed, and the sap is still in motion, therefore at the same season as ordinary budding is practised. It often occurs that the rind of the stock will not "run" and budding is not possible, but that is no hindrance to bud grafting. A bud is removed from the shoot of a Rose, quite thinly so as not to take much wood, and a similar slice is taken from the stock on one or opposite sides, the upper half of the leaf is removed and the bud affixed (German, angeplatted) to the stock with worsted, soft bast, &c., the ligature being passed round the stem, or branch, of the stock above and below the bud, and the short and loose ends knotted in the usual manner in budding. The chief point to be observed by the operator is to make the conjunction perfect between the two rinds, for when that is done the union of the sapwood just in bud and stock is assured. If two buds are laid on at the same height up the stem of a Rose stock, one ligature can be made to serve for fastening on both. In fitting a bud on to the main stem or strong branch of the same, a slight oblique incision should be made before the slice of wood and bark is removed and the bud-shield similarly shaped to fit closely, as is done when a T cut is made in ordinary "budding." Rosewood readily unites during growth, whether naturally or artificially produced.

WORKS ON CACTI.—Can any reader inform *G. W. F.* if there are any recent books on Cacti (or on succulent plants, including Cacti) published in the English language other than *Cactus Culture for Amateurs* (W. Watson)?

ANSWERS TO CORRESPONDENTS.

AMERICAN APPLE DISCOLORED: *W. P.* From the small portion sent it is impossible to ascertain the nature of the injury. The defect certainly appears as if caused by frost, but this we cannot say with certainty. To accurately determine the cause you must send us a whole fruit.

APPLE FOR NAMING: *A. P.* You will find the name given in our last issue, p. 416. We do not undertake to furnish names of plants and fruits by post.

BICOLOR CHRYSANTHEMUM: *A. J. C.* The flower-head you send is half yellow, half white. We do not know the pedigree of "Waban," but suppose the occurrence of the two colours may be due to a partial reversion to an ancestral form. Similar instances have been figured in our columns in previous years. (See fig. 163, p. 436.

CARNATION DISEASED: *Beaulieu.* The spots on the leaves are caused by a fungus, Helminthosporium echinulatum. The best plan is to pick off and burn all the diseased leaves, sponging the plants occasionally with a weak solution of Gishurst Compound has been known to effect much good.

HOT WATER WASTING THROUGH EXPANSION PIPE: *Boiler.* There is evidently something radically wrong, either in the manner in which the boiler has been set, or in the way in which the hot-water pipes have been attached to it, or the fixing of both may be faulty as shown by the fact that 100 gallons or so of water are wasted through the expansion pipe as soon as the water reaches the boiling point. You express the opinion that this waste through the expansion pipe is not caused through bad circulation in the heating system, and you admit that you have experienced similar trouble hitherto with four boilers of the same pattern. Then, if the trouble does not arise through faulty circulation, we may assume that it is caused through your boiler being too powerful for heating the quantity of 4-inch piping attached thereto, and being overheated the hot water escapes through the expansion pipe. As no allowance for this difference in the total length of piping which the said boiler is capable of heating is made in stoking, the overheated water and steam naturally escape through the expansion pipe safety valve, thereby emphasising the fact that too much fuel has been put in the furnace to heat the quantity of piping attached to it. If your supply cistern is fixed pretty close to the heating apparatus we should advise you to have it shifted to the end of the house occupying the highest level, heated by the same boiler, fixing the supply pipe in the side of return pipe to the heating apparatus, and in addition to this to put an extra 6-foot length of gas tubing on the top of the expansion pipe, but not to put a cap on it as you have suggested. We have known cases in which boilers of the same make as yours have been cured of the evil complained of by the carrying out of the alterations indicated. We have also known cases in which the same make of boiler as yours behaved in the manner described above, but the cause was faulty circulation, the result of the boiler, a 9 foot 6-inch one, not having been allowed sufficient rise from front casting to the back (third) one when being placed in position, a rise of at least 3½ inches (5 inches would not be too much) should be allowed in setting a boiler of this size and 2 inches for a 6 foot 6 inch apparatus. Thus set, a free circulation of hot water is assured in the boiler and pipes connected therewith providing there are no dips in the flows. Another cause of trouble arising in this type of boiler into which the water is conveyed through the middle casting (as in the case of the "Mammoth") instead of through the usual front casting, is brought about by not letting the said middle casting 1 inch deeper in the brickwork than the front one when setting the heating apparatus in position, so as to cause the water on entering the boiler through the casting to rush up the bottom, side, and top tubes of the boiler and thence through the main and branch flow pipes, thereby ensuring perfect circulation in duly fixed pipes, pipes in which a rise of about half inch in every 9-foot length has been allowed from the boiler onward. But should the middle casting of this boiler be fixed on the same level or a shade higher than the front casting on the brickwork, air will probably accumulate at the point where the water enters the middle casting and a sluggish circulation and waste of water through the expansion pipe follow, in addition to a series of rifle-like reports being heard coming from the front part of boiler as soon as the water gets on the boil, especially when clinkering and stoking the fire. In addition to the middle casting of the boiler described being set 1 inch lower than the front one, the same rise as recommended above from front to back casting should be allowed in placing the apparatus in position. Fortunately horizontal tubular boilers are now invariably constructed so that the water shall enter through the front casting. We have known cases in which the water in the flow-pipe ceased to become heated at a point some distance from the boiler, with the result that the hot water kept shooting up the expansion pipe when the fire was being pushed for the purpose of forcing the hot water through the compressed air in pipe. The stoker did not succeed in this object until a small hole was punched in the flow-pipe, a length beyond the point where the water ceases to become heated, and where there was a slight dip, thereby releasing the pent-up air, and then immediately stopping the hole by driving into it a peg made of a hard wood (only the work of a minute), and within a short space of time the said pipe became as hot as possible throughout the entire length. Bad circulation in main pipes caused through dips, or because insufficient rise was allowed in fixing, may be easily remedied by inserting therein a stem pipe 6 or 9 inches long with a cock on the top to let off accumulated air. We assume that all the air taps at the end of the flow-pipes are clear and in good working order. We have gone into the subject matter of your inquiry at some length because the information may be helpful, not only to you but to other readers who may be experiencing trouble in the working of their heating apparatuses.

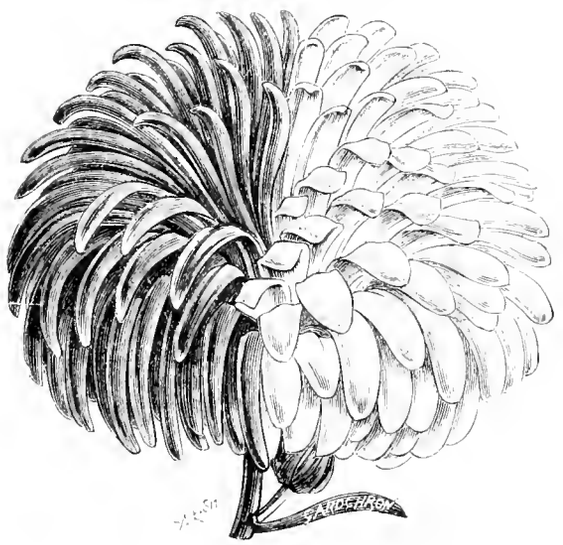

FIG. 103.—A PARTI-COLOURED CHRYSANTHEMUM.

MUSHROOM SPAWN: *M. J. W.* As far as choice of seasons go, you might send the spawn to South Africa now. We cannot recommend particular makers or dealers, but there are several who advertise in these columns, either of whom, we should think, will take particular care to select good and fresh spawn when they know it is to be used for such a purpose.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in this issue are requested to be so good as to consult the following numbers.* *A Reader.* 1, Tower of Glamis; 2, Dumelow's Seedling (Wellington); 3, Chaumontel; 4, Leon Leclerc de Laval.—*H. T. C., Durham.* Franklin Golden Pippin.—*O. B.* 1, Allriston; 2, Cockle Pippin; 3, not recognised.—*Pomona.* 1, Waltham Abbey Seedling; 2, Scarlet Golden Pippin; 3, Brabant Bellefleur; 4, We cannot detect any difference between this and our own specimens of King of the Pippins.—*Zoe.* 1, Poa trivialis, 2, Bromus asper; 3, Arrhenatherum avenaceum; 4, Agrostis vulgaris; 5, Aira cæspitosa; 6, Agrostis alba.—*Beaulieu.* A variegated form of Cupressus Lawsoniana.—*W. C Cleeve.* Cymbidium Tracyanum.—*F. A.* 1, Lycaste Deppei; 2 Maxillaria variabilis. 2 Polystachya luteola; 4, Catasetum Garnettianum.—*A. D.* 1, Cypripedium Madiotianum (Chamberlainianum × Boxallii); 2, Cypripedium insigne; 3, Cypripedium Calypso (Spicerianum × Boxallii); 4, Cypripedium Actæus (C. insigne Sanderæ × Leeanum). The Seedling is Cypripedium nitens superbum.—*W. R. P.* 3, Acalyphas next week; 4, Cotyledon Umbilicus.—*J. W. B.* 1, Odontoglossum Harryanum, bad variety; 2, Dendrobium Phalænopsis, 3, Saintpaulia ionantha; 4, Nepeta Glechoma, variegated form.—*J. S.*; 1, Thuya phcata, Lobbi of gardeners; 2, Cupressus Lawsoniana, 3, Sequoia gigantea (Wellingtonia), 4, Abies nobilis; 5, Cupressus sempervirens; 6, Juniperus Virginiana var. Schottii. It is very difficult to name such scraps.—*F. W.* 1 and 3, both forms of Taxus baccata; 4, we cannot name the grass from such a wretched specimen; 2, not found.

NATIONAL ROSE SOCIETY: *E. R.* Apply to Mr. Edward Mawley, Rosebank, Berkhamsted, who is honorary secretary to the society.

PRIMULA POISONING: *E. Knights.* The irritant effects would generally soon pass off after the cause was removed. If you are still suffering it must be from some other malady which may have been set up as an indirect result of the Primula poison. You cannot do better than consult your doctor. We are unable to give you further advice.

SEEDS OF CLERODENDRON FALLAX: *Plentiful.* We do not know of anyone who would purchase them. You should advertise.

TESTIMONIALS AND CREDENTIALS: *Constant Reader* and *W. R.* Our publisher advises his clients, week after week, not to part with the original documents, but to send copies when necessary. We advert to the subject, because this week two cases have been brought under our notice, where men in quest of a situation through the advertising columns, have sent their testimonials and not received them back even after repeated application. Supposing these statements to be accurate, the refusal to return the documents is most inconsiderate, and might lead to unpleasant legal proceedings. The British Gardeners' Association might fitly enquire into the matter.

COMMUNICATIONS RECEIVED.—M. Hayata, Tokio—M. Alwin Berger, La Mortola—E. J. H.—F. M.—A. Adams (you should send us your address when contributing such a note. It is not necessary for publication, but as a guarantee of good faith—W. P.—A. C. B. (with thanks)—H. S.—D. P. D.—A. C.—W. C.—F. G. S.—C. H.—H. J. J.—C. H. (Plymouth)—R. A. R.—E. J. H.—Eucharis—H. JOHN ABERCROMBIE.

A HUNDRED years ago John Abercrombie died. His career as a writer on gardening is the most remarkable on record. Abercrombie is said to have been born in the "guid toon" of Edinburgh, in 1726. It is, at least, certain that he lived as a youth in Prestonpans, his father occupying, as tenant, the market-garden which is intersected by the East Coast railway, and on part of which the North British Station of Prestonpans now stands. Details of his life vary, one account having it that he migrated to the neighbourhood of London previous to his eighteenth birthday. The fact, which is still traditionally related in the district, that he was a witness of the Battle of Prestonpans, which was fought in 1745 in the vicinity of his father's grounds, one of the walls of which, it is believed, Sir John Cope utilised as a shelter to his troops, would indicate that he was nearer 20 years of age when he took this important step. John got on very well as a gardener, forcing (according to his own account) having been his strong point, and he used to chuckle in his later years over the surprise created by his feats in producing vegetables, &c., out of season. Part of his novitiate was passed in the Royal Gardens, Kew, and in due time he became a head gardener and married, his wife, so far as one may assume, being a woman of some ambition, and it was, perhaps, due to her initiative that he left the ranks of the private gardener and engaged in commercial horticulture. In 1750, he returned to Scotland, but was back in London within the year. It is difficult to determine when he first engaged as a nurseryman and market gardener. Loudon reports, on evidence which he considered unimpeachable, that Abercrombie was in prison when he wrote his first book, which was published in 1767; and we certainly read of worries that he had in business. Anyhow, it could only have been as a defaulter that he was imprisoned. Previous to this must have occurred his appointment as gardener to the Empress of Russia, which he failed to accept on account of his dread of the sea voyage, he himself having left it on record that he had actually embarked, but left the ship at the last moment for the above reason. The several narratives which I have consulted agree in giving 1770 as the date when he took a small nursery situated north of Mile End, and near Hackney. Not long after that time he engaged as a publican, an employment which he left to take another seed and nursery business at Newington and Tottenham Court. Another account relates that he took a tea garden at Hoxton, in 1774, which he laid out in arbours and other quaint designs, and where he cultivated exotic plants and fruits with great skill. Here and there about the garden he affixed pieces of poetry of his own composition. In 1781, one of his books bears evidence that he was still at Tottenham Court. For the last ten years of his life he resided in Somers Town, the chief employment of his latter days being visiting metropolitan nurseries, varied by more extended excursions to Cambridge on visits to his good friend Donn, Curator of Botany, there. He died, in 1806, from the result of a fall, which fractured his thigh bone, and he was buried at the expense of Donn, who, it is recorded, discharged also the expenses of his illness.

Abercrombie was a singularly healthy man, and the only serious illness he ever had was when he was about 50 years of age. He was abstemious to a degree, but drank enormous quantities of tea, which, with tobacco, which he smoked almost without intermission, he reckoned the chief means of his support. In his private life he was very lovable, and for his amusement played the violin, and liked nothing better than to get a number of young people to dance to his fiddling.

The available data regarding his plunge into authorship are contradictory, and perhaps scarcely to be depended on. In an "Account" prefixed to the *Practical Gardener*, published after his decease, the story is related how Abercrombie was waited on by Davis, the publisher, and Oliver Goldsmith, "about" 1770, with a proposal that he should write a book on gardening; Goldsmith to revise it, and Davis to publish it, and that Goldsmith failed to fulfil his part of the contract "because Abercrombie's style was best suited to the subjects of which it treated." Diffident of its success, the name of Mawe, gardener to the Duke of Leeds, was secured to place on the title page as its reputed author. In this account it is stated that Abercrombie and Mawe did not meet till the success of the book was established, the picture of that gentleman in gold-laced coat and bepowdered wig giving us a faint idea of the splendour of a duke's gardener in those times. Johnson dates the year of its preparation as 1778, and states that Mawe was paid £20 for the use of his name. Loudon relates that Mawe visited Abercrombie on the latter's application, and that he received much information from that person both then and subsequently. The title pages of some of the books on gardening which followed, carrying, as they do, the names of both as joint authors, seem to bear this out.

If it is assumed that this book, like many others at this period, was written for the publishers, who purchased from the person whose name appeared on the title page the right to so use his name, the whole mystery attending its production will be solved. The references to Davis apply no doubt to books which were published by him for Abercrombie at a later date.

It is clear, however, that none of those who wrote of Abercrombie had ever seen the book on which the foundation of his fame rests. Where the title page is transcribed it is never that of the first edition, and notes of the contents of later editions are given which do not appear in the early ones. Mistakes are also made in the year. As a fact the first edition seems to have always been scarce, and at present can hardly be got, which may be attributed to the fact that its purchasers were not of the book-preserving class. Its title page is as follows:—"*Every Man his own Gardener*, Being a New, and much more Complete, Gardener's Kalender than any hitherto published. Containing not only an Account of what Work is necessary to be done in the Hot-house, Green-house, Shrubbery, Kitchen, Flower, and Fruit Gardens, for every Month in the Year, but also ample Directions for performing the said Work, according to the newest and most approved Methods now in practice among the best Gardeners. By Mr. Mawe, Gardener to his Grace the Duke of Leeds, and Other Gardeners. London: Printed for W. Griffin, in Catherine Street in the Strand; W. Chase, at Norwich; T. Toft, at Chelmsford; and E Etherington, at York, 1767. [Price 4s. Bound.]"

The preface seems to be the work of the publisher. There is no table of contents nor index, the headlines and marginal indices obviously being deemed sufficient. It is an 12mo., as all the editions which followed are, and extends to 422 pages. By 1771 a fifth edition had been provided. I think the probable evolution of the book was this. Abercrombie may have written it voluntarily and disposed of it to Griffin, who, having a publication running called *Every Man his own Physician*, gave it a title corresponding to that. Not improbably he got Mr. Mawe's name for a consideration and added "other gardeners." The story of Davis applying to Abercrombie a few years later is no doubt credible, but only if it is conceded that another work on gardening was proposed, for we find Lockyer Davis, in Holborn, as publisher of books written by Abercrombie in immediate succession to the above. Edition followed edition in rapid succession, the sixteenth, and last, previous to the death of the author, appearing in 1800. This and

the first are the two best worth having. It was the practice of Abercrombie to add to each edition both in the text and in the lists of flowers, shrubs, trees, and fruits which became a prominent feature. Accordingly the 1800 print is a bulky volume of 758 pages, with, in addition, an index extending to 92 pages. After his death in 1806 the book continued to sell till 1857, when the 26th edition was published. One of my copies (1839) purports to have as one of the objects of its publication "to accommodate the work to the Scottish as well as the English climate."

The present-day reader may find it difficult to assign a reason why this calendar of gardening operations should have at a bound attained to such popularity and retained it for the long period of 90 years. *Evelyn's Calendar* ran to 10 editions, and covered 42 years; Miller's to 10 editions, and extended over 45 years. For one thing, the title is taking, and the medical treatise preceding it seems to have been popular and would help to make the success of this one by Abercrombie. But it is to the gardening literature of the period one must go to discover the true cause. *Miller's Calendar* was nothing less or more than a superannuated, scarcely modernised copy of Evelyn's, and there were no other cheap books of worth being published. *Hill's Eden* in 1757 was an attempt at something better, but it is involved in its structure and the price was prohibitory, and, like the others, the language was stilted and too scientific for everyday readers. Abercrombie's book consequently arrived at an opportune moment. Its language is so simple that it is plain to the most illiterate. Though somewhat prolix, the directions are sufficiently clear, and the get-up of the book was so inexpensive that it was within the reach of a widened circle of readers. Though admittedly a garden calendar and arranged as such, there is a connected thread running through the several months. Consequently, complete treatises on the culture of the plants of the period are given. Our author did not wait long till he again began to write—unfortunately, sometimes, on subjects he knew next to nothing about, and for a few years he must have written almost without interruption; in 1789 no fewer than five new books were given to the public. Of all his books, the most popular was the *Gardeners' Pocket Journal*, which ran into 35 editions. Fifteen of his books on gardening were published during his lifetime, and he left one in manuscript, which was published in 1816 with the title of the *Practical Gardener*.

There are several portraits of Abercrombie, one as frontispiece to *Propagation, &c., of Plants* (1784); another, a vignette in the 2nd edition of the *Gardeners' Daily Assistant* (1794); and a full-length in the 1800 edition of *Every Man his own Gardener*, at the age of 72. *R. P. Brotherston.*

FIG. 164.—CHRYSANTHEMUM EDITH HARLING; COLOUR YELLOW.

(For text see page 439.)

CHRYSANTHEMUM EDITH HARLING.

IN our issue for December 15 we reproduced drawings by Mr. Worthington Smith of the two excellent single-flowered Chrysanthemums known as Miss Till and Innovation, which were shown at a meeting of the Royal Horticultural Society on November 20 last. At the same meeting the Floral Committee recommended an Award of Merit to the variety Edith Harling, of which an illustration is given at fig. 164. In colour the flowers are canary shade of yellow, and the flowers not only possess good form but they are very freely produced. The plants are said to grow well, and they give good results whether the blooms are thinned out or remain unthinned. Our specimens were exhibited by Messrs. Wells & Co., of Merstham.

ROCK-GARDENS.

(Concluded from page 350.)

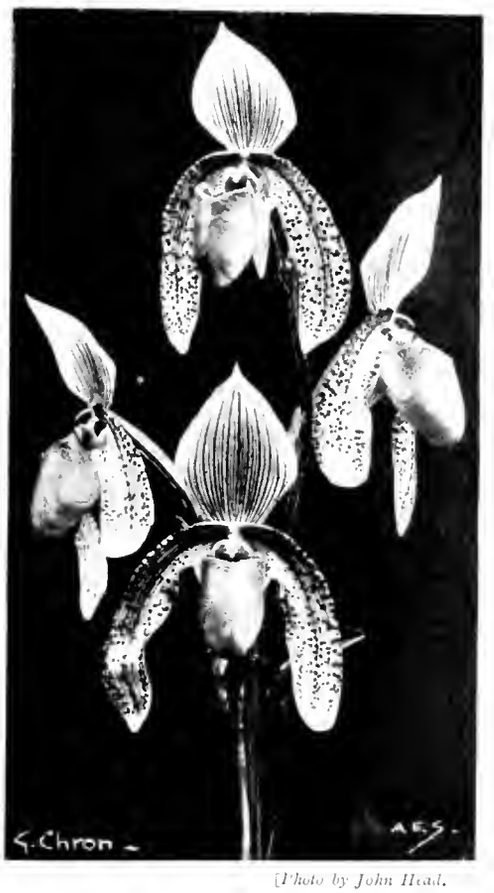
THE ROCKY AMPHITHEATRE.

A TYPE of rock-garden that is possible only on a large estate, and one that proves costly to construct if the ground is not favourable to the work, is the amphitheatre. It is the best type of rock garden for the dell, and it can also be constructed on the higher ground surrounding lakes and ponds or on the sides of any shallow pit or dip in the contour of the ground. It can be made to agree with general garden landscape when seen from without, but it should be self-contained, and once inside the rock-garden, nothing but trees of the garden proper should be discernible in the distance. A vista of equally wild scenery may be made to lead from it in any one direction, but no buildings, formal parterres, pergolas, or straight lines generally should be introduced. The object of the rocky amphitheatre is to produce an effect of grandeur, and its every detail should be of the boldest description proportionate to its size. Plants other than Alpines are admissible, and they may include groups of Conifers, Rhododendrons, Roses, belts of heather, Cortaderias, many kinds of xerophilous plants such as Yuccas, the Brazilian Eryngiums, Dracænas or Cordylines, dwarf Magnolias, and, in fact, all kinds of miniature trees and shrubs that will thrive in such a situation may be used if occasion require and permit. Large areas of water may lie at the foot of such a rock-garden, and any broken ground at its centre or sides may be rock-covered to lend an additional appearance of ruggedness to the scene.

Rock boulders may define the sky-line in places, but on some portions of the summit vegetation should be exhibited higher still. A waterfall can be designed in perfect harmony, or, on smaller structures, a cascade or rill. The sides of such a rockery may be built in a similar fashion to the outcrop rockery, but on a bolder scale. The excessive use of rock or stone is in no wise desirable, and if one covers one-third of its surfaces with these materials, using low-growing tree and shrub for the other two-thirds, a fair proportion of rock scenery and vegetation is maintained. The rocky amphitheatre may be approached through the rocky defile described on p. 349. The rock formations may be laid with the same accuracy as those of the outcrop rockery. Fissure accommodation must be provided for countless Alpines by piecing together smaller stones to form the more prominent bluffs, and the maintenance of moisture limits ensured by placing some stones to form conduits to convey percolating moisture to the plants' roots, and other stones to form drains to carry excess of moisture away. The same ruling in regard to stratification of the bolder groups as in the outcrop rockery must apply also. One may design a vertical or sub-vertical rift in any horizontal formation without offending a geologist—such rifts often occur in natural rock, but the general trend of every seam of any length should be in accordance with the lines of stratification.

TREES AND SHRUBS IN THE ROCK-GARDEN.

Every rock garden I have visited and studied has failed to impress me with any sense of realism in its design. It has either been too hard and repellent in its aspect, due to the use of too much stone, or it has shown the more familiar topsy-turvydom of plant life, in which the highest Alpine finds a place at the very foot of the rock-garden, whilst at the higher elevations are boles of trees, coarse herbs, and other inhabitants of the plains. The cultural disabilities attending such an arrangement I will deal with presently—the arrangement itself now. It has been occasioned mainly by starting badly. The first rock-garden was doubtless a trail of low pockets such as is formed now where a rock-garden proper cannot be built. A desire for a more natural surrounding for Alpines led to the stone-supported bank pocketed for plants; the shallow trench and the winding pathway developed from this in imitation of a rocky defile, with stone banks on either side—garden scenery clashed with the



[Photo by John Head.

FIG. 165. CYPRIPEDIUM YOUNGIANUM VAR. SUPERBUM.

rock scenery; hence it had to be shut out by belts of trees and shrubs, and the result is the familiar incongruity.

The winding trench is a start in one right direction, but it does not go far enough, or, rather, deep enough, and its surfaces are much too flat. A prominent bluff made up of small boulders, and surrounded wholly or partially with bold herbs and shrubs set back in chair-like recesses, does away with the anomaly described. The bluff becomes dominant, its plant denizens are at home culturally and geographically—the shrubby bases are the foils that make them so. Smaller seamed boulder outcrops occurring behind the shrub recesses, virtually place them in natural relations with themselves. Trees in the far background give prominence to every boulder outcropping at the top of the bank, but the same trees, springing directly from the outcrop and towering 40 feet above it, defeat the efforts of the planter in literally overwhelming the whole. The outcrop rockery does not affect to represent anything but an outcrop—but there the relations of shrub, Heather, and alpine plant are in accord, and the boulder masses benefit by a shrubby environment.

The rocky amphitheatre offers the best opportunity for correct arrangement of rock, shrub, and alpine plant. Its spaciousness admits of bold grouping of rock and shrub, and bold grouping means wide separation of rock from rock and shrub from shrub. The latter form the base of the scheme, the rocky outcrops the dominant factor, their fissures, pockets, moraines, and terraces the home of Alpines, for which the rockery exists. Take a vertical section of an average rockery, and note what it teaches, starting from the path upwards: (1) A small boulder, (2) a high level Alpine, (3) a larger boulder, (4) a coarse Alpine, (5) a still larger boulder, (6) a small shrub, (7) an Anchusa or Mullein, (8) a Lilac, (9) a Scots Fir. What an anomaly! And why wonder that such a rock-garden should impress one with its artificiality?

We will now take the cultural disability. It is readily conceded by all who study alpines that the majority root deeply and derive considerable support from percolation moisture. Alpines Nos. 2 and 4 would get what the Scots Fir, the Mullein, the Lilac, and the small shrub had to spare, and as much soil food as it could win from such hungry neighbours. *G. B. Mallett.*

FRUIT REGISTER.

SAM'S CRAB.

A MEDIUM-sized Apple, broadly ovoid-conic, truncate, somewhat five sided, and depressed at the top. Stalk very short, set in a deep basin. Skin smooth, red on the sunny side, yellow elsewhere, with red streaks. Sepals connivent. Flesh white, firm, with a pleasant acidulous flavour. Our specimen came from Herefordshire under the above name. It corresponds nearly, but not quite, with Hogg's description, *Fruit Manual* (1884), fifth edition, p. 205. The same name is applied to another Apple called in Herefordshire Longville's Kernel, p. 134, but our specimen agrees best with the one described by Hogg as above stated.

BRANDY APPLE.

THIS is a small Herefordshire Apple called also Golden Harvey. It is globular in form, obscurely five angled, round, with the deep eye and with deep basin in which the short stalk is set. The skin is smooth, deep crimson; the carpels are acute. Flesh white (yellow in Golden Harvey), crisp; sweet with a marked aromatic flavour. Hogg's *Manual*, fifth edition, p. 88, describes the skin as russety, so that probably our specimen is not correctly named, though in other points it agrees quite well with Hogg's description. It is a good dessert Apple and is stated to be an excellent cider Apple, owing to the strength of its juice.

CYPRIPEDIUM × YOUNGIANUM VAR. SUPERBUM.

CYPRIPEDIUM × Youngianum was first raised by Messrs. F. Sander & Co., St. Albans, and in 1890 an Award of Merit was awarded this hybrid by the Orchid Committee of the Royal Horticultural Society. Even more beautiful than the type is the variety superbum, an inflorescence of which we reproduce at fig. 165. The photograph was kindly forwarded to us by Mr James Renwick, Willow Wood Gardens, Riding, Mill-on-Tyne, who writes: "I am sending you a photograph of a plant of Cypripedium Youngianum superbum flowering in Mr. Drewett's collection. It was raised by Mr. Cookson many years ago, its parent being Cypripedium superbiens × Cypripedium Philippinense, and it is still among the best of its class."

COLONIAL NOTES.

THE GREAT NORTH WEST.

To show the progress made in a territory that was practically a desert in the recollection of many now living, we extract the following notes from the *Florists' Exchange*:—

EDMONTON, ALBERTA.—The long spells of fine, mild, and bright weather broke November 1, and since then there have been three snowstorms with—for this locality—the phenomenal fall of 18 inches. The first real cold for which the northland is celebrated arrived November 15, and for three days the thermometer has registered 25 below with no promise of a moderation in sight. The air is absolutely calm and dry, and not more radiation is required to heat the houses than under much milder conditions with the usual breeze stirring.

The Walter Ramsay establishment was completed in time for a formal opening on the Canadian Thanksgiving Day, October 17. At least 2,500 people took advantage of the invitation, including the Lieutenant-governor of the Province; the Provincial Premier, Mayor May, and the leading society in the city. The establishment, which is without doubt the most northerly greenhouse establishment on the American continent, came in for much commendation.

The Dominion landscape architect, Mr Todd, of Montreal, is in town in connection with the planning of the grounds around the new two million dollar parliament buildings that are just being started. The cities of Edmonton and Strathcona have also secured his services for plans for boulevards and parks on the banks of the Saskatchewan river.

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to Sir LEONARD G. LODER, Bart., Leonardslee, Sussex.

General work.—If the weather remains mild all kinds of work in the fruit garden can and should be pushed forward, and it must not be forgotten that of late years much bad weather has been experienced during February and March. If the weather proves frosty, the hauling of manure and soil will claim a large share of attention. This is best performed in frosty weather, and should never be done when the soil is thawing and sticky. Soils may be mixed, turned, and otherwise made ready for future use. A proper soil-yard is a valuable adjunct to the hardy fruit garden. Fires can be lighted and rubbish—such as prunings, old roots, &c.—burned. The ashes from wood fires when mixed with soil form a valuable fertiliser, and are excellent for top-dressing, or for mixing with the soil when planting. The pruning and training of all wall trees, except Peaches and Nectarines should be proceeded with. If Figs are to be protected, this should be done without delay: we have recently experienced 14° of frost in these gardens. The protection may consist of branches of evergreens placed over the Fig trees, but a better and more effectual plan is to tie some dry Bracken around the end of the shoots. The Bracken Fern forms a fine protective material against frost.

Store rooms should be thoroughly overhauled at least once a year, and a note made of labels, stakes, netting, &c., in stock, and the whole place put in a tidy condition. Point all stakes, creosote their ends, and tie them in bundles in their respective lengths.

The fruit room.—Pears required for current use should be handled very carefully and should be taken in a covered basket from the fruit room to a position in which they can be kept in a warm atmosphere for 24 hours previous to their being sent to the table. Pears when treated thus are much nicer than when eaten very cold.

PLANTS UNDER GLASS.

By B. CROMWELL, Gardener to T. SUTTON TIMMIS, Esq., Cleveley, Allerton, Liverpool.

Freesias are making satisfactory progress, and having filled their pots with roots, they should be afforded occasional waterings with liquid manure. Do not apply it in too strong a condition or the leaves will quickly assume a sickly appearance. The plants succeed best when they can be accommodated on shelves and kept well up to the light. A few of the more advanced plants of the Cape-grown bulbs may be afforded an atmospheric temperature of 62° to 65°. The flowers, even if few, are always appreciated in the drawing-room, and are attractive by reason of their perfume. Extra care must be exercised in fumigating Freesias, as these plants are most impatient of heavy smokings.

Pilea muscosa (microphylla).—Nothing is cleaner in appearance and more useful as a fringe around the stages of the stove or greenhouse than this Pilea. The unsightliness of the bare pots on the stages is prevented by its use. Cuttings may be inserted in the gravel, and they will grow freely, when they have grown too large they may be pulled out and replanted. If six or eight cuttings are inserted in small 48-size pots, they will soon furnish dwarf bushy plants which may be used in various ways, especially for furnishing greenery for the tops of large pots used in "house decoration." Cuttings may be rooted any time of the year in a warm moist atmosphere.

Roses in pots should be pruned and brought forward in batches according to the demand. If placed in an atmospheric temperature of 45° at night and 50° by day the plants will readily start into growth, but in view of the bad weather continuing it would not be practicable to hasten their growth by any increase of the above-mentioned heat for the present. Spray the plants over on fine mornings, but do not apply much water at the roots until they are in active growth.

Salvias.—As these plants pass out of flower, select a few of the best, shorten the shoots, and syringe the plants with a mixture of soft soap and sulphur to clear them of red spider. Afterwards, place them in a pit having an atmospheric temperature of 50° to 55°, when they will produce clean growths that may be used as "cuttings." This system is much better than propagating from the old growths.

General remarks.—Keep a watchful eye on Codiæums (Crotons) and other stove foliage plants, which are susceptible to red spider. An occasional syringing with a little diluted XL-All insecticide will have a good effect in keeping Codiæums clear of this troublesome pest. Sponging will be necessary in the case of Anthuriums, Alocasias, Marantas, and other similar plants.

FRUITS UNDER GLASS.

By T. W. BIRKINSHAW, Gardener to Lt.-Col. Sir CHAS. HAMILTON, Bart., Hatley Park, Bedfordshire.

Early Figs.—Pot-trees that were "started" as previously advised should be kept steadily growing, without suffering any check, which would probably cause the fruits to drop whilst still young. When the fruit has attained to half its full size, the temperature at night may be safely raised to 60°, and a rise of 5° more allowed during the day. The bottom heat should be kept at about 70°. Ventilation should be given very carefully, as the influx of cold currents of air would be detrimental to the young leaves. Close the house early in the afternoon, and syringe the trees whenever the weather is favourable.

Melons.—The time is now at hand for sowing seeds for the raising of plants to provide ripe fruits in May, but such early sowing can only be recommended to growers who have at their command a light position and a fair amount of artificial heat. Fill 3-inch pots with warm loam and a little wood ashes, and sow two seeds in each pot, in case one fails to germinate. Plunge the pots in a hot bed having a heat of 75° until the seedlings are through the soil; then place them on a shelf near to the glass. A hot bed should be made up of new tree leaves and long litter, thoroughly beating them down as the work proceeds. Some growers prefer fruiting the first Melon plants in pots, but we find the plants in beds most satisfactory. The border should be made of turfy loam, old mortar-rubble and wood ashes, making the bed very firm. When the seedlings have made two or three leaves, they should be planted out into this border. The atmospheric temperature for plants when first put out should not be allowed to fall below 60° to 65° at night, and 5° to 10° higher by day. Some growers prefer to grow their plants on the "cordon" system, and by this method more plants can be accommodated in a house, and larger fruit can be obtained. I have grown them in this way, but I now prefer to stop the plants when they have reached the first wire on the trellis and take up four growths, getting one fruit on each growth.

Young vines in borders.—The pruning and cleaning of these should now be given attention. The cutting back of the canes will require considerable forethought, as it depends in degree entirely on the strength of the rods. If they are thin and weakly, a length of 15 to 18 inches will be ample to leave for one season. Strong, well-ripened canes may be left 3 and 4 feet in length. In cleansing the rods, scraping of the bark should be avoided, at any rate, if mealy bug is not present. Vines which have made two or three seasons' growth may be allowed to carry two or three bunches of fruit next season, but not more. As the roots become more numerous in the border, more space must be given them; additions of 18 inches wide will be sufficient at one time.

Old vines.—Where these have made but weakly growths, and borne only small bunches of fruit, now is the time to overhaul the borders. Take away the old sour soil, and replace it with fresh compost of good turfy loam, wood ashes, and plenty of half-decayed leaf-soil, half-inch bones and some approved vine manure, adding a liberal quantity of old lime scraps. At the same time bring as many of the roots as possible nearer to the surface of the border. Let new rods be subsequently brought up from the bottom to replace the old ones, and much better results will be sure to follow.

THE FLOWER GARDEN.

By H. H. A. PETHERICK, Gardener to the Earl of PLYMOUTH, St. Fagan's Castle, Glamorganshire.

Preparing the ground.—If there are still beds and borders unprepared for the sowing of annuals or for planting with the summer bedding plants, the work should be pushed forward whenever the opportunity permits, not only to allow the ground to be influenced by the ameliorating effects of weather, but also to get it done before the stress of work commences, which the approach of springtime entails. In cases where the beds and borders have been used for many years, it is a wise proceeding to remove a little of the old soil and substitute fresh loam and well-decayed manure to prepare them for summer planting; for though there are some plants like Convolvulus, Tagetes, &c., that bloom more freely in an impoverished piece of ground, the majority of garden plants succeed best in rich soil.

Leaf-mould, and the gathering of leaves.—The value of leaf-mould is so much appreciated now by gardeners, that perhaps it is unnecessary in these notes to emphasize the great importance of anticipating the needs of the future, and of ensuring a plentiful store by artificial preparation. Leaf-mould in many instances is a valuable manure, and contains essential plant foods which cannot be overrated, but perhaps its chief importance in plant cultivation is its property of being able to convert soils particularly heavy soils—into a suitable rooting medium. Leaf-mould is an essential ingredient in the composition of soil especially prepared for the purposes of propagation—whether it be by cuttings or seedlings. In the formation of new flower beds or borders, where the soil happens to be naturally retentive and heavy, the beneficial results from a generous use of leaf-mould would be incalculable, both in aeration and drainage, and also in providing a humus full of plant nourishment. In making new plantations of Azaleas, Rhododendrons, or other Ericaceous plants in a district where lime abounds, leaf-mould could be utilised to a great extent in substitution for peat in fact, as a rooting medium for any plant whatever that abhors lime. As a top-dressing to encourage healthy surface root-action for Rhododendrons, &c., nothing could serve the purpose better than that provided in the form of leaf-mould and cow manure in the proportion of three parts of the former to one of the latter. For the successful culture of Bamboos, leaf-mould is invaluable, and as a top-dressing for perennial borders its value cannot be over estimated. There are places where leaf-mould can be obtained in large quantities naturally, such as in hollows and dells in woods, where the leaves have drifted and accumulated for years, slowly decomposing and forming leaf-mould of the best quality, but, unfortunately, these places are rare, and the majority of gardeners are dependent on their own exertions and foresight for their supply.

Selection of material and site.—The best leaf-mould is that procured from the leaves of Beech and Oak; and in collecting leaves, those from this source should be kept by themselves for the production of a store of extra quality for special requirements, but it by no means follows that leaf-mould made from the leaves of other deciduous trees is much inferior, and, therefore, all should be gathered and stored. In collecting leaves into a heap, care must be exercised to exclude any foreign material that would deteriorate the quality of the mould, such as wood of branches, or pine-needles in any appreciable quantity. The former would create a danger of fungoid disease, while pine-needles would tend to hinder decomposition, and always continue to be a source of detriment to the mould. The selection of the storing ground is a matter that demands careful consideration. In the first place, it should be large enough to contain at least three heaps in their different stages of maturation, for two years at least are requisite for its proper development for use, and each year's heap should not be too high, but should be spread sufficiently to have the advantage of being influenced by the weather and air, and again space should be provided to allow of the material being occasionally turned over. Furthermore, in choosing the position, it must be borne in mind that it should be open to the skies to catch all the rain that falls, but at the same time be so situated as to be sheltered from the drying effects of sun and winds, as well as being screened from observation if in the pleasure grounds. Above all, the "ground for leaves" should be so placed that easy ingress from all parts where the leaves are intended to be collected is ensured, so that they can be conveyed economically and expeditiously by cart, and that it possesses facilities for the removal by cart of the leaf-mould when its manufacture is complete.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Phalænopsis.—In the warmest house the Phalænopsis, more especially P. amabilis, P. grandiflora, P. Schilleriana and P. Sanderiana, are now developing strong flower spikes, and as the tops of these spikes become too near to the roof glass the plants should be correspondingly lowered, or the ends may decay by reason of the cold air passing between the laps in the glass. In some cases it may be more convenient to tie them down to neat stakes; at Burford we tie a piece of strong raffia about half way along the spikes with a small lump of lead attached to the end, and so weight them over arch-like until they are at least 2 feet from the glass. The plants require to be watered with the greatest care; large supplies are not needed, but it is not safe to let the roots get too dry. An occasional spraying of the surface moss and around the sides of the baskets will be sufficient. Do not allow any water to remain in the centre of the plants and thus cause decay. Phalænopsis will require an atmospheric temperature during the next few months ranging between 65° and 70°, but they dislike a close, stuffy atmosphere. If a "chink" of air can be left on the top ventilators, any over-abundance of moisture will escape, and there will be less likelihood of "spot" making its appearance on the foliage.

Schomburgkia thomsoniana and *S. Kimballiana*, which are also sending up tall flower spikes, should be removed from near the roof to a safer position upon the stage, but they must not be watered too freely or the bloom buds may drop off.

Oncidiums.—The same remarks apply also to such species as O. bicallosum and O. Cavendishianum, the thick, succulent leaves being extremely liable to decay at their base if much moisture be afforded. Such terete-leaved plants as Vanda teres, V. Hookeriana, V. Agnes Joaquim, and V. Marguerite Maron will have made sufficient growth for the season, and plants which were afforded fresh material for their roots to cling to, as advised in a former Calendar, have now become firmly established. They should now be afforded less water at the roots, but must not be kept so dry as to cause the stems to shrivel. Examine the plants occasionally, and if shrivelling is feared a slight dewing overhead now and then will keep them plump.

Vanda Watsoni grows freely in the Cattleya house, and is now producing flower spikes. Elevate the plant well up to the light, and keep the surface moss moist until the flowers open.

Dendrobium Wardianum.—Reverting to my last Calendar, I may say that it is uncommon to see thoroughly established plants of D. Wardianum of several years' standing which produce such fine sturdy pseudo-bulbs as those on newly imported plants, thus showing that our artificial methods of culture are not quite such as should be. These newly-imported pieces are so cheap the opportunity readily occurs for obtaining specimens to experiment with under various cultural conditions.

THE KITCHEN GARDEN.

By J. GIBSON, Gardener to His Grace the Duke of PORTLAND, Welbeck Abbey, Notts.

The year closes.—The gardener should "take stock" at the close of a year, and compare his present condition in respect to crops with his position at the end of the previous year. The present year has been, on the whole, a very successful one as far as crops have been concerned. Spring was somewhat late, but the winter crops lasted well, owing to the mildness of the autumn. The drought of the summer affected many crops on light soils, and made it difficult for small seeds to germinate, but little loss was suffered where the soil had been deeply worked. This matter of deeply working of the soil is the chief requirement for the successful cropping of the kitchen garden. Late vegetables are abundant, and there should be no lack during the latter part of the winter, unless unusually severe weather is experienced. We have been favoured with such a succession of mild winters, that many of the newer vegetables have not had an opportunity of proving their hardiness, and this applies to some extent to Broccolis. A cold "spell" would be welcomed by some cultivators who try these new varieties, as it would enable them to judge of their qualities for their future guidance. December affords an opportunity for thinking out what shall be done during next season in regard to the arrangement of the crops. The general motto should be "thoroughness," and if the gardener acts up to that motto there is little fear that he will fail. May the season of 1907 be one of success for all!

Digging.—Endeavour to get as much of the ground turned up as it is possible at this season.

Winter Vegetables.—From time to time clear all decaying leafage amongst Kales, Brussels-sprouts, &c., so that as little damage as possible is done to the edible portions. Seakale or Chicory roots may be all lifted and stored ready for forcing as required. The offsets of Seakale should be made into cuttings in readiness for planting in spring. Select a few of the best crowns for planting in a cool place to prolong the season as late as possible. Produce may thus be had until the end of May. Those who appreciate Turnip-tops should place a quantity of roots in the Mushroom-house, which is a very suitable place for this early batch. The roots will soon make growths, and if these are damped over daily with lukewarm water the produce will be very tender. A succession can easily be kept up until spring, when there is usually an abundance from the outside.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication *as well as specimens and plants for naming, should be addressed to the* **EDITOR**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not hold himself responsible for any communications or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, DECEMBER 29—Dutch Gard. Soc. meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick.—36·9°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, December* 26 (6 P.M.): Max. 35°; Min. 25°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December* 27 (10 A.M.): Bar., 29·2; Temp., 36°. *Weather*—Deep snow.

PROVINCES.—*Wednesday, December* 26 (6 P.M.): Max. 40° Cornwall; Min. 27° Berwick.

SALES FOR THE ENSUING WEEK.

MONDAY & FRIDAY—
Hardy border and other Plants, Roses, Azaleas, Fruit trees, &c., at 67 & 68, Cheapside, E.C, by Protheroe & Morris, at 12.

WEDNESDAY—
Dutch Bulbs, Herbaceous and other Plants, at 12.
Roses at 1.30 & 4 o'clock, Azaleas, Rhododendrons, Fruit trees, &c., at 4, at 67 and 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Consignment of Dendrobium Wardianum giganteum, also Established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Events of the Year.

Horticulturists have of late been so much occupied with social and semi-political matters, such as fertilisers and feeding-stuffs, fixtures, land-tenure, rating, the desirability or the inexpediency of legislation as a measure of protection against the invasion of the American Gooseberry-mildew, the proceedings of the British Gardeners' Association and the provisions of the Prevention of Corruption Act, the full text of which was given at p. 279 of our present volume, that they may be disposed to think that these subjects constitute the most important features of the year 1906 so far as horticulture is concerned. We have no desire to belittle these matters far from it but as regards progressive horticulture there are other matters of at least equal, if not of greater, importance. The first we would allude to is the establishment of a research station at Wisley under the superintendence of a scientific man conversant with the requirements of practical horticulture. It is difficult to over-estimate the value and importance of such an establishment if properly conducted. At present we can only speak of it as one of the most hopeful signs of the times, and we must wait not one, but probably several years before we can expect to reap to the full the advantages of such an institution. In the meantime, as the seed was sown in this present year, we may well allude to it as potentially, at least, one of the most important events of the year.

If we are of necessity obliged to speak of the research station as of something of which we may expect to reap the benefit in the future, we can refer with satisfaction to one thing that has been accomplished during the last summer. We allude to the Hybridisation Conference, which, in spite of its technicalities and occasional abstruseness, was an unqualified success and reflects the greatest credit on the R.H.S., under whose auspices it was carried to so successful an issue. Hybridisation and cross-breeding, which once were mysterious and haphazard procedures, are gradually being reduced to order, and no one will benefit more from this than the practical horticulturist. There is, now, as Mr. Bateson said, less of mystery and more of order, or as one of our Canadian friends picturesquely expressed it, "A clear path has been blazed through the jungle of heredity." There has been no such gathering of foreign horticultural celebrities in this country since the year 1866, and if the number was much smaller than in that memorable year, the aim was more definite and the work more specialised. The proceedings were as fully reported in our columns at the time as the exigencies of time and space permitted. The keynote of the whole was struck in Mr. Bateson's address, which was printed in full at p. 81, and the report to be issued by the society will contain the details of a very memorable gathering.

A change was made in the Directorate of Kew by the resignation of Sir William Thiselton-Dyer, under whose management the condition and utility of the garden were, from a horticultural point of view, much enhanced. His successor, Col. Prain, previously little known in horticultural circles at home, was appointed as Director with the unanimous approbation of those conversant with his work at the Calcutta Botanic Garden, and familiar with his well-earned reputation as a botanist. We notice also the retirement of Dr. Scott, our leading authority on the floras of past ages, as honorary director of the Laboratory at Kew, and trust that this very important post will be filled by some competent man of science in touch with practical horticulture.

Solanum Commersoni and its supposed derivatives have received much attention this year. If the statements made by certain French observers can be substantiated, the matter is one of very great interest scientifically, historically, as well as practically. Those, however, who are conversant with S. Commersoni and its characteristics may well be excused for feeling sceptical as to the "mutations," which are alleged, doubtless in all good faith, to have occurred in this species. At any rate, nothing of the kind was obvious in the carefully-conducted and extensive trials made by Messrs. Sutton, near Reading; trials of a varied character, and which were witnessed by many members of the Scientific Committee during the period of growth, as well as by various bodies of Potato experts at a later period of the year.

The exhibitions of the season call for no special remark, unless it be once more to plead for less monotony and greater practical utility from an educational point of view.

A portrait by Herkomer of the President of the R.H.S., which was exhibited some time since, and which will ultimately be placed in the hall of the society, serves to accentuate the sense which the Fellows at large entertain of the staunchness and loyalty of their president. The complimentary dinner to Mr. William Marshall, on the occasion of his completing the twenty-first year of his chairmanship of the Floral Committee, was a pleasant function, which gave his many friends an opportunity of manifesting their warm appreciation of his services.

Among the host of gardening books of various degrees of merit that have appeared during the year, two in particular stand out prominently, one is the *Hortus Veitchii*, a truly remarkable production, and a very valuable addition to horticultural literature, and the first volume of the *Trees of Great Britain and Ireland*, by Mr. Elwes, in collaboration with Dr. Henry, of which we have spoken quite recently. Both may be consulted in the Lindley Library. The English edition of Prof. De Vries' *Species and Varieties, their Origin by Mutation*, has also been published, and is of great interest to those concerned in the origin of new forms by a process of sporting.

No summary of events would be perfect without an allusion to the weather—a matter of special concern to those who have to do with gardens and fields. Truly, this year has been phenomenal in the matter of climate. The winter was not a very severe one, but the April frosts committed terrible havoc. Apples were greatly diminished, Pears even more so, and Plums were, generally speaking, conspicuous by their absence. Then came a summer hot, dry, and light almost beyond precedent. Indeed, the duration of bright sunlight was, we believe, quite unprecedented, whilst a continuous shade temperature during the day of over 90° at the end of August and beginning of September has hardly ever, if ever before, been recorded. November redressed the balance so far as rain is concerned, and induced premature flowering in Laburnums and other plants which seem quick enough to respond to climatic influences, but are obviously destitute of forethought and discretion.

We know not what the New Year may have in store for us, but it is certain that we have good reason to congratulate ourselves on what has been accomplished in the old one.

A glance over the obituary list is always a melancholy procedure, in some degree compensated for by the assurance that competent successors are coming forward to fill the vacancies left by the demise of their predecessors. Perhaps the greatest loss to horticulture generally is that of the learned, the sympathetic, the indefatigable Comte de Kerchove de Denterghem. C. B. Clarke was not much known in the gardening world, albeit he once held the Directorate of the Calcutta Garden, but as a systematic botanist and a man of singularly varied attainments and agreeable personality he will be much missed. Marshall Ward was one of the new school of botanists, but keenly alive to the requirements of practical cultivators. Glaziou, who died near Bordeaux, in April, rendered untold services to botany and horticulture by his very numerous introductions, both of living and of dried plants from Brazil, and yet no notice of his death appeared in the horticultural or botanical journals. Earlier in the year we lost Harrison Weir, genial, full of quips and cranks, but with ample and varied experience in gardening and natural history generally. In H. E. Milner we lost a representative man a landscape gardener of great repute and a charming personality. Meyer, of Exeter, was another landscape gardener whose loss we

have to lament; and then amongst gardeners we shall so greatly miss Harry Turner that we know not who is to replace him as a florist. Norman, of Hatfield, was a well known figure in horticultural circles, and the numerous tributes to his memory which appeared in our columns are a sufficient testimony of the esteem in which he was held. Andrew Henderson belonged so completely to a past generation that his death in Florida will only recall to those of the present day the memory of a once famous firm. Amongst others we may mention Oliver Hemsley, cut off at the beginning of what seemed a most promising career in India. Mahon succumbed to African fever. Froebel, of Zurich, and Pfitzer, of Heidelberg, are not so well known to British horticulturists, but they have left their mark, the one on scientific, the other on practical horticulture. The Heidelberg professor took part in the Hybridisation Conference before alluded to, when we little thought that we were so soon to lose him. The death of Mr. F. W. Burbidge occurred at the end of the preceding year, but the obituary notice could not be published till the first number of the present year. He did excellent work, and had his life been spared would probably have accomplished even more.

*** **OUR ALMANAC.**—According to our usual practice we shall issue NEXT WEEK a *Gardeners' Chronicle* Almanac for the year 1907. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical, and Allied Societies, or any of our correspondents, will send us* **IMMEDIATE INTIMATION** *of all fixtures for the coming year.*

BLUE HYDRANGEAS.—According to the *Moniteur du Jardinier* the following method is employed in some of the large German horticultural establishments to produce blue Hortensias. The process begins with growing young plants in trenches in the open air in summer, the trenches being filled in with ferruginous loam, to which iron-filings and alum are added. In autumn the plants are potted in a similar compost and kept in a cool house until the time comes for them to be transferred to heated pits, where they are to be forced. They are then watered with a weak solution of alum, which is strengthened as the trusses develop. Treated thus most of the plants are clear and bright in colouring of the flowers.

MELBOURNE ARGUS TIME-TABLES. — *The Melbourne Argus Time-Tables for 1907* mention all the British and foreign mail services between Australia, New Zealand and Great Britain, with rates of passage, postage and cable charges. They include a map and other information, and are of handy size for the pocket-book. To those having commercial dealings with our Southern colonies this book will be very serviceable.

"RATIN."—This is a new preparation for which it is claimed that it is unrivalled for exterminating rats and mice, and harmless to larger creatures. It causes among rats an epidemic of a particularly fatal nature, with a mortality often reaching 100 per cent. In certain isolated cases it has failed, but probably through being improperly used. "Ratin" must be fresh when laid down, must be protected from sun, light and rain, and be plentifully distributed. A stronger preparation named "Ratinin" is available, where the weaker kind proves ineffectual. "Ratin" has been successfully tried by German experimenters and in England, and particulars concerning it can be obtained from the Directors of the Bacteriological Laboratory, 17, Gracechurch Street, E.C.

NURSERY CATALOGUES FOR HAWAII.—The Board of Agriculture and Forestry is anxious to procure a number of seed and nursery catalogues from the leading firms in Great Britain. Many inquiries, we are told, come to the office daily for such information as may be found in these catalogues. The catalogues should be addressed to DAVID HAUGHS, Division of Forestry, Honolulu.

BURBANKIANA.—*Commentator* writes: "Many a great man, as HORACE and GRAY'S elegy remind us, has lived and died unknown for lack of a biographer. Possibly it is a worse fate to be extolled, not wisely but too well, by vociferous panegyrists. We none of us desire to belittle Mr. BURBANK. Reading between the lines of effusive eulogy, we discern a modest worker who has done, and is doing, much that is valuable. But it is his misfortune that no man, however great, can be so great as his portrait by Mr. W. S. HARWOOD. I have been reading this gentlemen's two books, entitled 'The New Earth' (see p. 194) and 'New Creations in Plant Life,' mentioned in your columns, January 20, 1906, of which the one is wholly, and the other mostly, an appreciation of Mr. BURBANK. Mr. W. S. HARWOOD breaks the golden rule that you should never exhaust the whole of your vocabulary in a single publication, not even in a discussion with your cabman. It impoverishes your future utterances. I will quote without comment, fearing to be reckoned by Mr HARWOOD among his hero's 'unjust critics who do not comprehend.' Mr. BURBANK is 'the foremost plant-breeder in the world.' He is 'to pave the way by his own discoveries and creations for others of all lands to follow in his footsteps.' His work resembles 'some strange, vast castle where every apartment is the scene of a miracle.' 'Not all the plant-breeders who have preceded him have ever done so much to ennoble floral life.' 'He has blazed a central way up through the unknown.' 'Over and over again he has disproved the Mendelian laws.' 'LUTHER BURBANK is unique among men in his knowledge of Nature and his manipulation and interpretation of her forces.' 'His name is bruited to-day all over the civilized world.' 'From him dates a new epoch.' 'The reflex of all future achievements will throw back its glory to brighten LUTHER BURBANK'S aureole.' One regrets to come down from these lyric heights. But in a recent horticultural journal, 'A Disappointed Gardener' gives, in dull prose and in detail, the sorry results of his trial of every one of the Burbank creations which he has been able to purchase. The Burbank Lily, the Shasta Daisy, the Fragrant Verbena, the Burbank Dahlia and others have one and all turned out quite mundane and mediocre (see *The Garden*, October 20, 1906). For myself, I can testify that 'Burbank's improved Shirley Poppies' are merely the Shirley strain lapsed and spoiled out of all character and beauty. There remain, it is true, many other creations of which we have not yet been privileged to make experiment. The hybrid between Blackberry and Apple would seem to fill an aching void. Also the Pomato, that 'delicious fruit borne on the top of the Potato haulm.' But it is excusable to judge only by the material which we have been allowed to see. This discrepancy between words and facts is not difficult of explanation. There has been no conscious exaggeration by Mr HARWOOD. What may be called intensive cultivation of plants, that is, the love and care and laborious evolution of each several plant by its own specialist, is a very old story with us. In America it has been unknown till yesterday. Hence the astonishment and the exuberant drum-beating over its beginnings. Youthfulness is good, but has the necessary defects of its qualities. An early horticultural operation of our childhood was the sowing in our own garden of our own Mustard and Cress. In our eyes it was not at all the Mustard and Cress of the old gardener, but a nobler growth of a more vivid green and a surpassing flavour. Also there was a fashion of sowing it to come up in the form of our names. Our transatlantic friends are now sowing their Mustard and Cress, and it spells their own names very large." *Commentator.*

KEW NOTES.

THE GREENHOUSE.

THE value of Buddleia asiatica can scarcely have been fully recognised when first introduced in 1874, or it would not have dropped out of cultivation so soon, as it is a very easy plant to grow. The fragrance of the flowers soon attracts attention. The plants are slender in growth, 2 feet to 4 feet in height. The racemes of white flowers lengthen considerably from the time the lower ones expand, till those at the apex are fully developed. I measured one in this house 20 inches in length. They are terminal and axillary, while in some instances small secondary racemes are developed on these.

Peristrophe speciosa, also known in gardens as Justicia speciosa, is flowering freely. The purple-carmine flowers are particularly interesting botanically, having a twisted corolla. Serviceable plants, 1 foot to 2 feet in height, can be grown annually from cuttings inserted in spring. Should larger plants be desired the growths on the old plants may be shortened, and the plants grown on a second year or longer if necessary.

The bold, handsome foliage of Senecio Petasites and S. grandifolius are an imposing feature in the house even before the plants are in flower. S. grandifolius, with its closely-packed heads of yellow flowers, is already at its best. S. Petasites is rather later, for at present only a few of the flowers on the large terminal panicles show colour.

A group of Plumbago rosea furnishes a bright patch of colour on one of the side stages. It requires stove treatment during the growing season, but may be removed to a warm greenhouse when in flower.

Solanum integrifolium serves to remind us of the festive season, with its red fruits resembling a small corrugated Tomato. The Roman Hyacinths and Paper White Narcissus turn our thoughts to spring. Potted up early in September, for the last month they have been brought on gradually in an intermediate house. A small group of Lycoris aurea, a pretty bulbous plant from China, is a rather distinct-looking subject with golden-yellow flowers. Grown four or five bulbs together in a pot, they thrive under similar treatment to that given to Nerines.

Chrysanthemum ornatum, a pretty Japanese species, has flowers resembling a Daisy; they are about an inch across, the ray florets white, the disc florets yellow. It is figured in the *Gardeners' Chronicle*, 1904, i., p. 51, fig. 22, under the name of C. marginatum.

The old double white Primula forms a pleasing groundwork for several large plants of Begonia Gloire de Sceaux. The coral pink flowers, and rich bronze-coloured foliage stand out prominent. The numerous varieties of Veronica speciosa are deserving of mention. Being almost hardy they furnish useful material for the decoration of greenhouses, where little or no artificial heat is available.

Moschosma riparium is remarkably vigorous in 6-inch pots. The plants are carrying two to four long growths covered with flowers. The plants have only been stopped once.

Other plants in flower at the present time are Eupatorium Purpusi var. monticola, an old friend under another name (the petticoat of gardens, see *Gardeners' Chronicle*, 1906, i., p. 274. Coleus thyrsoideus, Luculia grandiflora, Sparmannia africana, Impatiens Oliveri, Cheiranthus Kewensis, Jacobinia coccinea, Epacrises and Ericas. *W. D.*

THE FERNERY.

(See Supplementary Illustration.)

THE GENUS NEPHROLEPIS.

THIS genus of Ferns, having within the last few years developed a very remarkable capacity for sporting or "mutation" in more than one species, though more especially in N. exaltata, it may not be out of place to review it generally both from the normal and the variational points of view. Smith's "Ferns, British and Exotic," names nine species: N. pectinata, undulata, tuberosa, exaltata, ensifolia, hirsutula, biserrata, davallioides, and falciformis. [About seventeen adopted species are recognised in Christensen's recently published *Index Filicum* —ED.]. Only two of these, however, viz., exaltata and pectinata, figure prominently in our record of sports, while the records of the Royal Horticultural Society's Floral Committee, hereafter cited, chronicle awards to several other species, such as N. rufescens, N. cordata, N. cordifolia, and N. pluma, while others figure under specific names, though merely "sports" and not species proper. As usual, there is a number of synonyms, owing to the close relationship of this genus to the Nephrodium (Lastrea or Aspidium) genus, its fructification consisting of small, round spore-heaps covered by a somewhat kidney-shaped indusium attached to the centre, and very similar to that of our common male Fern. It is noteworthy, in connection with the sportive character of Nephrolepis that the veins are merely furcate, running out from the midrib to the edge of the frond, except where terminated, usually about midway, by a spore heap. It is undoubtedly this free venation which has contributed to the wonderful sub-division which has displayed itself in some of the "sports" alluded to. Taking N. exaltata as a salient example, the normal frond is merely pinnate, or once divided, the frond appearing like a double comb with broadish teeth, these teeth or pinnæ being smooth-edged, bluntly pointed, and slightly expanded at the base next the midrib, to which they are attached by an extremely short stalk. These fronds grow erect, and by continued uncoiling at the tips assume a great length as compared with their width, eventually having the outline of a straight sword blade, ignoring, of course, the divisions. The fronds arise in clumps, and at their bases produce very long stolons covered with whitish scales and carrying with them buds which are capable of producing plants at some distance from the parent. This involves a facility of propagation which has been so largely availed of as probably to account for the lack of variation in this species until recent years, since sports are far more apt to occur through seeds or spores than through buds. Mr. H. B. May (to whom and to Mr. Harry Veitch I am indebted for representative fronds and much information) has, moreover, informed me of the singular fact that when spores of N. exaltata are sown that species has never appeared in its own form in the resulting crop, which invariably consists of a batch of an allied but distinct and softer-fronded type (N. Zollingeriana or rufescens). So persistently indeed has this occurred that sowings of the normal form have been discontinued. As against this, however, we have the fact that the highly decomposite varieties recently obtained are undoubtedly referable to N. exaltata, and have presumably originated from spores of that species.

Unfortunately, however, for the scientist, the members of the trade, with whom these variants largely originate, can tell us little or nothing of their origin. The Ferns are raised by millions from spores, and in immense numbers by other propagative means, such as buds, stoloniferous or other, and every now and again a prize turns up among the resulting plants, probably only developing its character when it has been shifted more than once. Spore-propagation, moreover, is effected in an atmosphere charged with floating spores of all kinds, so that a pure culture is practically impossible. It is, consequently, absolutely impracticable to trace the parentage with any certainty whatever.

We have, therefore, to be content with the possession of the results of such sports, and in N. exaltata the transformation effected is really marvellous. Instead of long, narrow, erect, stiff-looking groups of fronds forming a more or less straggly plant, we have a compact, spreading rosette of wide-based, tapering fronds, divided and redivided into pinnæ, pinnules, and pinnulets developed so abundantly and vigorously, and, withal, arranged so charmingly, that they pile themselves up an inch or more deep, yet leaving deep, symmetrical grooves above the midribs, bordered evenly by the mossy masses arising from the secondary ones. The latest development on these lines has been aptly named N. e. todeaoides, so closely does it resemble Todea superba in its redundant delicacy of growth. The lines followed in this case correspond precisely with those seen in our native Shield Fern (Polystichum angulare) in its extreme plumose forms, all of which are undoubtedly due to a like cause, viz., a further extension of the furcating faculty of the free venation, the results being greater and greater sub-divisions of the fronds on more and more minute lines. Fortunately in these exaltata sports the stoloniferous nature of the Fern is retained, and permits of easy propagation. The spore-production, on the other hand, is likely to dwindle to nil. The thoroughly evergreen nature of N. exaltata adds much to the value of these beautiful variants. It will give some idea of the evolution of the best varieties now extant if we quote the various awards and certificates given to them, as they appeared, by the Royal Horticultural Society, together with their dates.

N. DAVALLIOIDES (?) FURCANS (Veitch, September 17, 1873) is the first on the list. This originated in Australia, being sent over from Sydney, and is a pretty polydactylous variety, an improved form of which N. d. multiceps, appeared 19 years later (H. B. May, August 23, 1892), presumably from a stray spore of furcans. Though certificated as N. davallioides, both these varieties have since been allocated, and properly so, to N. exaltata; N. davallioides being distinguished by very long pinnæ, a character quite absent in the two varieties in question, and in all other respects N. exaltata is obvious. N. davallioides has produced no known sports so far, and acquired its name from the fact that the fertile pinnæ are contracted and deeply crenate, the sori, or spore-heaps, occupying the extreme tips of the projections, so as to present some resemblance to the marginal projecting sori of the Davallia fructification.

N. DUFFII (Veitch, April 4, 1877) also came from the Sydney Botanic Gardens, and was named after Mr. Duff, the curator or foreman of that establishment. It is a curious dwarf, round-pinnaed, ramose form, a sport the species of which it is difficult or impossible to determine.

N. BAUSEII (Veitch, Sept. 9, 1884), a graceful, slender, recurved bipinnate form, with deeply-cut narrow pinnules, originated in a sowing by Mr. Bause of spores of N. pluma (Madagascar), a deciduous species, as is, of course, its offspring.

N. RUFESCENS TRIPINNATIFIDA (Veitch, July 1, 1886), came from Fiji, and is a splendid, bold-growing plumose form, cut precisely on the lines of our Welsh Polypody (P. v. cambricum), the pinnæ being enlarged and deeply cut into pointed pinnatifid segments instead of dividing and redividing on decomposite lines like the N. exaltata varieties referred to.

N. EXALTATA in 1890 produced a crested variety named N. e. plumosa (May, April 22, 1890), a name subsequently changed to N. e. grandiceps, as it does not belong at all to the plumose section. It forms a very compact and globular plant, with fronds divided and subdivided and pinnules multifid and incurved, while the frond tip justifies the amended name by bearing a heavy corymbose crest. In this crested or tasselled direction N. exaltata has yielded a number of other crested forms, culminating so far in N. e superba (May, April 22, 1890), in which the apices of the frond and its sub-divisions are developed into large bunchy tassels, so large indeed that the lateral ones are piled up one upon another so as to form a dense inch-deep fringe, the frond terminating in a large one to match. A curious variant of this type has appeared with each frond twisted spirally with singular effect (N. e. superba spiralis, May). The previously-described forms of N. e. furcans, multiceps and grandiceps are in all probability gradational forms of N. e. superba, although, as before explained, this cannot be established.

N. E. PIERSONII was distributed in the United States in 1903 as a splendid decomposite sport from the so-called Boston Fern (N. exaltata), and evoked great admiration as a decidedly fresh and promising break. N. e. elegantissima followed (May 29, 1906, Godfrey), still more finely cut, and, finally, so far as present records are concerned, Messrs. Rochford (October 9, 1906) capped an apparent climax with the N. e. todeaoides, already described. In this connection it is a curious fact that ten or twelve years ago, long before Piersonii appeared, Mr. Roupell, of Roupell Park, sent the writer a number of bipinnate fronds of N. exaltata, all unfortunately barren, which had appeared on a normal plant in his locality. This plant, however, either reverted or was lost sight of in some way, for, despite our urgent advice to sow and our prediction (since verified) that a capacity thus indicated might be the forerunner of very fine decomposite types, nothing more was heard of the particular plant.

N. PECTINATA, a narrow-fronded species, but otherwise not unlike N. exaltata, has recently yielded a very pretty crested form—N. p. canaliculata (May)—in which the short polydactylous pinnæ are turned upwards and rolled inwards in such a way as to render the frond almost tubular, whence the varietal name.

N. CORDATA VAR. TESSELATA (Prickett, October 23, 1906) has been christened on the *lucus a non lucendo* principle. It is a crested form of moderate merit, but we have quite failed to find any tessellated or mottled character justifying the varietal name.

We now come to one of the most remarkable variants of all in N. cordifolia crispata congesta (May, July 7, 1903), in which every part of the frond is so densely congested and so closely packed on the thickened and shortened stems, that the height is reduced to inches instead of feet, the plant being dwarfed to the utmost. N. Mayii (May, October 13, 1903), presumably the same species, is of similar type, but on bolder lines, forming a very handsome plant, and at the same time a remarkable contrast to the plumose and crested varieties described.

From the above it will be seen that with two or three exceptions, the more marked sports in this genus have appeared within the last four years, and that the finest forms, N. e. superba May and N. e. todeaoides, as representing the present extremes of cresting and plumation, may probably be the outcome of three or four preceding gradations. N. cordifolia congesta cristata, on the other hand, had no gradational forms, and N. pectinata canaliculata may be possibly due to a cross, being so closely allied to N. exaltata with its tasselled variants.

In conclusion, I take the opportunity of deprecating the use of [Latin] specific names for varietal forms. In the list before me there are N. Bauseii, N. Duffii, N. Mayii, and N. Westoni, to which awards have been given under specific names, although in two cases the species proper is known. *Chas. T. Druery, V.M.H., F.L.S.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

OMPHALODES LUCILIÆ. The illustration of this plant on p. 53 interested me greatly, and caused me to recall the solitary example of the plant that, some 35 years ago, was growing under my care in the nursery of the late Mr. Robert Parker, at Tooting. My instructions were to watch it so carefully day by day that not a single seed should be lost, for the Tooting plant was one of the very few which then existed in England. During the first season I was successful in harvesting a few dozen seeds, most of which were sown a little later the same season, the remainder being sold. The chief disappointment experienced in the raising of seedlings of the plant is that a large number are quite devoid of the characteristic glaucous leafage of the original plant, although identical in all other respects. At this date it is interesting to note that the plant still produces many green-leaved seedlings, and I have never known a batch to be perfectly free from them. In the month of May, either in 1874 or 1875, I had a plant strong enough from which to risk taking cuttings, and of these I secured 13, each with a "heel" attached. Not more than the eighth part of an inch separated the heart of the cutting from the heel, consequently each piece had to be tied to a little stick or peg to hold it in position. In less than five weeks every one of the cuttings was nicely rooted, and they were therefore potted up singly. Since that time I have rooted many cuttings of the plant, but the satisfaction on my first success was greatest. May and June are the best months for inserting cuttings, and bell-glasses should always be employed, for once they are permitted to droop they rarely, if ever, form roots. The plant will readily submit to division during the above named months, but interference during winter is most harmful, and as fatal in its results as is an application of manure to its roots. In regard to soil the plant is not especially fastidious. My first specimen was planted in a good depth of sandy loam and peat on the level ground, and it was partly protected by a handlight. In the late Mr. Atkins' garden at Pamswich this Omphalodes rambled in wild profusion over a low rocky slope, the roots for the most part being in loam and slate-chippings. In sandy peat it also succeeds well. The finest leaf growth and leaf colouring I have known the plant to develop was when planted in a deep fissure of rock in a mixture of strong loam-peat, Leighton-Buzzard grit with some finely-broken soft brick freely added. The rooting medium should be quite 2 feet in depth, and should be provided with means for perfect drainage. Slugs are very fond of the leaves. The plant succeeds well in the rock gardens if treated as described above, and it is also at home in the rock wall if its roots can penetrate into cool soil. *E. H. Jenkins, Hampton Hill.*

BEGONIA GLOIRE DE LORRAINE FROM SEED.—There are many gardeners who have yet to learn that Begonia Gloire de Lorraine does produce seed. I shall be much surprised if the note by Mr. Cromwell (see p. 406) does not fall as a bombshell on the ears of many professional men. The theory that hybrids are not capable of reproducing themselves by seed is, we know, gradually being broken down; but that B. Gloire de Lorraine is assisting in upsetting this theory is somewhat surprising. The number of articles that have been published during the past 15 years, in reference to the propagation and cultivation of this plant are enormous; but I do not recollect reading of anyone being successful in the saving of seed, at least with one exception. A note appeared in the *Gardeners' Chronicle* about six years ago. It had been inserted by a leading firm of nurserymen, and stated that they had been successful in the raising (not saving) of seed, and that they hoped at a future date to be in a position to exhibit the plants at a meeting of the Royal Horticultural Society. Whether they had the "honour" of doing this I trow not. The bearing of seed by this Begonia is not a matter of fact sort of thing in South Wales, as it appears to be at "Cleveley." A few particulars from Mr Cromwell as to his method of procuring seed otherwise than by self-fertilisation would, I am sure, be of great interest to a large number of the readers of this journal. *H. R., Cardiff.*

——— In the issue of *Gardeners' Chronicle* for December 15, p. 406, there is a note on Begonia Gloire de Lorraine, by Mr. B. Cromwell, and a part of the same is as follows: "The stock was raised by leaf propagation from cuttings, and from seed, the latter germinating on the surface of the pans, which last year were suspended in the corridor, thus showing clearly that B. Gloire de Lorraine will reproduce itself from seed providing the atmospheric surroundings are suitable." I think it would be of great interest to many readers if they could find out what treatment, in the way of "atmospheric surroundings," &c., are essential. *A. J. W.*

THE PLANTS OF THE BIBLE.—In your review of my book with the above title, you note two supposed errors and add one (?). (1) I did not mean the reader to infer that the scarlet cup of the Yew is poisonous, for I have eaten them repeatedly, and was never the worse. My words are: "It is the leaves and little green seed or kernel within the sweet, juicy, scarlet cup that is very poisonous. Children have died from eating the latter (i.e., the seed), and cattle from browsing on the foliage (i.e., the former). (2) The Weeping Willow (*Salix Babylonica*) is not mentioned as indigenous but "cultivated." My words are: "There are eight species of Willow in Palestine, including the cultivated *Salix Babylonica*, or 'Weeping Willow.'" With regard to my philological suggestion that *Almug* or *Algeim* was the Greek *Smilaks* or Yew, you observe "Philological sleight of hand of this description would enable one to prove (?) anything." By no means, for you omit the qualification that the "sleight of hand" must be rigidly conformable to Grimm's Law, viz., the Labials, Dentals and Gutterals are, respectively, interchangeable. A good example is seen in the word *Bodega* over a Spanish wine-shop, for it is identical with the German *Apothek*, though used in a different sense. *George Henslow.*

CHRYSANTHEMUMS AT SHAW'S GARDEN.

FROM an American journal we learn that there has been in St. Louis a rather novel Chrysanthemum show, differing in a number of respects from the usual exhibitions known by this name all over the country.

"Shaw's Garden," or the Missouri Botanical Garden as it is properly called, is very well known as a scientific establishment of international reputation and a place worth seeing by every visitor to St. Louis. It has also won recognition as a place to which florists may turn for information or carry their professional troubles with the certainty of getting willing help. But comparatively few people outside of St. Louis know that for several years past it has vied with the florists' clubs and horticultural societies of other large cities in staging Chrysanthemums on a large scale. In 1904, without impairing its own exhibit, the garden easily won the first prize for Chrysanthemums in number and variety at the national flower show that was held in the horticultural building of the World's Fair, even the Japanese exhibit falling behind it.

These Botanical Garden exhibitions differ from ordinary Chrysanthemum shows in several respects. The plants are all grown by the garden itself; they are not confined to commercially profitable varieties; they are arranged so as to represent the various Chrysanthemum types instructively, and as cut flowers are not used, their arrangement is made highly artistic. Perhaps the greatest difference lies in the fact that they are absolutely free to the public.

This year the Chrysanthemums were displayed in a large circular tent, nearly 100 feet in diameter, covering a large part of the parterre or sunken garden just within the main entrance, and the plants were plunged in the beds that a little later will be planted with Tulips for spring blooming. This arrangement in turf-bordered beds, separated by firm well drained walks, has made seeing them a delight to visitors, who have thronged the tent notwithstanding unprecedentedly inclement weather. For a part of the first week a dense blanket of smoke hung over the city, and offices and even street cars were kept lighted for a good part of the day. To meet this emergency, which reduced all of the flowers to a uniform cherry colour, electric lights were installed, and the directors of the garden took advantage of this circumstance to throw the tent open to the public during the evenings—a concession which has never before been made in the history of the garden, and which enabled a very large number of business men and women to see the flowers when they could not have done so during the daytime.

Everyone who has had to stage Chrysanthemums knows how hopeless the first plant—or the first half dozen plants, even—looks when it is moved into place in a hall. It was the same when the first specimens were set in the big tent, though they were large enough to make it necessary to take off roof sections of the houses they had been grown in, in order to get them out; but for all this, the tent has been full to overflowing with superb, single-head, bush and standard grown specimens, to the number of over 3,000 and representing over 300 varieties, each legibly named and all worked into as great harmony of colour as the entire gamut of Chrysanthemum colour allows. The primitive yellow Chrysanthemum Indicum and the very similar but later blooming "Golden Chain" variety have attracted a good deal of interest in contrast with the mammoth heads of the best trade varieties in all shades of white, yellow and red. As usual, a grafted plant occupied a prominent place, and attracted the attention of curiosity hunters; and in a sense this was justified by the plant itself, for it had been surrounded by potted plants of the 25 varieties to be grafted on it, and these were allowed to grow on their own roots until the inarching was completed, so that their flowers, instead of being starved as grafted flowers often are, were of normal size and perfection.

One good effect of the botanical exhibition is that the florists of the city have begun hustling for a fine flower show next year, and are talking of a $10,000 guarantee fund, to be raised in the course of the winter, so as to ensure an unusually good exhibit next fall.—*Florists' Exchange* (American).

LAW NOTE.

PURCHASE OF ORCHIDS FROM COLOURED PLATES.

WE have already announced the result of the appeal lodged by M. M. Linden et Cie against the decision of the lower courts. The full report of the trial, with the details of the motives upon which the judgment was based, is given in technical fashion in the *Journal des Tribunaux*, of Brussels, for December 9, 1906. This case has lasted some two and a half years, so that the law's delays are not peculiar to this country. We understand that Mr. Leemann has been repaid the money that he expended, with costs.

CHRYSANTHEMUM ROBERT MORGAN.—From the gardens of the Alexandra Palace we lately received a bunch of a single-flowered Chrysanthemum under this name. The flowers were large, clear reddish-brown or maroon colour, with a yellow centre, and showed evidence of good culture.

Obituary.

JOHN BRACK BOYD. The death occurred on the 12th instant of this well-known Scottish amateur gardener, of Cherry Trees, Yetholm, N.B. Mr Boyd was the raiser of some fine Saxifragas, notably the one bearing his name, S. Boydii, the history of which was given by Mr. Boyd's brother, himself a famous horticulturist, in our issue for May 12, 1906, p. 331. Deceased, who was 89 years of age, took a keen interest in gardening to the last.

THE WEATHER.

THE WEATHER IN WEST HERTS

Week ending December 26.

The heaviest fall of snow for nearly seven years. During the past week the temperatures have been all more or less below the average, but at no time was the cold severe, the exposed thermometer on the coldest night indicating only 15° of frost. At 2 feet deep the ground is at the present time 2°, and at 1 foot deep 3°, colder than is seasonable. Rain fell on only one day of the week, but there occurred a heavy fall of snow during the early morning of the 26th, which covered the ground to the average depth of 6 inches, making this the deepest fall of snow experienced here since February 14, 1900, or for nearly seven years. The percolation has been gradually slackening during the week, and has now almost ceased through both gauges. The sun shone on an average for one hour twelve minutes a day, which is about five minutes a day less than is usual at this season. During the seven days ending the 21st, no sunshine at all was recorded. The first five days of the week proved calm, but on the last two days the wind was rather high. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by about four per cent. *F.M., Berkhamsted, December 26, 1906.*

SCOTCH GARDENERS IN AMERICA.

(Concluded from page 424.)

AMONG the prominent seedsmen of America to-day the names of the following Scotsmen are included:—ROBERT JAMES and JOHN K. M. L. FARQUHAR, of Boston, Mass., natives of Fyvie, Aberdeenshire, introducers into commerce here of, among other good things, the Farquhar Rose, the Farquhar Violet, Lilium Philippinense, and Begonia Gloire de Lorraine. John K. M. L. Farquhar is a great traveller, and is in much demand as a lecturer on horticultural topics. ALEXANDER DON, of New York, a Brechin boy, a graduate from Drummond's, Stirling, is an expert on grass and other seeds, and for years was secretary-treasurer of the American Seed Trade Association. ALEXANDER FORBES is general manager of Peter Henderson and Company, New York, a man well posted in all branches of the seed business. Mr. Forbes is the inventor of a revolving showcase for display of seeds in packets. The CURRIE brothers, the largest seedsmen of Milwaukee, Wis., are natives of Ayrshire. ALEX. M. RENNIE, another Scot, is a prominent seedsman of Providence, R.I. ROBERT VEITCH and ARCHIBALD VEITCH, natives of Peebles, became well-known plantsmen and seedsmen in New Haven, Conn. WM. MEGGATT, born near Drumlanrig Castle, came to America in 1859, entering the garden seed business, from which he has retired. He is a replica of Burns's Captain Grose, and has a large and varied collection of antiquities. He was at one time president of the American Seed Trade Association.

As commercial florists, contributing their share toward the advancement of their craft, I would mention JAMES DEAN, a native of Wigtonshire, born in 1845, a noted grower of Easter plants, now retired. Mr. Dean is a veteran of the Civil War, and was president of the Society of American Florists for one term. His hobby is the collecting of antique firearms, of which he has a large and varied assortment. ADAM GRAHAM, Cleveland, O., a native of Fife, born in 1840, a successful florist, and man of affairs. An ex-president of the S.A.F.O.H.

Among modern Rose growers ALEXANDER MONTGOMERY, of the Waban Rose Conservatories, Natick, Mass., is a recognised leader. He was born at Port William in 1848, and apprenticed as gardener on the Earl of Galloway's estate. He came to America in 1882. The Waban, a sport from Catherine Mermet Rose, sometimes called the Red Mermet, originated at this establishment, and in recent years the new Rose Wellesley was obtained. Mr. Montgomery was president of the American Rose Society for two terms. Mr. Montgomery's son, Alex., Jr., is the author of a monograph on *The Grafting of Roses*. GEORGE ANDERSON, Philadelphia, a noted Rose grower, is a native of Jedburgh. One of the most widely known among the living floriculturists in the United States is PETER FISHER, of Ellis, Mass., the originator of some of the best of the present-day American Carnations. He has been engaged in improving that flower since 1892. His productions include the varieties Mrs. Thomas W. Lawson, the famous "$30,000-dollar Carnation," Enchantress, Nelson Fisher, Mrs. M. A. Patten, Beacon, and Evangeline. Mr. Fisher was born near Dunkeld, his father being land steward for the Duke of Athole. He received his training in the gardens of the estate of the Dowager Duchess of Athole. Mr. Fisher served as president of the American Carnation Society the present year. JOHN MURCHIE, Sharon, Pa., from the West of Scotland, is also a noted raiser of seedling Carnations, the variety Fred. Burke being one of his best. JOHN DONALDSON, a native of Banff, a graduate from the Earl of Fife's gardens, now of Elmhurst, N.Y., a Carnation specialist, was for years secretary of the New York Cut Flower Exchange. JOHN BIRNIE, of West Hoboken, N.J., from Aberdeenshire, a noted grower of Geraniums, Verbenas, and Carnations, is one of the leading men in the New York Plant Market. JOHN NICOL, also an Aberdonian, who in his young days was gardener at Viscount Arbuthnott's estate, near Bervie, is an ex-president of the New York Market Florists' Association.

JOHN SCOTT, a native of Newlandrig, near Dalkeith, served under Wm. Priest at New Battle Abbey. He is at present president of the New York Florists' Club. The popular Nephrolepis exaltata var. Scottii, a sport of the type, originated with him. Mr. Scott is one of our progressive young florists, and is building up a large establishment at Flatbush, near New York.

WILLIAM and JAMES T. SCOTT, brothers, natives of Aberdeenshire, possess a facile pen, and contribute numerous articles on gardening subjects to the technical Press. William Scott was for several terms president of the Tarrytown (N.Y.) Horticultural Society, and is a very successful grower and exhibitor of Grapes, Chrysanthemums, and vegetables. These gentlemen have recently entered the ranks of the commercial growers, with greenhouses at Elmsford, N.Y.

WILLIAM SIM, Cliftondale, Mass., a native of Fyvie, apprenticed at Dunnottar House, near Stonehaven, ranks high among our progressive young florists. He is an expert grower of Tomatos under glass, and as a cultivator of the Princess of Wales single Violet has few, if any, equals. It may be safely said of him that he was among the first to grow Sweet Peas under glass to a high state of perfection.

In the retail florist branch of the business, ALEX. MCCONNELL, New York, takes a leading place. He was born in the Isle of Man of Scotch parents, and is in all things truly Scottish. The WEIR brothers, John and Fred., of Brooklyn, N.Y., are prominent retailers in the city of churches. Their father, James Weir, a native of Perth, was a pioneer grower of plants around New York City. SAM. MURRAY, Kansas City, Mo., a native of the West of Scotland, is a leading retailer in his home city, and has few peers as a grower of the Gloire de Lorraine Begonia.

In the list of park superintendents is included the names of JOHN MCLAREN, of the Golden Gate Park, San Francisco's beauty spot, which figured prominently as a camping ground for the recent earthquake-fire sufferers. Mr. McLaren is a Perthshire man, and Golden Gate Park is an enduring monument to his skill. JOHN DUNBAR is assistant park superintendent of Rochester, N.Y., a frequent writer to horticultural journals. JOHN W. DUNCAN, from Aberdeenshire, is assistant superintendent of the park system of Boston, Mass., and a local correspondent of a leading trade journal. RODERICK CAMPBELL is superintendent of the Syracuse (N.Y.) parks.

WILLIAM FALCONER, one of the ablest gardeners in the United States, born in 1850, a native of Inverness-shire, commenced his horticultural career in the establishment of John Grigor and Company, Forres. He graduated from Kew, and joined the staff of the *Garden* in 1872. Two years later he came to America, and has held such important positions as superintendent of the Botanical Garden at Harvard University, gardener for the late Mr. Charles A. Dana, editor of the *New York Sun*, and superintendent of Schenley Park, Pittsburg, Pa., in the development of which he played a prominent part. He is now superintendent of Allegheny Cemetery, Pa. Mr. Falconer was the first editor of *Gardening*, an illustrated horticultural periodical. He is a careful writer and frequent contributor to the technical Press, and is author of *Mushrooms and How to Grow Them*. Among cemetery superintendents may also be mentioned ROBERT CAMPBELL, a native of Ellerslie, Renfrewshire, in charge of Cave Hill Cemetery, Louisville, Ky.; and ALEXANDER REID, superintendent of Oakwood Cemetery, Chicago.

Along the scientific lines the Hon. JAMES WILSON, the present Secretary of Agriculture in President Roosevelt's Cabinet, is a native of Ayrshire. He has drawn to his department many able scientists in special lines of investigation in horticulture, whose work is of the greatest benefit to those commercially or otherwise engaged in the cultivation of fruits, flowers and vegetables in America. GEORGE W. OLIVER, a native of East Lothian, and a graduate from the Edinburgh Botanical Gardens, is an expert in the Bureau of Plant Industry, Department of Agriculture, Washington, D.C. Mr. Oliver has done some excellent work in the improvement of the Easter Lily, in hybridising Water Lilies, Nepenthes, and other plants.

ROBERT CAMERON, a native of Inverness, a former Kewite, is curator of the Harvard Botanical Gardens at Cambridge, Mass., and has collected in the West Indies, South America, and elsewhere many fine specimens for that institution.

JOHN MUIR, of California, ranks as one of our foremost living botanists, and is an author of repute.

PRIVATE GARDENERS.

I now come to private gardeners. Around Newport, R.I., some of the finest residences and private gardens in America are to be found, and in the development of the grounds and in the care of the greenhouses Scotsmen have been, and are, prominent. Among them are WILLIAM FINDLAY, a native of Fife, noted as a grower of fruits under glass; JAMES MCLEISH, a Roseneath boy, a most successful Grape grower, and a past president of the Newport Horticultural Society; ALEXANDER MACLELLAN, a native of Lanarkshire, a good all-round gardener, who has given much attention to the eradication and prevention of insect pests, one of the originators of the Newport Horticultural Society, and its present president. JAMES ROBERTSON, a Forfarshire lad, in addition to his other qualifications as a gardener, is an authority on Dahlias, and has raised several good seedlings. COLIN ROBERTSON, his brother, is an expert grower of Crotons, and is also an enthusiastic cultivator of Dahlias. JAMES BOYD, from Selkirk, is a successful grower of Lilies, Peaches and Nectarines under glass. HUGH WILLIAMSON, from the Burns country, has one of the largest collections of H.P. Roses in the locality, and is a very successful exhibitor.

ANDREW MEIKLE, a native of Lark Hall, Lanarkshire, ranks high as a landscape gardener and maker-up of floral designs. He was at one time financial secretary of the local society. JAMES KYLE hails from Kirkcudbrightshire, and is an expert grower of Adiantum Farleyense. CHARLES D. STARK is an excellent cultivator of ornamental foliage plants. ANDREW POW is a native of Hawick; has raised some very good varieties of Nerines, and is also an expert Chrysanthemum grower. DAVID MCINTOSH served his apprenticeship at Skibo Castle, now the Scottish home of Andrew Carnegie. Mr. McIntosh was one of the originators of the Newport Horticultural Society, and has been its secretary for nearly five years. He is a frequent contributor to the horticultural Press, and is an able plantsman.

At Orange, N.J., PETER DUFF, a graduate from the gardens of St. Martins, Perthshire, now superintendent of Mr. J. Crosby Brown's fine estate, and an expert in Chrysanthemum culture; MALCOLM MACRORIE, a West Highlander, superintendent of the estate of Doctor Mandeville; and GEORGE SMITH, formerly gardener for Colgate, of soap fame, now a commercial florist, all held for a term the office of president of the New Jersey Floricultural Society. WILLIAM REID, another Scotsman, is its treasurer at present.

JOHN F. JOHNSTON, an Edinburgh lad, gardener on the Dana Estate, Glen Cove, is secretary of the Nassau County (N.Y.) Horticultural Society; and his brother-in-law, W. H. WAITE, a graduate of the Edinburgh Botanical Gardens, holds a similar office in connection with the Elberon (N.J.) Horticultural Society. Each of these young men contributes frequently to the gardening Press, both being expert photographers of plants and flowers.

DAVID FRASER, a native of Craigo, Forfarshire, who served his apprenticeship at Usan, near Montrose, is head gardener for Mr. Henry C. Frick, the millionaire ironmaster of Pittsburg, Pa., and the present secretary of the Chrysanthemum Society of America.

JOHN DALLAS, a native of the North of Scotland, has held several positions as head gardener in the New England States, and has contributed freely of his excellent practical knowledge to gardening periodicals. His brother, Alexander, is a well-known florist of Waterbury, Conn.

PETER BISSET, a native of Auchtermuchty, where he was born in 1869, served his gardening apprenticeship at Dalmeny Park, the seat of the Earl of Rosebery, under the late John Moyes. Mr. Bisset is now superintendent of the estate of "Twin Oaks," near Washington, D.C. He has raised several good Water Lilies, among them Nymphæa alba magnifica, N. O'Marana, Bissetii, and others, and is now engaged on a

work called *The Book of Water Gardening*. He has also given attention to cross-fertilisation of Roses, the new Tea Rose Queen Beatrice being one of his seedlings. Mr. Bisset is president of the Florists' Club of Washington, and a member of the executive committee of the American Rose Society.

So far as the pioneers in the profession are concerned, the conditions they faced are very clearly set forth in a letter written by Grant Thorburn to a London magazine in 1832. In that communication Mr. Thorburn said:—

"We have neither lords spiritual nor temporal in this country, with seventy thousand pounds sterling a year at their backs, and who to assist them in spending so much money, must employ perhaps thirty horsemen, a hundred labourers, and, it may be, thirty gardeners. Almost every man is his own gardener, and perhaps not in America are there three gentlemen who employ gardeners for the twelve months round. While our present system of government continues, as we have no hereditary estates, and property is consequently always shifting, we never shall have what are called overgrown fortunes. No man is able to employ ten gardeners in this country; therefore, while the present system continues in Britain, gardeners will meet with much better encouragment there than in America. . . . But, notwithstanding all this, a gardener may live very comfortably in America. Single men are generally engaged by the year, and receive from twelve to fifteen dollars per month, bed, board, and washing. It is expected from them to raise vegetables sufficient to supply the family; to take care of a few flower beds, and sometimes a small greenhouse." Mr. Thorburn then refers to the opportunity of saving money and engaging in market-gardening near a city, continuing: "But I would not advise a gardener who has a family to come here except he can bring with him one hundred or two hundred guineas, for it often happens that some months go over his head before he gets into a situation."

"A man wants only health, hands, a good character, and a good spade, to work his way in this country."

Three-quarters of a century has wrought considerable and gradual change. While our system of government is still the same, we are yet without lords, either spiritual or temporal, we have now a comparatively large number of individuals who have amassed fortunes running into the millions of dollars, and the majority of these men (and women) own big estates, and well-kept gardens and grounds. The latest directory of gardeners, published in 1904, gives the total in the United States and Canada as 2,000; the number may now have reached 3,000 in the two countries. There is, however, no surplus of good positions. Some of the head gardeners at Newport, R.I., have held their present places for from 15 years to a quarter of a century; it is the same elsewhere throughout the country, and there always seems to be a man "on the spot" to fill any vacancy, and, more often than not, a superabundance of applicants. The greater portion of the positions a-going are filled through the media of the various seed houses, a practice that has been in vogue since seed stores had their being here. The trained, capable, sober gardener, as against the incapable and dissolute, will, and does, of course always push his way to the front wherever he goes; but he has quite a good many drawbacks to contend against in America, perhaps not experienced to such an extent at home. Chief among these is the pretender, the man with the smattering of gardening, the garden labourer who poses as a professional, who is willing, as he is only qualified, to do all the "chores," as such work as attending horse, milking the cow, &c., is called, in addition to looking after the garden, imperfectly, and who works for little wages. Strange, too, many such are employed here in spite of their deficiencies. The competent, well-conducted gardener who comes to the United States in these days must take his chances, and when once he gets a foothold, make his merit felt in order to win success; and, it may be said, there is no room here for the discontented or the vicious.

Thorburn's advice respecting the married gardener—and for that matter the unmarried one, too—in regard to having a little nest egg to fall back upon still holds good. As in his day, quite a number of professional gardeners, as I have previously stated, enter the commercial business of growing plants, cut flowers, &c., for market; in fact, many of our most successful florists have at one time been private gardeners.

In regard to emoluments, I called on my friend, PATRICK O'MARA, of Peter Henderson & Company, New York, who has had more experience probably in the placing of gardeners in this country than any other one man, to get a line on present-day gardeners' wages. He informs me that these run from $720 a year, with house rent free, coal, and, in a good many cases, light, milk, vegetables from the surplus raised on the place, up to $1,500 a year, carrying the same perquisites. Places paying the latter figure are not numerous. Single men, under gardeners, receive from $25 to $50 a month, and board. Single men who have charge of places run about the same, depending on the character of the position. Most of the head gardeners are benedicts, and the number of assistant gardeners on any one place rarely exceeds, on an average, five or six.

Mr. O'Mara has, during the 20 years he has acted as the gardeners' friend, had a splendid opportunity to learn the traits, capabilities, &c., of men of the different nationalities that have come under his observation; and he gives it as his opinion, and without any disparagement of other men, that as a class Scotch gardeners head the list for all-round satisfaction. They have a greater power of concentration, are not so easily distracted by extraneous influences, such as affairs of church or state, as, say, an Irishman, or a German; and their chief glory lies rather in the achievement, the renown that attaches to difficulties overcome and victories won, than in the purely sordid side of the work.

It is facts like these, combined with the other native characteristics for which the men from ayont the Tweed are famed the world over, that in all things connected with horticulture, enable Scotland to still stand where she did at the top.

Alec Wallace, New York, November 5, 1906.

MARKETS.

COVENT GARDEN, December 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

REMARKS.—The severe snow-storm has curtailed the supply of all green vegetables such as Savoys, Brussel's Sprouts, &c., and this morning (December 27) the market was practically empty, so far as these were concerned. Celery, however, is plentiful. The sea fogs, and bad weather generally, delayed the transit of much foreign produce, and Tomatos are especially dear. Foreign Tomatos arrive in boxes, four of which nailed together by strips of wood, constitute a "bundle." All vegetables are very dear. The Christmas trade generally has been very good. *E. H. R., Covent Garden, Thursday, December 27.*

POTATOS.

Bedfords, 65s. to 70s.; Blacklands, 60s. to 70s.; Kents, 65s. to 80s.; Lincolns, 70s. to 90s.; Dunbars, 80s. to 95s. The trade for best samples has improved, but it is less good than it should be at this season. *W. J. C. & S., Covent Garden, December 27.*

COVENT GARDEN FLOWER MARKET.

The Christmas trade was disappointing. On Saturday morning there were very few empty stands, and most of them were nearly full. Prices advanced but little. The frost checked the trade for the more tender plants. I saw some Poinsettias, which were good and plentiful, passing through the streets, without protection, early in the morning when the ground was hard with frost. It seemed a pity, for after such an exposure the bracts would droop down in a few hours. Begonia Gloire de Lorraine was fully exposed at the same time. It is this sort of treatment that spoils the trade for tender plants, for if they reach the customers before showing the effects from cold they soon deteriorate, and the buyers being disappointed, do not purchase the same plants again. Azalea indica though fairly hardy will not stand exposure after being forced into flower. Ericas made better prices, but supplies were more than equal to the demand. Marguerites were over plentiful. Sprays were good. Chinese Primulas from several growers were better than we have seen them for several years past. Bouvardias as they appear now can hardly be recommended. Cyclamen vary, but some are very good. White Hyacinths (Dutch) are better than those seen a few days earlier, and the "Romans" are good. Tulips vary; some are very good, but others have been over forced; they are plentiful in white, red, and yellow colours. Solanums are still over plentiful, and many of them are far advanced and the berries drop easily. A fairly good trade has been done in foliage plants, but the supply is excessive.

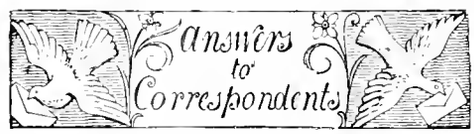
CUT FLOWERS.

These have been abundant, and very little advance was made in prices. A few extra fine Callas made 8s. per dozen, but 5s. was about the ruling price for very good samples, and 5s. was the highest price asked for Lilium longiflorum. Roses advanced in prices considerably; General Jacqueminot went out at 8s. per dozen blooms, and other sorts were proportionately dear. Carnations also cleared at better prices. It is true that many of the Chrysanthemums are rather far advanced, but even good, fresh white blooms did not rise in price, except it was for extra large flowers. Poinsettias instead of advancing were rather lower in price. Lily of the Valley continues plentiful. Eucharis remained on sale at closing time. Violets are not quite so plentiful and have advanced in price. Camellias were sold at low prices. Orchid blooms, particularly Cattleyas, are not so abundant as they were a few weeks ago. Daffodils were not quite so plentiful, the first crop being over, but Tulips and Roman Hyacinths were abundant. Narcissus Paper White, Glorious, and Soleil d'Or (imported) are plentiful and good. The "Minnie a" is much better, for we are now getting the true Acacia armata. Ranunculus is good and Roses are of fair quality. Eucalyptus globulus in flower is attractive. Foliage of all descriptions continues abundant. *A. H.*

ENQUIRIES AND REPLIES.

HEATH'S BOOK ON VIOLETS.—If Mr. Percy Allder (see p. 379) will make application to Mr. J. Heath, Violet specialist, Flinder, Kingskerswell, Devon, he will get all the information he requires. *G. Goddard.*

USE OF GAS LIME AGAINST EEL-WORM.—I am thinking of preparing soil for next year's Tomato growing, and as a safeguard against eel-worm, &c., have thought of mixing gas lime with the soil and keeping them exposed in the open air until wanted for use. How much gas lime will it be safe to put with a cart load of soil? If mixed now, will it be safe to use it at about the middle of March? There will be a large heap of about 40 cart loads; will the centre of the heap be sufficiently exposed for the air to act on the lime, or should it be turned occasionally? *B. A.*



AUBRIETIAS AND ALYSSUMS: *L. W.* Aubrietia deltoidea Campbelli (syn. A. Hendersoni) is perhaps the best Aubrietia for the purpose of growing on and covering a stone wall, as it possesses a vigorous constitution with a fine tufted habit, while its large flowers of a deep shade of violet blue are extremely attractive. "Dr. Mules," a new variety, with flowers of a rich glowing purple, is preferred by many, but while admitting it is undoubtedly one of the best three to grow in a limited collection, we should give it second place to the former. A. d. graeca superba may be chosen as the third variety, because of its good habit and the profuseness of its light purple flowers, which are produced over a very extended period. Of Alyssums the best for growing on walls is A. montanum, because of its dwarf and spreading habit. Its flowers are yellow and very sweet scented, and its foliage is a pleasing shade of glaucous green. For ordinary spring-bedding purposes A. saxatile compactum and A. s. flore pleno are best.

BOOKS: *O. T. M. Dictionaries* (Nicholson's) *and the French translation*, by Mottet, published at 26, Rue Jacob, Paris; *Bailey's Cyclopædia of American Horticulture* (Macmillan), Emil Koehne, Deutsche Dendrologie (Stuttgart, Enke); *Dippel Handbuch der Laubholzkunde* (Berlin Parey); *Beissner Handbuch der Nadelholzkunde* (Berlin Parey); *Veitch's Manual of the Coniferæ* (James Veitch & Sons); *Sargent Manual of the Trees of North America* (Constable & Co.) and the *Silva*, of the same author, in 14 large 4to volumes; *Fertilisation of Flowers*, Müller. Apply to Macmillan & Co.—*C. P. D.* We do not know of any complete or recently published book on the natural orders. The last edition of *Henfrey's Elementary Course of Botany*, now some years old, contains the fullest account of the natural orders for your purposes. We do not know any book in English on Geographical Botany. Messrs. Stanford, Long Acre, or Philip, Fleet Street, would supply you with a globe. Write for their catalogue. *Kerner and Oliver* can be had from our publisher, at the price of 30s., postage extra.

BREACH OF CONTRACT: *A. B.* If you were engaged for the situation, and the agreement is in writing, we think you would be able to claim a week's wages or a month's wages, according to the length of notice that would be necessary to terminate the same engagement after you had actually commenced work. Such claim, however, might be disallowed in a court of law if one of the parties could prove that he obtained certain knowledge after making the contract that justified him in denouncing it.

FRUITS OF PASSIFLORA EDULIS: *C. Bailey.* As the unripe fruits of P. edulis chiefly consist of juice, the only thing you can do is to boil it with sugar, and make a flavouring essence of it. If very liquid, you might add a small quantity of brandy before bottling the syrup. In a compost of Bananas, for instance, some of this syrup would be delicious.

GROWING VEGETABLES AND HARDY FRUIT FOR MARKET: *C. E. A.* Your question is a difficult one to answer, seeing that so much depends upon circumstances and local conditions. Therefore we should advise you to consider the matter from every point of view before embarking in the business of market-gardener with a view to securing an annual income of £250 from the growing and marketing of vegetables and hardy fruits from a given acreage. Careful consideration is especially necessary in your case, inasmuch as you possess no special knowledge of the business upon which you propose to embark. You would have to rely upon the honesty and business ability of a manager who possesses the knowledge you lack. If you decide to make the attempt you should try and obtain on lease five, 10, 15, or more acres within five or six miles of the large and populous city near which you write from, and which is also within easy reach of other important centres of industry to which you could send the produce in your own conveyances to the several shops. By arrangement with some of the stable people you might then load your cart with manure on the return journey. You should, at all events, endeavour to get land enough to admit of your keeping two or more horses for ploughing, &c., so as to dispense with as much manual labour as possible in the production and marketing of crops; doing everything thoroughly and at the same time economically. Put plenty of manure into the ground, cultivate it well, and crop it closely and in regular succession with the vegetables most in demand. If you have capital enough to start in this fashion you may succeed. Should you be able to erect some low, narrow houses for the production of Cucumbers, and procure a good man to grow them, you would stand a still better chance of securing an income. But there would be no use in your commencing vegetable-growing for market unless you were near to a large city like Manchester or Birmingham, and such like centres in which to dispose of your produce.

HEATING GREENHOUSE: *A. R. G.* From the further particulars with which you have furnished us, including the height of the ridge of house from the floor-line, &c., it appears the cubic space is considerably less than your estimate. Therefore, we think that four rows of 4-inch hot-water piping will be sufficient to ensure a minimum atmospheric temperature of 45° during severe weather in winter, especially if you have no front lights or only shallow ones. In this case we should recommend you to fix two pipes, putting the flow and return, one above the other, parallel with, and close up to, side wall on either side of the house, and fixing the position of the pipes in a line of say 2 feet from the wall-plate, on piers or suspension hooks, made so that the top 2 inches rests on the wall-plate, and is secured thereon with a screw. With regard to your last question our answer is, about 20½ feet.

JOURNAL FOR MARKET GARDENERS: *J. A. Fruit Grower, Fruiterer, Florist, and Market Gardener*, price 1d., published weekly at 1, 2, and 3, Salisbury Court, London, E.C., or *Profitable Farm and Garden*, price 1d., published weekly by Messrs. Collingridge, 148 and 149, Aldersgate Street, E.C.

PINEAPPLE DECAYED: *J. T.* The plants have been subjected to some error of culture, which has caused a check to them, resulting in the diseased condition seen. It is not due to a fungoid pest. We do not undertake to reply by post.

TUBEROSES INTENDED FOR FLOWERING IN SEPTEMBER AND OCTOBER: *Constant Reader.* The bulbs which are now coming to hand should be potted in successional batches, and those intended for late flowering should be kept in sand in a dry room. If they are to flower in September and October, the bulbs should be taken from the sand and potted up at the end of May or the beginning of June. Under ordinary treatment they will then produce flowers at the time stated. A good compost for the rooting medium is formed of loam and leaf mould, and if the pots could be plunged in a bottom heat of 65° 70° when the plants are about to start into growth, a much more even growth would be ensured. When the roots have become active, the plants should be placed in a position near to the glass, in a moist atmosphere, and be frequently syringed, to keep down red spider. All side growths should be rubbed off as they appear, thus the vigour in the bulb will be concentrated into the nourishment of the central growth, which will in due time produce strong spikes of flowers.

WOODLICE: *T. C.* Place hollowed slices of Potatos, Turnips, or other vegetables near their haunts, and examine these baits occasionally, when many woodlice will be found congregated on the under surface. Garden mats, rolled and placed on the ground, also act as excellent traps for these pests. See note published on p. 435 of last week's issue, under "Cockroaches," &c., for a proprietary poison that was recommended for destroying woodlice.
